   1. Show interconnecting signal and control wiring, and interface devices that prove compatibility of inputs and outputs.
   2. For networked controls, list network protocols and provide statements from manufacturers that input and output devices comply with interoperability requirements of the network protocol.
B. Qualification Data: For testing agency.
C. Field quality-control reports.
D. Software licenses and upgrades required by and installed for operation and programming of digital and analog devices.
E. Sample Warranty: For manufacturer’s special warranty.

1.9 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For lighting controls to include in emergency, operation, and maintenance manuals.
B. Software and Firmware Operational Documentation:
   1. Software operating and upgrade manuals.
   2. Program Software Backup: Username and password for manufacturer’s support website.
   3. Device address list.
   4. Printout of software application and graphic screens.
   5. Testing and adjusting of panic and emergency power features.

1.10 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. One (1) ON/OFF Load Controller with three relays
   2. One (1) ON/OFF/Dimming Load Controller with three relays
   3. One (1) of each type of motion sensor used
   4. One (1) daylight sensor
   5. One (1) two-button digital wall switch
   6. One (1) four-button digital wall switch
   7. One (1) eight-button digital wall switch
1.11 QUALITY ASSURANCE
A. Testing Agency Qualifications: Accredited by NETA.
   1. Testing Agency's Field Supervisor: Certified by NETA to supervise on-site testing.
B. Example Contractor Startup/Commissioning Worksheet – must be completed prior to factory start-up

1.12 DELIVERY, STORAGE, AND HANDLING
A. Handle and prepare panels for installation according to NECA 407.

1.13 WARRANTY
A. Special Warranty: Manufacturer agrees to repair or replace components of standalone multipreset modular dimming controls that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Damage from transient voltage surges.
   2. Warranty Period: Cost to repair or replace any parts for two years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 SYSTEM REQUIREMENTS
A. Lighting control zones shall consist of one or more intelligent lighting control components (digital load controllers), be capable of stand-alone operation, and be capable of being connected to a higher-level network backbone.
B. Network Characteristics
   1. In-Room Network:
      a. The In-Room network shall be a free topology lighting control network using physical wiring connections and communication protocol designed to control a room/space/small area of a building.
      b. Digital room devices connect to the In-Room network, which provides both communications and power to room devices.
   2. Global Network (In-Room to In-Room Network):
      a. The Global network shall be a linear topology network to connect In-Room networks and relay panels (if applicable) for centralized control.
      b. Each In-Room Network to be connected to the Global Network shall include a single network bridge, and the network bridge is the only room-based device that is connected to the Global Network.
      c. The Global Network shall utilize communications cabling as specified by the manufacturer. The maximum cable run for each segment (distance between In-Room Networks) shall meet manufacturer limitations.
   3. Individual lighting zones must continue to provide a user defined default level of lighting control in the event of a system communication failure with the Global Network or the management software becoming unavailable.
   4. All switching and dimming for a specific lighting zone shall take place within the devices located in the zone itself (i.e. not in remotely located devices such as panels) to facilitate system robustness and minimize wiring requirements. Specific applications that require centralized or remote switching shall be capable of being accommodated.
5. System shall be capable of using a web-based software management program that enables remote system control, status monitoring, and creation of lighting control schedules and profiles.

2.2 DIGITAL LOAD CONTROLLERS (ROOM CONTROLLERS)

A. General
   1. Digital load controllers shall be simple to install and shall not have dip switches or potentiometers, or require special configuration.
   2. The controllers shall include the following features:
      a. Standard junction box mounting.
      b. Low voltage connection using standard RJ-45 connectors and CAT5e cable. Other wiring topologies are acceptable if controls accomplish all requirements specified in these documents.
      c. Each connected load shall be capable of any of the following behaviors: Manual ON, Automatic ON, Automatic ON to 50 percent, or Automatic ON to Preset level or last level set.
      d. UL 2043 plenum rated.
      e. Manual override and LED indication for each load.
      f. Power supply to power the digital load controller itself and the peripheral sensors and controls connected to the In-Room Network.
      g. Dual voltage (120/277 VAC, 60 Hz), rated for 20A total load, derating to 16A required for some dimmed loads (forward phase dimming).
      h. Zero cross circuitry for each load.
      i. All digital parameter data programmed into an individual room controller or plug load controller shall be retained in non-volatile FLASH memory within the controller itself. Memory shall have an expected life of no less than 10 years.

B. On/Off Load Controllers
   1. Controllers shall include the following:
      a. Multiple relay configurations per unit.

C. ON/OFF/Dimming Load Controllers
   1. Controllers shall include the following:
      a. Multiple relay configurations per unit.
      b. Each dimming output channel shall have an independently configurable minimum and maximum calibration trim level to set the dimming range to match the true dynamic range of the connected LED driver.
      c. One dimming output per relay.
         1) 0-10V Dimming: Where indicated, one 0-10 volt analog output per relay for control of compatible LED drivers. The 0-10 volt output shall automatically close upon loss of power to the Controller to assure full light output from the controlled lighting.
         2) Line Voltage, Forward Phase Dimming: Where indicated, one forward phase control line voltage dimming output per relay for control of compatible LED drivers, forward phase compatible ELV, and incandescent loads.
      d. Each load shall have an independently configurable preset ON level for Normal Hours and After Hours events to allow different dimmed levels to be established at the start of both Normal Hours and After Hours events.

2.3 DIGITAL MOTION SENSORS

A. General
   1. Sensors shall be available in wall, ceiling, corner-mounted, or wall-switch configurations.
   2. Sensors shall use either passive infrared (PIR) sensing, or if dual technology, passive infrared and passive acoustic or passive infrared and ultrasonic sensing for detecting room occupancy.
3. Sensors shall be able to function together with other sensors in order to provide expanded coverage areas.

B. Features
   1. Sensors shall be provided with the following features:
      b. Dual-Technology Sensors shall have independent configurable trigger modes to choose proper technology according to space use to eliminate false-triggers.
      c. Each sensor may be programmed to control specific loads within an In-Room network.
      d. Each sensor shall allow remote programming through a handheld commissioning tool via a two-way infrared (IR) transceiver or by configuration through a local network device.

C. Digital Wall Switch Motion Sensors
   1. Digital wall switch motion sensors shall be provided with the following features:
      a. Shall not allow current to pass to the load when sensor is in the unoccupied (Off) condition.
      b. One- or two-button switches for one or two switch-legs.
      c. Optional daylight sensor feature for daylighting override.

2.4 DIGITAL DAYLIGHT SENSORS

A. Daylight sensors shall be provided with the following features:
   1. Digital daylighting sensors shall work with room controllers to provide automatic switching, bi-level, tri-level, or dimming daylight harvesting capabilities for any load type connected to a room controller.
   2. Daylighting sensors shall be interchangeable without the need for rewiring.
   3. Sensor light level range shall be from 1-250 foot-candles (fc).
   4. For switching daylight harvesting, the daylight sensor shall provide a field-selectable deadband (separation) between the “ON” setpoint and the “OFF” setpoint that will prevent the lights from cycling excessively after they turn OFF.
   5. For dimming daylight harvesting, the daylight sensor shall provide the option, when the daylight contribution is sufficient, of turning lights OFF or dimming lights to a field-selectable minimum level.
   6. Delay shall be incorporated into the photocell to prevent rapid response to passing clouds.
   7. Daylight sensors shall have an independently configurable fade rate for both increasing and decreasing light level in units of percent-per-second.
   8. Daylight Sensors shall provide adjustable cut-off time (0-120 minutes). Cut-off time is defined by the number of selected minutes the load is at the minimum output before the load turns off.
   9. Optional wall switch override shall allow occupants to reduce lighting level to increase energy savings or, if permitted by system administrator, raise lighting levels for a selectable period of time or cycle of occupancy.
   10. Each sensor shall allow remote programming through a handheld commissioning tool via a two-way infrared (IR) transceiver or by configuration through a local network device.

2.5 DIGITAL MANUAL CONTROLS

A. Wall Switches
   1. Low voltage dimming and momentary pushbutton switches in 1, 2, 3, 4, 5, and 8 Button configurations.
   2. Wall switches shall include the following features:
      a. Buttons may be programmed as Load or Scene Buttons.
      b. Buttons may be programmed as ON/OFF, ON only, or OFF only.
      c. Switch buttons may be bound to any load on a room controller and are not load type dependent.
B. Dimmer Switches
   1. Raise/lower dimming adjustment controls.
   2. Dimmer switches shall include multiple LEDs to indicate load levels.
   3. Dimmer switches shall be able to be ganged with multi-button switches under the same wall-plate.
   4. Three-way and 4-way switch locations are supported for ON/OFF or Dimming control.
C. Digital Scene Switches
   1. Scene switches allow for Preset Scene recall and dimming override control.
D. Touch Panel Controls
   1. Touch Panel Controls are allowed, but not required. Touch Panel Controls are used for adjusting lighting and to set up and control preset lighting scenes in the associated room/space.
   2. Touch panel controls shall be provided with the following features:
      a. Full-color multi-touch capacitive touchscreen for controlling lighting and system components
      b. Control up to 16 dynamic lighting zones/scenes per touch screen or acting as up to 16 ON/OFF/DIM control switches
      c. Lighting zones/scenes can be comprised of lighting intensity, color, color temperature, and luminaire position
      d. Modify color and color temperature using a digital color palette and UV rating scale
      e. Proximity screen sensor for auto "wake-up"
      f. Auto dimming and user adjustable backlight
      g. Device shall enable configuration of all switches, dimmers, and lighting preset scenes via password protected setup screens. User programmable screen lock limiting access to all feature controls and programming
      h. Full alpha-numeric scene and zone naming
      i. Configurable interface to reflect project requirements
      j. Lighting zones/scenes support control of forward/reverse phase dimming, 0-10V, RGB, tunable white, and moving fixtures
      k. Integral astronomical time clock enables lighting scenes
      l. Partition status control and visualization
      m. Direct DMX control
      n. Digital motion sensor control
      o. Digital daylight harvesting response
      p. Shall have the ability to control connected load through time schedules.
      q. RS-232/contact closure capable for 3rd party integration
      r. Local wireless Bluetooth connectivity with mobile app
      s. Device shall have a micro-USB style connector for local computer connectivity.
      t. Remote-mounted power supply

2.6 DIGITAL LED LUMINAIRES
A. Digital LED luminaires are allowed, but not required.
B. Digital LED Luminaires with are luminaires with embedded controls (a.k.a. "enabled" luminaires). Enabled luminaires to have a mechanically-integrated control device, allowing the luminaires to communicate digitally with other digital lighting controls. All lighting control devices and “enabled” luminaires within a controlled room/space shall be networked together, enabling digital communication between devices.

2.7 DIGITAL AUXILIARY INPUT/OUTPUT (I/O) INTERFACE MODULES
A. General
1. Operate on Class 2 power supplied by In-Room network.
2. Status LEDs indicate if input is energized.
3. UL 2043 plenum rated where required.

B. Switched Contact Closure Interface
1. Utilized for automatic control via input from other sources such as switches, relay-based system
2. Includes 24VDC output and input terminals for momentary or maintained third party contact closure inputs.
3. Utilize input module for an Auto ON and Sweep OFF function input from other sources for the controlled area. During normal hours of operation, all local low-voltage devices are fully operational. During after hours, a timer shall be applied to all low-voltage switches or dimmers so that the room will automatically sweep off every two hours following switch activation. Provide a blink warning to alert occupants of impending OFF.
4. Specific I/O devices shall have a dimming control output that can control 0-10 VDC dimmable ballasts or LED drivers by sinking up to 20 mA of current.
5. Specific I/O devices shall have an input that reads a 0-10 VDC signal from an external device.
6. Specific I/O devices shall have a switch input that can interface with either a maintained or momentary switch and run a switch event (e.g. toggle the lighting load) or run a local/remote control profile.
7. Specific I/O devices shall sense state of low-voltage outdoor photocells.
8. Specific I/O devices shall sense momentary and maintained contact closures, and either toggle a connected load after a momentary contact or ramp the load high/low during a maintained contact (stopping when the contact releases).

C. Serial Data Interface
1. Utilized for control from A/V system to send ON/OFF/Preset commands to In-Room Network.
2. Includes 24VDC output and 10 pin RS232 connection.
3. Coordinate programming with the Distributed Digital Lighting Control System manufacturer’s technician and the A/V system technician for successful interface between both systems.

2.8 DIGITAL LIGHTING CONTROL PANELS (RELAY AND DIMMING PANELS)

A. General
1. It is the intent of this paragraph to provide a Digital Lighting Control Panel as part of an integrated lighting control system. Contractor is responsible for confirming that the panels and associated peripheral devices such as sensors and manual controls interoperate as a single system.
2. Digital Lighting Control Panels shall be incorporated into the lighting control system Global Network where used.
3. Provide lighting control panels in the locations and capacities as indicated on the plans and schedules. Each panel shall be of modular construction and consist of the following components:
   a. The panel cover shall have a hinged and lockable door with restricted access to line voltage section of the panel.
   b. The interior construction shall provide total isolation of line voltage (Class 1) wiring from low voltage (Class 2) wiring within the assembled panel.
   c. Direct wired switch inputs associated with each relay shall support two-wire, momentary or maintained contact switches.
   d. Digital inputs shall support digital switches, digital I/O modules capable of receiving 0-5V or 0-10V analog photocell inputs, digital I/O modules capable of receiving momentary or maintained contact closure inputs, digital photocell modules, and digital occupancy sensors.
e. Power supply shall be a multi-voltage transformer assembly with rated power to supply all electronics, occupancy sensors, switches, pilot lights, and photocells associated with the lighting control panel as necessary to meet the project requirements.

B. Relays
1. Relays shall provide the following ratings and features:
   a. Panel shall provide one 0-10VDC dimming output paired with each relay.
   b. Each relay shall contain an LED status light and an override pushbutton. True relay state shall be indicated by the on-board LED and shall be available to external control devices and systems via BACnet. Isolated low voltage contacts provide for true relay status feedback and pilot light indication.
   c. Relays shall be individually replaceable in a modular plug-in design.
   d. Relays shall be single-phase normally-closed latching type relays capable of switching 120/277 VAC or two-phase relays capable of switching 208/240/480 VAC loads.
   e. Relays shall be rated to switch up to a 30A ballast load at 277 VAC.
   f. Tested to 300,000 mechanical on/off cycles.
   g. Relay operation shall be automatically sequenced to reduce impact on the electrical distribution system when large loads are controlled simultaneously.

C. Digital Network Clock
1. Each panel shall include a digital clock capable to issue system wide automation commands.
2. The clock module shall provide astronomical capabilities, time delays, blink warning, daylight savings, and holiday functions and shall include battery backup for the clock function and for program retention. The clock capability of each panel shall employ non-volatile memory and shall retain user programming and time for a minimum of 10 years.
3. The clock capability of each panel shall operate on a basis of ON/OFF or Normal Hours/After Hours to automation groups that implement pre-configured control scenarios. Scenarios shall include:
   a. Scheduled ON / OFF
   b. Manual ON / Scheduled OFF
   c. Astro ON / OFF (or Photo ON / OFF)
   d. Astro and Schedule ON / OFF (or Photo and Schedule ON / OFF)
4. Schedules programmed into the clock of any one panel shall be capable of executing local schedules or Dark/Light (photocell or Astro) events for that panel in the event that global network communication is lost.

2.9 CONFIGURATION TOOLS
A. A configuration tool facilitates optional customization of In-Room networks.
   1. Provide two Configuration Tools for the project.
   2. Provide free, downloadable PC software for direct programming of In-Room Networks.

B. Features and functionality of the wireless configuration tool shall include but not be limited to:
   1. Optional customization of In-Room networks using two-way wireless communications or USB interface.
   2. Must be able to read and modify parameters for room controllers, occupancy sensors, wall switches, daylighting sensors, network bridges and relay panels, and identify room devices by type and serial number.
   3. Adjust or fine-tune daylighting settings established during auto-configuration, and input light level data to complete configuration of open loop daylighting controls.

2.10 NETWORK CABLES
A. In-Room Networks
1. This specification is based on CAT5e data cables for In-Room Networks. Other wiring topologies are acceptable if controls accomplish all requirements specified in these documents.

2. Use manufacturer’s factory-tested Cat 5e cable with pre-terminated RJ-45 connectors for In-Room Networks. If manufacturer’s cables are not used, each field-terminated cable shall be tested prior to installation and testing results submitted to the Manufacturer’s Representative for approval prior to proceeding with the Work.

3. UL 2043 plenum rated where required.

B. Global Network

1. The Global Network, where used, shall utilize communications cabling as specified by the manufacturer. The maximum cable run for each segment (distance between In-Room Networks) shall meet manufacturer limitations.

C. Class 2 0-10V Control Circuits Installed with Class 1 Conductors: Stranded copper, Type THHN/THWN-2, complying with UL 83 in raceway

2.11 NETWORK INTERFACES

A. Global Network Bridge:

1. Provide one bridge for each In-Room Network that is to be connected to the Global Network.

2. UL 2043 plenum rated where required.

3. Manufacturer-specified network cable shall daisy-chain all network bridges together.

4. The Global Network Bridge module connects an In-Room Network to a segment of the Global Network for communication between rooms, relay panels, and a Global Management Controller.

5. The Global Network Bridge shall be provided as a separate module connected on the In-Room network.

6. Global Network Bridge shall make all room devices connected to the In-Room network and all device parameters visible to the Global Management Controller via the Global Network.

7. The global network bridge shall link back to front-end controller for connection to building LAN for centralized programming.

8. If a network bridge loses communication with the Global Network, In-room network shall stay active and operate as normally programmed. There shall be no disruption to local control.

B. Global Management Controller:

1. For networked applications, the system shall include at least one Global Management Controller to manage network communication. It shall be capable of serving up a graphical user interface via a standard web browser utilizing either unencrypted TCP/IP or encrypted SSL TCP/IP traffic via a configurable port.

2. Each Global Management Controller shall have integral support for at least three segments of the Global Network. Each segment may alternately be connected to the Global Management Controller via external routers and switches, using standard Ethernet structured wiring. Each router shall accommodate one segment of the Global Network.

C. Operational features of the Controller shall include the following:

1. Connection to PC or LAN via standard Ethernet TCP/IP with the option to use SSL encrypted connections for all traffic.

2. Graphical user interface shall be compatible with current internet browsers, and shall not require installation of any lighting control software on an end-user PC.

3. Log-in security capable of restricting some users to view-only or other limited operations.

4. Ability to view and modify room device operational parameters. It shall be possible to set device parameters independently for normal hours and after-hours operation including sensor time delays and sensitivities, and load response to sensor including Manual-On or Auto-On.
5. Ability to set up schedules for rooms and panels, view and override current status of panel channels and relays, and assign relays to groups. Schedules shall automatically set controlled zones or areas to either a normal-hours or after-hours mode of operation. Support for a minimum of 100 unique schedules, each with up to four time events per day. Support for annual schedules, holiday schedules and unique date-bound schedules.

6. Ability to group rooms and loads for common control by schedules, switches, or network commands.

D. Network Equipment
   1. Provide all necessary network components, i.e. routers, switches, repeaters, etc. as suggested by the manufacturer for a complete Global Network System.
   2. Global Network cables shall be furnished and installed by this contractor per manufacturer requirements.

E. Management Software
   1. Every device parameter (e.g. sensor time delay and photocell setpoint) shall be available and configurable remotely from the software.
   2. Software shall require all users to log in with a User Name and Password.
   3. Software shall provide at least three permission levels for users.
   4. All sensitive stored information and privileged communication by the software shall be encrypted.
   5. All device firmware and system software updates must be available for automatic download and installation via the internet.
   6. Software shall be capable of managing systems interconnected via a WAN (wide area network).

PART 3 EXECUTION

3.1 DELIVERY, STORAGE, AND HANDLING
   A. Store products in a clean, dry space in original manufacturer's packaging in accordance with manufacturer's written instructions until ready for installation.

3.2 PROJECT CONDITIONS
   A. Maintain environmental conditions (temperature, humidity, and ventilation) within limits recommended by manufacturer. Do not install products under environmental conditions outside manufacturer's absolute limits.
   B. Do not install equipment until following conditions can be maintained in spaces to receive equipment:
      1. Ambient temperature: 32 to 104 degrees F (0 to 40 degrees C).
      2. Relative humidity: Maximum 90 percent, non-condensing.

3.3 SENSOR LAYOUTS
   A. Confirm quantity and provide appropriate coverage by sensors on a per-space requirement. Symbols on drawings are diagrammatic and represent design intent only.
   B. Occupancy sensors shall be installed at locations indicated on the manufacturer’s submittal layout drawings. Sensors shall be located to prevent false triggering of the lights to ON when no occupant is present.
3.4 INSTALLATION

A. Install system in accordance with the approved system shop drawings and manufacturer's instructions.

B. Install all room/space devices using manufacturer's factory-tested Cat 5e cable with pre-terminated RJ-45 connectors.
   1. If pre-terminated cable is not used for room/space wiring, each field-terminated cable shall be tested following installation and testing results submitted to the Manufacturer’s Representative for approval prior to proceeding with the Work.
   2. Install all room-to-room digital devices using manufacturer-supplied network wire. Network wire substitution is not permitted and may result in loss of product warranty.
   3. Low-voltage wiring topology must comply with manufacturer's specifications.
   4. Document final wiring locations, routing, and topology on as-built drawings.

C. All line-voltage connections shall be tagged to indicate circuit and switched legs.

D. Test all devices to ensure proper communication.

E. Calibrate all sensor time delays and sensitivity to guarantee proper detection of occupants and energy savings.

F. Adjust time delay so that controlled area remains lighted while occupied.

G. Provide written or computer-generated documentation on the configuration of the system including room-by-room description including:
   1. Sensor parameters, time delays, sensitivities, and daylighting setpoints.
   2. Sequence of operation, (e.g. manual ON, Auto OFF. etc.)
   3. Load Parameters (e.g. blink warning, etc.)

H. Tighten all panel Class I conductors at circuit breakers and at loads to torque ratings as marked on enclosure UL label.

I. All Class II cabling shall enter enclosures from within low-voltage wiring areas and shall remain within those areas. No Class I conductors shall enter a low-voltage area.

J. Run separate neutrals for any phase dimmed branch load circuit. Different types of dimmed loads shall have separate neutrals.

K. Verify all loads to be free from short circuits prior to connection to room controllers.

3.5 FIELD QUALITY CONTROL

A. Electrician/Low Voltage Technician: Any low voltage wiring made onsite by electrical or low voltage contractor must be verified end to end with industry standard test equipment capable of printing or producing a digital file of the testing results.

B. Manufacturer’s Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing. Notify Manufacturer in writing a minimum of three (3) weeks prior to system start-up and testing.

C. Tests and Inspections: Manufacturer’s service representative or electrical/low-voltage contractor installing low voltage cabling that is not pre-terminated from the manufacturer shall perform the following inspections and prepare reports:

D. Tests and Inspections: Manufacturer’s service representative shall perform the following inspections and prepare reports:
   1. Verify end-to-end testing of all low voltage wiring that is not pre-terminated from the manufacturer. Provide detailed results via paper or digital format downloadable from testing equipment.
2. Verify Class I and II wiring connections by validating system performance.
3. Set IP addresses and other network settings of system front-end hardware per facility’s IT instructions.
4. Verify/complete task programming for all switches, dimmers, time clocks, and sensors.
5. Verify that the control of each space complies with the Lighting Sequence of Operation.
6. Correct any system issues and retest.

E. Provide a report in table format with drawings, or using a software file that can be opened in the manufacturer’s system software including each room or space that has lighting control installed. Indicate the following:
   1. Date of test or inspection.
   2. Loads per space.
   3. Fixture Address identification.
   4. Quantity and Type of each device installed.
   5. Reports providing each device's settings.

3.6 POST START-UP TUNING
A. Adjust sensor time delays and sensitivities to meet the Owner's requirements 30 days from initial occupancy. Provide a detailed report to the Architect/Owner of post start-up activity.

3.7 WARRANTY
A. Manufacturer shall provide a 5-year limited warranty on products within this installation, except where otherwise noted, and consisting of a one-for-one device replacement.

3.8 PRODUCT SUPPORT AND SERVICE
A. Factory telephone support shall be available at no cost to the Owner following acceptance. Factory assistance shall consist of assistance in solving application issues pertaining to the control equipment.

3.9 CONSTRUCTION VERIFICATION ITEMS
A. Contractor is responsible for utilizing the construction verification checklists supplied under specification Section 260800 "Commissioning of Electrical".

3.10 AGENCY TRAINING
A. All training provided for agency shall comply with the format, general content requirements and submission guidelines specified under Section 017800 "Closeout Submittals".
B. The Contractor, through their supplier, shall provide training on the system operation for the owner as part of this contract. The training shall consist of two (2) four-hour sessions.

3.11 CYBERSECURITY RISK MITIGATION
A. Refer to specification section 013100, "Project Management and Coordination" for cybersecurity risk mitigation strategy.
B. Coordinate with Owner’s IT Department to restrict external network access to Internet connected system through virtual private network (VPN) connections only.
C. Disable any protocols for remote connectivity, unless constantly required for day-to-day operations.
D. All external transport data shall be routed through encrypted channels with 2048-bit secure sockets layer (SSL).
D. Coordinate with Owner’s IT Department to implement a Web server-based human machine interface (HMI) that relies on IT technologies to secure access and restrict ports that can be opened on the firewall. Coordinate with Owner’s IT Department to restrict access to known IP addresses only.

E. Where building system networks are not physically separate from IT business networks, coordinate with Owner’s IT Department to segregate networked and Internet connected systems from the IT business network using virtual local area network (VLAN) IT technologies to restrict internal attacks/breakdowns.

F. Set unique, cryptographically strong passwords for administrator and user accounts. Default passwords must be changed before systems are connected to the Owner’s network.

G. Collect only the data that is necessary for analytics and optimization.

END OF SECTION
SECTION 262213
LOW-VOLTAGE DISTRIBUTION TRANSFORMERS

PART 1 GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section includes distribution, dry-type transformers with a nominal primary and secondary rating of 600 V and less, with capacities up to 1500 kVA.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product.
      1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type and size of transformer.
      2. Include rated nameplate data, capacities, weights, dimensions, minimum clearances, installed devices and features, and performance for each type and size of transformer.

   B. Shop Drawings:
      1. Provide coversheet indicating project title, project location, and vendor contact information.
      2. Organize submittal into logical sections and provide table of contents.
      3. Provide itemized bill of materials indicating model number and quantity for each product.
      4. On datasheets with multiple products, indicate which product is provided under this project.
      5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
      6. Manufacturers' catalog sheets with complete technical data for each item being furnished.
      7. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
      8. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment.
      9. Include diagrams for power, signal, and control wiring.

1.4 INFORMATIONAL SUBMITTALS
   A. Qualification Data: For testing agency.
   B. Source quality-control reports.
   C. Field quality-control reports.

1.5 CLOSEOUT SUBMITTALS
   A. Operation and Maintenance Data: For transformers to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE
   A. Testing Agency Qualifications: Accredited by NETA.
1. Testing Agency’s Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 DELIVERY, STORAGE, AND HANDLING
A. Inspection: On receipt, inspect for and note any shipping damage to packaging and transformer.
   1. If manufacturer packaging is removed for inspection, and transformer will be stored after inspection, re-package transformer using original or new packaging materials that provide protection equivalent to manufacturer’s packaging.
B. Storage: Store in a warm, dry, and temperature-stable location in original shipping packaging.
C. Temporary Heating: Apply temporary heat according to manufacturer’s written instructions within the enclosure of each ventilated-type unit, throughout periods during which equipment is not energized and when transformer is not in a space that is continuously under normal control of temperature and humidity.
D. Handling: Follow manufacturer’s instructions for lifting and transporting transformers.

1.8 COORDINATION
A. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.
B. Coordinate installation of wall-mounting and structure-hanging supports with actual transformer provided.

PART 2 PRODUCTS

2.1 MANUFACTURERS
A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. ACME Electric Corporation; Power Distribution Products Division.
   2. Dongan Electric Manufacturing
   4. Federal Pacific Transformer Company; Division of Electro-Mechanical Corp.
   5. General Electric Company.
   7. Marcus Transformer LTD
   8. MGM Transformer Company
   9. Micron Industries Corporation
   10. Mirus International Inc.
   12. Square D Co/Groupe Schneider NA; Schneider Electric.
B. Source Limitations: Obtain each transformer type from single source from single manufacturer.

2.2 GENERAL TRANSFORMER REQUIREMENTS
A. Description: Factory-assembled and -tested, air-cooled units for 60-Hz service.
B. Comply with NFPA 70.
   1. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
C. Transformers Rated 15 kVA and Larger:
1. Comply with 10 CFR 431 (DOE 2016) efficiency levels.
2. Marked as compliant with DOE 2016 efficiency levels by an NRTL.

D. Shipping Restraints: Paint or otherwise color-code bolts, wedges, blocks, and other restraints that are to be removed after installation and before energizing. Use fluorescent colors that are easily identifiable inside the transformer enclosure.

2.3 DISTRIBUTION TRANSFORMERS

A. Comply with NFPA 70.

B. Cores: Electrical grade, non-aging silicon steel with high permeability and low hysteresis losses.
   1. One leg per phase.
   2. Core volume shall allow efficient transformer operation at 10 percent above the nominal tap voltage.
   3. Grounded to enclosure.

C. Coils: Continuous windings except for taps.
   1. Coil Material: Copper.
   2. Internal Coil Connections: Brazed or pressure type.
   3. Terminal Connections: Bolted.

D. Enclosure: Ventilated.
   1. NEMA 250, Type 2: Core and coil shall be encapsulated within resin compound using a vacuum-pressure impregnation process to seal out moisture and air.
   2. KVA Ratings: Based on convection cooling only and not relying on auxiliary fans.
   3. Wiring Compartment: Sized for conduit entry and wiring installation.
   4. Finish: Comply with NEMA 250.
      a. Finish Color: Gray weather-resistant enamel.

E. Taps for Transformers 3 kVA and Smaller: One 5 percent tap above normal full capacity.

F. Taps for Transformers 7.5 to 24 kVA: One 5 percent tap above and one 5 percent tap below normal full capacity.

G. Taps for Transformers 25 kVA and Larger: Two 2.5 percent taps above and four 2.5 percent taps below normal full capacity.

H. Insulation Class, Smaller Than 30 kVA: 180 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.

I. Insulation Class, 30 kVA and Larger: 220 deg C, UL-component-recognized insulation system with a maximum of 115 deg C rise above 40 deg C ambient temperature.

J. Energy Efficiency for Transformers Rated 15 kVA and Larger:
   1. Complying with DOE 2016 Amended Energy Conservation Standard for Low-Voltage Dry-Type Distribution Transformers, efficiency levels.
      a. 15 kVA: 97.89% efficiency
      b. 30 kVA: 98.27% efficiency
      c. 45 kVA: 98.40% efficiency
      d. 75 kVA: 98.60% efficiency
      e. 112.5 kVA: 98.74% efficiency
      f. 150 kVA: 98.83% efficiency
      g. 225 kVA: 98.94% efficiency
      h. 300 kVA: 99.02% efficiency
      i. 500 kVA: 99.14% efficiency
K. Grounding: Provide ground-bar kit or a ground bar installed on the inside of the transformer enclosure.

L. K-Factor Rating: Transformers indicated to be K-factor rated shall comply with UL 1561 requirements for nonsinusoidal load current-handling capability to the degree defined by designated K-factor.
   1. Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor, without exceeding the indicated insulation class in a 40 deg C maximum ambient and a 24-hour average ambient of 30 deg C.
   2. Indicate value of K-factor on transformer nameplate.
   3. Unit shall comply with requirements of DOE 2016 efficiency levels when tested according to NEMA TP 2 with a K-factor equal to one.

M. Electrostatic Shielding: Each winding shall have an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.
   1. Arrange coil leads and terminal strips to minimize capacitive coupling between input and output terminals.
   2. Include special terminal for grounding the shield.

N. Neutral: Rated 200 percent of full load current for K-factor-rated transformers.

O. Wall Brackets: Manufacturer's standard brackets.

P. Low-Sound-Level Requirements: Maximum sound levels when factory tested according to IEEE C57.12.91, as follows:
   1. 9.00 kVA and Less: 40 dBA.
   2. 9.01 to 30.00 kVA: 45 dBA.
   3. 30.01 to 50.00 kVA: 48 dBA for K-factors of 13 dBA.
   4. 50.01 to 150.00 kVA: 53 dBA for K-factors of 13 dBA.
   5. 150.01 to 300.00 kVA: 58 dBA for K-factors of 13 dBA.

2.4 IDENTIFICATION

A. Nameplates: Engraved, laminated-acrylic or melamine plastic signs for each distribution transformer, mounted with corrosion-resistant screws. Nameplates and label products are specified in Section 260553 "Identification for Electrical Systems."

2.5 SOURCE QUALITY CONTROL

A. Test and inspect transformers according to IEEE C57.12.01 and IEEE C57.12.91.
   1. Resistance measurements of all windings at rated voltage connections and at all tap connections.
   2. Ratio tests at rated voltage connections and at all tap connections.
   3. Phase relation and polarity tests at rated voltage connections.
   4. No load losses, and excitation current and rated voltage at rated voltage connections.
   5. Impedance and load losses at rated current and rated frequency at rated voltage connections.
   6. Applied and induced tensile tests.
   7. Regulation and efficiency at rated load and voltage.
   8. Insulation-Resistance Tests:
      a. High-voltage to ground.
      b. Low-voltage to ground.
      c. High-voltage to low-voltage.
   9. Temperature tests.

B. Factory Sound-Level Tests: Conduct prototype sound-level tests on production-line products.
PART 3 EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are as needed to maintain working clearances required by NFPA 70 and manufacturer's written instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Section 260526 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at location of transformer.

E. Environment: Enclosures shall be rated for the environment in which they are located. Covers for NEMA 250, Type 4X enclosures shall not cause accessibility problems.

F. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install wall-mounted transformers level and plumb with wall brackets fabricated by transformer manufacturer.
   1. Coordinate installation of wall-mounted and structure-hanging supports with actual transformer provided.

B. Install transformers level and plumb on a concrete base with vibration-dampening supports. Locate transformers away from corners and not parallel to adjacent wall surface.

C. Construct concrete bases according to Section 033000 "Cast-in-Place Concrete" and anchor floor-mounted transformers according to manufacturer's written instructions and requirements in Section 260529 "Hangers and Supports for Electrical Systems."
   1. Coordinate size and location of concrete bases with actual transformer provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.
   2. Install neoprene pads for mounting.

D. Secure transformer to concrete base according to manufacturer's written instructions.

E. Secure covers to enclosure and tighten all bolts to manufacturer-recommended torques to reduce noise generation.

F. Remove shipping bolts, blocking, and wedges.

G. Do not install any transformer rated 50 KVA or larger above a lay-in acoustic tile ceiling.

H. Do not install any transformers above lay-in acoustic tile ceilings where the space above the ceiling is serving as an air handling plenum. Do not install transformers above any other type ceilings under any circumstances.

I. Suspend hanging transformers with a trapeze of unistrut or angle iron and threaded rod and requirements in Section 260529 "Hangers and Supports for Electrical Systems."
   1. Install neoprene pads for mounting.

J. Provide a local enclosed circuit breaker overcurrent device/disconnect for all transformers not located within sight of primary feeder breaker. Size to be same as upstream overcurrent device.
3.3 CONNECTIONS
A. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
B. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."
C. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.
D. Provide flexible connections at all conduit and conductor terminations and supports to eliminate sound and vibration transmission to the building structure.

3.4 FIELD QUALITY CONTROL
A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
B. Perform tests and inspections with the assistance of a factory-authorized service representative.
C. Small (Up to 167-kVA Single-Phase or 500-kVA Three-Phase) Dry-Type Transformer Field Tests:
   1. Visual and Mechanical Inspection.
      a. Inspect physical and mechanical condition.
      b. Inspect anchorage, alignment, and grounding.
      c. Verify that resilient mounts are free and that any shipping brackets have been removed.
      d. Verify the unit is clean.
      e. Perform specific inspections and mechanical tests recommended by manufacturer.
      f. Verify that as-left tap connections are as specified.
      g. Verify the presence of surge arresters and that their ratings are as specified.
   2. Electrical Tests:
      a. Measure resistance at each winding, tap, and bolted connection.
      b. Perform insulation-resistance tests winding-to-winding and each winding-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.5. Calculate polarization index: the value of the index shall not be less than 1.0.
      c. Perform turns-ratio tests at all tap positions. Test results shall not deviate by more than one-half percent from either the adjacent coils or the calculated ratio. If test fails, replace the transformer.
      d. Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.
D. Large (Larger Than 167-kVA Single Phase or 500-kVA Three Phase) Dry-Type Transformer Field Tests:
   1. Visual and Mechanical Inspection:
      a. Inspect physical and mechanical condition.
      b. Inspect anchorage, alignment, and grounding.
      c. Verify that resilient mounts are free and that any shipping brackets have been removed.
      d. Verify the unit is clean.
      e. Perform specific inspections and mechanical tests recommended by manufacturer.
      f. Verify that as-left tap connections are as specified.
      g. Verify the presence of surge arresters and that their ratings are as specified.
   2. Electrical Tests:
      a. Measure resistance at each winding, tap, and bolted connection.
b. Perform insulation-resistance tests winding-to-winding and each winding-to-ground. Apply voltage according to manufacturer's published data. In the absence of manufacturer's published data, comply with NETA ATS, Table 100.5. Calculate polarization index: the value of the index shall not be less than 1.0.

c. Perform power-factor or dissipation-factor tests on all windings.

d. Perform turns-ratio tests at all tap positions. Test results shall not deviate by more than one-half percent from either the adjacent coils or the calculated ratio. If test fails, replace the transformer.

e. Perform an excitation-current test on each phase.

f. Perform an applied voltage test on all high- and low-voltage windings to ground. See IEEE C57.12.91, Sections 10.2 and 10.9.

g. Verify correct secondary voltage, phase-to-phase and phase-to-neutral, after energization and prior to loading.

E. Remove and replace units that do not pass tests or inspections and retest as specified above.

F. Infrared Scanning: Two months after Substantial Completion, perform an infrared scan of transformer connections.

1. Use an infrared-scanning device designed to measure temperature or detect significant deviations from normal values. Provide documentation of device calibration.

2. Perform two follow-up infrared scans of transformers, one at four months and the other at 11 months after Substantial Completion.

3. Prepare a certified report identifying transformer checked and describing results of scanning. Include notation of deficiencies detected, remedial action taken, and scanning observations after remedial action.

G. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.5 ADJUSTING

A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 5 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.

B. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.6 CLEANING

A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION
PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Service and distribution switchboards rated 600 V and less.
   2. Surge protection devices.
   3. Disconnecting and overcurrent protective devices.
   4. Instrumentation.
   5. Control power.
   6. Accessory components and features.
   7. Identification.
   8. Mimic bus.

1.3 REFERENCES
A. Latest Edition of Referenced Standards:

1.4 RELATED SECTIONS
A. Section 260574 "Overcurrent Protective Device Arc-Flash Study" for arc-flash study and arc-flash label requirements.

1.5 ACTION SUBMITTALS
A. Product Data: For each type of switchboard, overcurrent protective device, Surge Protective Device SPD (formerly transient voltage suppression device or TVSS), ground-fault protection per NEC 230.95, accessory, and component.
   1. Include dimensions and manufacturers’ technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
B. Shop Drawings: For each switchboard and related equipment.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
2. Organize submittal into logical sections and provide table of contents.
3. Provide itemized bill of materials indicating model number and quantity for each product.
4. On datasheets with multiple products, indicate which product is provided under this project.
5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
6. Manufacturers' catalog sheets with complete technical data for each item being furnished.
7. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment. Show tabulations of installed devices, equipment features, and ratings.
8. Detail enclosure types for types other than NEMA 250, Type 1.
9. Detail bus configuration, current, and voltage ratings.
11. Detail Infrared window locations and dimensions.
12. Identify IR window transmission levels for short wave and long wave transmittance.
13. Include descriptive documentation of optional barriers specified for electrical insulation and isolation.
14. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
15. Include time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Include selectable ranges for each type of overcurrent protective device.
16. Include diagram and details of proposed mimic bus.
17. Include schematic and wiring diagrams for power, signal, and control wiring.
18. Include report of emergency system(s) overcurrent devices selective coordination with all supply side overcurrent protective devices.

C. Samples: Representative portion of mimic bus with specified material and finish, for color selection.

D. Delegated Design Submittal:
   1. For arc-flash hazard study.
   2. For arc-flash labels.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified Installer.
B. Field Quality-Control Reports:
   1. Test procedures used.
   2. Test results that comply with requirements.
   3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

1.7 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For switchboards and components to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
      a. Routine maintenance requirements for switchboards and all installed components.
      b. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
      c. Time-current coordination curves for each type and rating of overcurrent protective device included in switchboards. Include selectable ranges for each type of overcurrent protective device.
1.8 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Potential Transformer Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
   2. Control-Power Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than two of each size and type.
   3. Fuses and Fusible Devices for Fused Circuit Breakers: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
   4. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
   5. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
   6. Indicating Lights: Equal to 10 percent of quantity installed for each size and type, but no fewer than one of each size and type.

1.9 QUALITY ASSURANCE

A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.
B. Testing Agency Qualifications: Member company of NETA or an NRTL.
   1. Testing Agency’s Field Supervisor: Currently certified by NETA to supervise on-site testing.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Deliver switchboards in sections or lengths that can be moved past obstructions in delivery path.
B. Remove loose packing and flammable materials from inside switchboards and install temporary electric heating (250 W per section) to prevent condensation.
C. Handle and prepare switchboards for installation according to NECA 400.

1.11 FIELD CONDITIONS

A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving switchboards into place.
B. Environmental Limitations:
   1. Do not deliver or install switchboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above switchboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.
   2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
      a. Ambient Temperature: Not exceeding 104 deg F (40 deg C).
C. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
   1. Notify Architect, Construction Manager and Owner no fewer than seven days in advance of proposed interruption of electric service.
   2. Indicate method of providing temporary electric service.
   3. Do not proceed with interruption of electric service without Owner's written permission.
4. Comply with NFPA 70E.

1.12 COORDINATION
A. Coordinate layout and installation of switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.13 WARRANTY
A. Manufacturer's Warranty: Manufacturer agrees to repair or replace switchboard enclosures, buswork, overcurrent protective devices, accessories, and factory installed interconnection wiring that fail in materials or workmanship within specified warranty period.
1. Warranty Period: Two years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 SWITCHBOARDS
A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
4. Square D; a brand of Schneider Electric.
B. Source Limitations: Obtain switchboards, overcurrent protective devices, components, and accessories from single source from single manufacturer.
C. Product Selection for Restricted Space: Drawings indicate maximum dimensions for switchboards including clearances between switchboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.
D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
E. Comply with NEMA PB 2.
F. Comply with NFPA 70.
G. Comply with UL 891.
H. Front-Connected, Front-Accessible Switchboards:
   1. Main Devices: Manually operated, and stationary mounted, Individual construction.
   3. Sections front and rear aligned.
I. Nominal System Voltage: 480Y/277 V.
J. Main-Bus Continuous: As shown on drawings.
K. Indoor Enclosures: Steel, NEMA 250, Type 1.
L. Enclosure Finish for Indoor Units: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface.

M. Barriers: Between adjacent switchboard sections.

N. Insulation and isolation for main bus of main section and main and vertical buses of feeder sections.

O. Space Heaters: Factory-installed electric space heaters of sufficient wattage in each vertical section to maintain enclosure temperature above expected dew point.

P. Service Entrance Rating: Switchboards intended for use as service entrance equipment shall contain from one to six service disconnecting means with overcurrent protection, a neutral bus with disconnecting link, a grounding electrode conductor terminal, and a main bonding jumper.

Q. Arc Energy Reduction
   1. Provide for circuit breakers 1200A and larger with one of the following:
      a. An energy reducing maintenance bypass switch with visual status indicator. Switch, indicator, and associated circuitry and connections shall meet the requirements of NEC article 240.87.

R. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.

S. Removable, Hinged Rear Doors and Compartment Covers: Secured by standard bolts, for access to rear interior of switchboard.

T. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.
   1. Set back from front to clear circuit-breaker removal mechanism.
   2. Removable covers shall form top, front, and sides. Top covers at rear shall be easily removable for drilling and cutting.
   3. Bottom shall be insulating, fire-resistant material with separate holes for cable drops into switchboard.
   4. Cable supports shall be arranged to facilitate cabling and adequate to support cables indicated, including those for future installation.

U. Buses and Connections: Three phase, four wire unless otherwise indicated.
   1. Provide phase bus arrangement A, B, C from front to back, top to bottom, and left to right when viewed from the front of the switchboard.
   3. Copper feeder circuit-breaker line connections.
   5. Main-Phase Buses and Equipment-Ground Buses: Uniform capacity for entire length of switchboard's main and distribution sections. Provide for future extensions from both ends.
   6. Disconnect Links:
      a. Isolate neutral bus from incoming neutral conductors.
      b. Bond neutral bus to equipment-ground bus for switchboards utilized as service equipment or separately derived systems.
   7. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with mechanical connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.
V. Future Devices: Equip compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment.

W. Bus-Bar Insulation: Factory-applied, flame-retardant, tape wrapping of individual bus bars or flame-retardant, spray-applied insulation. Minimum insulation temperature rating of 105 deg C.

2.2 SURGE PROTECTION DEVICES

A. SPD’s are not to be supplied as integral to switchboards. Refer to Section 264313 Surge Protection for Low-Voltage Electrical Power Circuits for requirements.

2.3 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. In the emergency distribution system(s), provide devices to selectively coordinate with all supply side overcurrent protective devices.

B. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
   3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings:
      a. Instantaneous trip.
      b. Long- and short-time pickup levels.
      c. Long- and short-time time adjustments.
      d. Ground-fault pickup level, time delay, and I^2t response.
   4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.
   5. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker; trip activation on fuse opening or on opening of fuse compartment door.
   6. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
   8. MCCB Features and Accessories:
      a. Standard frame sizes, trip ratings, and number of poles.
      b. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor material.
      c. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits.
      d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
      e. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
      f. Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 75 percent of rated voltage.
      g. Undervoltage Trip: Set to operate at 35 to 70 percent of rated voltage without intentional time delay.
      h. Auxiliary Contacts: Two SPDT switches with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.
      i. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
C. Insulated-Case Circuit Breaker (ICCB): 80 percent rated, sealed, insulated-case power circuit breaker with interrupting capacity rating to meet available fault current.
   1. Fixed circuit-breaker mounting.
   2. Two-step, stored-energy closing.
   3. Standard-function, microprocessor-based trip units with interchangeable rating plug, trip indicators, and the following field-adjustable settings:
      a. Instantaneous trip.
      b. Long- and short-time time adjustments.
      c. Ground-fault pickup level, time delay, and $I^2t$ response.
   4. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
   5. Remote trip indication and control.
   6. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
   7. Control Voltage: 120-V ac.

2.4 INSTRUMENTATION
A. Instrument Transformers: NEMA EI 21.1, and the following:
   1. Current Transformers: IEEE C57.13; 5 A, 60 Hz, secondary; wound type; single secondary winding and secondary shorting device. Burden and accuracy shall be consistent with connected metering and relay devices.
   2. Control-Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kVA.
   3. Current Transformers for Neutral and Ground-Fault Current Sensing: Connect secondary wiring to ground overcurrent relays, via shorting terminals, to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit breaker, ground-fault protection.
B. Multifunction Digital-Metering Monitor: Microprocessor-based unit suitable for three- or four-wire systems and with the following features:
   1. Switch-selectable digital display of the following values with maximum accuracy tolerances as indicated:
      a. Phase Currents, Each Phase: Plus or minus 1 percent.
      b. Phase-to-Phase Voltages, Three Phase: Plus or minus 1 percent.
      c. Phase-to-Neutral Voltages, Three Phase: Plus or minus 1 percent.
      d. Megawatts: Plus or minus 2 percent.
      e. Megavars: Plus or minus 2 percent.
      f. Power Factor: Plus or minus 2 percent.
      g. Frequency: Plus or minus 0.5 percent.
      h. Accumulated Energy, Megawatt Hours: Plus or minus 2 percent; accumulated values unaffected by power outages up to 72 hours.
      i. Megawatt Demand: Plus or minus 2 percent; demand interval programmable from five to 60 minutes.
      j. Contact devices to operate remote impulse-totalizing demand meter.
   2. Mounting: Display and control unit flush or semiflush mounted in instrument compartment door.
   3. BAS Interface: Provide hardware and software to enable the BAS to monitor, control, display, and record data for use in processing reports.
      a. Hardwired Points:
         1) Control: On-off operation, one for each relay.

2.5 CONTROL POWER
A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control-power transformer.
B. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for No. 8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

2.6 ACCESSORY COMPONENTS AND FEATURES
A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.
B. Spare-Fuse Cabinet: Suitably identified, wall-mounted, lockable, compartmented steel box or cabinet. Arrange for wall mounting.
C. Mounting Accessories: For anchors, mounting channels, bolts, washers, and other mounting accessories, comply with requirements in Section 260548 “Seismic Controls for Electrical Systems” or manufacturer’s instructions.

2.7 IDENTIFICATION
A. Mimic Bus: Entire single-line switchboard bus work, as depicted on factory record drawing, on a photoengraved nameplate.
   1. Nameplate: At least 0.032-inch- (0.813-mm-) thick anodized aluminum, located at eye level on front cover of the switchboard incoming service section.
B. Coordinate mimic-bus segments with devices in switchboard sections to which they are applied. Produce a concise visual presentation of principal switchboard components and connections.
C. Presentation Media: Painted graphics in color contrasting with background color to represent bus and components, complete with lettered designations.
D. Service Equipment Label: NRTL labeled for use as service equipment for switchboards with one or more service disconnecting and overcurrent protective devices.

PART 3 EXECUTION
3.1 EXAMINATION
A. Receive, inspect, handle, and store switchboards according to NECA 400.
   1. Lift or move panelboards with spreader bars and manufacturer-supplied lifting straps following manufacturer’s instructions.
   2. Use rollers, slings, or other manufacturer-approved methods if lifting straps are not furnished.
   3. Protect from moisture, dust, dirt, and debris during storage and installation.
   4. Install temporary heating during storage per manufacturer's instructions.
B. Examine switchboards before installation. Reject switchboards that are moisture damaged or physically damaged.
C. Examine elements and surfaces to receive switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.
D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION
A. Install switchboards and accessories according to NECA 400.
B. Equipment Mounting: Install switchboards on concrete base, 4-inch (100-mm) nominal thickness. Comply with requirements for concrete base specified in Section 033000 “Cast-in-Place Concrete.”
1. Install conduits entering underneath the switchboard, entering under the vertical section where the conductors will terminate. Install with couplings flush with the concrete base. Extend 2 inches (50-mm) above concrete base after switchboard is anchored in place.

2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.

3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.

4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

5. Install anchor bolts to elevations required for proper attachment to switchboards.

6. Anchor switchboard to building structure at the top of the switchboard if required or recommended by the manufacturer.

C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from switchboard units and components.

D. Operating Instructions: Frame and mount the printed basic operating instructions for switchboards, including control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of switchboards.

E. Install filler plates in unused spaces of panel-mounted sections.

F. Install overcurrent protective devices and instrumentation.

1. Set field-adjustable switches and circuit-breaker trip ranges.

G. Install spare-fuse cabinet.

H. Comply with NECA 1.

3.3 CONNECTIONS

A. Bond conduits entering underneath the switchboard to the equipment ground bus with a bonding conductor sized per NFPA 70.

B. Support and secure conductors within the switchboard according to NFPA 70.

C. Extend insulated equipment grounding cable to busway ground connection and support cable at intervals in vertical run.

3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Switchboard Nameplates: Label each switchboard compartment with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

C. Device Nameplates: Label each disconnecting and overcurrent protective device and control device mounted in compartment doors with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL

A. Perform tests and inspections:

1. Acceptance Testing:
a. Test insulation resistance for each switchboard bus, component, connecting supply, feeder, and control circuit. Open control and metering circuits within the switchboard, and remove neutral connection to surge protection and other electronic devices prior to insulation test. Reconnect after test.

b. Test continuity of each circuit.

2. Test ground-fault protection of equipment for service equipment per NFPA 70.

4. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

5. Perform the following infrared scan tests and inspections and prepare reports:
   a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard. Remove front panels so joints and connections are accessible to portable scanner.
   b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
   c. Instruments and Equipment: 1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

6. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

B. Switchboard will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports, including a certified report that identifies switchboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."

3.7 PROTECTION

A. Temporary Heating: Apply temporary heat, to maintain temperature according to manufacturer's written instructions, until switchboard is ready to be energized and placed into service.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain switchboards, overcurrent protective devices, instrumentation, and accessories, and to use and reprogram microprocessor-based trip, monitoring, and communication units.

END OF SECTION
SECTION 262416
PANELBOARDS

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Distribution panelboards.
   2. Lighting and appliance branch-circuit panelboards.
   3. Load centers.
   4. Electronic-grade panelboards.

1.3 DEFINITIONS
A. ATS: Acceptance testing specification.
B. GFCI: Ground-fault circuit interrupter.
C. GFEP: Ground-fault equipment protection.
D. HID: High-intensity discharge.
E. MCCB: Molded-case circuit breaker.
F. SPD: Surge protective device.
G. VPR: Voltage protection rating.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of panelboard.
   1. Include materials, switching and overcurrent protective devices, SPDs, accessories, and components indicated.
   2. Include dimensions and manufacturers’ technical data on features, performance, electrical characteristics, ratings, and finishes.
B. Shop Drawings: For each panelboard and related equipment.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers’ catalog sheets with complete technical data for each item being furnished.
   7. Include dimensioned plans, elevations, sections, and details.
   8. Show tabulations of installed devices with nameplates, conductor termination sizes, equipment features, and ratings.
9. Detail enclosure types including mounting and anchorage, environmental protection, knockouts, corner treatments, covers and doors, gaskets, hinges, and locks.
10. Detail bus configuration, current, and voltage ratings.
11. Short-circuit current rating of panelboards and overcurrent protective devices.
12. Include evidence of NRTL listing for series rating of installed devices.
13. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices and auxiliary components.
14. Include wiring diagrams for power, signal, and control wiring.
15. Key interlock scheme drawing and sequence of operations.
16. Include time-current coordination curves for each type and rating of overcurrent protective device included in panelboards. Include selectable ranges for each type of overcurrent protective device.

1.5 INFORMATIONAL SUBMITTALS
A. Panelboard Schedules: For installation in panelboards. Submit final versions after load balancing.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For panelboards and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017823 “Operation and Maintenance Data,” include the following:
   1. Manufacturer's written instructions for testing and adjusting overcurrent protective devices.
   2. Time-current curves, including selectable ranges for each type of overcurrent protective device that allows adjustments.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Keys: Two spares for each type of panelboard cabinet lock.
   2. Circuit Breakers Including GFCI and Ground Fault Equipment Protection (GFEP) Types: Two spares for each panelboard.
   3. Fuses for Fused Switches: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.
   4. Fuses for Fused Power-Circuit Devices: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

1.8 QUALITY ASSURANCE
A. Manufacturer Qualifications: ISO 9001 or 9002 certified.

1.9 DELIVERY, STORAGE, AND HANDLING
A. Remove loose packing and flammable materials from inside panelboards; install temporary electric heating (250 W per panelboard) to prevent condensation.
B. Handle and prepare panelboards for installation according to NECA 407.

1.10 FIELD CONDITIONS
A. Environmental Limitations:
1. Do not deliver or install panelboards until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above panelboards is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

2. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
   a. Ambient Temperature:
      1) Not exceeding 23 deg F (minus 5 deg C) to plus 104 deg F (plus 40 deg C) for interior mounted equipment.
      2) Not exceeding minus 22 deg F (minus 30 deg C) to plus 122 deg F (plus 50 deg C) for exterior mounted equipment.

B. Service Conditions: NEMA PB 1, usual service conditions, as follows:
   1. Ambient temperatures within limits specified.
   2. Altitude not exceeding 6600 feet (2000 m).

C. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
   1. Notify Architect, Construction Manager and Owner no fewer than seven days in advance of proposed interruption of electric service.
   2. Do not proceed with interruption of electric service without Owner's written permission.
   3. Comply with NFPA 70E.

1.11 WARRANTY
A. Manufacturer's Warranty: Manufacturer agrees to repair or replace panelboards that fail in materials or workmanship within specified warranty period.
   1. Panelboard Warranty Period: 24 months from date of Substantial Completion.

B. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace SPD that fail in materials or workmanship within specified warranty period.
   1. SPD Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PANELBOARDS COMMON REQUIREMENTS
A. Product Selection for Restricted Space: Drawings indicate maximum dimensions for panelboards including clearances between panelboards and adjacent surfaces and other items. Comply with indicated maximum dimensions.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

C. Comply with NEMA PB 1.

D. Comply with NFPA 70.

E. Enclosures: Flush- and surface-mounted cabinets.
   1. Rated for environmental conditions at installed location.
      a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
      b. Outdoor Locations: NEMA 250, Type 3R.
      c. Other Wet or Damp Indoor Locations: NEMA 250, Type 4.
d. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids:
   NEMA 250, Type 12.
   1) Mechanical rooms.
   2) Workshops
   3) Design Studios
   4) Space where extensive mechanical equipment, duct work, piping, etc. are located in close proximity.

2. Height: 84 inches (2.13 m) maximum.
3. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box. Trims shall cover all live parts and shall have no exposed hardware.
4. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover. Trims shall cover all live parts and shall have no exposed hardware.

5. Finishes:
   a. Panels and Trim: Steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
   b. Back Boxes: Same finish as panels and trim.

F. Incoming Mains:
   1. Location: Convertible between top and bottom.
2. Main Breaker: Main lug interiors up to 400 amperes shall be field convertible to main breaker.

G. Phase, Neutral, and Ground Buses:
      a. Plating shall run entire length of bus.
      b. Bus shall be fully rated the entire length.
   2. Interiors shall be factory assembled into a unit. Replacing switching and protective devices shall not disturb adjacent units or require removing the main bus connectors.
3. Equipment Ground Bus: Adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
   4. Isolated Ground Bus (where noted on drawings): Adequate for branch-circuit isolated ground conductors; insulated from box. Where isolated ground transformers or feeders shown with isolated ground conductors on the one-line diagram.
5. Full-Sized Neutral: Equipped with full-capacity bonding strap for service entrance applications. Mount electrically isolated from enclosure. Do not mount neutral bus in gutter.
6. Extra-Capacity Neutral Bus: Neutral bus rated 200 percent of phase bus and UL listed as suitable for nonlinear loads. Rated 200 percent of full load current for K-factor rated transformers, and any transformer shown on the riser diagrams or one-line diagrams with 200% rated feeders.
7. Split Bus: Vertical buses divided into individual vertical sections.

H. Conductor Connectors: Suitable for use with conductor material and sizes.
2. Terminations shall allow use of 75 deg C rated conductors without derating.
3. Size: Lugs suitable for indicated conductor sizes, with additional gutter space, if required, for larger conductors.
4. Main and Neutral Lugs: Mechanical type, with a lug on the neutral bar for each pole in the panelboard.
5. Ground Lugs and Bus-Configured Terminators: Mechanical type, with a lug on the bar for each pole in the panelboard.
6. Feed-Through Lugs: Mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device.
7. Subfeed (Double) Lugs: Mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
8. Extra-Capacity Neutral Lugs: Rated 200 percent of phase lugs mounted on extra-capacity neutral bus.

I. NRTL Label: Panelboards or load centers shall be labeled by an NRTL acceptable to authority having jurisdiction for use as service equipment with one or more main service disconnecting and overcurrent protective devices. Panelboards or load centers shall have meter enclosures, wiring, connections, and other provisions for utility metering. Coordinate with utility company for exact requirements.

J. Future Devices: Panelboards or load centers shall have mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices.
   1. Percentage of Future Space Capacity: 20 percent.

K. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals. Assembly listed by an NRTL for 100 percent interrupting capacity.
   1. Panelboards and overcurrent protective devices rated 240 V or less shall have short-circuit ratings as shown on Drawings, but not less than 10,000 A rms symmetrical.
   2. Panelboards and overcurrent protective devices rated above 240 V and less than 600 V shall have short-circuit ratings as shown on Drawings, but not less than 14,000 A rms symmetrical.

2.2 POWER PANELBOARDS
A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   4. Square D; a brand of Schneider Electric.

B. Panelboards: NEMA PB 1, power and feeder distribution type.

C. Doors: Secured with vault-type latch with tumbler lock; keyed alike.
   1. For doors more than 36 inches (914 mm) high, provide two latches, keyed alike.

D. Mains: As indicated on drawings and schedules.

F. Branch Overcurrent Protective Devices for Circuit-Breaker Frame Sizes Larger Than 125 A: Bolt-on circuit breakers.

2.3 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS
A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   4. Square D; a brand of Schneider Electric.

B. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.
C. Mains: As indicated on drawings and schedules.

D. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.

E. Doors: Concealed hinges; secured with flush latch with tumbler lock; keyed alike.

F. Doors: Door-in-door construction with concealed hinges; secured with multipoint latch with tumbler lock; keyed alike. Outer door shall permit full access to the panel interior. Inner door shall permit access to breaker operating handles and labeling, but current carrying terminals and bus shall remain concealed.

2.4 DISCONNECTING AND OVERTURE PROTECTIVE DEVICES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
4. Square D; a brand of Schneider Electric.

B. MCCB: Comply with UL 489, with interrupting capacity to meet available fault currents.

1. Thermal-Magnetic Circuit Breakers:
   a. Inverse time-current element for low-level overloads.
   b. Instantaneous magnetic trip element for short circuits.
   c. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

3. Electronic Trip Circuit Breakers:
   a. RMS sensing.
   b. Field-replaceable rating plug or electronic trip.
   c. Digital display of settings, trip targets, and indicated metering displays.
   d. Multi-button keypad to access programmable functions and monitored data.
   e. Ten-event, trip-history log. Each trip event shall be recorded with type, phase, and magnitude of fault that caused the trip.
   f. Integral test jack for connection to portable test set or laptop computer.
   g. Field-Adjustable Settings:
      1) Instantaneous trip.
      2) Long- and short-time pickup levels.
      3) Long and short time adjustments.
      4) Ground-fault pickup level, time delay, and I squared T response.

4. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller; let-through ratings less than NEMA FU 1, RK-5.

5. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).

6. GFEP Circuit Breakers: Class B ground-fault protection (30-mA trip).

9. MCCB Features and Accessories:
   a. Standard frame sizes, trip ratings, and number of poles.
   b. Breaker handle indicates tripped status.
   c. UL listed for reverse connection without restrictive line or load ratings.
   d. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor materials.
2.5 IDENTIFICATION

A. Panelboard Label: Manufacturer's name and trademark, voltage, amperage, number of phases, and number of poles shall be located on the interior of the panelboard door.

B. Breaker Labels: Faceplate shall list current rating, UL and IEC certification standards, and AIC rating.

C. Circuit Directory: Directory card inside panelboard door, mounted in metal frame with transparent protective cover.
   1. Circuit directory shall identify specific purpose with detail sufficient to distinguish it from all other circuits.

D. Circuit Directory: Computer-generated circuit directory mounted inside panelboard door with transparent plastic protective cover.
   1. Circuit directory shall identify specific purpose with detail sufficient to distinguish it from all other circuits.

2.6 ACCESSORY COMPONENTS AND FEATURES

A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Handle Padlock Attachment: Handle attachment for 1, 2, or 3 pole breakers to lock breaker in ON or OFF position.
PART 3 EXECUTION

3.1 EXAMINATION
A. Verify actual conditions with field measurements prior to ordering panelboards to verify that equip-
ment fits in allocated space in, and comply with, minimum required clearances specified in
NFPA 70.
B. Receive, inspect, handle, and store panelboards according to NECA 407.
C. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have
been subjected to water saturation.
D. Examine elements and surfaces to receive panelboards for compliance with installation tolerances
and other conditions affecting performance of the Work.
E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INTEGRATED POWER AND CONTROL SOLUTIONS EQUIPMENT
A. As a voluntary alternate provide the panelboards, lighting controls, dry-type transformers, and other
electrical room components, as a factory assembled UL Listed unit. It is the contractor’s responsi-
bility to provide coordination drawings indicating code required working clearances are able to be
maintained as well as door swings and locations. This must be approved by the Owner and Archi-
tect.

3.3 INSTALLATION
A. Coordinate layout and installation of panelboards and components with other
construction that pen-
etrates walls or is supported by them, including electrical and other types of equipment, raceways,
piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain re-
quired workspace clearances and required clearances for equipment access doors and panels.
B. Comply with NECA 1.
C. Install panelboards and accessories according to NECA 407.
D. Equipment Mounting:
   1. Install panelboards on cast-in-place concrete equipment base(s). Comply with requirements for
      concrete base specified in Section 033000 "Cast-in-Place Concrete."
   2. Attach panelboard to the vertical finished or structural surface behind the panelboard.
E. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and tempo-
rary blocking of moving parts from panelboards.
F. Mount top of trim at a maximum of 90 inches (2286 mm) above finished floor unless otherwise indi-
cated. Operating handle of top-most circuit breaker, in on position, shall not be higher than 79
   inches (2000 mm) above finished floor or grade.
G. Mount panelboard cabinet plumb and rigid without distortion of box.
H. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.
I. Mounting panelboards with space behind is recommended for damp, wet, or dirty locations. The
   steel slotted supports in the following paragraph provide an even mounting surface and the recom-
   mended space behind to prevent moisture or dirt collection.
J. Mount surface-mounted panelboards to steel slotted supports 5/8 inch (16 mm) in depth. Orient
   steel slotted supports vertically.
K. Install overcurrent protective devices and controllers not already factory installed.
1. Set field-adjustable, circuit-breaker trip ranges.
2. Tighten bolted connections and circuit breaker connections using calibrated torque wrench or torque screwdriver per manufacturer’s written instructions.

L. Make grounding connections and bond neutral for services and separately derived systems to ground. Make connections to grounding electrodes, separate grounds for isolated ground bars, and connections to separate ground bars.

M. Install filler plates in unused spaces.

N. Stub four 1-inch (27-EMT) empty conduits from panelboard into accessible ceiling space or space designated to be ceiling space in the future. Stub four 1-inch (27-EMT) empty conduits below slab not on grade.

O. Arrange conductors in gutters into groups and bundle and wrap with wire ties after completing load balancing.

P. Mount spare fuse cabinet in accessible location.

3.4 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with Section 260553 "Identification for Electrical Systems."

B. Create a directory to indicate installed circuit loads after balancing panelboard loads; incorporate Owner's final room designations. Obtain approval before installing. Use a computer or typewriter to create directory; handwritten directories are not acceptable.

C. Panelboard Nameplates: Label each panelboard with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

D. Device Nameplates: Label each branch circuit device in distribution panelboards with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

E. Install warning signs complying with requirements in Section 260553 "Identification for Electrical Systems" identifying source of remote circuit.

F. Label panelboards “LIFE SAFETY” PER NEC 110 AND 700 as applicable to the branch they serve.

3.5 FIELD QUALITY CONTROL

A. Acceptance Testing Preparation:
   1. Test insulation resistance for each panelboard bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

B. Tests and Inspections:
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.
   3. Perform the following infrared scan tests and inspections and prepare reports:
      a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each panelboard. Remove front panels so joints and connections are accessible to portable scanner.
      b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each panelboard 11 months after date of Substantial Completion.
      c. Instruments and Equipment:
1) Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

C. Panelboards will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Adjust moving parts and operable component to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."

C. Load Balancing: After Substantial Completion, but not more than 60 days after Final Acceptance, measure load balancing and make circuit changes.
   1. Measure as directed during period of normal system loading.
   2. Perform load-balancing circuit changes outside normal occupancy/working schedule of the facility and at time directed. Avoid disrupting critical 24-hour services such as fax machines and on-line data processing, computing, transmitting, and receiving equipment.
   3. After circuit changes, recheck loads during normal load period. Record all load readings before and after changes and submit test records.
   4. Tolerance: Difference exceeding 20 percent between phase loads, within a panelboard, is not acceptable. Rebalance and recheck as necessary to meet this minimum requirement.

3.7 PROTECTION

A. Temporary Heating: Prior to energizing panelboards, apply temporary heat to maintain temperature according to manufacturer's written instructions.

3.8 CLEANING

A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match original finish.

END OF SECTION
SECTION 262726
WIRING DEVICES

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. GFCI receptacles.
   2. SPD receptacles.
   3. Twist-locking receptacles.
   4. Pendant cord-connector devices.
   5. Cord and plug sets.
   6. Toggle switches.
   7. Wall plates.
   8. Floor service outlets.

1.3 DEFINITIONS
A. Abbreviations of Manufacturers' Names:
   1. Cooper: Cooper Wiring Devices; Division of Cooper Industries, Inc.
B. BAS: Building automation system.
C. EMI: Electromagnetic interference.
D. GFCI: Ground-fault circuit interrupter.
E. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
F. RFI: Radio-frequency interference.
G. SPD: Surge protective device.
H. UTP: Unshielded twisted pair.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
6. Manufacturers' catalog sheets with complete technical data for each item being furnished.

B. Shop Drawings: List of legends and description of materials and process used for premarking wall plates.

C. Samples: One for each type of device and wall plate specified, in each color specified.

D. Samples: One cut, stamped, or engraved plate for approval.

E. Provide separate submittal directly to the Architect for approval of color and finishes of devices and plates. This submittal shall include all samples. Any devices submittal will be reviewed for technical performance only. Color and finishes must be approved by the project Architect.

1.5 INFORMATIONAL SUBMITTALS
A. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For wiring devices to include in all manufacturers' packing-label warnings and instruction manuals that include labeling conditions.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Floor Service-Outlet Assemblies: One for every 10, but no fewer than one.

PART 2 PRODUCTS

2.1 GENERAL WIRING-DEVICE REQUIREMENTS
A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 70.

C. Devices that are manufactured for use with modular plug-in connectors may be substituted under the following conditions:
   1. Connectors shall comply with UL 2459 and shall be made with stranding building wire.
   2. Devices shall comply with the requirements in this Section.

D. Devices for Owner-Furnished Equipment:
   1. Receptacles: Match plug configurations.
   2. Cord and Plug Sets: Match equipment requirements.

E. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 MANUFACTURERS
A. Manufacturers' Names: Shortened versions (shown in parentheses) of the following manufacturers' names are used in other Part 2 articles:
   1. Eaton. (Arrow Hart is acceptable only where noted.)
   2. Hubbell Incorporated; Wiring Device-Kellems (Hubbell).
2.3 STRAIGHT-BLADE RECEPTACLES

A. Duplex Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Eaton; 5361 (single), 5362 (duplex). (Arrow Hart AH5362)
      b. Hubbell; HBL5361 (single), HBL5352 (duplex).
      c. Leviton; 5361 (single), 5362 (duplex).
      d. Pass & Seymour; 5361 (single), 5362 (duplex).

B. Isolated-Ground, Duplex Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498, and FS W-C-596.
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Eaton; IG5362. (Arrow Hart IG5362)
      b. Hubbell; IG5362.
      c. Leviton; 5362IG.
      d. Pass & Seymour; IG5362.
   2. Description: Straight blade; equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

2.4 GFCI RECEPTACLES

A. General Description:
   1. 2015 UL 943/CSA C22.2 No 144.1/ANCE NMX-J-250 Compliant.
   2. Self-testing, auto-monitoring with test-fail indication, with disconnection of power in case of test failure.
   3. Straight blade, feed-through type.
   4. Comply with NEMA WD 1, NEMA WD 6, UL 498, UL 943 Class A, and FS W-C-596.
   5. Include indicator light that shows when the GFCI has malfunctioned and no longer provides proper GFCI protection.

B. Duplex GFCI Convenience Receptacles, 125 V, 20 A:
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      b. Hubbell; GFRST20.
      c. Leviton; GFNT2.
      d. Pass & Seymour; 2097.

C. Tamper-Resistant GFCI Convenience Receptacles, 125 V, 20 A:
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Eaton TRSGF20
      b. Hubbell; GFTRST20.
      c. Leviton GFTR2
      d. Pass & Seymour; 1597TR.

D. Hospital-Grade, Duplex GFCI Convenience Receptacles, 125 V, 20 A: Comply with NEMA WD 1, NEMA WD 6 Configuration 5-20R, UL 498 Supplement sd, and FS W-C-596.
1. **Products:** Subject to compliance with requirements available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Eaton; SGFH20.
   b. Hubbell; GFRST83.
   c. Leviton; N7899-HF.
   d. Pass & Seymour; 2095HG.

### 2.5 **PLUG-IN TYPE DEVICES**

A. Equivalent devices to those listed above (receptacles) and below (switches) from the following manufactures in the series listed may be used instead of traditional wired devices.

1. Eaton: ArrowLink Modular Wiring Devices.
3. Leviton: Lev-Lok Modular Wiring Devices
4. Pass & Seymour: PlugTail Modular Wiring Devices

B. **Description:**

1. Device shall be plug connected, with a pigtail connector. The pigtail shall be connected to the building wiring. Provision shall be made for the pigtail connector to keep out construction debris including drywall compound, paint, and dust.
2. Device shall comply with all standards for traditional wired device and be equivalent grade and function as traditional wired device it replaces.

### 2.6 **TWIST-LOCKING RECEPTACLES**

A. **Twist-Lock, Single Convenience Receptacles, 125 V, 20 A:** Comply with NEMA WD 1, NEMA WD 6 Configuration L5-20R, and UL 498.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Eaton; CWL520R.
   b. Hubbell; HBL2310.
   c. Leviton; 2310.
   d. Pass & Seymour; L520-R.

B. **Twist-Lock, Isolated-Ground, Single Convenience Receptacles, 125 V, 20 A:** comply with NEMA WD 1, NEMA WD 6 Configuration L5-20R, and UL 498.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Eaton; IGL520R.
   b. Hubbell; IG2310.
   c. Leviton; 2310-IG.
   d. Pass & Seymour; IG4700.

2. **Description:**

   a. Comply with NEMA WD 1, NEMA WD 6 Configuration L5-20R, and UL 498.
   b. Grounding: Equipment grounding contacts shall be connected only to the green grounding screw terminal of the device and with inherent electrical isolation from mounting strap. Isolation shall be integral to receptacle construction and not dependent on removable parts.

### 2.7 **PENDANT CORD-CONNECTOR DEVICES**

A. **Description:**

1. Matching, locking-type plug and receptacle body connector.
2. NEMA WD 6 Configurations L5-20P and L5-20R, heavy-duty grade, and FS W-C-596.
4. External Cable Grip: Woven wire-mesh type made of high-strength, galvanized-steel wire strand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.8 CORD AND PLUG SETS
A. Description:
   1. Match voltage and current ratings and number of conductors to requirements of equipment being connected.
   2. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.

2.9 TOGGLE SWITCHES
A. Comply with NEMA WD 1, UL 20, and FS W-S-896.
B. Switches, 120/277 V, 20 A:
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Single Pole:
         1) Eaton; AH1221.
         2) Hubbell; HBL1221.
         3) Leviton; 1221-2.
         4) Pass & Seymour; CSB20AC1.
      b. Two Pole:
         1) Eaton; AH1222.
         2) Hubbell; HBL1222.
         3) Leviton; 1222-2.
         4) Pass & Seymour; CSB20AC2.
      c. Three Way:
         1) Eaton; AH1223.
         2) Hubbell; HBL1223.
         3) Leviton; 1223-2.
         4) Pass & Seymour; CSB20AC3.
      d. Four Way:
         1) Eaton; AH1224.
         2) Hubbell; HBL1224.
         3) Leviton; 1224-2.
         4) Pass & Seymour; CSB20AC4.
C. Pilot-Light Switches, 20 A:
   1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
      a. Eaton; AH1221PL for 120 and 277 V.
      b. Hubbell; HBL1201PL for 120 and 277 V.
      c. Leviton; 1221-LH1.
      d. Pass & Seymour; PS20AC1RPL for 120 V, PS20AC1RPL7 for 277 V.
   2. Description: Single pole, with LED-lighted handle, illuminated when switch is off.
D. Key-Operated Switches, 120/277 V, 20 A:
1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Eaton; AH1221L.
   b. Hubbell; HBL1221L.
   c. Leviton; 1221-2L.
   d. Pass & Seymour; PS20AC1-L.

2. Description: Single pole, with factory-supplied key in lieu of switch handle.

E. Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   b. Hubbell; HBL1557.
   c. Leviton; 1257.
   d. Pass & Seymour; 1251.

F. Key-Operated, Single-Pole, Double-Throw, Momentary-Contact, Center-off Switches: 120/277 V, 20 A; for use with mechanically held lighting contactors, with factory-supplied key in lieu of switch handle.

1. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, the following:
   a. Eaton; 1995L.
   b. Hubbell; HBL1557L.
   c. Leviton; 1257L.
   d. Pass & Seymour; 1251L.

### 2.10 WALL PLATES

A. Single and combination types shall match corresponding wiring devices.

1. Plate-Securing Screws: Metal with head color to match plate finish.
2. Material for Finished Spaces: Refer to schedule on drawings.
3. Material for Unfinished Spaces: Refer to schedule on drawings.
4. Material for Damp Locations: Cast aluminum with spring-loaded lift cover, and listed and labeled for use in wet and damp locations.

B. Wet-Location, Weatherproof Cover Plates: NEMA 250, complying with Type 3R, weather-resistant, die-cast aluminum with lockable cover.

### 2.11 FLOOR SERVICE FITTINGS

A. Type: Modular, flush-type, dual-service units suitable for wiring method used.

1. Refer to schedule on drawings for additional information regarding floor service devices.

B. Compartments: Barrier separates power from voice and data communication cabling.

C. Service Plate: Rectangular, die-cast aluminum with satin finish.

D. Power Receptacle: NEMA WD 6 Configuration 5-20R, gray finish, unless otherwise indicated.

E. Voice and Data Communication Outlet:

1. Refer to schedule on drawings for additional information regarding floor service devices.
2.12 POKE-THROUGH ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Hubbell Incorporated; Wiring Device-Kellems.
   2. Pass & Seymour/Legrand.
   3. Square D/Schneider Electric.
   4. Thomas & Betts Corporation.
   5. Wiremold/Legrand.

B. Description:
   1. Factory-fabricated and -wired assembly of below-floor junction box with multichanneled, through-floor raceway/firestop unit and detachable matching floor service-outlet assembly.
   2. Comply with UL 514 scrub water exclusion requirements.
   3. Service-Outlet Assembly: Flush type with two simplex receptacles and space for two RJ-45 jacks complying with requirements in Section 271500 “Communications Horizontal Cabling.”
   4. Size: Selected to fit nominal 3-inch (75-mm) cored holes in floor and matched to floor thickness.
   5. Fire Rating: Unit is listed and labeled for fire rating of floor-ceiling assembly.
   6. Closure Plug: Arranged to close unused 3-inch (75-mm) cored openings and reestablish fire rating of floor.
   7. Wiring Raceways and Compartments: For a minimum of four No. 12 AWG conductors and a minimum of two, four-pair cables that comply with requirements in Section 271500 “Communications Horizontal Cabling.”

2.13 PREFABRICATED MULTIOUTLET ASSEMBLIES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Hubbell Incorporated; Wiring Device-Kellems.
   2. Wiremold/Legrand.

B. Description:
   1. Two-piece surface metal raceway, with factory-wired multioutlet harness.
   2. Components shall be products from single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.

C. Raceway Material: Metal, with manufacturer's standard finish.

D. Multioutlet Harness:
   1. Receptacles: 15-A, 125-V, NEMA WD 6 Configuration 5-15R receptacles complying with NEMA WD 1, UL 498, and FS W-C-596.
   2. Receptacle Spacing: 12 inches (300 mm).
   3. Wiring: No. 12 AWG solid, Type THHN copper, two circuit, connecting alternating receptacles.

2.14 FINISHES

A. Device Color:
   1. Wiring Devices Connected to Normal Power System: Refer to schedules on drawings for finishes and colors unless otherwise indicated or required by NFPA 70 or device listing.
   3. SPD Devices: Blue.
   4. Isolated-Ground Receptacles: As specified above, with orange triangle on face.

B. Wall Plate Color: For plastic covers, match device color.
PART 3 EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1, including mounting heights listed in that standard, unless otherwise indicated.

B. Coordination with Other Trades:
   1. Protect installed devices and their boxes. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
   2. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
   3. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
   4. Install wiring devices after all wall preparation, including painting, is complete.

C. Conductors:
   1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
   2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
   3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.
   4. Existing Conductors:
      a. Cut back and pigtail, or replace all damaged conductors.
      b. Straighten conductors that remain and remove corrosion and foreign matter.
      c. Pigtail existing conductors is permitted, provided the outlet box is large enough.

D. Device Installation:
   1. Replace devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
   2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
   3. Do not remove surface protection, such as plastic film and smudge covers, until the last possible moment.
   4. Connect devices to branch circuits using pigtails that are not less than 6 inches (152 mm) in length.
   5. When there is a choice, use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
   6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
   7. When conductors larger than No. 12 AWG are installed on 15- or 20-A circuits, splice No. 12 AWG pigtails for device connections.
   8. Tighten unused terminal screws on the device.
   9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.

E. Receptacle Orientation:
   1. Install ground pin of vertically mounted receptacles down, and on horizontally mounted receptacles to the right.

F. Device Plates: Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.
G. **Arrangement of Devices:** Unless otherwise indicated, mount flush, with long dimension vertical and with grounding terminal of receptacles on top. Group adjacent switches under single, multigang wall plates.

H. **Adjust locations of floor service outlets and service poles to suit arrangement of partitions and furnishings.**

I. **Exact field locations of floors, walls, partitions, doors, windows, and equipment may vary from locations shown on the drawings. Prior to locating sleeves, boxes and chases for rough-in of conduit and equipment, the contractor shall check with other contractors concerned, to determine exact field location of the above items. In addition, he shall check for exact direction of door swings so that local switches are properly located on the strike side.**

J. **Where more than one wiring device occurs in any one location, arrange devices in gangs with common cover plate, excluding wall box dimmers. Where ganged switches serving 277V lighting are served by different circuits, so as to result in the voltage between switches exceeding 300V, provide barriers in box per NEC Section 404-8(b).**

K. **In locations where several pieces of wall-mounted equipment such as wall switches and thermostats are in the same general area, all shall be installed and grouped in a neat, orderly fashion, all of the same horizontal or vertical center line, whichever the case may be. Variation from this direction shall be approved by the owner or the owner’s representative. All receptacles and switches shall be mounted at a height as directed in drawings.**

L. **Install devices, accessories, and assemblies level, plumb, square with building lines, and secure.**

M. **Install GFCI type receptacles where located in bathrooms, kitchens, garages, outdoors, or within six feet of a water source.**

N. **Install GFCI type receptacles at all locations indicated as EWC (electric water cooler).**

O. **Install GFCI type receptacles at all locations for vending machines.**

P. **Install GFCI type receptacle with an in-use weatherproof cover for all receptacles indicated as weatherproof.**

Q. **Devices mounted in boxes which are not flush with the surface of the wall shall be installed so that the mounting yoke or strap of the device is held rigidly at the surface of the wall, but not supported by the wall. Provide washers or spacers to fill in the area between the box and the finished wall line.**

R. **Receptacles shall be installed so that the removal of the receptacle does not interrupt the continuity of the circuit.**

S. **Receptacles and switches shall have their device screws covered by two wraps of PVC electrical tape. Receptacles with integral hinged plastic covers meet this requirement.**

T. **For installations of multioutlet assemblies or service poles using multiple circuits, provide a multi-pole circuit breaker in panelboard for branch circuits.**

### 3.2 **GFCI RECEPTACLES**

A. **Install non-feed-through-type GFCI receptacles where protection of downstream receptacles is not required.**

### 3.3 **IDENTIFICATION**

A. **Comply with Section 260553 "Identification for Electrical Systems."**

B. **Switches:** Where three or more switches are ganged, and elsewhere as indicated, identify each switch with approved legend engraved on wall plate.
C. Identify each receptacle with panelboard identification and circuit number. Use hot, stamped, or engraved machine printing with black-filled lettering on face of plate, and durable wire markers or tags inside outlet boxes. Characters to be 3/16” minimum height.

3.4 FIELD QUALITY CONTROL

A. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.

B. Perform the following tests and inspections:
   1. Test Instruments: Use instruments that comply with UL 1436.
   2. Test Instrument for Convenience Receptacles: Digital wiring analyzer with digital readout or illuminated digital-display indicators of measurement.

C. Tests for Convenience Receptacles:
   1. Line Voltage: Acceptable range is 105 to 132 V.
   2. Percent Voltage Drop under 15-A Load: A value of 6 percent or higher is unacceptable.
   3. Ground Impedance: Values of up to 2 ohms are acceptable.
   4. GFCI Trip: Test for tripping values specified in UL 1436 and UL 943.
   5. Using the test plug, verify that the device and its outlet box are securely mounted.
   6. Tests shall be diagnostic, indicating damaged conductors, high resistance at the circuit breaker, poor connections, inadequate fault current path, defective devices, or similar problems. Correct circuit conditions, remove malfunctioning units and replace with new ones, and retest as specified above.

D. Wiring device will be considered defective if it does not pass tests and inspections.

E. Prepare test and inspection reports.

END OF SECTION
SECTION 262816
ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Fusible switches.
      2. Nonfusible switches.
      3. Receptacle switches.
      4. Shunt trip switches.
      5. Molded-case circuit breakers (MCCBs).
      7. Enclosures.

1.3 DEFINITIONS
   A. NC: Normally closed.
   B. NO: Normally open.
   C. SPDT: Single pole, double throw.

1.4 ACTION SUBMITTALS
   A. Product Data: For each type of enclosed switch, circuit breaker, accessory, and component indicated. Include dimensioned elevations, sections, weights, and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
      1. Enclosure types and details for types other than NEMA 250, Type 1.
      2. Current and voltage ratings.
      3. Short-circuit current ratings (interrupting and withstand, as appropriate).
      4. Include evidence of NRTL listing for series rating of installed devices.
      5. Detail features, characteristics, ratings, and factory settings of individual overcurrent protective devices, accessories, and auxiliary components.
         a. Include time-current coordination curves (average melt) for each type and rating of overcurrent protective device; include selectable ranges for each type of overcurrent protective device. Provide in PDF electronic format.
   B. Shop Drawings: For enclosed switches and circuit breakers.
      1. Include plans, elevations, sections, details, and attachments to other work.
      2. Include wiring diagrams for power, signal, and control wiring.
      3. Provide coversheet indicating project title, project location, and vendor contact information.
      4. Organize submittal into logical sections and provide table of contents.
      5. Provide itemized bill of materials indicating model number and quantity for each product.
      6. On datasheets with multiple products, indicate which product is provided under this project.
7. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.

8. Manufacturers' catalog sheets with complete technical data for each item being furnished.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For qualified testing agency.

B. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For enclosed switches and circuit breakers to include in emergency, operation, and maintenance manuals.

1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
   a. Manufacturer's written instructions for testing and adjusting enclosed switches and circuit breakers.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Fuses: Equal to 10 percent of quantity installed for each size and type, but no fewer than three of each size and type.

2. Fuse Pullers: Two for each size and type.

1.8 FIELD CONDITIONS

A. Environmental Limitations: Rate equipment for continuous operation under the following conditions unless otherwise indicated:

1. Ambient Temperature: Not less than minus 22 deg F (minus 30 deg C) and not exceeding 104 deg F (40 deg C).

1.9 WARRANTY

A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace components that fail in materials or workmanship within specified warranty period.

1. Warranty Period: two years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Source Limitations: Obtain enclosed switches and circuit breakers, overcurrent protective devices, components, and accessories, within same product category, from single manufacturer.

B. Product Selection for Restricted Space: Drawings indicate maximum dimensions for enclosed switches and circuit breakers, including clearances between enclosures, and adjacent surfaces and other items. Comply with indicated maximum dimensions.
C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

D. Comply with NFPA 70.

2.2 FUSIBLE SWITCHES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. ABB Inc.
   2. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   5. Square D; a brand of Schneider Electric.

B. Type HD, Heavy Duty:
   1. Single throw.
   2. Three pole.
   3. 600-V ac.
   4. 200 A and smaller.
   5. UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate specified fuses.
   6. Lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

C. Accessories:
   1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
   2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
   5. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.
   6. Hookstick Handle: Allows use of a hookstick to operate the handle.
   7. Lugs: Mechanical type, suitable for number, size, and conductor material.
   8. Service-Rated Switches: Labeled for use as service equipment.

2.3 NONFUSIBLE SWITCHES

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   4. Square D; a brand of Schneider Electric.

B. Type GD, General Duty, Single Throw, 600 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept two padlocks, and interlocked with cover in closed position.

C. Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.
D. Type HD, Heavy Duty, Six Pole, Single Throw, 600-V ac, 200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

E. Type HD, Heavy Duty, Double Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

F. Accessories:
   1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
   2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   3. Isolated Ground Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   4. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.
   5. Hookstick Handle: Allows use of a hookstick to operate the handle.
   6. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.4 RECEPTACLE SWITCHES

A. In the emergency distribution system(s), provide devices to selectively coordinate with all supply side overcurrent protective devices.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   4. Square D; a brand of Schneider Electric.

C. Type HD, Heavy-Duty, Single-Throw Fusible Switch: 600-V ac, 60 A; UL 98 and NEMA KS 1; horsepower rated, with clips or bolt pads to accommodate specified fuses; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

D. Type HD, Heavy-Duty, Single-Throw Nonfusible Switch: 600-V ac, 60 A; UL 98 and NEMA KS 1; horsepower rated, lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

E. Interlocking Linkage: Provided between the receptacle and switch mechanism to prevent inserting or removing plug while switch is in the on position, inserting any plug other than specified, and turning switch on if an incorrect plug is inserted or correct plug has not been fully inserted into the receptacle.

F. Receptacle: Polarized, three-phase, four-wire receptacle (fourth wire connected to enclosure ground lug).

G. Accessories:
   1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
   2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   3. Isolated Ground Kit: Internally mounted; insulated, labeled for copper and aluminum neutral conductors.
   4. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
5. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.
6. Hookstick Handle: Allows use of a hookstick to operate the handle.
7. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.5 SHUNT TRIP SWITCHES

A. In the emergency distribution system(s), provide devices to selectively coordinate with all supply side overcurrent protective devices.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Bussmann, an Eaton business
   2. Littelfuse, Inc.
   3. Mersen USA

C. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with 200-kA interrupting and short-current current rating when fitted with Class J fuses.

D. Type HD, Heavy-Duty, Three Pole, Single-Throw Fusible Switch: 600-V ac, 60 A; UL 98 and NEMA KS 1; integral shunt trip mechanism; horsepower rated, with clips or bolt pads to accommodate specified fuses; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

E. Type HD, Heavy-Duty, Three Pole, Single-Throw Nonfusible Switch: 600-V ac, 60 A; UL 98 and NEMA KS 1; integral shunt trip mechanism; horsepower rated, lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

F. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses, with a control power source of enough capacity to operate shunt trip, connected pilot, and indicating and control devices.

G. Accessories:
   1. Oiltight key switch for key-to-test function.
   2. Oiltight red ON pilot light.
   3. Isolated neutral lug; 200 percent rating.
   4. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.
   5. Form C alarm contacts that change state when switch is tripped.
   6. Three-pole, double-throw, fire-safety and alarm relay; 120-V ac coil voltage.
   7. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.
   8. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   9. Isolated Ground Kit: Internally mounted; insulated, labeled for copper and aluminum neutral conductors.
  10. Class R Fuse Kit: Provides rejection of other fuse types when Class R fuses are specified.
  11. Auxiliary Contact Kit: One NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating - 120-V ac.
  12. Hookstick Handle: Allows use of a hookstick to operate the handle.
  13. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.6 MOLDED-CASE CIRCUIT BREAKERS

A. In the emergency distribution system(s), provide devices to selectively coordinate with all supply side overcurrent protective devices.
B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
4. Square D; a brand of Schneider Electric.

C. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.

D. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit-breaker tripping mechanism for maintenance and testing purposes.

E. The maximum ampere rating and UL, IEC, or other certification standards with applicable voltage systems and corresponding interrupting ratings shall be clearly marked on face of circuit breaker. Circuit breakers shall be 100 percent rated. Circuit breaker/circuit breaker combinations for series connected interrupting ratings shall be listed by UL as recognized component combinations.

F. MCCBs shall be equipped with a device for locking in the isolated position.

G. Lugs shall be suitable for 140 deg F (60 deg C) rated wire on 125-A circuit breakers and below.

H. Standards: Comply with UL 489 and NEMA AB 3, with interrupting capacity to comply with available fault currents.

K. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:

1. Instantaneous trip.
2. Long- and short-time pickup levels.
3. Long- and short-time time adjustments.
4. Ground-fault pickup level, time delay, and I^2t response.

L. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

M. Integrally Fused Circuit Breakers: Thermal-magnetic trip element with integral limiter-style fuse listed for use with circuit breaker and trip activation on fuse opening or on opening of fuse compartment door.

N. Ground-Fault, Circuit-Interrupter (GFCI) Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).

O. Ground-Fault, Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).

P. Features and Accessories:

1. Standard frame sizes, trip ratings, and number of poles.
2. Lugs: Mechanical type, suitable for number, size, trip ratings, and conductor material.
3. Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge lighting circuits.
4. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
5. Communication Capability: Circuit-breaker-mounted communication module with functions and features compatible with power monitoring and control system, specified in Section 260913 "Electrical Power Monitoring and Control."
6. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact.
7. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.
8. Auxiliary Contacts: One SPDT switch with “a” and “b” contacts; “a” contacts mimic circuit-breaker contacts, “b” contacts operate in reverse of circuit-breaker contacts.
9. Alarm Switch: One NO contact that operates only when circuit breaker has tripped.
10. Key Interlock Kit: Externally mounted to prohibit circuit-breaker operation; key shall be removable only when circuit breaker is in off position.
11. Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.
12. Electrical Operator: Provide remote control for on, off, and reset operations.
13. Accessory Control Power Voltage: Remote mounted and powered; 120-V ac.

2.7 ENCLOSURES
A. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
B. Enclosure Finish: The enclosure shall be finished with gray baked enamel paint, electrodeposited on cleaned, phosphatized steel (NEMA 250 Type 1).
C. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts. NEMA 250 Types 7 and 9 enclosures shall be provided with threaded conduit openings in both endwalls.
D. Operating Mechanism: The circuit-breaker operating handle shall be directly operable through the front cover of the enclosure (NEMA 250 Type 1). The cover interlock mechanism shall have an externally operated override. The override shall not permanently disable the interlock mechanism, which shall return to the locked position once the override is released. The tool used to override the cover interlock mechanism shall not be required to enter the enclosure in order to override the interlock.
E. Enclosures designated as NEMA 250 Type 4, 4X stainless steel, 12, or 12K shall have a dual cover interlock mechanism to prevent unintentional opening of the enclosure cover when the circuit breaker is ON and to prevent turning the circuit breaker ON when the enclosure cover is open.

PART 3 EXECUTION
3.1 EXAMINATION
A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.
B. Proceed with installation only after unsatisfactory conditions have been corrected.
1. Commencement of work shall indicate Installer’s acceptance of the areas and conditions as satisfactory.
3.2 PREPARATION
A. Interruption of Existing Electric Service: Do not interrupt electric service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electric service according to requirements indicated:
   1. Notify Architect, Construction Manager, and Owner no fewer than seven days in advance of proposed interruption of electric service.
   2. Indicate method of providing temporary electric service.
   3. Do not proceed with interruption of electric service without Owner's written permission.
   4. Comply with NFPA 70E.

3.3 ENCLOSURE ENVIRONMENTAL RATING APPLICATIONS
A. Enclosed Switches and Circuit Breakers: Provide enclosures at installed locations with the following environmental ratings.
   1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
   2. Outdoor Locations: NEMA 250, Type 3R.
   3. Other Wet or Damp, Indoor Locations: NEMA 250, Type 4.
   4. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 250, Type 12.

3.4 INSTALLATION
A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.
B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.
C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from enclosures and components.
D. Install fuses in fusible devices.
E. Comply with NECA 1.

3.5 IDENTIFICATION
A. Comply with requirements in Section 260553 "Identification for Electrical Systems."
   1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
   2. Label each enclosure with engraved metal or laminated-plastic nameplate.

3.6 FIELD QUALITY CONTROL
A. Perform tests and inspections with the assistance of a factory-authorized service representative.
B. Tests and Inspections for Switches:
   1. Visual and Mechanical Inspection:
      a. Inspect physical and mechanical condition.
      b. Inspect anchorage, alignment, grounding, and clearances.
      c. Verify that the unit is clean.
      d. Verify blade alignment, blade penetration, travel stops, and mechanical operation.
      e. Verify that fuse sizes and types match the Specifications and Drawings.
      f. Verify that each fuse has adequate mechanical support and contact integrity.
g. Inspect bolted electrical connections for high resistance using one of the two following methods:
   1) Use a low-resistance ohmmeter.
      (a) Compare bolted connection resistance values to values of similar connections. Inve-
          stigate values that deviate from those of similar bolted connections by more than
          50 percent of the lowest value.
   2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench
      method in accordance with manufacturer's published data or NETA ATS Table 100.12.
      (a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the
          absence of manufacturer's published data, use NETA ATS Table 100.12.

h. Verify that operation and sequencing of interlocking systems is as described in the Specifi-
   cations and shown on the Drawings.

i. Verify correct phase barrier installation.

j. Verify lubrication of moving current-carrying parts and moving and sliding surfaces.

2. Electrical Tests:
   a. Perform resistance measurements through bolted connections with a low-resistance ohm-
      meter. Compare bolted connection resistance values to values of similar connections. Inve-
      stigate values that deviate from adjacent poles or similar switches by more than 50 per-
      cent of the lowest value.
   b. Measure contact resistance across each switchblade fuseholder. Drop values shall not ex-
      ceed the high level of the manufacturer's published data. If manufacturer's published data
      are not available, investigate values that deviate from adjacent poles or similar switches by
      more than 50 percent of the lowest value.
   c. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and
      phase-to-ground with switch closed, and across each open pole. Apply voltage in accord-
      ance with manufacturer's published data. In the absence of manufacturer's published data,
      use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than
      those published in Table 100.1 or as recommended in manufacturer's published data.
   d. Measure fuse resistance. Investigate fuse-resistance values that deviate from each other
      by more than 15 percent.
   e. Perform ground fault test according to NETA ATS 7.14 "Ground Fault Protection Systems,
      Low-Voltage."

C. Tests and Inspections for Molded Case Circuit Breakers:
   1. Visual and Mechanical Inspection:
      a. Verify that equipment nameplate data are as described in the Specifications and shown on
         the Drawings.
      b. Inspect physical and mechanical condition.
      c. Inspect anchorage, alignment, grounding, and clearances.
      d. Verify that the unit is clean.
      e. Operate the circuit breaker to ensure smooth operation.
      f. Inspect bolted electrical connections for high resistance using one of the two following
         methods:
         1) Use a low-resistance ohmmeter.
            (a) Compare bolted connection resistance values to values of similar connections. Inve-
                stigate values that deviate from those of similar bolted connections by more than
                50 percent of the lowest value.
         2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench
            method in accordance with manufacturer's published data or NETA ATS Table 100.12.
            (a) Bolt-torque levels shall be in accordance with manufacturer's published data. In the
                absence of manufacturer's published data, use NETA ATS Table 100.12.
      g. Inspect operating mechanism, contacts, and chutes in unsealed units.
h. Perform adjustments for final protective device settings in accordance with the coordination study.

2. Electrical Tests:
   a. Perform resistance measurements through bolted connections with a low-resistance ohmmeter. Compare bolted connection resistance values to values of similar connections. Investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
   b. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with circuit breaker closed, and across each open pole. Apply voltage in accordance with manufacturer's published data. In the absence of manufacturer's published data, use Table 100.1 from the NETA ATS. Investigate values of insulation resistance less than those published in Table 100.1 or as recommended in manufacturer's published data.
   c. Perform a contact/pole resistance test. Drop values shall not exceed the high level of the manufacturer's published data. If manufacturer's published data are not available, investigate values that deviate from adjacent poles or similar switches by more than 50 percent of the lowest value.
   d. Perform insulation resistance tests on all control wiring with respect to ground. Applied potential shall be 500-V dc for 300-V rated cable and 1000-V dc for 600-V rated cable. Test duration shall be one minute. For units with solid state components, follow manufacturer's recommendation. Insulation resistance values shall be no less than two megohms.
   e. Determine the following by primary current injection:
      1) Long-time pickup and delay. Pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.
      2) Short-time pickup and delay. Short-time pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.
      3) Ground-fault pickup and time delay. Ground-fault pickup values shall be as specified. Trip characteristics shall not exceed manufacturer's published time-current characteristic tolerance band, including adjustment factors.
      4) Instantaneous pickup. Instantaneous pickup values shall be as specified and within manufacturer's published tolerances.
   f. Perform minimum pickup voltage tests on shunt trip and close coils in accordance with manufacturer's published data. Minimum pickup voltage of the shunt trip and close coils shall be as indicated by manufacturer.
   g. Verify correct operation of auxiliary features such as trip and pickup indicators; zone interlocking; electrical close and trip operation; trip-free, anti-pump function; and trip unit battery condition. Reset all trip logs and indicators. Investigate units that do not function as designed.
   h. Verify operation of charging mechanism. Investigate units that do not function as designed.

3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

4. Perform the following infrared scan tests and inspections and prepare reports:
   a. Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each enclosed switch and circuit breaker. Remove front panels so joints and connections are accessible to portable scanner.
   b. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each enclosed switch and circuit breaker 11 months after date of Substantial Completion.
   c. Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

D. Enclosed switches and circuit breakers will be considered defective if they do not pass tests and inspections.

E. Prepare test and inspection reports.
   1. Test procedures used.
   2. Include identification of each enclosed switch and circuit breaker tested and describe test results.
   3. List deficiencies detected, remedial action taken, and observations after remedial action.

3.7 ADJUSTING

A. Adjust moving parts and operable components to function smoothly, and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Overcurrent Protective Device Coordination Study."

END OF SECTION
SECTION 263213.16
GASEOUS EMERGENCY ENGINE GENERATORS

PART 1 GENERAL

1.1 SUMMARY
A. Section includes packaged engine generators for emergency use with the following features:
   1. Natural gas engine.
   2. Gaseous fuel system.
   3. Control and monitoring.
   4. Generator overcurrent and fault protection.
   5. Generator, exciter, and voltage regulator.
   6. Outdoor engine generator enclosure.
   8. Finishes.

B. Related Requirements:
   1. Section 263600 "Transfer Switches" for transfer switches including sensors and relays to initiate automatic-starting and -stopping signals for engine generators.

1.2 DEFINITIONS
A. EPS: Emergency power supply.
B. EPSS: Emergency power supply system.
C. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
   2. Include thermal damage curve for generator.
   3. Include time-current characteristic curves for generator protective device.
   4. Include fuel consumption in cubic feet per hour (cubic meters per hour) at 0.8 power factor at 0.5, 0.75, and 1.0 times generator capacity.
   5. Include generator efficiency at 0.8 power factor at 0.5, 0.75, and 1.0 times generator capacity.
   6. Include airflow requirements for cooling and combustion air in cubic feet per minute (cubic meters per minute) at 0.8 power factor, with air-supply temperature of 95, 80, 70, and 50 deg F (35, 27, 21, and 10 deg C). Provide Drawings indicating requirements and limitations for location of air intake and exhausts.
   7. Include generator characteristics, including, but not limited to, kilowatt rating, efficiency, reactances, and short-circuit current capability.

B. Shop Drawings:
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.

6. Manufacturers' catalog sheets with complete technical data for each item being furnished.

7. Include plans and elevations for engine generator and other components specified.

8. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

9. Identify fluid drain ports and clearance requirements for proper fluid drain.

10. Design calculations for selecting vibration isolators and seismic restraints and for designing vibration isolation bases.

11. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and supported equipment. Include base weights.

12. Include diagrams for power, signal, and control wiring. Complete schematic, wiring, and interconnection diagrams showing terminal markings for EPS equipment and functional relationship between all electrical components.

13. Include report of emergency system(s) overcurrent devices selective coordination with all supply side overcurrent protective devices.

1.4 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, manufacturer and testing agency.

B. Source Quality-Control Reports: Including, but not limited to, the following:
   1. Certified summary of prototype-unit test report.
   2. Certified Test Reports: For components and accessories that are equivalent, but not identical, to those tested on prototype unit.
   4. Report of factory test on units to be shipped for this Project, showing evidence of compliance with specified requirements.
   6. Report of exhaust emissions showing compliance with applicable regulations.

C. Field quality-control reports.

D. Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For packaged engine generators to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 017823 "Operation and Maintenance Data," include the following:
      a. List of tools and replacement items recommended to be stored at Project for ready access. Include part and drawing numbers, current unit prices, and source of supply.
      b. Operating instructions laminated and mounted adjacent to generator location.
      c. Training plan.

1.6 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fuses: One for every 10 of each type and rating, but no fewer than one of each.
2. Indicator Lamps: Two for every six of each type used, but no fewer than two of each.
3. Filters: One set each of lubricating oil, fuel, and combustion-air filters.
4. Tools: Each tool listed by part number in operations and maintenance manual.

1.7 QUALITY ASSURANCE
A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.
B. Maintenance Proximity: Not more than four hours' normal travel time from Installer's place of business to Project site.
C. Manufacturer Qualifications: A qualified manufacturer. Maintain, within 200 miles (321 km) of Project site, a service center capable of providing training, parts, and emergency maintenance repairs.

1.8 COORDINATION
A. Coordinate size and location of concrete bases for package engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.9 WARRANTY
A. Manufacturer's Warranty: Manufacturer agrees to repair or replace components of packaged engine generators and associated auxiliary components that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 2 years from date of Substantial Completion.

PART 2 PRODUCTS
2.1 MANUFACTURERS
A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Caterpillar; Engine Div.
   2. Generac Power Systems, Inc.
   3. Kohler Co.; Generator Division.
   4. Magnetek, Inc.
B. Source Limitations: Obtain packaged engine generators and auxiliary components from single source from single manufacturer.

2.2 PERFORMANCE REQUIREMENTS
A. B11 Compliance: Comply with B11.19.
B. NFPA Compliance:
   2. Comply with NFPA 70.
   3. Comply with NFPA 110 requirements for Level 1 EPSS.
C. UL Compliance: Comply with UL 2200.
D. Engine Exhaust Emissions: Comply with EPA Tier 3 requirements and applicable state and local government requirements.
E. Noise Emission: Comply with applicable state and local government requirement criteria for maximum noise level at adjacent property boundaries due to sound emitted by engine generator, including engine, engine exhaust, engine cooling-air intake and discharge, and other components of installation.

F. Environmental Conditions: Engine generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:
1. Ambient Temperature: 5 to 104 deg F (Minus 15 to plus 40 deg C).
2. Relative Humidity: Zero to 95 percent.
3. Altitude: Sea level to 750 feet (300 m).

2.3 ENGINE GENERATOR ASSEMBLY DESCRIPTION

A. Factory-assembled and tested, water-cooled engine, with brushless generator and accessories.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

C. EPSS Class: Engine generator shall be classified as Class 6 according to NFPA 110.

D. Service Load: 350 kVA.

E. Power Factor: 0.8, lagging.

F. Frequency: 60 Hz.

G. Voltage: 480-V ac.

H. Phase: Three-phase, four-wire wye.

I. Induction Method: Turbocharged.

J. Governor: Adjustable isochronous, with speed sensing.

K. Mounting Frame: Structural-steel framework to maintain alignment of mounted components without depending on concrete foundation. Provide lifting attachments sized and spaced to prevent deflection of base during lifting and moving.
1. Rigging Diagram: Inscribed on metal plate permanently attached to mounting frame to indicate location and lifting capacity of each lifting attachment and engine generator center of gravity.

L. Capacities and Characteristics:
1. Power Output Ratings: Nominal ratings as indicated at 0.8 power factor excluding power required for the continued and repeated operation of the unit and auxiliaries, with capacity as required to operate as a unit as evidenced by records of prototype testing.
2. Nameplates: For each major system component to identify manufacturer’s name and address, and model and serial number of component.

M. Engine Generator Performance:
1. Steady-State Voltage Operational Bandwidth: 3 percent of rated output voltage, from no load to full load.
2. Transient Voltage Performance: Not more than 20 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within three seconds.
3. Steady-State Frequency Operational Bandwidth: 0.5 percent of rated frequency, from no load to full load.
4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.
5. Transient Frequency Performance: Less than 5 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within five seconds.

6. Output Waveform: At no load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for single harmonics. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50 percent.

7. Sustained Short-Circuit Current: For a three-phase, bolted short circuit at system output terminals, system shall supply a minimum of 250 percent of rated full-load current for not less than 10 seconds and then clear the fault automatically, without damage to generator system components.

8. Start Time: Comply with NFPA 110, Type 10, system requirements.

2.4 ENGINE

A. Fuel: Natural gas.

B. Rated Engine Speed: 1800 rpm.

C. Lubrication System: Engine or skid mounted.
   1. Filter and Strainer: Rated to remove 90 percent of particles 5 micrometers and smaller while passing full flow.
   2. Thermostatic Control Valve: Control flow in system to maintain optimum oil temperature. Unit shall be capable of full flow and is designed to be fail-safe.
   3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.

D. Jacket Coolant Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity and with UL 499.

E. Cooling System: Closed loop, liquid cooled, with radiator factory mounted on engine generator mounting frame and integral engine-driven coolant pump.
   1. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
   2. Size of Radiator: Adequate to contain expansion of total system coolant, from cold start to 110 percent load condition.
   3. Expansion Tank: Constructed of welded steel plate and rated to withstand maximum closed-loop coolant-system pressure for engine used. Equip with gage glass and petcock.
   4. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.
      a. Rating: 50-psig (345-kPa) maximum working pressure with coolant at 180 deg F (82 deg C), and noncollapsible under vacuum.
      b. End Fittings: Flanges or steel pipe nipples with clamps to suit piping and equipment connections.

F. Muffler/Silencer: Semicritical type, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements.
   1. Minimum sound attenuation of 18 dB at 500 Hz.
   2. Sound level measured at a distance of 25 feet (8 m) from exhaust discharge after installation is complete shall be 85 dBA or less.

G. Air-Intake Filter: Heavy-duty, engine-mounted air cleaner with replaceable dry-filter element and "blocked filter" indicator.
H. Starting System: 24-V electric, with negative ground.
   1. Components: Sized so they are not damaged during a full engine-cranking cycle, with ambient temperature at maximum specified in "Performance Requirements" Article.
   2. Cranking Motor: Heavy-duty unit that automatically engages and releases from engine flywheel without binding.
   3. Cranking Cycle: As required by NFPA 110 for system level specified.
   4. Battery: Nickel cadmium, with capacity within ambient temperature range specified in "Performance Requirements" Article to provide specified cranking cycle at least three times without recharging.
   5. Battery Cable: Size as recommended by engine manufacturer for cable length indicated. Include required interconnecting conductors and connection accessories. Provide disconnect switch with lockout/tagout capability for local disconnection of generator.
   6. Battery Compartment: Factory fabricated of metal with acid-resistant finish and thermal insulation. Thermostatically controlled heater shall be arranged to maintain battery above 50 deg F (10 deg C) regardless of external ambient temperature within range specified in "Performance Requirements" Article. Include accessories required to support and fasten batteries in place. Provide ventilation to exhaust battery gases.
   7. Battery Stand: Factory-fabricated, two-tier metal with acid-resistant finish designed to hold the quantity of battery cells required and to maintain the arrangement to minimize lengths of battery interconnections.
   9. Battery Charger: Current-limiting, automatic-equalizing and float-charging type designed for nickel-cadmium batteries. Unit shall comply with UL 1236 and include the following features:
      a. Operation: Equalizing-charging rate of 10 A shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
      b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 40 to 140 deg F (minus 40 to plus 60 deg C) to prevent overcharging at high temperatures and undercharging at low temperatures.
      c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
      e. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
      f. Enclosure and Mounting: NEMA 250, Type 1, wall-mounted cabinet.

2.5 GASEOUS FUEL SYSTEM
A. Natural Gas Piping: Comply with requirements in Section 231123 "Facility Natural Gas Piping."
B. Gas Train: Comply with NFPA 37.
C. Engine Fuel System:
   1. Natural Gas, Vapor-Withdrawal System:
      a. Carburetor.
      b. Fuel-Shutoff Solenoid Valves: NRTL-listed, normally closed, safety shutoff valves; one for each fuel source.
   2. Fuel Filters: One for each fuel type.
   4. Flexible Fuel Connectors: Minimum one for each fuel connection.
5. Fuel change gas pressure switch.

2.6 CONTROL AND MONITORING

A. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of engine generator. When mode-selector switch is switched to the on position, engine generator starts. The off position of same switch initiates engine generator shutdown. When engine generator is running, specified system or equipment failures or derangements automatically shut down engine generator and initiate alarms.

B. Provide minimum run-time control set for 30 minutes, with override only by operation of a remote emergency-stop switch.

C. Comply with UL 508A.

D. Configuration: Operating and safety indications, protective devices, basic system controls, and engine gages shall be grouped in a common control and monitoring panel mounted on the engine generator. Mounting method shall isolate the control panel from engine generator vibration. Panel shall be powered from the engine generator battery.

E. Control and Monitoring Panel:
   1. Digital controller with integrated LCD display, controls, and microprocessor, capable of local and remote control, monitoring, and programming, with battery backup.
   2. Instruments: Located on the control and monitoring panel and viewable during operation.
      a. Engine lubricating-oil pressure gage.
      b. Engine-coolant temperature gage.
      c. DC voltmeter (alternator battery charging).
      d. Running-time meter.
      e. AC voltmeter, for each phase connected to a phase selector switch.
      f. AC ammeter, connected to a phase selector switch.
      g. AC frequency meter.
      h. Generator-voltage adjusting rheostat.
   3. Controls and Protective Devices: Controls, shutdown devices, and common visual alarm indication as required by NFPA 110 for Level 1 system, including the following:
      a. Cranking control equipment.
      c. Control switch not in automatic position alarm.
      d. Overcrank alarm.
      e. Overcrank shutdown device.
      f. Low water temperature alarm.
      g. High engine temperature pre-alarm.
      h. High engine temperature.
      i. High engine temperature shutdown device.
      j. Overspeed alarm.
      k. Overspeed shutdown device.
      l. Coolant low-level alarm.
      m. Coolant low-level shutdown device.
      n. Coolant high-temperature prealarm.
      o. Coolant high-temperature alarm.
      q. Coolant high-temperature shutdown device.
      r. EPS load indicator.
      s. Battery high-voltage alarm.
      t. Low-cranking voltage alarm.
Gaseous Emergency Engine Generators

u. Battery-charger malfunction alarm.
v. Battery low-voltage alarm.
w. Lamp test.
x. Contacts for local and remote common alarm.
y. Low-starting air pressure alarm.
z. Low-starting hydraulic pressure alarm.

bb. Air shutdown damper alarm when used.
cc. Air shutdown damper shutdown device when used.
dd. Generator overcurrent-protective-device not-closed alarm.

e. Generator motor stability

F. Connection to Datalink:
1. A separate terminal block, factory wired to Form C dry contacts, for each alarm and status indication.
2. Provide connections for datalink transmission of indications to remote data terminals via Ethernet. Data system connections to terminals are covered in Section 260913 "Electrical Power Monitoring and Control."
3. Provide connection for datalink transmission of indicated signals to Division 23 Controls contractor. Refer to specification 230993 for emergency generator interface requirements. Division 26 responsible for all required generator components and protocols required.

G. Common Remote Panel with Common Audible Alarm: Comply with NFPA 110 requirements for Level 1 systems. Include necessary contacts and terminals in control and monitoring panel. Remote panel shall be powered from the engine generator battery.

H. Remote Alarm Annunciator: An LED indicator light labeled with proper alarm conditions shall identify each alarm event, and a common audible signal shall sound for each alarm condition. Silencing switch in face of panel shall silence signal without altering visual indication. Connect so that after an alarm is silenced, clearing of initiating condition will reactivate alarm until silencing switch is reset. Cabinet and faceplate are surface- or flush-mounting type to suit mounting conditions indicated.

1. Overcrank alarm.
2. Coolant low-temperature alarm.
3. High engine temperature pre-alarm.
4. High engine temperature alarm.
5. Low lube oil pressure alarm.
6. Overspeed alarm.
7. Low-fuel main tank alarm.
8. Low coolant level alarm.
9. Low-cranking voltage alarm.
10. Contacts for local and remote common alarm.
12. Air shutdown damper when used.
14. Control switch not in automatic position alarm.
15. Lamp test.
16. Low-cranking voltage alarm.
17. Generator overcurrent-protective-device not-closed alarm.

I. Supporting Items: Include sensors, transducers, terminals, relays, and other devices and include wiring required to support specified items. Locate sensors and other supporting items on engine or generator unless otherwise indicated.

J. Remote Emergency-Stop Switch: Flush; wall mounted unless otherwise indicated; and labeled. Push button shall be protected from accidental operation.
2.7 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. Overcurrent protective devices for the entire EPSS shall be coordinated to optimize selective tripping when a short circuit occurs. Coordination of protective devices shall consider both utility and EPSS as the voltage source.
   1. Overcurrent protective devices for the EPSS shall be accessible only to authorized personnel.

B. In the emergency distribution system(s), provide devices to selectively coordinate with all supply side overcurrent protective devices.

C. Generator Circuit Breaker: Molded-case, electronic-trip type; 100 percent rated; complying with UL 489.
   2. Trip Settings: Selected to coordinate with generator thermal damage curve.
   3. Shunt Trip: Connected to trip breaker when engine generator is shut down by other protective devices.
   4. Mounting: Adjacent to or integrated with control and monitoring panel.

D. Ground-Fault Indication: Comply with NFPA 70 Article 700, "Emergency System" signals for ground fault.
   1. Indicate ground fault with other engine generator alarm indications.
   2. Trip generator protective device on ground fault.

2.8 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

A. Comply with NEMA MG 1.

B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.

C. Electrical Insulation: Class H or Class F.

D. Stator-Winding Leads: Brought out to terminal box to permit future reconnection for other voltages if required. Provide six-lead alternator.

E. Range: Provide limited range of output voltage by adjusting the excitation level.

F. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, overspeed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.

G. Enclosure: Dripproof.

H. Instrument Transformers: Mounted within generator enclosure.

I. Voltage Regulator: Solid-state type, separate from exciter, providing performance as specified and as required by NFPA 110.
   1. Adjusting Rheostat on Control and Monitoring Panel: Provide plus or minus 5 percent adjustment of output-voltage operating band.
   2. Maintain voltage within 20 percent on one step, full load.
   3. Provide anti-hunt provision to stabilize voltage.
   4. Maintain frequency within 15 percent and stabilize at rated frequency within five seconds.

J. Strip Heater: Thermostatically controlled unit arranged to maintain stator windings above dew point.

K. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.

L. Subtransient Reactance: 13 percent, maximum.
2.9 **OUTDOOR ENGINE GENERATOR ENCLOSURE**

A. Description: Vandal-resistant, sound-attenuating, weatherproof steel housing, wind resistant up to 100 mph (160 km/h). Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Panels shall be removable by one person without tools. Instruments and control shall be mounted within enclosure.

B. Structural Design and Anchorage: Comply with ASCE/SEI 7 for wind loads up to 100 mph (160 km/h).

C. Hinged Doors: With padlocking provisions.

D. Space Heater: Thermostatically controlled and sized to prevent condensation.

E. Lighting: Provide weather-resistant LED lighting with 30 fc (330 lx) average maintained.

F. Thermal Insulation: Manufacturer's standard materials and thickness selected in coordination with space heater to maintain winter interior temperature within operating limits required by engine generator components.

G. Muffler Location: Within enclosure.

H. Engine-Cooling Airflow through Enclosure: Maintain temperature rise of system components within required limits when unit operates at 110 percent of rated load for two hours with ambient temperature at top of range specified in system service conditions.
   2. Automatic Dampers: At engine cooling-air inlet and discharge. Dampers shall be closed to reduce enclosure heat loss in cold weather when unit is not operating.
   3. Ventilation: Provide temperature-controlled exhaust fan interlocked to prevent operation when engine is running.

I. Interior Lights with Switch: Factory-wired, vaporproof luminaires within housing; arranged to illuminate controls and accessible interior. Arrange for external electrical connection.
   1. DC lighting system for operation when remote source and generator are both unavailable.

J. Sound Attenuation: Provide sound attenuation to reduce total sound output of generator set while operating at rated output to 75 dB at 25 ft.

2.10 **VIBRATION ISOLATION DEVICES**

A. Elastomeric Isolator Pads: Oil- and water-resistant elastomer or natural rubber, arranged in single or multiple layers, molded with a nonslip pattern and galvanized-steel baseplates of sufficient stiffness for uniform loading over pad area, and factory cut to sizes that match requirements of supported equipment.
   3. Number of Layers: Two.
   4. Minimum Deflection: 1 inch (25 mm).

B. Comply with requirements in Section 232116 "Hydronic Piping Specialties" for vibration isolation and flexible connector materials for steel piping.

C. Comply with requirements in Section 233113 "Metal Ducts" for vibration isolation and flexible connector materials for exhaust shroud and ductwork.

D. Vibration isolation devices shall not be used to accommodate misalignments or to make bends.
2.11 **FINISHES**

A. Indoor and Outdoor Enclosures and Components: Manufacturer's standard finish over corrosion-resistant pretreatment and compatible primer.

2.12 **SOURCE QUALITY CONTROL**

A. Prototype Testing: Factory test engine generator using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.
   2. Test components and accessories furnished with installed unit that are not identical to those on tested prototype to demonstrate compatibility and reliability.
   3. Test generator, exciter, and voltage regulator as a unit.
   4. Full-load run.
   5. Maximum power.
   7. Transient and steady-state governing.
   10. Report factory test results within 10 days of completion of test.

**PART 3 EXECUTION**

3.1 **EXAMINATION**

A. Examine areas, equipment bases, and conditions, with Installer present, for compliance with requirements for installation and other conditions affecting packaged engine generator performance.

B. Examine roughing-in for piping systems and electrical connections to verify actual locations of connections before packaged engine generator installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 **INSTALLATION**

A. Comply with NECA 1 and NECA 404.

B. Comply with packaged engine generator manufacturers’ written installation and alignment instructions and with NFPA 110.

C. Equipment Mounting:
   1. Install packaged engine generators on cast-in-place concrete equipment bases. Comply with requirements for equipment bases and foundations specified in Section 033000 "Cast-in-Place Concrete."
   2. Coordinate size and location of concrete bases for packaged engine generators. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.
   3. Install packaged engine generator with elastomeric isolator pads having a minimum deflection of 1 inch (25 mm) on 12-inch- (100-mm-) high concrete base. Secure enclosure to anchor bolts installed in concrete bases. Concrete base construction is specified in Section 260548 "Seismic Controls for Electrical Systems." Division 3 ERP#3 specifications and detailed within Division #3 drawings.20

D. Install packaged engine generator to provide access, without removing connections or accessories, for periodic maintenance.

E. Gaseous Fuel Piping:
1. Natural gas piping, valves, and specialties for gas distribution are specified in Section 23123 "Facility Natural Gas Piping."

F. Electrical Wiring: Install electrical devices furnished by equipment manufacturers but not specified to be factory mounted.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping and specialties.

B. Connect fuel, cooling-system, and exhaust-system piping adjacent to packaged engine generator to allow service and maintenance.

C. Connect cooling-system water piping to engine generator and heat exchanger with flexible connectors.

D. Connect engine exhaust pipe to engine with flexible connector.

E. Gaseous Fuel Connections:
   1. Connect fuel piping to engines with a gate valve and union and flexible connector.
   2. Install manual shutoff valve in a remote location to isolate gaseous fuel supply to the generator.
   3. Vent gas pressure regulators outside building a minimum of 60 inches (1500 mm) from building openings.

F. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

G. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables." Provide a minimum of one 90-degree bend in flexible conduit routed to the engine generator from a stationary element.

H. Balance single-phase loads to obtain a maximum of 10 percent unbalance between any two phases.

I. Connect transfer switches to generator.

J. Connect all heaters, and accessories to emergency power.

3.4 IDENTIFICATION

A. Identify system components according to Section 230553 "Identification for HVAC Piping and Equipment" and Section 260553 "Identification for Electrical Systems."

B. Install a sign indicating the generator neutral is bonded to the main service neutral at the main service location.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections with the assistance of a factory-authorized service representative.

C. Tests and Inspections:
   1. Perform tests recommended by manufacturer and each visual and mechanical inspection and electrical and mechanical test listed in first two subparagraphs below, as specified in NETA ATS. Certify compliance with test parameters.
      a. Visual and Mechanical Inspection:
         1) Compare equipment nameplate data with Drawings and the Specifications.
         2) Inspect physical and mechanical condition.
3) Inspect anchorage, alignment, and grounding.
4) Verify that the unit is clean.

b. Electrical and Mechanical Tests:
   1) Perform insulation-resistance tests according to IEEE 43.
      (a) Machines Larger Than 200 hp (150 kW): Test duration shall be 10 minutes. Calculate polarization index.
      (b) Machines 200 hp (150 kW) or Less: Test duration shall be one minute. Calculate the dielectric-absorption ratio.
   2) Test protective relay devices.
   3) Verify phase rotation, phasing, and synchronized operation as required by the application.
   4) Functionally test engine shutdown for low oil pressure, overtemperature, overspeed, and other protection features as applicable.
   5) Perform vibration test for each main bearing cap.
   6) Conduct performance test according to NFPA 110.
   7) Verify correct functioning of the governor and regulator.

2. NFPA 110 Acceptance Tests: Perform tests required by NFPA 110 that are additional to those specified here including, but not limited to, single-step full-load pickup test.

3. Battery Tests: Equalize charging of battery cells according to manufacturer's written instructions. Record individual cell voltages.
   a. Measure charging voltage and voltages between available battery terminals for full-charging and float-charging conditions. Check electrolyte level and specific gravity under both conditions.
   b. Test for contact integrity of all connectors. Perform an integrity load test and a capacity load test for the battery.
   c. Verify acceptance of charge for each element of the battery after discharge.
   d. Verify that measurements are within manufacturer's specifications.

4. Battery-Charger Tests: Verify specified rates of charge for both equalizing and float-charging conditions.

5. System Integrity Tests: Methodically verify proper installation, connection, and integrity of each element of engine generator system before and during system operation. Check for air, exhaust, and fluid leaks.

6. Exhaust-System Back-Pressure Test: Use a manometer with a scale exceeding 40-inch wg (120 kPa). Connect to exhaust line close to engine exhaust manifold. Verify that back pressure at full-rated load is within manufacturer's written allowable limits for the engine.

7. Exhaust Emissions Test: Comply with applicable government test criteria.

8. Voltage and Frequency Transient Stability Tests: Use recording oscilloscope to measure voltage and frequency transients for 50 and 100 percent step-load increases and decreases, and verify that performance is as specified.

9. Harmonic-Content Tests: Measure harmonic content of output voltage at 25 and 100 percent of rated linear load. Verify that harmonic content is within specified limits.

10. Noise Level Tests: Measure A-weighted level of noise emanating from engine generator installation, including engine exhaust and cooling-air intake and discharge, at four locations 25 feet (8 m) from edge of the generator enclosure, and compare measured levels with required values.

D. Coordinate tests with tests for transfer switches and run them concurrently.

E. Test instruments shall have been calibrated within the past 12 months, traceable to NIST Calibration Services, and adequate for making positive observation of test results. Make calibration records available for examination on request.

F. Leak Test: After installation, charge exhaust, coolant, and fuel systems and test for leaks. Repair leaks and retest until no leaks exist.
G. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation for generator and associated equipment.

H. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

I. Remove and replace malfunctioning units and retest as specified above.

J. Retest: Correct deficiencies identified by tests and observations, and retest until specified requirements are met.

K. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation resistances, time delays, and other values and observations. Attach a label or tag to each tested component indicating satisfactory completion of tests.

L. Infrared Scanning: After Substantial Completion, but not more than 60 days after final acceptance, perform an infrared scan of each power wiring termination and each bus connection while running with maximum load. Remove all access panels, so terminations and connections are accessible to portable scanner.
   1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan 11 months after date of Substantial Completion.
   2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
   3. Record of Infrared Scanning: Prepare a certified report that identifies terminations and connections checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

M. Submit report to show emergency system(s) overcurrent devices selective coordination with all supply side overcurrent protective devices.

3.6 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months’ full maintenance by skilled employees of manufacturer’s authorized service representative. Include quarterly preventive maintenance and exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by manufacturer and adjusting as required for proper operation. Parts shall be manufacturer’s authorized replacement parts and supplies.

3.7 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain packaged engine generators.

END OF SECTION
SECTION 263214
GENERATOR CONNECTION CABINET

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Generator Connection Cabinet (also referred to as Tap Box and Docking Station)
   2. Accessory components and features.
   3. Identification.

1.3 PERFORMANCE REQUIREMENTS
A. Seismic Performance: Generator Connection Cabinets shall withstand the effects of earthquake motions determined according to SEI/ASCE 7.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of connection cabinet. Include dimensions and manufacturers' technical data on features, performance, electrical characteristics, ratings, accessories, and finishes.
B. Shop Drawings: For each connection cabinet and related equipment.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers' catalog sheets with complete technical data for each item being furnished.
   7. Include dimensioned plans, elevations, sections, and details, including required clearances and service space around equipment.
   8. Detail enclosure type.
   9. Detail bus configuration, current, and voltage ratings.
   11. Include descriptive documentation of optional barriers specified for electrical insulation and isolation.
   12. Include diagram and details of proposed mimic bus.
   13. Include schematic and wiring diagrams for power, signal, and control wiring.
   14. Include report of emergency system(s) overcurrent devices selective coordination with all supply side overcurrent protective devices.
C. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

1.5 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified Installer.
B. Field Quality-Control Reports:
   1. Test procedures used.
   2. Test results that comply with requirements.
   3. Results of failed tests and corrective action taken to achieve test results that comply with requirements.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For generator connection cabinets and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Section 017800 "Closeout Submittals," include the following:
   1. Routine maintenance requirements for generator connection cabinets and all installed components.

1.7 QUALITY ASSURANCE
A. Installer Qualifications: An employer of workers qualified as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.
B. Testing Agency Qualifications: Member company of NETA or an NRTL.
   1. Testing Agency's Field Supervisor: Currently certified by NETA to supervise on-site testing.
C. Source Limitations: Obtain generator connection cabinets, components, and accessories from single source from single manufacturer.
D. Product Selection for Restricted Space: Drawings indicate maximum dimensions for generator connection cabinets including clearances between generator connection cabinets and adjacent surfaces and other items. Comply with indicated maximum dimensions.
E. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
F. Comply with NFPA 70.
G. Comply with UL.

1.8 PROJECT CONDITIONS
A. Installation Pathway: Remove and replace access fencing, doors, lift-out panels, and structures to provide pathway for moving generator connection cabinets into place.
B. Environmental Limitations:
   1. Rate equipment for continuous operation under the following conditions unless otherwise indicated:
      a. Ambient Temperature: Not exceeding 104 deg F (40 deg C).
C. Service Conditions: NEMA PB 2, usual service conditions, as follows:
   1. Ambient temperatures within limits specified.
   2. Altitude not exceeding 6600 feet (2000 m).
1.9 COORDINATION

A. Coordinate layout and installation of generator connection cabinets and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate sizes and locations of concrete bases with actual equipment provided. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified with concrete.

1.10 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace transient voltage suppression devices that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 MANUFACTURED UNITS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. American Midwest Power (AMP)
   2. APT
   3. ASCO
   4. ESL Power Systems
   5. HIPOWER
   6. LEX Products
   7. Power Products Inc.
   8. Powertron
   9. Trystar

B. All equipment shall be new.

C. Generator tap box manufacturer must have produced and sold generator tap boxes as a standard product for a minimum of (2) years.

D. Contractor shall be responsible for the equipment until it has been installed and is finally inspected, tested and accepted in accordance with the requirements of this Specification.

E. Nominal System Voltage: 480Y/277 V.

F. Bus Continuous: As shown on drawings.

G. Generator tap box shall consist of cam-style male connectors and grounding terminals, all housed within a padlockable enclosure.

H. Generator tap box enclosure shall be Type 3R, constructed of continuous seam-welded, powder coated steel. The main access shall be through a hinged door that extends the full height of the enclosure. Access for portable generator cables with female cam-style plugs shall be via cable entry openings in the bottom of the enclosure. A hinged flap door shall be provided to cover the cable openings when cables are not connected; the hinged flap door shall allow cable entry only after the main access door has been opened. Enclosure shall be powder coated after fabrication; color shall be light gray RAL 7038.
I. Cam-style male connectors (inlets) shall be UL Listed single-pole separable type and rated 400 amps at 600VAC. Cam-style male connectors shall be color coded. Cam-style male connectors shall be provided for each phase and for ground, and shall also be provided for neutral if required. The ground cam-style male connectors shall be bonded to the enclosure, and a ground lug shall be provided for connection of the facility ground conductor. None of the cam-style male connectors shall be accessible unless the main access door is open.

J. Buses and Connections: Three phase, four wire unless otherwise indicated.
   1. Phase- and Neutral-Bus Material: Hard-drawn copper of 98 percent conductivity, with tin-plated aluminum or copper feeder circuit-breaker line connections.

2.2 IDENTIFICATION
   A. Provide label of generator connection cabinet and instruction sign for operation of disconnect/over-current device in emergency distribution switchgear.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine generator connection cabinet before installation. Reject generator connection cabinets that are moisture damaged or physically damaged.
   B. Examine elements and surfaces to receive generator connection cabinets for compliance with installation tolerances and other conditions affecting performance of the Work.
   C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION
   A. Generator connection cabinet shall be installed as shown on the drawings and per the manufacturer’s written instructions. In addition, the installation shall meet the requirements of local codes, the National Electrical Code and National Electrical Contractors Association’s “Standard of Installation”.
   B. Equipment Mounting: Install generator connection cabinet on concrete base, 6-inch (100-mm) nominal thickness, reinforced. Comply with requirements for concrete base specified in Section 033000 “Cast-in-Place Concrete.”
      1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (450-mm) centers around the full perimeter of concrete base.
      2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
      3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
      4. Install anchor bolts to elevations required for proper attachment to generator connection cabinet.
   C. Temporary Lifting Provisions: Remove temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from generator connection cabinet and components.
   D. Comply with mounting and anchoring requirements specified in Section 260548 “Seismic Controls for Electrical Systems.”
   E. Operating Instructions: Frame and mount the printed basic operating instructions for generator connection cabinet. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on inside of front door of generator connection cabinet.
3.3 IDENTIFICATION

A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

B. Generator Connection Cabinet Nameplates: Label each generator connection cabinet with a nameplate complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Perform tests and inspections.
   1. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.

C. Acceptance Testing Preparation:
   1. Test insulation resistance for each bus, component, connecting supply, feeder, and control circuit.
   2. Test continuity of each circuit.

D. Tests and Inspections:
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   2. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

E. Generator connection cabinet will be considered defective if it does not pass tests and inspections.

END OF SECTION
SECTION 263600
TRANSFER SWITCHES

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section includes automatic transfer switches rated 600 V and less, including the following:
   1. Bypass/isolation switches.
B. Related Requirements:
   1. Section 213113 "Electric-Drive, Centrifugal Fire Pumps" for automatic transfer switches for fire pumps.
   2. Section 263213 “Engine Generators” for generator interface.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product indicated.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for transfer switches.
   2. Include rated capacities, weights, operating characteristics, and accessories.
B. Shop Drawings:
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers’ catalog sheets with complete technical data for each item being furnished.
   7. Include plans, elevations, sections, details showing minimum clearances, conductor entry provisions, gutter space, and installed features and devices.
   8. Include material lists for each switch specified.
   9. Single-Line Diagram: Show connections between transfer switch, bypass/isolation switch, power sources, and load; and show interlocking provisions for each combined transfer switch and bypass/isolation switch.
   10. Riser Diagram: Show interconnection wiring between transfer switches, bypass/isolation switches, annunciators, and control panels.
C. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

1.4 INFORMATIONAL SUBMITTALS
A. Qualification Data: For manufacturer-authorized service representative.
B. Field quality-control reports.
1.5 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For each type of product to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 017800 “Closeout Submittals,” include the following:
      a. Features and operating sequences, both automatic and manual.
      b. List of all factory settings of relays; provide relay-setting and calibration instructions, including software, where applicable.

1.6 QUALITY ASSURANCE
A. Testing Agency Qualifications:
   1. Member company of NETA.
      a. Testing Agency’s Field Supervisor: Certified by NETA to supervise on-site testing.

1.7 FIELD CONDITIONS
A. Interruption of Existing Electrical Service: Do not interrupt electrical service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary electrical service:
   1. Notify Owner no fewer than seven days in advance of proposed interruption of electrical service.
   2. Do not proceed with interruption of electrical service without Owner’s written permission.

1.8 WARRANTY
A. Manufacturer’s Warranty: Manufacturer agrees to repair or replace components of transfer switch or transfer switch components that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 24 months from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. Comply with NEMA ICS 1.
C. Comply with NFPA 99.
D. Comply with NFPA 110.
E. Comply with UL 1008 unless requirements of these Specifications are stricter.
F. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated.
G. Tested Fault-Current Closing and Short-Circuit Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.
   1. Where transfer switch includes internal fault-current protection, rating of switch and trip unit combination shall exceed indicated fault-current value at installation location.
   2. Short-time withstand capability for three cycles.
H. Repetitive Accuracy of Solid-State Controls: All settings shall be plus or minus 2 percent or better over an operating temperature range of minus 20 to plus 70 deg C.

I. Resistance to Damage by Voltage Transients: Components shall meet or exceed voltage-surge withstand capability requirements when tested according to IEEE C62.62. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

J. Electrical Operation: Accomplish by a nonfused, momentarily energized solenoid or electric-motor-operated mechanism. Switches for emergency or standby purposes shall be mechanically and electrically interlocked in both directions to prevent simultaneous connection to both power sources unless closed transition.

K. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.

M. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval is adjustable from 1 to 30 seconds.
   1. Provide pre-transfer contacts for each elevator controller.

N. Signal-After-Transfer Contacts or Switch Position Contacts: A set of normally open/normally closed dry contacts operates after a transfer to an emergency source. These contacts shall allow only one elevator to operate at time while on generator power.
   1. Provide post transfer contacts for each elevator controller.

O. Generator Start Circuit: The integrity of the generator control wiring shall be continuously monitored. Loss of integrity of the remote start circuit(s) shall initiate visual and audible annunciation of generator malfunction at the generator local and remote annunciator(s) and start the generator(s).

P. Service-Rated Transfer Switch:
   1. Comply with UL 869A and UL 489.
   2. Provide terminals for bonding the grounding electrode conductor to the grounded service conductor.
   3. In systems with a neutral, the bonding connection shall be on the neutral bus.
   4. Provide removable link for temporary separation of the service and load grounded conductors.
   5. Surge Protective Device: Service rated.

Q. Neutral Switching: Where four-pole switches are indicated, provide overlapping neutral contacts.

R. Neutral Terminal: Solid and fully rated unless otherwise indicated.

S. Oversize Neutral: Ampacity and switch rating of neutral path through units indicated for oversize neutral shall be double the nominal rating of circuit in which switch is installed.

T. Battery Charger: For generator starting batteries.
   1. Float type, rated 2A.
   2. Ammeter to display charging current.
   3. Fused ac inputs and dc outputs.

U. Annunciation, Control, and Programming Interface Components: Devices at transfer switches for communicating with remote programming devices, annunciators, or annunciator and control panels shall have communication capability matched with remote device.
V. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, by color-code or by numbered or lettered wire and cable with printed tape markers at terminations. Color-coding and wire and cable markers are specified in Section 260553 "Identification for Electrical Systems."
   1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
   2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
   3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.
   4. Accessible via front access.

W. Enclosures: General-purpose NEMA 250, Type 1, complying with NEMA ICS 6 and UL 508, unless otherwise indicated.

2.2 CONTACTOR-TYPE AUTOMATIC TRANSFER SWITCHES

   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. ASCO (Schneider Electric)
      b. Cummins Power Generation
      c. Caterpillar; Engine Div.
      d. Eaton
      e. GE Zenith Controls.
      f. General Electric Company
      g. Hubbell Power Systems, Inc.
      h. Kohler Power Systems; Generator Division.
      i. MTU On Site Energy.

   B. Comply with Level 1 equipment according to NFPA 110.

   C. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
      1. Limitation: Switches using molded-case switches or circuit breakers or insulated-case circuit-breaker components are unacceptable.
      2. Switch Action: Double throw; mechanically held in both directions.
      3. Contacts: Silver composition or silver alloy for load-current switching. Contactor-style automatic transfer-switch units, rated 600 A and higher, shall have separate arcing contacts.
      4. Conductor Connectors: Suitable for use with conductor material and sizes.
      6. Main and Neutral Lugs: Mechanical type.
      7. Ground Lugs and Bus-Configured Terminators: Mechanical type.
      8. Ground bar.
      9. Connectors shall be marked for conductor size and type according to UL 1008.

   D. Automatic Open-Transition Transfer Switches: Interlocked to prevent the load from being closed on both sources at the same time.
      1. Sources shall be mechanically and electrically interlocked to prevent closing both sources on the load at the same time.

   E. Automatic Delayed-Transition Transfer Switches: Pauses or stops in intermediate position to momentarily disconnect both sources, with transition controlled by programming in the automatic transfer-switch controller. Interlocked to prevent the load from being closed on both sources at the same time.
      1. Adjustable Time Delay: For override of normal-source voltage sensing to delay transfer and engine start signals for alternative source. Adjustable from zero to six seconds, and factory set for one second.
2. Sources shall be mechanically and electrically interlocked to prevent closing both sources on the load at the same time.
3. Fully automatic break-before-make operation with center off position.
4. Fully automatic break-before-make operation with transfer when two sources have near zero phase difference.

F. Automatic Closed-Transition Transfer Switches: Connect both sources to load momentarily. Transition is controlled by programming in the automatic transfer-switch controller.
   1. Fully automatic make-before-break operation when transferring between two available power sources.
   2. Load transfer without interruption, through momentary interconnection of both power sources not exceeding 100 ms.
   3. Initiation of No-Interruption Transfer: Controlled by in-phase monitor and sensors confirming both sources are present and acceptable.
      a. Initiation occurs without active control of generator.
      b. Automatic transfer-switch controller takes active control of generator to match frequency, phase angle, and voltage.
      c. Controls ensure that closed-transition load transfer closure occurs only when the two sources are within plus or minus 5 electrical degrees maximum, and plus or minus 5 percent maximum voltage difference.
   4. Failure of power source serving load initiates automatic break-before-make transfer.
   5. Provide connection to shunt-trip breaker to open with “failure to sync” signal to normal source feeder breaker.

G. Manual Switch Operation: Under load, with door closed and with either or both sources energized. Transfer time is same as for electrical operation. Control circuit automatically disconnects from electrical operator during manual operation.

I. Electric Nonautomatic Switch Operation: Electrically actuated by push buttons designated “Normal Source” and “Alternative Source." Switch shall be capable of transferring load in either direction with either or both sources energized.

J. Signal-Before-Transfer Contacts: A set of normally open/normally closed dry contacts operates in advance of retransfer to normal source. Interval shall be adjustable from 1 to 30 seconds.

K. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.

L. Automatic Transfer-Switch Controller Features:
   1. Controller operates through a period of loss of control power.
   2. Undervoltage Sensing for Each Phase of Normal Source: Sense low phase-to-ground voltage on each phase. Pickup voltage shall be adjustable from 85 to 100 percent of nominal, and dropout voltage shall be adjustable from 75 to 98 percent of pickup value. Factory set for pickup at 90 percent and dropout at 85 percent.
   3. Voltage/Frequency Lockout Relay: Prevent premature transfer to generator. Pickup voltage shall be adjustable from 85 to 100 percent of nominal. Factory set for pickup at 90 percent. Pickup frequency shall be adjustable from 90 to 100 percent of nominal. Factory set for pickup at 95 percent.
   4. Time Delay for Retransfer to Normal Source: Adjustable from zero to 30 minutes, and factory set for 10 minutes. Override shall automatically defeat delay on loss of voltage or sustained undervoltage of emergency source, provided normal supply has been restored.
   5. Test Switch: Simulate normal-source failure.
   6. Switch-Position Pilot Lights: Indicate source to which load is connected.
8. Unassigned Auxiliary Contacts: Two normally open, single-pole, double-throw contacts for each switch position, rated 10 A at 240-V ac.
9. Transfer Override Switch: Overrides automatic retransfer control so transfer switch will remain connected to emergency power source regardless of condition of normal source. Pilot light indicates override status.
10. Engine Starting Contacts: One isolated and normally closed, and one isolated and normally open; rated 10 A at 32-V dc minimum.
11. Engine Shutdown Contacts: Time delay adjustable from zero to five minutes, and factory set for five minutes. Contacts shall initiate shutdown at remote engine-generator controls after retransfer of load to normal source.
12. Engine-Generator Exerciser: Solid-state, programmable-time switch starts engine generator and transfers load to it from normal source for a preset time, then retransfers and shuts down engine after a preset cool-down period. Initiates exercise cycle at preset intervals adjustable from 7 to 30 days. Running periods shall be adjustable from 10 to 30 minutes. Factory settings shall be for 7-day exercise cycle, 20-minute running period, and 5-minute cool-down period. Exerciser features include the following:
   a. Exerciser Transfer Selector Switch: Permits selection of exercise with and without load transfer.
   b. Push-button programming control with digital display of settings.
   c. Integral battery operation of time switch when normal control power is unavailable.

M. Large-Motor-Load Power Transfer:
1. In-Phase Monitor: Factory-wired, internal relay controls transfer so contacts close only when the two sources are synchronized in phase and frequency. Relay shall compare phase relationship and frequency difference between normal and emergency sources and initiate transfer when both sources are within 15 electrical degrees, and only if transfer can be completed within 60 electrical degrees. Transfer shall be initiated only if both sources are within 2 Hz of nominal frequency and 70 percent or more of nominal voltage.
2. Motor Disconnect and Timing Relay Controls: Designated starters in loss of power scenario shall disconnect motors before transfer and reconnect them selectively at an adjustable time interval after transfer. Control connection to motor starters shall be through wiring external to automatic transfer switch. Provide adjustable time delay between 1 and 60 seconds for reconnecting individual motor loads. Provide relay contacts rated for motor-control circuit inrush and for actual seal currents to be encountered.
3. Programmed Neutral Switch Position: Switch operator with programmed neutral position arranged to provide a midpoint between the two working switch positions, with an intentional, time-controlled pause at midpoint during transfer. Adjustable pause from 0.5 to 30 seconds minimum, and factory set for 0.5 second unless otherwise indicated. Time delay occurs for both transfer directions. Disable pause unless both sources are live.

2.3 TRANSFER SWITCH ACCESSORIES
A. Bypass/Isolation Switches:
1. Source Limitations: Same manufacturer as transfer switch in which installed.
2. Comply with requirements for Level 1 equipment according to NFPA 110.
3. Description: Manual type, arranged to select and connect either source of power directly to load, isolating transfer switch from load and from both power sources. Include the following features for each combined automatic transfer switch and bypass/isolation switch:
   a. Means to lock bypass/isolation switch in the position that isolates transfer switch with an arrangement that permits complete electrical testing of transfer switch while isolated. Interlocks shall prevent transfer-switch operation, except for testing or maintenance, while automatic transfer switch is isolated.
   b. Provide means to make power available to transfer-switch control circuit for testing and maintenance purposes.
   c. Drawout Arrangement for Transfer Switch: Provide physical separation from live parts and accessibility for testing and maintenance operations. Transfer switch and bypass/isolation switch shall be in isolated compartments.
   d. Transition: Provide closed-transition operation when transferring from main transfer switch to bypass/isolation switch on the same power source.
   e. Transition: Provide closed-transition operation when transferring between power sources.
   f. Bypass/Isolation Switch Current, Voltage, Closing, and Short-Circuit Withstand Ratings: Equal to or greater than those of associated automatic transfer switch, and with same phase arrangement and number of poles.
   g. Contact temperatures of bypass/isolation switches shall not exceed those of automatic transfer-switch contacts when they are carrying rated load.
   h. Manual Control: Constructed so load bypass and transfer-switch isolation can be performed by one person in no more than two operations in 15 seconds or less. Operating handles shall be externally operated.
   i. Automatic and Nonautomatic Control: Automatic transfer-switch controller shall also control the bypass/isolation switch.
   j. Legend: Manufacturer's standard legend for control labels and instruction signs shall describe operating instructions.
   k. Maintainability: Fabricate to allow convenient removal of major components from front without removing other parts or main power conductors.

4. Interconnection of Bypass/Isolation Switches with Automatic Transfer Switches: Factory-installed copper bus bars; plated at connection points and braced for the indicated available short-circuit current.

2.4 SOURCE QUALITY CONTROL

A. Factory Tests: Test and inspect components, assembled switches, and associated equipment according to UL 1008. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

B. Prepare test and inspection reports.

1. For each of the tests required by UL 1008, performed on representative devices, for legally required systems. Include results of test for the following conditions:
   a. Overvoltage.
   b. Undervoltage.
   c. Loss of supply voltage.
   d. Reduction of supply voltage.
   e. Alternative supply voltage or frequency is at minimum acceptable values.
   f. Temperature rise.
   g. Dielectric voltage-withstand; before and after short-circuit test.
   h. Overload.
   i. Contact opening.
   j. Endurance.
   k. Short circuit.
I. Short-time current capability.
   m. Receptacle withstand capability.
   n. Insulating base and supports damage.

PART 3 EXECUTION

3.1 INSTALLATION
   A. Floor-Mounting Switch: Anchor to floor by bolting.
      1. Install transfer switches on cast-in-place concrete equipment base(s). Comply with require-
         ments for equipment bases and foundations specified in Section 033000 "Cast-in-Place Con-
         crete."
      2. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases.
      3. Provide workspace and clearances required by NFPA 70.
   B. Annunciator and Control Panel Mounting: Flush in wall unless otherwise indicated.
   C. Identify components according to Section 260553 "Identification for Electrical Systems."
   D. Set field-adjustable intervals and delays, relays, and engine exerciser clock.
   E. Comply with NECA 1.

3.2 IDENTIFICATION
   A. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs
      as specified in Section 260553 "Identification for Electrical Systems."
   B. Transfer Switch Nameplates: Label each transfer switch with engraved metal or laminated-plastic
      nameplate mounted with corrosion-resistant screws.
   C. Label transfer switches “LIFE SAFETY” or “EQUIPMENT” per NEC 110 and 700 as applicable to
      the branch they serve.

3.3 CONNECTIONS
   A. Wiring to Remote Components: Match type and number of cables and conductors to generator
      sets, motor controls, control, and communication requirements of transfer switches as recom-
      mended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to
      accommodate required wiring.
   B. Wiring Method: Install cables in raceways and cable trays except within electrical enclosures. Con-
      ceal raceway and cables except in unfinished spaces.
      1. Comply with requirements for raceways and boxes specified in Section 260533 "Raceways and
         Boxes for Electrical Systems."
   C. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and
      without exceeding manufacturer's limitations on bending radii.
   D. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."
   E. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Ca-
      bles."
   F. Connect twisted pair cable according to Section 260523 "Control-Voltage Electrical Power Cables."
   G. Connect twisted pair cable according to Section 271513 "Communications Copper Horizontal Ca-
      bling."
H. Route and brace conductors according to manufacturer's written instruction, and Section 260529
"Hangers and Supports for Electrical Systems." Do not obscure manufacturer's markings and la-
bels.

I. Final connections to equipment shall be made with liquidtight, flexible metallic conduit no more than
18 inches (457 mm) in length.

J. Provide all necessary connections between automatic transfer switches.

K. Provide all necessary connections between automatic transfer switches and generator(s).

L. Provide all necessary connections between automatic transfer switches and normal source feeder
breakers.

3.4 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service rep-
resentative:

1. After installing equipment test for compliance with requirements according to NETA ATS.

2. Visual and Mechanical Inspection:
   a. Compare equipment nameplate data with Drawings and Specifications.
   b. Inspect physical and mechanical condition.
   c. Inspect anchorage, alignment, grounding, and required clearances.
   d. Verify that the unit is clean.
   e. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding
      surfaces.
   f. Verify that manual transfer warnings are attached and visible.
   g. Verify tightness of all control connections.
   h. Inspect bolted electrical connections for high resistance using one of the following meth-
      ods, or both:
      1) Use of low-resistance ohmmeter.
      2) Verify tightness of accessible bolted electrical connections by calibrated torque-wrench
         method according to manufacturer's published data.
   i. Perform manual transfer operation.
   j. Verify positive mechanical interlocking between normal and alternate sources.
   k. Perform visual and mechanical inspection of surge arresters.
   l. Inspect control power transformers.
      1) Inspect for physical damage, cracked insulation, broken leads, tightness of connec-
         tions, defective wiring, and overall general condition.
      2) Verify that primary and secondary fuse or circuit-breaker ratings match Drawings.
      3) Verify correct functioning of drawout disconnecting contacts, grounding contacts, and
         interlocks.

3. Electrical Tests:
   a. Perform insulation-resistance tests on all control wiring with respect to ground.
   b. Perform a contact/pole-resistance test. Compare measured values with manufacturer's ac-
      ceptable values.
   c. Verify settings and operation of control devices.
   d. Calibrate and set all relays and timers.
   e. Verify phase rotation, phasing, and synchronized operation.
   f. Perform automatic transfer tests.
   g. Verify correct operation and timing of the following functions:
      1) Normal source voltage-sensing and frequency-sensing relays.
      2) Engine start sequence.
      3) Time delay on transfer.
      4) Alternative source voltage-sensing and frequency-sensing relays.
5) Automatic transfer operation.
6) Interlocks and limit switch function.
7) Time delay and retransfer on normal power restoration.
8) Engine cool-down and shutdown feature.

   a. Check for electrical continuity of circuits and for short circuits.
   b. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
   c. Verify that manual transfer warnings are properly placed.
   d. Perform manual transfer operation.

5. After energizing circuits, perform each electrical test for transfer switches stated in NETA ATS and demonstrate interlocking sequence and operational function for each switch at least three times.
   a. Simulate power failures of normal source to automatic transfer switches and retransfer from emergency source with normal source available.
   b. Simulate loss of phase-to-ground voltage for each phase of normal source.
   c. Verify time-delay settings.
   d. Verify pickup and dropout voltages by data readout or inspection of control settings.
   e. Test bypass/isolation unit functional modes and related automatic transfer-switch operations.
   f. Perform contact-resistance test across main contacts and correct values exceeding 500 microhms and values for one pole deviating by more than 50 percent from other poles.
   g. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

   a. Verify grounding connections and locations and ratings of sensors.

B. Coordinate tests with tests of generator and run them concurrently.

C. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests.

D. Transfer switches will be considered defective if they do not pass tests and inspections.

E. Remove and replace malfunctioning units and retest as specified above.

F. Prepare test and inspection reports.

G. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.
   1. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
   2. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.
   3. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
3.5 STARTUP SERVICE
A. Engage a factory-authorized service representative to perform startup service.
B. Inspect field-assembled components and equipment installation, including piping and electrical connections. Report results in writing.
C. Complete installation and startup checks according to manufacturer’s written instructions.
D. Coordinate this startup with that for generator equipment.

3.6 CLEANING
A. After completing equipment installation, inspect unit components. Remove paint splatters and other spots, dirt, and debris. Repair damaged finish to match original finish.
B. Clean equipment internally, on completion of installation, according to manufacturer’s written instructions. Vacuum only; do not use compressed air for cleaning.

3.7 DEMONSTRATION
A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain transfer switches and related equipment.
B. Training shall include testing ground-fault protective devices and instructions to determine when the ground-fault system shall be retested. Include instructions on where ground-fault sensors are located and how to avoid negating the ground-fault protection scheme during testing and circuit modifications.
C. Coordinate this training with that for generator equipment.

END OF SECTION
SECTION 265119
LED INTERIOR LIGHTING

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Interior solid-state luminaires that use LED technology.
   2. Lighting fixture supports.
B. Related Requirements:
   1. Section 260923 “Lighting Control Devices” for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.
   2. Section 260936 “Modular Dimming Controls” for architectural dimming systems.
   3. Section 260943.03 “Distributed Digital Lighting Controls” for manual or programmable control systems with low-voltage control wiring or data communication circuits.

1.3 DEFINITIONS
A. CCT: Correlated color temperature.
B. CRI: Color Rendering Index.
C. Fixture: See “Luminaire.”
D. IP: International Protection or Ingress Protection Rating.
E. LED: Light-emitting diode.
F. Lumen: Measured output of lamp and luminaire, or both.
G. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers’ catalog sheets with complete technical data for each item being furnished.
   7. Arrange in order of luminaire designation.
   8. Include data on features, accessories, and finishes.
   9. Include physical description and dimensions of luminaires.
   10. Include emergency lighting units, including batteries and chargers.
   11. Include life, output (lumens, CCT, and CRI), and energy efficiency data.
12. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing and Calculation Guides, of each lighting fixture type. The adjustment factors shall be for lamps and accessories identical to those indicated for the lighting fixture as applied in IES LM-79 and IES LM-80.
   a. Manufacturers’ Certified Data: Photometric data certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
   b. Provide certification of one of the following:
      1) LM-79-08 report at T=0 and at T=6000 hours with a summary table showing the percent lumen output change and percent input power change.
      2) LM-80-08 test data for the LEDs at the three temperatures per LM-80-08. Provide extrapolation data using an exponential decay function to show the output at 50,000 hours. Provide the Ts value from the LM-79-08 and where the point falls in relation to the LM-80-08 extrapolated data. Interpolate between the LM-80-08 data for the Ts temperature.

B. Sustainable Design Submittals:
   1. Product Data for Credit IEQ 4.2: For paints and coatings, documentation including printed statement of VOC content.
   2. Laboratory Test Reports for Credit IEQ 4.2: For paints and coatings, documentation indicating that products comply with the testing and product requirements of the California Department of Public Health's "Standard Method for the Testing and Evaluation of Volatile Organic Chemical Emissions from Indoor Sources Using Environmental Chambers.”
   3. Refer to Section 018113 "Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

C. Samples for Verification: For each type of luminaire.
   1. Include Samples of luminaires and accessories to verify finish selection.

D. Product Schedule: For luminaires and lamps. Use same designations indicated on Drawings.

1.5 INFORMATIONAL SUBMITTALS
A. Qualification Data: For testing laboratory providing photometric data for luminaires.
B. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.
C. Product Certificates: For each type of luminaire.
D. Product Test Reports: For each luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency
E. Sample warranty.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For luminaires and lighting systems to include in operation and maintenance manuals.
   1. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Lamps: Ten for every 100 of each type and rating installed. Furnish at least one of each type.
2. LEDs: Provide One for every 100 factory assembled replacement LED package with electrical leads. Furnish at least one of each type. May be unitized with power supply unit/driver.
3. Power Supply Units/ driver: One for every 100 of each type and rating installed. Furnish at least one of each type. May be unitized with LEDs.
4. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
5. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

1.8 QUALITY ASSURANCE
A. Institute for Electrical and Electronics Engineers (IEEE)
   1. IEEE PAR1789 - Recommending practices for modulating current in High Brightness LEDs for mitigating health risks to viewers
B. Luminaire Photometric Data Testing Laboratory Qualifications: Luminaire manufacturer's laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.
C. Provide luminaires from a single manufacturer for each luminaire type.
D. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.

1.9 DELIVERY, STORAGE, AND HANDLING
A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

1.10 WARRANTY
A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
B. Warranty Period: Five year(s) from date of Substantial Completion.
C. Warranty Period for Light Sources: Five year replacement material warranty on all light sources (LED package, LED array, or LED module) including, but not limited to the LED die, encapsulate, and phosphor for the LEDs lumen maintenance not achieving L70 after 50,000 hours.

PART 2 PRODUCTS

2.1 MANUFACTURERS
A. Products: Subject to compliance with requirements, available products that may be incorporated into the Work include, but are not limited to, product(s) indicated on Drawings.

2.2 LUMINAIRE REQUIREMENTS
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by UL, ETL, CSA, or other qualified testing agency, and marked for intended location and application.
B. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Locate labels where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
   1. Label shall include the following lamp characteristics:
      a. "USE ONLY" and include specific lamp type.
      b. Lamp diameter, shape, size, wattage, and coating.
c. CCT and CRI.

C. Recessed luminaires shall comply with NEMA LE 4.

D. NRTL Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by an NRTL.

E. Rated lamp life of 50,000 hours.

F. Lamps dimmable from 100 percent to 0 percent of maximum light output.

G. Internal driver.

H. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

2.3 LEDS

A. LED sources must meet the following requirements:

1. Operating temperature rating must be between -40°C and +50°C

2. Correlated Color Temperature (CCT):
   a. Nominal CCT: 2700 K (2725 ± 145)
   b. Nominal CCT: 3000 K (3045 ± 175)
   c. Nominal CCT: 3500 K (3465 ± 245)
   d. Nominal CCT: 4000 K (3985 ± 275)
   e. Nominal CCT: 4500 K (4503 ± 243)
   f. Nominal CCT: 5000 K (5028 ± 283)
   g. Nominal CCT: 5700 K (5665 ± 355)
   h. Nominal CCT: 6500 K (6530 ± 510)
   i. Du’v’ tolerance of 0.001 ± 0.006

3. Color Rendering Index (CRI): greater than or equal to 80.

4. Luminaire manufacturer must submit reliability reports indicating that the manufacturer of the LED (chip, diode, or package) has performed JEDEC (Joint Electron Devices Engineering Council) reliability tests on the LEDs as follows:
   a. High Temperature Operating Life (HTOL)
   b. Room Temperature Operating Life (RTOL)
   c. Low Temperature Operating Life (LTOL)
   d. Powered Temperature Cycle (PTMCL)
   e. Non-Operating Thermal Shock (TMSK)
   f. Mechanical Shock
   g. Variable Vibration Frequency
   h. Solder Heat Resistance (SHR)

2.4 LED DRIVERS / POWER SUPPLYS

A. LED drivers must meet the following requirements:

1. Drivers must have a minimum efficiency of 85%.

2. Starting Temperature: -40°C.

3. Electrical Characteristics.
   a. Volts: as indicated on Luminaire Schedule.
   b. Phase: Single.
   c. Hertz: 60.

4. Power supplies can be UL Class I or II output.

5. Drivers must have a Power Factor (PF) of greater than or equal to 0.90.

6. Drivers must have a Total Harmonic Distortion (THD) of less than or equal to 20%.

8. Drivers must be Reduction of Hazardous Substances (RoHS) compliant.
9. Inrush current <2A
10. Sound rating: Inaudible in a 24 dB ambient.
11. Class P thermally protected.
12. Drivers with 0-10V dimming capability must be isolated and not allow current to leak between the power source and the 0-10V control circuit.

2.5 LED LUMINAIRE
A. Provide luminaires with integral LED thermal management system (heat sinking).
B. Luminaires shall be equipped with an LED driver that accepts 120V through 277V, 50hz to 60hz (UNIV). Component-to-component wiring within the luminaire will carry no more than 80% of rated current and be listed by UL for use at 600 VAC at 302°F/150°C or higher. Plug disconnects shall be listed by UL for use at 600 VAC, 15A or higher.
C. LED modules shall have a minimum L70 service life of 75,000 hours at 25°C ambient temperature and based on IESNA LM-80 methodology.
D. Provide luminaires with individual LED arrays/ modules and drivers that are accessible and replaceable from exposed side of the luminaire. Luminaires requiring removal or replacement of entire luminaire to access LEDs and drivers will NOT be accepted.
E. Luminaire efficiency shall be minimum of 70 lumens per watt.
F. Warranty: 5 year warranty covering the LED arrays, and LED drivers.
G. Continuous Flicker Free dimming range 100% to 0% measured relative light output.

2.6 MATERIALS
A. Metal Parts:
   1. Free of burrs and sharp corners and edges.
   2. Sheet metal components shall be steel unless otherwise indicated.
   3. Form and support to prevent warping and sagging.
B. Steel:
   1. ASTM A 36/A 36M for carbon structural steel.
   2. ASTM A 568/A 568M for sheet steel.
C. Stainless Steel:
   1. Manufacturer's standard grade.
   2. Manufacturer's standard type, ASTM A 240/240 M.
D. Galvanized Steel: ASTM A 653/A 653M.
E. Aluminum: ASTM B 209.

2.7 METAL FINISHES
A. Variations in finishes are unacceptable in the same piece. Variations in finishes of adjoining components are acceptable if they are within the range of approved Samples and if they can be and are assembled or installed to minimize contrast.

2.8 LUMINAIRE SUPPORT
A. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.
B. Single-Stem Hangers: 1/2-inch (13-mm) steel tubing with swivel ball fittings and ceiling canopy. Finish same as luminaire.

C. Wires: ASTM A 641/A 641 M, Class 3, soft temper, zinc-coated steel, 12 gage (2.68 mm).

D. Rod Hangers: 3/16-inch (5-mm) minimum diameter, cadmium-plated, threaded steel rod.

E. Hook Hangers: Integrated assembly matched to luminaire, line voltage, and equipment with threaded attachment, cord, and locking-type plug.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for luminaire to verify actual locations of luminaire and electrical connections before fixture installation. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 TEMPORARY LIGHTING

A. If approved by the Architect, use selected permanent luminaires for temporary lighting not to exceed 2,500 hours of use for LED luminaries. When construction is sufficiently complete, clean luminaires used for temporary lighting.

3.3 INSTALLATION

A. Comply with NECA/IESNA-500, “Recommended Practice for Installing Indoor Commercial Lighting Systems.”

B. Comply with NECA 1.

C. Install luminaires level, plumb, and square with ceilings and walls unless otherwise indicated.

D. Install lamps in each luminaire.

E. Supports:
   1. Sized and rated for luminaire weight.
   2. Able to maintain luminaire position after cleaning and relamping.
   3. Provide support for luminaire without causing deflection of ceiling or wall.
   4. Luminaire mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and vertical force of 400 percent of luminaire weight.

F. Flush-Mounted Luminaire Support:
   1. Secured to outlet box.
   2. Attached to ceiling structural members at four points equally spaced around circumference of luminaire.
   3. Trim ring flush with finished surface.

G. Wall-Mounted Luminaire Support:
   1. Attached to a minimum 20 gauge backing plate attached to wall structural members
   2. Do not attach luminaires directly to gypsum board.

H. Ceiling-Mounted Luminaire Support:
   1. Ceiling mount with two 5/32-inch- (4-mm-) diameter aircraft cable supports adjustable to 120 inches (6 m) in length.
I. Suspended Luminaire Support:
   1. Pendants and Rods: Where longer than 48 inches (1200 mm), brace to limit swinging.
   3. Continuous Rows of Luminaires: Use tubing or stem for wiring at one point and wire support for suspension for each unit length of luminaire chassis, including one at each end.
   4. Do not use ceiling grid as support for pendant luminaires. Connect support wires or rods to building structure.

J. Ceiling-Grid-Mounted Luminaires:
   1. Secure to any required outlet box.
   2. Secure luminaire to the luminaire opening using approved fasteners in a minimum of four locations, spaced near corners of luminaire.
   3. Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

K. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables" for wiring connections.

L. Light Track: Support track on maximum of 4 foot centers.

3.4 IDENTIFICATION
A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.5 FIELD QUALITY CONTROL
A. Perform the following tests and inspections:
   1. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.
      a. If 0-10V dimming does not perform to expectations, the contractor shall provide low pass filters at the 0-10V source to remedy performance issues.
   2. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery power and retransfer to normal.

B. Luminaire will be considered defective if it does not pass operation tests and inspections.

C. Prepare test and inspection reports.

D. Inspect each installed luminaire for damage. Replace damaged luminaires and components.

E. Advance Notice: Give dates and times for field tests.

F. Malfunctioning Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.
   1. Corroded Fixtures: Replace during warranty period.

3.6 STARTUP SERVICE
A. Clean luminaires internally and externally after installation. Use methods and materials recommended by manufacturer.
3.7 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting the direction of aim of luminaires to suit occupied conditions. Make up to two visits to Project during other-than-normal hours for this purpose. Some of this work may be required during hours of darkness.

1. During adjustment visits, inspect all luminaires. Replace lamps or luminaires that are defective.
2. Parts and supplies shall be manufacturer’s authorized replacement parts and supplies.
3. Adjust the aim of luminaires in the presence of the Architect.

B. Adjust aimable luminaires according to the directions shown on lighting drawings or per Owner’s direction.

3.8 INTERIOR LUMINAIRE SCHEDULE

A. See drawings for Luminaire Schedule.

END OF SECTION
PART 1 - GENERAL

1.1 SUMMARY

A. The work in this section includes furnishing and installing the following major elements, components, and associated accessories:

1. Interior luminaires
2. Fixture finishes
3. Light sources, lamps
4. Lampholders
5. Ballasts, transformers and drivers
6. Luminaire accessories

B. Related sections.

1. Division 00 – Procurement and Contracting Requirements
2. Division 01 – General Requirements
3. Division 09 – Finishes (including field painting of luminaires)
4. Division 11 – Equipment (including Theater, Stage and Audio-Visual Equipment)
5. Division 26 – Electrical (including all Sections under Division 260000 related to electrical devices for lighting).
6. Division 27 – Communications
7. Division 28 – Electronic Safety and Security

1.2 REFERENCES

A. Refer to Division 01 for general project references and standards.

B. All sections under Divisions of the American National Standards Institute (ANSI) related to electrical devices for lighting

C. American Society of Heating, Refrigerating and Air-Conditioning Engineers/Illuminating Engineering Society of North America (ASHRAE/IESA) Standard 90.1

D. Electrical Testing Laboratories, Inc. (ETL)

E. Illuminating Engineering Society of North America (IESNA)

F. International Energy Conservation Code (IECC)

G. National Electrical Code (NEC)

H. National Electrical Contractors Association (NECA)

I. National Electrical Manufacturers Association (NEMA)
1.3 SYSTEM DESCRIPTION

A. Performance Requirements

1. Contractor shall provide and install all components necessary for a complete working luminaire or luminaire system.
2. Existing light fixtures in the Valade Theater shall be inspected and re-used where possible.

1.4 SUBMITTALS

A. Refer to Division 01 – Administrative Requirements for project submittal procedures.

B. Provide the required number of submittals promptly and deliver through appropriate channels, leaving sufficient time for adequate review and possible re-submittals without jeopardizing project schedule.

1. Allow a minimum of ten (10) working days for the Lighting Consultant to review a submittal or re-submittal.

C. Contractor is responsible for verification of all actual field dimensions, quantities, coordination, and compliance with contract documents.

D. No release of orders for lighting equipment shall be made until review of submittals is complete.

E. Contractor-originated submittals: The submittals should demonstrate that the Contractor has coordinated the details of the equipment with the manufacturer including the mounting requirements, the architectural conditions, and the electrical requirements, as well as verified any recent changes in equipment availability.

1. Copies of the Lighting Designer’s or Architect’s construction documents cut sheets are not acceptable. The Contractor and/or the Contractor’s supplier shall provide their own submittal information for review.

F. Submit an indexed list of fixture types and quantities and catalog cuts for all product data. Manufacturer’s product data shall be marked clearly to indicate all technical information that indicates conformance to all specified requirements in contract documents. Product data shall include, but not be limited to, the following information:

1. Manufacturer’s catalog sheets of standard fixtures, indicating materials, gauges, dimensions, standard finishes available, weights, label by Underwriters’ Laboratories Inc. (UL) or an equivalent organization acceptable to the jurisdictional authority.
2. Notation of any variation from the specified product. This includes manufacturer initiated revisions or replacements of the specified product.
3. Photometry: Candlepower curves and/or other photometric performance data from the manufacturer’s catalogue sheets or printout of the IES file
4. Complete LED driver/power supply information as applicable to each fixture type. Submittal is to include the ballast, transformer or driver/power supply manufacturer name, part number and electrical specifications, including operating frequencies.
driver/power supply information shall also include corresponding compatible dimming devices, if dimming is required.

5. For lighting fixtures or components with cooling fans, or other potential sources of noise, submittal information shall include measured noise output in decibels (dB).

6. Manufacturer’s catalogue sheets for all specified accessories.

7. An inventory of all other equipment to be supplied including types, quantities, and reference to applicable drawings and schematics.

8. The equipment manufacturer shall provide additional information or demonstrations as required by the Owner or Architect to show conformance with Part 2 of this Specification. The additional information or demonstrations shall only be required prior to submittal final approval and by written notification from the Architect, or should product delivered to the job site be different from materials described in final submittals or published product literature. All demonstrations shall be at a location and time and in a manner chosen by the Owner.

G. Submittals shall be reviewed according to scope of work.

1. The Lighting Consultant shall review only the fixture types within their scope of work. Those types are designated in the fixture schedule and on the drawings with the prefix “L”.

2. Provide fixture submittals/shop drawings for all fixtures in the scope of work concurrently as one complete package. Return submittals shall be in one complete package containing only the fixtures still needing review.

3. Incomplete or partial submittals/shop drawings shall be returned without review.

H. Shop Drawings

1. Provide shop drawings for all nonstandard fixture types and configurations.

2. Provide dimensioned line drawings for these fixture types:
   a. Type L100 series
   b. Type L101 series

3. Shop drawing submittals shall include:
   a. One paper copy of the complete, fully dimensioned fixture drawings including all major components and details of fabrication.
   b. An electronic copy of the shop drawings in PDF scalable and printable format.
   c. Related architectural schematics with plans, sections and details indicating assembly, structural coordination, and installation of components.
   d. Inventory of all equipment to be supplied including types, quantities and reference to applicable drawings and schematics.
   e. Approximate weight of fully assembled fixture configurations.
   f. A complete finish schedule indicating the finish of all visible parts.

I. Light Fixture Mock-ups

1. Provide mock-ups of the light fixture types as listed below for aesthetic and functional approval by the Architect. Provide mock-ups after submittal review but prior to purchase.
INTERIOR LUMINAIRES

of fixtures. Coordinate with the architectural requirements of the mock-up as listed in Specification Section 014339. After the mock-up is approved, it will be an example for all other fixtures of the same type. Provide the following mock-ups

a. Type L100 (1) 4ft sample, including fixture and mounting accessories. Purpose of the mockup is to review the lighting effect and the appearance of the donor wall signage. Results of mockup may affect fixture location, accessories and/or fixture specification.

b. Type L150 (1) sample, including fixture and mounting accessories. Purpose of the mockup is to review the appearance of the fixture housing with the uneven wall treatment in the perimeter walls of the proscenium theatre. Results of mockup may affect fixture location, accessories and/or fixture specification.

c. Type L151 (1) sample, including fixture and mounting accessories. Purpose of the mockup is to review the aesthetic integration of the fixture housing with the vertical wood rods at the perimeter walls of the Valade Theatre. Results of mockup may affect fixture location, accessories and/or fixture specification.

d. Type L500 (2) samples, including fixture and mounting accessories for each, (1) 4’x4’ paint sample using Scuffmaster GOH31845303 Ambient Design AD10341 paint and (1) 4’ x 4’ paint sample using Scuffmaster GOH3184300 Burnished Metallic BR002 paint sample. Purpose of the mockup is to review and conduct side by side comparison of how the two paint options will perform under the specified lighting application. Results of mockup may affect fixture location, accessories and/or fixture specification. Construction of paint sample mockup and confirmation of paint color to be coordinated with Hamilton Anderson Architects.

J. Manufacturer’s Instructions

1. Provide manufacturer’s instructions for proper storage, handling, protection, examination, preparation, and installation of product to the Contractor prior to installation.

K. Closeout Submittals

1. Coordinate with Division 01 – Execution Requirements.

L. Operation and Maintenance Data

1. Coordinate with Division 01 – Facility Operation.

M. Substitutions

1. The identification and submittal of fixtures proposed as substitutions shall be in accordance with Part 2 of this specification section, and Division 01 – Product Requirements, and Bidding and Contracting Requirements.

2. The Owner / Architect is final authority concerning whether a proposed substitution is acceptable.

3. Submittals for fixtures proposed as substitutions shall meet the submittal requirements listed above, and the additional submittal requirements listed below:

a. The deadline for submittals for proposed substitutions shall be the earliest date determined by either:
1) The deadline established in Division 01 of this specification.

2) A date early enough to meet construction schedule requirements including time for substitutions submittal reviews. The minimum time allowance for substitutions submittal reviews shall be the time allotted for reviews of named fixture submittals plus an additional ten (10) working days.

b. All proposed substitutions shall be included in a single submittal package.

c. Any fixture that differs in any manner from that scheduled by manufacturer’s name shall be marked "exception", and exact differences shall be clearly indicated.

d. Associated unit cost credits to the owner for the proposed substitution shall be identified.

e. Photometry from an independent testing laboratory calculated according to IESNA standards is required.

1) Photometry shall include at a minimum:
   a) Candlepower distribution curve and table printed on paper. Data in table shall have vertical angles no greater than 10° increments, (5°, 15°, and 25° etc.). All asymmetric distributions shall have quadrants represented in 22.5° increments, (parallel, 22.5°, 45° ... normal), or sufficient increments to fully describe asymmetric light distribution.

f. Samples shall be required for all nonscheduled manufacturers that are submitted with insufficient data. Samples shall be provided for any proposed substitution upon request of the Architect.

g. Calculations of light levels produced by the substituted fixtures shall be required. Calculations shall:

1) Be performed using a recognized industry standard computerized lighting program. Acceptable software for computerized lighting programs includes, but is not limited to AGI by Lighting Analysts, Inc.

2) Be presented as a point-by-point grid of maintained footcandle levels taken at the horizontal plane at task. The grid shall be overlaid graphically on a to-scale light fixture layout with clearly identified fixture types.

3) Include the total Light Loss Factor used and a list of the individual loss factors in its composition.

4) Include an indexed list of the electronic photometry files used to represent the light fixtures.

5) Include an indexed list of the light fixture heights used in the calculation.

6) Include an indexed list of the lamp lumens and fixture wattages used in the calculation.

4. All additional expenses of any kind with respect to substitution(s) shall be born by the Contractor/Bidder. This shall include, but not be limited to, all fees and expenses incurred by the Architect and other related Consultants for evaluation of the substitution and
subsequent integration into the project, should the substitution be taken; and/or additional costs of other contractors related to the substitution(s).

1.5 QUALITY ASSURANCE

A. Qualifications

1. The manufacturer shall own and operate his/her own shop for fabrication of architectural luminaires and be regularly engaged in the fabrication and installation of such equipment. Fabrication of such equipment shall comprise no less than 90% of the manufacturer's business.

2. The Manufacturer shall have been engaged in the fabrication of the above equipment for at least the past 5 years

B. Regulatory Requirements

1. All luminaires shall be included in a list published by a National Recognized Testing Laboratory acceptable to the authority having jurisdiction and concerned with product evaluation such as Underwriters Laboratory (UL) or ETL.

1.6 DELIVERY, STORAGE & HANDLING

A. Delivery, storage and handling shall be coordinated with the General Contractor and shall meet all requirements described in Division 01 – Product Requirements.

B. Packing, Shipping, Handling & Unloading

1. Equipment shall be individually wrapped and sealed and substantially crated for shipment. All handling and shipping shall be performed in accordance with manufacturer’s recommendations. Store products in unopened cartons in a protected location.

2. All shipping costs to the job site are the responsibility of the Contractor. The shipping method/company is at the discretion of the Contractor in order to facilitate Acceptance at Site.

C. Acceptance at Site

1. The Contractor shall be responsible for acceptance of lighting equipment at the jobsite, confirming that all quantities and counts are correct and for keeping accurate logs and records of such information. Logs and records shall include but not be limited to date of shipment, date of acceptance at the jobsite, name and signature of individual accepting equipment at the jobsite, location of storage area, and confirmation of quantity counts listed on bills of lading. A copy of the shipping invoice or bill of lading shall be kept with each log entry of acceptance at the jobsite. Logs and records shall be made available to the Owner immediately upon request.

D. Storage and Protection

1. Upon delivery, the materials shall be stored under cover in a dry and clean location, off the ground. Delivered materials which are damaged or otherwise not suitable for installation shall be removed from the job site and replaced with acceptable materials.
2. Replace at no expense to the Owner, all equipment and materials which are damaged during storage or handling.
3. Delivery of material shall be scheduled to reduce on-site storage time required.
4. Refer to Division 01 for additional storage and protection requirements.

1.7 PROJECT / SITE CONDITIONS

A. Environmental Requirements

1. Verify all conditions at jobsite. Promptly report variations and obstructions to the Owner. All additions and or corrections shall be requested prior to fabrication.
2. Confirm all ceiling depths and ceiling thicknesses to insure that recessed fixtures can be installed in all ceiling conditions prior to order of the fixtures. After confirmation with the Architect, order modified fixtures for variations in ceiling depths or ceiling thicknesses.
3. The Contractor shall document the locations and condition of the existing light fixtures that shall be removed, stored and re-used prior to removal of the light fixtures to ensure the fixtures are re-installed in the same location.

B. Field Measurements

1. Where possible, field measurements shall be taken prior to installation preparations to ensure proper fitting of work.

1.8 SEQUENCING AND SCHEDULING

A. The Contractor shall provide a schedule of milestone completion dates for specific areas required to be completed prior to installation of equipment provided under this section to the General Contractor. These completion dates shall describe the required condition and level of finish required of each space.

1. The installation of the lighting equipment shall not occur until all painting in the area has been completed.
2. The installation of any lighting components sensitive to construction debris and dust shall not be installed until all debris and dust has been removed.

1.9 WARRANTY

A. Refer to Division 01 – Execution Requirements.

B. Contractor shall provide his/her own warranties as well as factory warranties. All equipment and labor in this contract shall be free from defects in products or workmanship for at least one year after date of acceptance of installation by Owner, unless otherwise noted or approved by Owner.

1.10 SYSTEM STARTUP, OWNER’S INSTRUCTIONS & COMMISSIONING

A. Coordinate with Division 01 – Execution Requirements and Facility Operation.

B. Instruction shall be provided to the Owner for proper relamping or replacing LED module procedures for all luminaires.
1.11 MAINTENANCE

A. Extra Materials
   1. Coordinate with Division 01 – Execution Requirements.

B. Maintenance Service
   1. Lighting system maintenance shall be in accordance with Division 01 – Facility Operation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. For the purpose of establishing minimum functional and aesthetic criteria, product manufacturers have been indicated in the Interior Light Fixture Schedule.

B. Substitutions shall be in compliance with Division 1 – Product Requirements.

C. Fixture groups by the same manufacturer
   1. All products of the same specified type shall be by the same manufacturer.
   2. Each fixture group listed below shall be by the same manufacturer and from the same product line by that manufacturer:
      a. Group 1: Type L100 series
      b. Group 2: Type L101 series

2.2 MANUFACTURED UNITS

A. Fixture types are indicated by alphanumeric designations.

B. Provide all products with UL Label for the appropriate mounting conditions or with equivalent label by another National Recognized Testing Laboratory acceptable to the authority having jurisdiction.

C. Voltage is as specified in the Interior Lighting Fixture Schedule. Lamps shall be operated at no greater than their rated voltage.

D. In all cases where a device or a part of the equipment is referred to in a singular manner in the contract documents, it is intended that such reference shall include and apply to as many devices as are required to complete the installation.

E. Provide lighting fixtures new and complete with mounting accessories, junction boxes, trims and lamps.
   1. Provide lamps indicated on the Interior Lighting Fixture Schedule, or if not indicated, as recommended by the fixture manufacturer. Lamps shall be compatible with the respective fixture in all cases.
2. Fixture Type catalogue numbers do not necessarily denote required mounting equipment or accessories. Provide all appropriate mounting accessories for mounting conditions. For example, include plaster frames for plaster ceiling.

F. Fixture mounting shall carry the weight of the fixture to the building construction, clear of ducts or pipes.

G. Ball swivels and cable end hardware shall be concealed with sleeves.

H. Seismic Restraints

1. All pendant mounted fixtures shall have secondary seismic restraints from the mounting canopy to the main body of the fixture. Manufacturer shall provide detail drawings of method of seismic restraint for approval by Architect.

I. Recessed and pendant mounted fixtures shall have leveling provisions.

J. All recessed fixtures shall have the appropriate NEMA-Type frame that is compatible with the ceiling type specified by the Architect.

K. All mounting frames installed in damp locations or in plaster ceilings shall be galvanized.

L. Fixtures in non-accessible ceilings shall have accessible junction boxes, ballasts, and transformers through fixture apertures or in remote accessible locations.

M. All fixtures shall be free of inappropriate light leaks.

N. No metal clips, screws, angles, etc. shall be visible when the fixture is viewed from below.

O. Die casts shall be smooth, free of pits, grooves, and imperfections.

P. Spinnings shall be smooth and clean with finished edges, and free of spinning lines.

Q. Fixtures shall be ventilated for proper operation.

R. Recessed fixtures shall have integral thermal protection.

S. All adjustable fixtures shall have locking rotation and tilt devices.

2.3 COMPONENTS

A. Light Sources

1. LIGHT EMITTING DIODE (LED)

   a. LED sources shall be integrated in luminaire with Correlated Color Temperature of 3000K and Color Rendering Index (CRI) exceeding 90.

   b. The LED shall emit no UV or IR.

   c. The LED shall deliver average lumen maintenance of 70% through 50,000 hours minimum under typical conditions. Proper current de-rating shall be observed to maintain junction temperature below the rated maximum.
d. LED modules in the same L series fixture type shall have consistent color. Excessive color variation observed by Architect shall be replaced by the Contractor at no additional expense to the Owner.

2. Replacement of Lamps in Existing Light Fixtures
   a. Lamps in existing light fixtures shall be replaced with new lamps with Correlated Color Temperature of 3000K and Color Rendering Index (CRI) exceeding 90.

B. Lampholders
   1. Lampholders shall hold lamps securely to prevent damage caused by normal vibrations and maintenance handling.

C. Reflector Cones
   1. Cone flange shall be formed as an integral part of cone and shall have identical appearance as inner cone unless otherwise indicated. Flange overlap shall have a perpendicular orientation to cone and shall have adequate width to cove ceiling opening with no visible light leaks.

D. Light Emitting Diode (LED) drivers
   1. LED power supplies and dimming devices shall have short circuit, overload, and overheating protection.
   2. LED power supplies, LED dimming devices, and LEDs or fixture-integrated LEDs shall each be compatible with the other LED devices to which they are connected. Inter-compatibility of LED devices shall be as determined by the manufacturers of those devices.
   3. LED power supply and LED dimming devices provided shall be compatible with the dimming control system.
   4. Power supply output and secondary load wiring size shall be adjusted to accommodate for voltage drop over the entire length of the run.
   5. Dimming range shall be 10 – 100% unless otherwise indicated in the Light Fixture Schedule.
   6. Driver shall be capable of operating LED at any light level within the dimming range. This shall be accomplished without first flashing.
   7. Light level output shall be continuous, even, and flicker-free over the entire dimming range.

E. Housings
   1. Provide safety devices for removable fixture elements, (cones, louvers, lenses, etc.). Safety device shall support element while out of normal operating position and be removable. Safety device shall not interfere with normal operation of fixture.

F. Louvers, baffles, diffusers, lenses
   1. Fixtures with baffles/louvers riveted or welded to the housing are not acceptable.

2.4 ACCESSORIES
   A. Provide all individual light fixtures with accessories as listed in the Interior Light Fixture Schedule
2.5 FIXTURE FINISHES

A. Fixture finishes shall be coordinated with the General Contractor and shall meet all requirements described in Division 09 – Paints and Coatings.

B. Powder-coat paint

1. Powder coat paint shall be factory applied.

C. Self-flange cones shall be factory painted, not field painted, unless otherwise noted in Interior Lighting Fixture Schedule.

D. All color finishes shall be approved by the Architect.

2.6 EXISTING LIGHT FIXTURES

A. The condition of existing light fixtures shall be reviewed on site by the Contractor. This includes inspection of fixture body, lenses, wiring, mounting, ballast, transformer or driver. Contractor shall determine if existing light fixtures function adequately and safely and can be re-used.

B. Contractor shall document and report light fixtures that can and cannot be re-used. Existing light fixtures which cannot be re-used shall be replaced with new, similar type light fixture.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Review each luminaire to determine suitability for lamps specified.

B. The Contractor shall verify the site conditions for suitability of installation. If errors or defects exist in luminaire mounting locations, the luminaires shall be withheld from installation until the situation is remedied.

C. Confirm all ceiling depths and ceiling thicknesses to insure that recessed fixtures can be installed in all ceiling conditions prior to order of the fixtures. After confirmation with the Architect, order modified fixtures for variations in ceiling depths or ceiling thicknesses.

3.2 INSTALLATION

A. Light fixture installation shall be coordinated with the General Contractor and shall meet all requirements described in Division 01 – Execution Requirements.

B. Light fixtures shall be installed as located on architectural plans and reflected ceiling plans, as zoned for control per electrical drawings and per approved shop drawings.

C. Light fixtures shall be installed in accordance with fixture manufacturer's written instructions, applicable requirements of NEC, applicable NECA Recommended Practices, NEMA standards, and recognized industry practices.
D. Verify locations and spacing of lighting fixtures with drawings and notify Architect of any variance or conflict between the plans and field conditions. Do not proceed until conflict has been resolved.

E. Work shall be coordinated with other trades. Lighting fixture locations shall have priority over location of ducts, diffusers, sprinklers, smoke detectors and other non-structural obstructions.

F. Structural support of all fixtures shall comply with the applicable building codes having jurisdiction over the project.

G. Provide all necessary hardware and blocking to ensure that fixtures are mounted level, true, square, plumb, and in proper alignment.

H. Fixtures installed in suspended T-bar ceilings shall be equipped with T-bar clips tested for use with that ceiling system. Clips shall be securely fastened to suspended T-bar ceiling system framing members.

I. All fixtures shall be unpacked, lamped if necessary, accessorized and installed for the final adjustment by the Contractor under the direction of the Architect.

J. Luminaires shall be bonded to branch circuit equipment-grounding conductor.

K. Recessed Fixtures

1. All fixtures shall be installed with the bottom of the fixture housing aligned with the finished ceiling line unless otherwise noted in manufacturer’s installation instructions.

2. Ceiling insulation shall be a minimum of 3” away from the light fixture unless the fixture is Insulated Ceiling rated.

3. Holes shall be cut to exact fixture size so that no gaps shall be present when trims or cones are installed.

4. Round holes in acoustical tile ceiling shall be cut using adjustable diameter cutter on slow speed drill press.

5. Installation of trims shall be tight with no gaps or light leaks. Reflector cones, baffles, aperture plates and decorative elements shall be installed after completion of plastering, ceiling tile work painting and general cleanup of areas.

L. Linear Fixtures

1. Linear fixtures, surface mounted or suspended, shall not have more than ¼” variation in alignment for any 16’ run.

2. In spaces with parallel rows of suspended fixtures all cord feeds shall be installed with the same orientation.

3.3 FIELD QUALITY CONTROL

A. Operate each luminaire after installation and connection. Inspect each fixture for proper connections and operation.

B. Perform testing of operation of temporary or emergency power systems.

C. Verify that all lenses, louvers, baffles, fixture trim cones, diffusers and other parts are thoroughly cleaned in a manner recommended by the manufacturer.
D. Replacement of blemished parts: Any luminaire components, including but not limited to reflector cones, lenses and louvers, that have been over-sprayed or damaged by paint or other materials bonding permanently to surfaces shall be replaced at no cost to the Owner.

3.4 ADJUSTING

A. All adjustable architectural luminaires shall be focused, aimed or otherwise adjusted by the Contractor under the direction of the Architect during the final adjustment.

1. Lighting adjustment shall take place after the project’s amenities, such as furniture, artwork, graphics, signage, planting and final finishes, have been installed and after any system commissioning has occurred.

2. The Contractor shall provide personnel to work with the Architect’s personnel to adjust the lighting fixtures. The Architect shall direct representative examples of fixture adjustment for the Contractor, but shall not adjust each individual fixture. The Contractor shall be responsible for adjusting all fixtures.

   a. Contractor’s personnel shall be familiar with the installed lighting equipment and the lighting controls for the site.

   b. Lighting fixture adjustments shall occur at night in daylit areas.

   c. The focusing and checkout of the lighting requires that all work lights be turned off in the area of the lighting adjustments.

3.5 CLEANING

A. Coordinate with Division 01 – General requirement.

B. The Contractor shall thoroughly clean all existing light fixtures that shall be retained and re-used.

3.6 DEMONSTRATION

A. Maintenance personnel shall be advised on replacing LED modules and/or re-lamping and maintenance procedures and be given by the Contractor a list of light sources required for the light fixtures on the project.

3.7 PROTECTION

A. Light fixtures, once installed, shall be protected from damage during the remainder of construction period.

B. The Contractor shall protect the existing light fixtures that shall be retained and re-used from damage.

   1. If necessary to protect the existing light fixtures, the Contractor shall remove, store and re-install light fixtures when the site is ready.
3.8 SCHEDULE AND PRODUCT DATA

A. For additional information, refer to the Interior Light Fixture Schedule in Electrical drawings and Product Data Sheets (catalog cuts) following the end of this Section.

END OF SECTION 26 52 01
SECTION 265219
EMERGENCY AND EXIT LIGHTING

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Emergency lighting units.
   2. Exit signs.
   4. Luminaire support components.

1.3 DEFINITIONS
A. CCT: Correlated color temperature.
B. CRI: Color Rendering Index.
C. Emergency Lighting Unit: A lighting unit with internal or external emergency battery powered supply and the means for controlling and charging the battery and unit operation.
D. Fixture: See "Luminaire" Paragraph.
E. Lumen: Measured output of lamp and luminaire, or both.
F. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of emergency lighting unit, exit sign, and emergency lighting support.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers' catalog sheets with complete technical data for each item being furnished.
   7. Include data on features, accessories, and finishes.
   8. Include physical description of the unit and dimensions.
   9. Battery and charger for light units.
10. Include life, output of luminaire (lumens, CCT, and CRI), and energy-efficiency data.
11. Include photometric data and adjustment factors based on laboratory tests, complying with IES LM-45, for each luminaire type.
   a. Manufacturers’ Certified Data: Photometric data certified by manufacturer’s laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
B. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

1.5 INFORMATIONAL SUBMITTALS
A. Qualification Data: For testing laboratory providing photometric data for luminaires.
B. Product Certificates: For each type of luminaire.
C. Product Test Reports: For each luminaire for tests performed by manufacturer and witnessed by a qualified testing agency.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For luminaires and lighting systems to include in emergency, operation, and maintenance manuals.
   1. Provide a list of all lamp types used on Project; use ANSI and manufacturers’ codes.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Lamps: 10 for every 100 of each type and rating installed. Furnish at least one of each type.
   2. Luminaire-mounted, emergency battery pack: One for every 20 emergency lighting units. Furnish at least one of each type.
   3. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
   4. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.

1.8 QUALITY ASSURANCE
A. Luminaire Photometric Data Testing Laboratory Qualifications: Luminaire manufacturer’s laboratory that is accredited under National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products and complying with applicable IES testing standards.
B. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.

1.9 DELIVERY, STORAGE, AND HANDLING
A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering before shipping.

1.10 WARRANTY
A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Two year(s) from date of Substantial Completion.

PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS FOR EMERGENCY LIGHTING
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. NRTL Compliance: Fabricate and label emergency lighting units, exit signs, and batteries to comply with UL 924.

C. Comply with NFPA 70 and NFPA 101.

D. Comply with NEMA LE 4 for recessed luminaires.

E. Lamp Base: Comply with ANSI C81.61.

F. Bulb Shape: Complying with ANSI C79.1.

2.2 EMERGENCY LIGHTING

A. General Requirements for Emergency Lighting Units: Self-contained units.
   1. Emergency Luminaires: As indicated on Interior Lighting Fixture Schedule, with the following additional features:
      a. Internal emergency power unit.
      b. Rated for installation in damp locations, and for sealed and gasketed luminaires in wet locations.
      c. UL 94 flame rating.

B. Emergency Lighting Unit:
   1. Emergency Lighting Unit: As indicated on Interior Lighting Fixture Schedule.
   2. Wall with universal junction box adaptor.
   3. UV stable thermoplastic housing
   4. Two LED lamp heads.
   5. Internal emergency power unit.

2.3 EXIT SIGNS

A. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.

2.4 MATERIALS

A. Metal Parts:
   1. Free of burrs and sharp corners and edges.
   2. Sheet metal components shall be steel unless otherwise indicated.
   3. Form and support to prevent warping and sagging.

B. Doors, Frames, and Other Internal Access:
   1. Smooth operating, free of light leakage under operating conditions.
   2. Designed to permit relamping without use of tools.
   3. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.

C. Conduit: Electrical metallic tubing, minimum 3/4 inch (21 mm) in diameter.

2.5 METAL FINISHES

A. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

2.6 LUMINAIRE SUPPORT COMPONENTS

A. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.
B. Support Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, 12 gage (2.68 mm)

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for conditions affecting performance of luminaires.

B. Examine roughing-in for luminaire to verify actual locations of luminaire and electrical connections before luminaire installation.

C. Examine walls, floors, roofs, and ceilings for suitable conditions where emergency lighting luminaires will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with NECA/IESNA-500, “Recommended Practice for Installing Indoor Commercial Lighting Systems.”

B. Comply with NECA 1.

C. Install luminaires level, plumb, and square with ceilings and walls unless otherwise indicated.

D. Install lamps in each luminaire.

E. Supports:
   1. Sized and rated for luminaire and emergency power unit weight.
   2. Able to maintain luminaire position when testing emergency power unit.
   3. Provide support for luminaire and emergency power unit without causing deflection of ceiling or wall.
   4. Luminaire-mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire and emergency power unit weight and vertical force of 400 percent of luminaire weight.

F. Wall-Mounted Luminaire Support:
   1. [Attached to structural members in walls] [Attached to a minimum 20-gage backing plate attached to wall structural members] [Attached using through bolts and backing plates on either side of wall] <Insert means of attachment>.
   2. Do not attach luminaires directly to gypsum board.

G. Suspended Luminaire Support:
   1. Pendants and Rods: Where longer than 48 inches (1200 mm), brace to limit swinging.
   3. Continuous Rows of Luminaires: Use tubing or stem for wiring at one point and [tubing or rod] [wire support] for suspension for each unit length of luminaire chassis, including one at each end.
   4. Do not use ceiling grid as support for pendant luminaires. Connect support wires or rods to building structure.

H. Ceiling Grid Mounted Luminaires:
   1. Secure to any required outlet box.
2. Secure emergency power unit using approved fasteners in a minimum of four locations, spaced near corners of emergency power unit.
3. Use approved devices and support components to connect luminaire to ceiling grid and building structure in a minimum of four locations, spaced near corners of luminaire.

3.3 IDENTIFICATION
A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.4 FIELD QUALITY CONTROL
A. Perform the following tests and inspections:
   1. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery power and retransfer to normal.
B. Luminaire will be considered defective if it does not pass operation tests and inspections.
C. Prepare test and inspection reports.
D. Inspect each installed luminaire for damage. Replace damaged luminaires and components.
E. Advance Notice: Give dates and times for field tests.
F. Malfunctioning Fixtures and Components: Replace or repair, then retest. Repeat procedure until units operate properly.
G. Corroded Fixtures: Replace during warranty period.

3.5 CLEANING
A. Clean luminaires internally and externally after installation. Use methods and materials recommended by manufacturer.

3.6 INTERIOR LUMINAIRE SCHEDULE
A. See drawings for Luminaire Schedule.

END OF SECTION
PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes
1. Provide all electrical services, materials, labor and installation suitable to accommodate the installation and complete function of the Division 11 theatrical systems equipment specified in other Sections, including:
   a. Section 116133 – Theatrical Rigging
   b. Section 116135 – Stage Extension - Orchestra Pit Lift System
   c. Section 116163 – Theatrical Lighting Dimming and Control
   d. Section 116173 – Theatrical Lighting Fixtures
   e. Section 126100 – Fixed Auditorium Seating
2. Coordinate Theatrical Systems-related electrical materials installation with the Theatrical Systems drawings.
3. Provide Theatrical Systems-related electrical materials and methods in accordance with all requirements and related sections of Division 26 and as detailed herein. In event of conflict, the stricter requirement will prevail.
4. Provide all Theatrical Systems junction boxes, pull boxes, terminal cabinets, cable trays, cable hooks, conduit, enclosures, standard outlet and device back boxes, and other electrical materials and hardware for a complete Theatrical Systems electrical infrastructure as specified herein and in quantities and location as shown on the Theatrical Systems and Electrical drawings.
5. Provide all disconnects, panelboards and company switches for Theatrical Systems Equipment as specified herein and in quantities as shown on Electrical drawings.
6. Provide test reports and verification that wiring installations comply with applicable standards and the requirements set forth in the Division 11 Theatrical Systems documents and by the equipment manufacturers.
7. Under work of this Section, related to Section 116133 – Theatrical Rigging Systems (TR-series Drawings)
   a. Coordinate with the work of Section 116133 - Theatrical Rigging
   b. Provide all conduit, wire, wire pulling and termination for theatrical rigging equipment.
   c. Provide terminations for motorized theatrical rigging systems motion control racks and devices; low voltage termination will be terminated under the direct supervision of the Theatrical Rigging contractor.
   d. Provide all local motor disconnects as required to complete system in a code compliant manner.
   e. Provide and terminate all wiring and receptacles required for theatrical rigging system power as indicated on drawings.
   f. Provide terminations for all system electrical safety devices.
8. Under work of this Section, related to Section 116135 – Stage Extension - Orchestra Pit Lift System (TE-series Drawings)
   a. Coordinate with the work of Section 116135 - Stage Extension - Orchestra Pit Lift System.
   b. Provide all conduit, wire, wire pulling and termination for motorized theatrical stage lift equipment.
c. Provide terminations for motorized theatrical stage lift system motor control racks and devices, low voltage termination will be terminated under the direct supervision of the Theatrical Machinery contractor.

d. Provide all local motor disconnects as required to complete system in a code compliant manner.

e. Provide terminations for all system electrical safety devices.

9. Under work of this Section, related to Section 116163 - Theatrical Lighting Dimming and Control Systems (TL-series Drawings)
   a. Coordinate with the work of Section 116163 - Theatrical Lighting Dimming and Control systems.
   b. Provide all conduit, wire, and wire pulling for theatrical lighting systems.
   c. Provide and terminate all wiring and receptacles required for the Theatrical Lighting system "LS" power system as indicated on drawings.
   d. Provide terminations for theatrical lighting system racks and devices; low voltage termination will be terminated under the direct supervision of the Theatrical Lighting contractor.
   e. Provide interface(s) as necessary to dim architectural LED lighting fixtures within the performance spaces with input control signal (DMX control protocol) provided under section 116163.
   f. Provide emergency transfer panel(s) to transfer designated architectural house lighting branch circuits, as determined by the Electrical Engineer, from normal to emergency power.
   g. Provide emergency power branch circuits to designated architectural LED lighting control signal interface(s) provided under Section 116163.

10. Under work of this Section, related to Section 126100 – Fixed Auditorium Seating (TS-series Drawings)
   a. Coordinate with the work of Section 126100 – Fixed Auditorium Seating.
   b. Provide all conduit, wire, wire pulling, floor junction boxes and terminations for fixed auditorium seating aisle light fixtures.
   c. Layout and install underfloor and in-slab conduit and aisle light junction boxes based on the seating layout shop drawings for Section 126100 – Fixed Auditorium Seating with review action “No Exceptions” or “Make Corrections Noted”.

11. Delegated Design:
   a. Refer to Section 260529 – Hanger and Support for Electrical Systems
   b. Refer to Section 260548 – Electrical Vibration and Noise Control
   c. Provide design of the means of fastening, suspending and supporting of the work of this Section.

B. Products Installed But Not Supplied Under This Section
   1. Related to Section 116133 - Theatrical Rigging Systems
      a. Install all Theatrical Rigging Systems line voltage and low voltage control equipment as furnished under Section 116133.
      b. Terminate all Theatrical Rigging System power disconnects and devices within equipment racks (including receptacles, etc.), as furnished under Section 116133.
      c. Install all Theatrical Rigging Systems specialty panel and device back boxes furnished by Division 11 where noted. Provide all required conduit, electrical hardware, and mounting brackets.

C. Related to Section 116135 – Stage Extension - Orchestra Pit Lift System
   1. Install all Stage Extension Lift line voltage and low voltage control equipment as furnished under Section 116135.
   2. Terminate all Stage Extension Lift System power disconnects and devices within equipment racks (including receptacles, etc.), as furnished under Section 116135.
3. Install all Stage Extension - Orchestra Pit Lift System specialty panel and device back boxes furnished by Division 11 where noted. Provide all required conduit, electrical hardware, and mounting brackets.

D. Related to Section 116163 - Theatrical Lighting Dimming and Control
   a. Receive, store and install dimmed and switched power distribution equipment and associated control equipment furnished under Section 116163.
   b. Receive, store and install all power and control distribution and connection devices furnished under Section 116163.
   c. Install all head-end control equipment furnished under Section 116163 under the direct supervision of the equipment manufacturer.
   d. Coordinate and install control signal interfaces provided under Section 116163 to transfer control signal for designated architectural LED lighting fixtures and drive all loads to full in the case of a loss of normal power.
   e. Install terminal boxes and terminate flexible multi-cable drops to fixed electric battens.

2. Related to Section 126100 – Fixed Auditorium Seating
   a. Receive, store, move to installation location and install transformers and proprietary power supplies related to aisle lights.
   b. Terminate aisle lighting fixtures furnished under Section 126100.

1.2 REFERENCES

A. Abbreviations and Acronyms
   1. The following abbreviations and acronyms are relevant to this Section and are in addition to those defined in Division 01 – General Requirements.
      a. A/R – As Required
      b. ATP – Acceptance Test Procedure
      c. AWG – American Wire Gauge
      d. Cat – Category
      e. CP – Connection Panel
      f. CWANA – Complete with all necessary accessories
      g. FAT – Factory Acceptance Test
      h. MCR – Motion Control Rack
      i. RF – Radio Frequency
      j. RU – Rack Unit. One Rack Unit equals 1.75 inches of vertical panel height.
      k. TSE – Theatre and Stage Equipment

1.3 ADMINISTRATIVE REQUIREMENTS

A. Coordination
   1. Under work of this Section, coordinate the installation of all Electrical provisions for the Theatrical Systems and Equipment.
   2. Comply with “hold clear” requirements indicated in the Contract Documents for the Theatrical Systems and Equipment.

B. Pre-installation Meeting
   1. Refer to Division 01 – General Requirements for information regarding pre-installation meeting with General Contractor.

C. Sequencing
1. Install the theatrical systems wiring devices following completion of all painting and wet trade work in the area, and the area is continuously free of excessive water, dirt, dust and debris that may be harmful to installed equipment.

2. Sequence the work to comply with the equipment delivery, storage and handling requirements specified elsewhere in this Section.

3. Computer grade network components, rack processors and modules, and any other equipment sensitive to construction debris and dust shall not be installed until all debris and dust has been removed. Typical finished “office” cleanliness shall be required and must be continuously maintained in rooms in which computer grade equipment is to be installed.

4. Computer grade network components, rack processors and modules, and any other valuable equipment shall not be installed until equipment rooms are continuously secure.

5. The unpacking and installation of computer control consoles and peripheral devices shall not occur until the control room is continuously secure, free of dust and debris, and climate controlled.

6. Scheduling:
   a. Comply with the project schedule.
   b. Install, startup, test and commission the work of this Section in a timely manner to allow the work of the various Theatre and Stage Equipment Sections to proceed in conformance with their portion of the project schedule, including a reasonable allowance for the startup, testing, commissioning, and Acceptance Testing Procedures specified in those Sections.

1.4 SUBMITTALS

A. Submit information on materials being proposed in accordance with the requirements of Division 01 – General Requirements.

B. Product Data
   1. Submit for each product specified in this Section.

C. Shop Drawings
   1. Provide coordinated mounting detail drawings for all theatrical devices.
   2. Provide coordinated plan detail drawings showing all theatrical related MEP equipment regardless of its location.
   3. Provide coordinated section and elevation detail drawings showing all theatrical related MEP equipment in all theatrical systems equipment rooms, including but not limited to dimmer rooms, control rooms, projection rooms, theatrical audio video equipment rack rooms, etc.

D. Delegated Design Submittals
   1. Provide design of the means of anchorage, fastening, suspension and support of the work of this Section.
   2. Provide drawings and calculations meeting the review requirements of the authorities having jurisdiction, stamped and wet signed by a Professional Engineer licensed in the project jurisdiction for work of the specific type performed.

E. Site Quality Control Submittals
   1. Submit test reports for wire and cable installed under work of this Section.

F. Manufacturer Reports
1.5 DELIVERY, STORAGE, AND HANDLING

A. Storage and Handling Requirements
   1. Theatre and Stage Equipment is classified according to its susceptibility to construction conditions that may affect its operation. Classes shall be defined by the following paragraphs.
      a. Class 1:
         1) Cable and distribution apparatus, structural elements, electrical back boxes, face plates, terminal boxes, and empty dimmer racks and empty equipment rack frames may be stored in weather-protected spaces under “normal” construction site conditions provided that no electronic components are contained within devices. Storage boxes shall be sturdy and well-sealed, and equipment shall be protected with imperforate inner plastic sheeting.
         2) Contractor may install this class of equipment in weather-protected spaces under “normal” construction site conditions provided that equipment is protected from dust and moisture by sturdy imperforate plastic sheeting and completely covered with corrugated cardboard held securely in place by tape with an acrylic adhesive that provides UV resistance, such as “blue painter’s tape”. Cardboard covers shall not be removed until area is broom cleaned. Under no circumstances shall equipment remain uncovered overnight during installation or while work which causes high dust or moisture levels in area of placement is taking place.
      b. Class 2:
         1) Control panels, dimmer modules, spare parts, test and other equipment (except as listed under Class 3) not subject to damage by concrete dust or dirt shall be stored and protected as specified herein for Class 1 devices.
         2) Contractor shall not install equipment in this class until area of installation is broom cleaned, “blown” clean with pressurized air, mopped, air conditioned and secure. Contractor may install control panels with electronic components under Class 2 conditions, but electronic components must be removed and not installed until area of installation meets Class 3 conditions.
      c. Class 3:
         1) Mixing and control consoles, computers, dimmer control electronics, filled equipment racks and other electronic equipment shall not be shipped to site until the rack and control rooms are finished, air conditioned, dust free, broom and mop cleaned, secure, and in all respects complete and ready for occupation.
         2) This class of equipment shall not be unpacked until the system is complete in all other respects. Under no circumstances may any equipment in this class be removed from the rack and control rooms into or through spaces that are not cleaned, air conditioned, and complete.

PART 2 - PRODUCTS

2.1 EQUIPMENT AND COMPONENTS

A. Raceways
   1. Refer to Section 260533 – Raceways and Boxes for Electrical Systems, in addition to the following.
   2. Conduit and Fittings
      a. Provide electrical metallic tubing (EMT) conduit for all Theatrical Systems wiring with the following exceptions:
         1) PVC conduit is NOT acceptable, except within concrete slab.
3. Cable Trays
   a. General
      1) Provide cable trays, tray supports, and splicing hardware to accommodate cable runs as shown on theatre equipment drawings. Refer to sections 116163.
      2) Trays to be adequately mounted so that there is no visible deflection between supported sections.

4. Cable Hooks
   a. Cable hooks for temporary cable routing
      1) Provide one piece, non-metallic cable saddle rack, with three saddle hooks, 32" long x 3" wide x 5" deep.
      2) Provide location and quantity to accommodate cable runs as shown on the electrical drawings.
      3) Cable saddle rack shall be finished gray
      4) Cable saddle rack shall be by Underground Devices, Model 3SR3, or equal.

B. Boxes
   1. Refer to Section 260533 - Raceways and Boxes for Electrical Systems, in addition to the following.
   2. Pull and Junction Boxes
      a. Pull and junction boxes shall be as specified under 260533, Electrical Boxes, Pull and Junction Boxes.
   3. Theatrical Lighting Control Station (TC) back boxes
      a. Theatrical lighting control station back boxes shall be an extra deep masonry box with a minimum depth of 2-1/2" to accommodate electronics and connectors.
      b. Provide recessed outlet boxes so that the receptacle-outlet cover plate can be securely attached to the back box as intended by the receptacle-outlet cover plate manufacturer.
      c. Provide recessed outlet boxes so that the receptacle-outlet cover plate is flush with the final finished surface of the surrounding wall finish. Verify surface treatments with architect prior to installation.

C. Theatrical Systems Line Voltage Cable
   1. Provide only cable types specified in Electrical Documents. No substitutions allowed without written approval of the Architect, Theatre Consultant and specialized Theatrical Systems Manufacturer/Contractor.
   2. Size cables and wires to compensate for voltage drop in all line voltage cable runs so that voltage measured at each remote device is no less than 115V under a loaded condition with a 10 amp load.
   3. Cable splicing may only be used where cable lengths exceed available stock purchasable lengths or in relocating existing devices. Any cable splices must be fully insulated. Conductor counts of 8 or more conductors shall utilize a terminal strip with bussing straps.
      a. Crimped butt type splices are acceptable for conductor counts of less than 8 conductors.
      b. Wire nuts are not acceptable.
   4. The Architect, Theatre Consultant and specialized Theatrical Systems Manufacturer/Contractor shall be notified in advance of all splice locations for approval.

D. Theatrical Systems Control Cable
   1. General
      a. Provide only wire types specified in Electrical Documents and verified by Theatrical Systems Manufacturer/Contractor's shop drawings. No substitutions allowed without written approval of the Architect, Theatre Consultant and specialized Theatrical Systems Manufacturer/Contractor.
b. Wire types provided in Electrical documents represent the information available at the time of bid and are provided for development of conduit size requirement and bidding purposes. Determination of the final wire type is dependent on the proprietary systems of the successful Division 11 manufacturer. Do not purchase or install any Theatrical Systems control cable until shop drawings for these systems are approved.

c. All wire to be installed in conduit unless otherwise noted or by specific written agreement by Electrical Engineer. Should an exception be made allowing cable to be run outside of conduit, contractor shall provide appropriate plenum rated cable for approval by Electrical Engineer and Theatrical Systems Manufacturers.

d. Network cable runs shall be continuous. Cable splicing will not be acceptable.

e. All network cable runs must be confirmed. Lengths exceeding 250 feet (75M) shall be identified and run with fiber optic cable.

2. Network Cabling

a. Theatrical Lighting Control Network Cabling

1) The Theatrical Lighting Control systems network cable runs consist of copper twisted pair wiring or optical fiber for the transport of Ethernet protocol as indicated in the Theatrical Lighting System drawings and specifications.

2) Cabling shall include a 3 foot service loop at the field device and minimum 12 foot service loop at terminal panels/equipment racks.

3) Category 5e Network cabling lengths exceeding 250 feet shall be identified by contractor at the time of shop drawing submittal.

4) All Category 5e network runs exceeding 250 feet must be run via satellite network locations added to resolve over-length conditions. Fiber optic cabling may not be substituted unless specified otherwise.

5) All network cable runs shall be continuous. Cable splices, wire nuts, terminal strips, etc., are not acceptable.

b. Theatrical Rigging & Stage Lift Automation Control System Cabling

1) The Theatrical Rigging automation control systems network cable runs consist of copper twisted pair wiring or optical fiber for the transport of Ethernet protocol as indicated in the Theatrical Rigging control system drawings and specifications.

2) Cabling shall include a 3 foot service loop at the field device and minimum 12 foot service loop at terminal panels/equipment racks.

3) Network cabling lengths exceeding the Theatrical Rigging Automation System contractor's defined maximum length for each segment of the Theatrical Rigging Automation Control System shall be identified by contractor at the time of shop drawing submittal.

4) Network cable runs exceeding the Theatrical Rigging Automation System Contractor's defined maximum length for each segment of the Theatrical Automation Control System must be rerun to bring the lengths to below the required maximum cable length.

5) All network cable runs shall be continuous. Cable splices, wire nuts, terminal strips, etc., are not acceptable.

E. Wiring Devices

1. Refer to Section 262726 - Wiring Devices, in addition to the following

2. Provide Theatrical systems receptacles and other required wiring devices, complete with associated hardware and wall plates, as specified below. Verify cover plate finish color with the Architect.

3. Theatrical Lighting receptacles

a. Theatrical Lighting Fixture Circuit - Edison/Straight Blade Receptacle Types

1) Duplex 20 Amp 120V Edison receptacles shall be standard NEMA 5-20R configuration, 2-pole, 3-wire.

   a) Receptacles shall be Hubbell HBL8319C, or approved equal.
b) Plugs shall be Hubbell HBL8315C, or approved equal.

b. Theatrical Lighting Fixture Circuit - Twist-Lock/Locking Receptacle Types
   1) Single 20 Amp 208V Twist-Lock receptacles shall be standard NEMA L6-20R configuration, 2-pole, 3-wire.
   2) 3-phase 20 Amp 120/208V Twist-Lock receptacles shall be standard NEMA L21-20R configuration, 4-pole, 5-wire.

c. Theatrical Lighting System power receptacle-outlets "LS" – Edison/Straight Blade Receptacle Types
   1) Duplex receptacle outlets shall be standard NEMA 5-20R "Edison" straight blade U-ground, 20A/120V 2-pole, 3-wire devices
   2) Provide cover plate, with blue label for circuits marked “LIGHTING SYSTEM POWER" and indicate home run panel and circuit breaker number.

4. Theatrical Rigging receptacles
   a. Theatrical Rigging Chain Hoist power receptacle – Twist-Lock/Locking Receptacle Types
      1) 3-phase 30 Amp 120/208V Twist-Lock receptacles shall be standard NEMA L21-30R configuration, 4-pole, 5-wire
         a) Receptacle shall be Hubbell or equal
         b) Receptacle color shall be green.
      2) Receptacle to be fed from general power panels designated TMG-#
      3) Provide cover plate with label marked indicating home run panel and circuit breaker number.

5. Company Switches & Receptacles
   a. Provide Theatrical Systems company switch disconnects and receptacles as described herein and as shown on Electrical drawings.
   b. 60 Amp Theatrical Lighting / Theatrical Rigging company switch receptacles
      1) Company switch receptacle configuration shall be 120/208-volt 3-phase 4-wire & equipment ground 60-amp mechanically interlocked pin and sleeve receptacle provided with mating plug connector.
      2) Provide 60-amp Hubbell HBL560MI9W Receptacle and HBL560P9W Plug.
   c. 100 Amp Theatrical Lighting / Theatrical Rigging company switch receptacles
      1) Company switch receptacle configuration shall be 120/208-volt 3-phase 4-wire & equipment ground 100-amp mechanically interlocked pin and sleeve receptacle provided with mating plug connector.
      2) Provide 100-amp Hubbell HBL5100MI9W Receptacle and HBL5100P9W Plug.
   d. 200 Amp Theatrical Audio Video company switch disconnect
      1) Company switch shall be 120/208-volt 3-phase 4-wire & equipment ground 200-amp device with means of connection for both single pole E1016 compatible connectors and direct wire lugs in a connection chamber.
      2) Provide Lex Products CS-200F-C5DS1 or Union Connector CSC-2010-CSP.
         a) Provide isolated ground option.
   e. 400 Amp Theatrical Lighting company switch disconnect
      1) Company switch shall be 120/208-volt 3-phase 5-wire & equipment ground 400-amp device with means of connection for both single pole E1016 compatible connectors and direct wire lugs in a connection chamber.
      2) Provide Lex Products CS-400F-C6DS1 or Union Connector CSC-4020-CSP.
         a) Provide double neutral option.

F. Architectural Lighting Emergency Transfer Panels
   1. Provide an emergency transfer system to provide automatic transfer of designated architectural house lighting branch circuits from theatrical system power controls to emergency power upon loss of normal power.
   2. Refer to Electrical drawings for designation and quantity of emergency branch circuits. Emergency power source to be provided under Division 26.
3. Unit shall provide multiple 20A circuits and be compatible with single or three phase systems.
4. Unit shall provide continuous monitoring of normal and emergency power in order to activate automatic power transfer.
5. The unit shall be UL1008 listed.
6. The transfer switch shall be electrically operated and mechanically held.
7. Unit shall include a normally closed dry contact closure for fire alarm input.
8. Provide:
   a. Electronic Theatre Controls ELTS2, circuit quantity as listed on drawings.

PART 3 - EXECUTION

3.1 THEATRICAL SYSTEMS INSTALLATION

A. General
1. Comply with the requirements of Section 260500 – Part 3 – Execution for Electrical Systems, and the following more restrictive requirements for Electrical systems work related to Theatre and Stage Equipment systems infrastructure.
2. At theatrical function catwalks, lighting catwalks and similar theatrical purpose functional positions, coordinate locations of all Electrical installation with the “hold clear” zones for Theatre and Stage Equipment.
3. Install all dimmer racks, equipment racks, terminal boxes, cable trays, conduit, enclosures and wiring devices in conformance with the static load and seismic restraint requirements of all local and national building Codes applicable to the project.
4. No conduit or conduit supports are permitted on horizontal railings, on vertical hangers below 48 inches, overhead rigging grids, or across theatrical lighting positions.
5. Mount all theatrical systems devices as shown on the drawings. Where the Contractor may desire deviations from mounting methods shown on the drawings due to field conditions, submit a Request For Information (RFI) in conformance with Project procedures and obtain response before proceeding with the work.

B. Raceway, Conduit and Fittings
1. Unless otherwise indicated, for Theatre and Stage Equipment systems infrastructure, provide a conduit system of steel material.
2. Provide rigid steel conduit where exposed to physical damage.
3. Below slab-on-grade, at other underground locations, and embedded in concrete masonry units (CMU) provide:
   a. Rigid steel conduit (RSC) with bitumastic coating, or,
   b. PVC Coated Rigid Steel Conduit (CRSC), or,
   c. At other locations, provide electrical metallic tubing (EMT).
4. Install raceway free of dents, nicks, and burrs. Ream all cut raceway and raceway ends.
5. Provide conduit trade size as indicated, but not less than:
   a. For metallic conduit, ¾ inch trade size.
   b. For rigid non-metallic conduit, 1 inch trade size.

6. Wireways, Auxiliary Gutters and Associated Fittings
7. Install plumb and square.
8. Protect cables from damage from cover fastening screws.

C. Cable Trays
1. Install cable trays in conformance with NFPA 70 Articles 250 and 392, NEMA VE 2.
2. Install with sufficient space maintained about the cable trays to permit adequate access for installing and maintaining the cables. Install with a minimum clear distance of 3 feet on one side, and one foot above the top member of the cable tray to any obstruction above.
3. Provide cable trays, tray supports, and splicing hardware to accommodate cable runs as shown on theatrical drawings. Coordinate cable tray size and loading depth with the wiring requirements of the related theatrical drawings and Division 11 Section.

4. Provide drop-out fittings above equipment racks, and at other locations as required to maintain cable bend radius limits.

D. Outlet, Device, Pull and Junction Boxes, Terminal Cabinets
1. Comply with NFPA 70 Article 314 and the following:
2. Provide a pull box for any conduit run which is greater than 150 feet or where the run includes the equivalent of three 90 degree bends, including those bends located immediately at an outlet or fitting.
3. Label pull boxes with the system name and box circuit identification.
4. Indicate locations of pull boxes and terminal cabinets on Record Documents.
5. Recessed outlet boxes shall be installed as follows:
   a. Install recessed outlet boxes so that the receptacle-outlet cover plate can be securely attached to the back box as intended by the receptacle-outlet cover plate manufacturer.
   b. Install recessed outlet boxes so that the receptacle-outlet cover plate is flush with the final finished surface of the surrounding wall finish. Verify surface treatments with architect prior to installation.
   c. Install recessed boxes plumb, true, and slightly back of the final finished surface so the device cover can be installed tight to the finish surface.
6. Surface mount outlet boxes shall be installed as follows:
   a. Install surface mounted outlet boxes so that the back of the box is flush with the final finished surface of the surrounding wall finish.
   b. Install surface boxes plumb and true. Coordinate box size with device size. Any surface mount back box which allows the receptacle-outlet cover plate to overhang the edge of the box presents a safety hazard and shall not be acceptable.
7. Surface treatments with Architect prior to installation
8. Mark the inside of all back boxes with the device designation as indicated in the theatrical systems drawings using a permanent marker or paint pen.

E. Wiring Device Installation
1. All theatrical systems devices are to be mounted as shown on the drawings. Deviations from mounting methods shown on the drawings due to field conditions should be approved by the Architect prior to installation.
2. Mark the inside of all back boxes with the device designation as indicated in the theatrical systems drawings using a permanent marker or paint pen.
3. All network device cover plates must be labeled with the allowable remaining portable cable length such that the entire run does not exceed 300 feet or individual system specification, whichever is less.
4. Clean all boxes of any dust, dirt or debris prior to cover plate installation.
5. All devices, plates & equipment must be covered after installation and protected from construction dust and debris.

F. Theatrical Systems Control Cables
1. Theatrical Systems Ethernet network shall be Category 5e UTP /100Base-TX cabling installed in accordance with all applicable standards including but not limited to IEEE 802.3u standard.
   a. Cable runs between hubs shall not exceed 250 feet (75 meters). Contractor shall verify run lengths prior to installation.
   b. No splices. No exceptions.
   c. Contractor shall provide field installation reports verifying that cable installations comply with specifications.
2. Theatrical Systems Fiber Optic (single-mode fiber back bone) /100Base-FX cabling shall be installed in accordance with all applicable standards including but not limited to IEEE 802.3u standard (if required).

3. Termination of all control cabling shall be undertaken only under the direct supervision of the applicable Theatrical System Manufacturer’s authorized field service personnel.

3.2 SYSTEM STARTUP AND COMMISSIONING

A. Test, “ring out” and provide industry standard compliance documentation for all cable types provided for the theatrical systems and equipment, including but not limited to:
   1. 120V power receptacles
   2. Category cable & network devices
   3. Fiber optic devices

B. Provide personnel at the time of commissioning to supervise the inspection / testing of theatre systems related electrical equipment. This includes distribution boards, circuit breaker panels, relay panels, and all mains voltage devices installed under this section.

C. Provide the appropriate test equipment for the commissioning of theatre systems related electrical equipment.

D. Provide access (ladders, lifts, scaffolding, etc.) to all theatre systems related electrical equipment for inspection at the time of commissioning.

3.3 FIELD QUALITY CONTROL

A. Field Tests and Inspection:

1. Electrical Contractor shall replace any Theatrical Systems cable that was damaged during cable pull within empty conduit infrastructure.

2. Prior to energizing of the Theatrical Systems, perform complete system check-out to verify that all items are correctly installed and shall safely operate as specified herein.

3. Perform required tests and adjustments upon completion of installation of Theatrical Systems, including but not limited to those specified herein.

4. Contractor shall provide sufficient field service personnel (minimum of 2) to perform all tests specified below. Contractor shall furnish sufficient workmen to operate all equipment and to assist in all tests specified below. Contractor shall provide ladders and other devices, to allow access to all devices to be tested and communication between parties.

5. Contractor shall carry out the following inspections of the Theatrical Systems cabling and submit to the Theatre Consultant the written results at each inspection for inclusion on the permanent records of the theatrical systems. Follow EIA standards RS-160 and RS-219 in performing test. Make corrections necessary to bring system(s) into compliance with the specifications.

a. Category Cable:

1) Test cabling using at least one (1) of the following test measurement devices or equal:

a) Category 5e/6 Cable Pair Tester, Level III or later tester for full compliance with TIA/EIA 568-B.1 and B.2, (to include all current addendums) - Microtest Omniscanner, HP, Scope, Fluke, Siemon, or equal.

b) Outside Plant Voice Cabling Plant tester - capable of detecting shorts, opens, reversals, mis-wiring and crosstwists. (example: Siemon STM-8).

2) Performance Requirements
Theatrical System Electrical Requirements

a) To EIA/TIA standards referenced herein for Category 5e/6 cabling. Performance requirement is for circuit end-to-end.

3) Test Procedures:
   a) Use the specified Category cable test set, and test using the Permanent Link procedure.
   b) Verify that all Category cable runs meet TIA/EIA-568B compliance, using an appropriate Level III testing instrument. The instrument must verify the integrity of all conductors, as well as correctness of termination sequence. Tests shall be performed between modular jacks at TA panels and modular jacks at patch panel.
   c) Test station wire only after all pairs of station wire in an area have been terminated at both ends, and no work of this Section or other Sections may cause physical disturbance to the wiring.
   d) Test and submit a test report for each individual cable segment.
   e) Provide 250MHz sweep test, polarity checks, near-end cross talk, signal attenuation, noise, DC loop back resistance, pair-by-pair continuity and length.
   f) Submit a test report indicating that the link meets Category 5e/6 minimum requirements for at least the following parameters.
      • Wire map, pin to pin match
      • Length
      • Report by frequency:
      • Insertion loss
      • NEXT, worst pair to pair
      • Power sum NEXT
      • ELFEXT, worst pair to pair
      • Power sum ELFEXT
      • Return loss
      • Report pass or fail
   g) Correct any and all transpositions found
   h) Retest
   i) If any conductor in a station wire tests either open or short, then the entire station wire is to be removed, replaced, and re-tested.

b. Fiber Optic Cable:
   1) Test cabling using at least one (1) of the following test measurement devices or equal:
      a) Optical power meter (HP, Siecor, 3M, Fotec).
      b) Optical Time Domain Reflectometer (Tektronix TTP2 Fiber Master Optical Time Domain Reflectometer or equal).
   2) Performance Requirements
      a) Optical Budget, any end to end link - not to exceed the sum of the following:
         • The specified cable performance, pro-rated for total link distance.
         • Multimode:
            • 1). 0.03 dB for each fusion splice
            • 2). 0.3 dB for each mechanical splice
            • 3). 0.4 dB for each LC connector
   3) Test Procedures:
      a) Measure and record all fiber optic line End-to-End attenuations in accordance with TIA/EIA-526-14A using factory terminated test jumpers. Overall line attenuation, including all patch panel connections and mechanical or fusion splices shall be in accordance with TIA/EIA-
568B. All fiber connectors shall be tested to assure insertion losses < 0.3 dB (typical) and 0.75 dB (maximum).

b) Test each fiber link for overall attenuation from end to end in both directions.

c) Perform the attenuation acceptance test for multi-mode cable at both the 850nm and 1300nm wavelengths.

END OF SECTION 26 55 61
SECTION 26 56 00
EXTERIOR LUMINAires

PART 1 - GENERAL

1.1 SUMMARY

A. The work in this section includes furnishing and installing the following major elements, components, and associated accessories:

1. Exterior (Wet and Damp Label) luminaires and accessories
2. Fixture finishes
3. Light sources, lamps
4. Lampholders
5. Ballasts, transformers and drivers
6. Luminaire Accessories
7. Poles

B. Related sections

1. Introductory Information, Bidding Requirements, Contracting Requirements.
2. Division 01 – General Requirements
3. Division 09 – Finishes
4. Division 10 - Specialties
5. Division 26 – Electrical
6. Division 27 – Communications
7. Division 28 – Electronic Safety and Security

H. National Electrical Contractors Association (NECA)

I. National Electrical Manufacturers Association (NEMA)
J. National Fire Protection Association (NFPA) 70 National Electrical Code
K. Underwriters Laboratories, Inc. (UL)

1.3 SYSTEM DESCRIPTION

A. Performance Requirements

1. Contractor shall provide and install all components necessary for a complete working luminaire or luminaire system.

1.4 SUBMITTALS

A. Refer to Division 01 – Submittals for project submittal procedures.

B. Provide the required number of submittals promptly and deliver through appropriate channels, leaving sufficient time for adequate review and possible re-submittals without jeopardizing project schedule.

1. Allow a minimum of ten (10) working days for the Lighting Consultant to review a submittal or re-submittal.

C. Contractor is responsible for verification of all actual field dimensions, quantities, coordination, and compliance with contract documents.

D. No release of orders for lighting equipment shall be made until review of submittals is complete.

E. Contractor-originated submittals: The submittals should demonstrate that the Contractor has coordinated the details of the equipment with the manufacturer including the mounting requirements, the architectural conditions, and the electrical requirements, as well as verified any recent changes in equipment availability.

1. Copies of the Lighting Designer’s or Architect’s construction documents cut sheets are not acceptable. The Contractor and/or the Contractor’s supplier shall provide their own submittal information for review.

F. Submit an indexed list of fixture types and quantities and catalog cuts for all product data. Manufacturer’s product data shall be marked clearly to indicate all technical information that indicates conformance to all specified requirements in contract documents. Product data shall include, but not be limited to, the following information:

1. Manufacturer’s catalog sheets of standard fixtures, indicating materials, gauges, dimensions, standard finishes available, weights, label by Underwriters’ Laboratories Inc. (UL) or an equivalent organization acceptable to the jurisdictional authority.
2. Notation of any variation from the specified product. This includes manufacturer initiated revisions or replacements of the specified product.
3. Photometry: Candlepower curves and/or other photometric performance data from the manufacturer’s catalogue sheets or printout of the IES file.
4. Manufacturer’s catalog sheets of lamps to be provided with fixtures indexed to fixture types.
5. Complete LED driver/power supply information as applicable to each fixture type. Submittal is to include the transformer or driver/power supply manufacturer name, part number and electrical specifications, including operating frequencies. LED driver/power
supply information shall also include corresponding compatible dimming devices, if dimming is required.

6. For lighting fixtures or components with cooling fans, or other potential sources of noise, submittal information shall include measured noise output in decibels (dB).

7. Manufacturer’s catalogue sheets for all specified accessories.

8. An inventory of all other equipment to be supplied including types, quantities, and reference to applicable drawings and schematics.

9. The equipment manufacturer shall provide additional information or demonstrations as required by the Owner or Architect to show conformance with Part 2 of this Specification. The additional information or demonstrations shall only be required prior to submittal final approval and by written notification from the Architect, or should product delivered to the job site be different from materials described in final submittals or published product literature. All demonstrations shall at a location and time and in a manner chosen by the Owner.

G. Submittals shall be reviewed according to scope of work.

1. The Lighting Consultant shall review only the fixture types within their scope of work. Those types are designated in the fixture schedule and on the drawings with the prefix “L”.

2. Provide fixture submittals/shop drawings for all fixtures in the scope of work concurrently as one complete package. Return submittals shall in one complete package containing only the fixtures still needing review.

3. Incomplete or partial submittals/shop drawings shall be returned without review.

H. Shop Drawings

1. Provide shop drawings for nonstandard fixture types and configurations.

2. Shop drawing submittals shall include:

   a. One paper copy of the complete, fully dimensioned fixture drawings including all major components and details of fabrication.

   b. An electronic copy of the shop drawings in PDF scalable and printable format.

   c. Related architectural schematics with plans, sections and details indicating assembly, structural coordination, and installation of components.

   d. Inventory of all equipment to be supplied including types, quantities and reference to applicable drawings and schematics.

   e. Approximate weight of fully assembled fixture configurations.

   f. A complete finish schedule indicating the finish of all visible parts.

I. Light Fixture Mock-Ups

1. Upon approval of the shop drawing submittals, provide mock-ups of the fixture types to be determined, for aesthetic and functional approval by the Architect.

J. Manufacturer’s Instructions

1. Provide manufacturer’s instructions for proper storage, handling, protection, examination, preparation, and installation of product to the Contractor prior to installation.
K. Closeout Submittals
   1. Coordinate with Division 01 – Execution Requirements.

L. Operation and Maintenance Data
   1. Coordinate with Division 01 – Facility Operation.

M. Substitutions
   1. The identification and submittal of fixtures proposed as substitutions shall be in accordance with Part 2 of this specification section, and Division 01 – Product Requirements, and Bidding and Contracting Requirements.
   2. The Owner / Architect is final authority concerning whether a proposed substitution is acceptable.
   3. Submittals for fixtures proposed as substitutions shall meet the submittal requirements listed above, and the additional submittal requirements listed below:
      a. The deadline for submittals for proposed substitutions shall be the earliest date determined by either:
         1) The deadline established in Division 01 of this specification.
         2) A date early enough to meet construction schedule requirements including time for substitutions submittal reviews. The minimum time allowance for substitutions submittal reviews shall be the time allotted for reviews of named fixture submittals plus an additional ten (10) working days.
      b. All proposed substitutions shall be included in a single submittal package.
      c. Any fixture that differs in any manner from that scheduled by manufacturer's name shall be marked "exception", and exact differences shall be clearly indicated.
      d. Associated unit cost credits to the owner for the proposed substitution shall be identified.
      e. Photometry from an independent testing laboratory calculated according to IESNA standards is required.
         1) Photometry shall include at a minimum:
            a) Candlepower distribution curve and table printed on paper. Data in table shall have vertical angles no greater than 10° increments, (5°, 15°, and 25° etc.). All asymmetric distributions shall have quadrants represented in 22.5° increments, (parallel, 22.5°, 45° ... normal), or sufficient increments to fully describe asymmetric light distribution.
      f. Samples shall be required for all nonscheduled manufacturers that are submitted with insufficient data. Samples shall be provided for any proposed substitution upon request of the Architect.
      g. Calculations of light levels produced by the substituted fixtures shall be required. Calculations shall:
1) Be performed using a recognized industry standard computerized lighting program. Acceptable software for computerized lighting programs includes, but is not limited to AGI by Lighting Analysts, Inc.

2) Be presented as a point-by-point grid of maintained footcandle levels taken at the horizontal plane at grade. The grid shall overlaid graphically on a to-scale light fixture layout with clearly identified fixture types.

3) Include the total Light Loss Factor used and a list of the individual loss factors in its composition.

4) Include an indexed list of the electronic photometry files used to represent the light fixtures.

5) Include an indexed list of the light fixture heights used in the calculation.

6) Include an indexed list of the lamp lumens and fixture wattages used in the calculation.

4. All additional expenses of any kind with respect to substitution(s) shall be born by the Contractor/Bidder. This shall include, but not be limited to, all fees and expenses incurred by the Architect and other related Consultants for evaluation of the substitution and subsequent integration into the project, should the substitution be taken; and/or additional costs of other contractors related to the substitution(s).

1.5 QUALITY ASSURANCE

A. Manufacturers qualifications

1. The manufacturer shall own and operate his/her own shop for fabrication of architectural luminaires and be regularly engaged in the fabrication and installation of such equipment. Fabrication of such equipment shall comprise no less than 90% of the manufacturer's business.

2. The Manufacturer shall have been engaged in the fabrication of the above equipment for at least the past 5 years

B. Regulatory Requirements

1. All luminaires shall be included in a list published by a National Recognized Testing Laboratory acceptable to the authority having jurisdiction and concerned with product evaluation such as Underwriters Laboratory (UL) or ETL.

1.6 DELIVERY, STORAGE & HANDLING

A. Delivery, storage and handling shall be coordinated with the General Contractor and shall meet all requirements described in Division 01 – Product Requirements.

B. Packing, Shipping, Handling & Unloading

1. Equipment shall be individually wrapped and sealed and substantially crated for shipment. All handling and shipping shall be performed in accordance with manufacturer's recommendations. Store products in unopened cartons in a protected location.
2. All shipping costs to the job site are the responsibility of the Contractor. The shipping method/company is at the discretion of the Contractor in order to facilitate Acceptance at Site.

C. Acceptance at Site

1. The Contractor shall be responsible for acceptance of lighting equipment at the jobsite, confirming that all quantities and counts are correct and for keeping accurate logs and records of such information. Logs and records shall include but not be limited to date of shipment, date of acceptance at the jobsite, name and signature of individual accepting equipment at the jobsite, location of storage area, and confirmation of quantity counts listed on bills of lading. A copy of the shipping invoice or bill of lading shall be kept with each log entry of acceptance at the jobsite. Logs and records shall be made available to the Owner immediately upon request.

D. Storage and Protection

1. Upon delivery, the materials shall be stored under cover in a dry and clean location, off the ground. Delivered materials which are damaged or otherwise not suitable for installation shall be removed from the job site and replaced with acceptable materials.
2. Replace at no expense to the Owner, all equipment and materials which are damaged during storage or handling.
3. Delivery of material shall be scheduled to reduce on-site storage time required.
4. Refer to Division 01 for additional storage and protection requirements.

1.7 PROJECT / SITE CONDITIONS

A. Environmental Requirements

1. Verify all conditions at jobsite. Promptly report variations and obstructions to the Owner. All additions and or corrections shall requested prior to fabrication.

B. Existing Conditions

1. Verify all conditions at jobsite.
2. Confirm adequate support and footings for pole mounted fixtures.

C. Field Measurements

1. Where possible, field measurements shall be taken prior to installation preparations.

1.8 SEQUENCING AND SCHEDULING

A. The Contractor shall provide a schedule of milestone completion dates for specific areas required to be completed prior to installation of equipment provided under this section to the General Contractor. These completion dates shall describe the required condition and level of finish required of each space.

1. The installation of the lighting equipment shall not occur until all painting in the area has been completed.
2. The installation of any lighting components sensitive to construction debris and dust shall not be installed until all debris and dust has been removed.
1.9 WARRANTY

A. Refer to Division 01 – Execution Requirements.

B. Contractor shall provide his/her own warranties as well as factory warranties. All equipment and labor in this contract shall be free from defects in products or workmanship for at least one year after date of acceptance of installation by Owner, unless otherwise noted or approved by Owner.

1.10 SYSTEM STARTUP, OWNER’S INSTRUCTIONS & COMMISSIONING

A. Coordinate with Division 01 – Execution Requirements and Facility Operation.

B. Instruction shall be provided to the Owner for proper relamping or replacing LED module procedures for all luminaires.

1.11 MAINTENANCE

A. Extra Materials

1. Coordinate with Division 01 – Execution Requirements.

B. Maintenance Service

1. Lighting system maintenance shall be in accordance with Division 01 – Facility Operation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. For the purpose of establishing minimum functional and aesthetic criteria, product manufacturers have been indicated in the Exterior Light Fixture Schedule attached to the end of this Section.

B. Substitutions shall be in compliance with Division 1 – Product Requirements.

C. Fixture groups by the same manufacturer

1. All products of the same specified type shall be by the same manufacturer

2.2 MANUFACTURED UNITS

A. Fixture types are indicated by alphanumeric designations.

B. Provide all products with UL Label for the appropriate mounting conditions or with equivalent label by another National Recognized Testing Laboratory acceptable to the authority having jurisdiction.

C. Voltage is as specified in the Exterior Lighting Fixture Schedule. Lamps shall be operated at no greater than their rated voltage.
D. In all cases where a device or a part of the equipment is referred to in a singular manner in the contract documents, it is intended that such reference shall include and apply to as many devices as are required to complete the installation.

E. Provide lighting fixtures new and complete with mounting accessories, junction boxes, trims and lamps.
   1. Provide lamps indicated on the Exterior Lighting Fixture Schedule, or if not indicated, as recommended by the fixture manufacturer. Lamps shall be compatible with the respective fixture in all cases.
   2. Fixture Type catalogue numbers do not necessarily denote required mounting equipment or accessories. Provide all appropriate mounting accessories for all mounting conditions.

F. All recessed fixtures shall have the appropriate NEMA-Type frame that is compatible with the ceiling type specified by the Architect.

G. Fixtures in non-accessible ceilings shall have accessible junction boxes, ballasts, and transformers through fixture apertures.

H. All fixtures shall be free of inappropriate light leaks.

I. No metal clips, screws, angles, etc. shall be visible when the fixture is viewed from below.

J. Die casts shall be smooth, free of pits, grooves, and imperfections.

K. Spinnings shall be smooth and clean with finished edges, and free of spinning lines.

L. Fixtures shall be ventilated for proper ballast, driver and light source operation.

M. Recessed fixtures shall have integral thermal protection.

N. All adjustable fixtures shall have locking rotation and tilt devices.

2.3 COMPONENTS

A. Light Sources
   1. LIGHT EMITTING DIODE (LED)
      a. LED sources shall be integrated in luminaire with Correlated Color Temperature (CCT) 3000K and Color Rendering Index (CRI) exceeds 80.
      b. The LED shall emit no UV or IR.
      c. The LED shall deliver average lumen maintenance of 70% through 50,000 hours minimum under typical conditions. Proper current de-rating shall be observed to maintain junction temperature below the rated maximum.
      d. LED modules in the same L series fixture type shall have consistent color. Excessive color variation observed by Architect shall be replaced by the Contractor at no additional expense to the Owner.

B. Lampholders
1. Lampholders shall hold lamps securely to prevent damage caused by normal vibrations and maintenance handling.

C. Reflector Cones

1. Cone flange shall be formed as an integral part of cone and shall have identical appearance as inner cone unless otherwise indicated. Flange overlap shall have a perpendicular orientation to cone and shall have adequate width to cove ceiling opening with no visible light leaks.

D. Light Emitting Diode (LED) drivers

1. LED power supplies and dimming devices shall have short circuit, overload, and overheating protection.
2. LED power supplies, LED dimming devices, and LEDs or fixture-integrated LEDs shall each be compatible with the other LED devices to which they are connected. Inter-compatibility of LED devices shall be as determined by the manufacturers of those devices.
3. LED power supply and LED dimming devices provided shall be compatible with specified lighting controls.
4. Power supply output and secondary load wiring size shall be adjusted to accommodate for voltage drop over the entire length of the run.
5. Dimming range shall be 10–100% unless otherwise indicated in the Light Fixture Schedule.
6. Light level output shall be continuous, even, and flicker-free over the entire dimming range.

E. Housings

1. Provide safety devices for removable fixture elements, (cones, louvers, lenses, etc.). Safety device shall support element while out of normal operating position and be removable. Safety device shall not interfere with normal operation of fixture.

F. Louvers, baffles, diffusers, lenses

1. Fixtures with baffles/louvers riveted or welded to the housing are not acceptable.

G. Poles

2. Furnish bolt templates and pole mounting accessories to installer of pole foundations.

2.4 ACCESSORIES

A. Provide all individual fixtures with accessories as listed in the Exterior Light Fixture Schedule.

2.5 FIXTURE FINISHES

A. Fixture finishes shall be coordinated with the General Contractor and shall meet all requirements described in Division 09 – Paints and Coatings.

B. All color finishes shall approved by the Architect.

C. Painted finish
1. All painted finish shall be factory applied.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine each luminaire to determine suitability for lamps specified.

B. The Contractor shall verify the site conditions for suitability of installation. If errors or defects exist in luminaire mounting locations, the luminaires shall be withheld from installation until the situation is remedied.

C. Self-flange cones shall be factory painted, not field painted, unless otherwise noted in Interior Lighting Fixture Schedule.

D. All custom color finishes shall approved by Architect.

3.2 INSTALLATION

A. Light fixture installation shall be coordinated with the General Contractor and shall meet all requirements described in Division 01 – Execution Requirements.

B. Light fixtures shall be installed as located on architectural plans and as zoned for control per electrical drawings and per approved shop drawings.

C. Light fixtures shall be installed in accordance with fixture manufacturer's written instructions, applicable requirements of NEC, applicable NECA Recommended Practices, NEMA standards, and recognized industry practices.

D. Verify locations and spacing of lighting fixtures with drawings and notify Architect of any variance or conflict between the plans and field conditions. Do not proceed until conflict has been resolved.

E. Work shall be coordinated with other trades.

F. Structural support of all fixtures shall comply with the applicable building codes having jurisdiction over the project.

G. Provide all necessary hardware and blocking to ensure that fixtures are mounted level, true, square, plumb, and in proper alignment.

H. All fixtures shall be unpacked, lamped, accessorized and installed for the final adjustment by the Contractor under the direction of the Architect.

I. Luminaires shall be bonded to branch circuit equipment-grounding conductor.

3.3 FIELD QUALITY CONTROL

A. Coordinate with Division 01 – Quality Requirements.
B. Operate each luminaire after installation and connection. Inspect each fixture for proper connections and operation.

C. Perform testing of operation of temporary or emergency power systems.

D. Verify that all lenses, louvers, baffles, fixture trim cones, diffusers and other parts are thoroughly cleaned in a manner recommended by the manufacturer.

E. Replacement of blemished parts: Any luminaire components, including but not limited to reflector cones and louvers, that have been over-sprayed or damaged by paint or other materials bonding permanently to surfaces shall be replaced at no cost to the Owner.

3.4 ADJUSTING

A. Coordinate with Division 01 – Execution Requirements.

B. All adjustable architectural luminaires shall be focused, aimed or otherwise adjusted by the Contractor under the direction of the Architect during the final adjustment.

1. Lighting adjustment shall take place after the project’s amenities, such as furniture, artwork, graphics, signage, planting and final finishes, have been installed and after any system commissioning has happened.

2. The Contractor shall provide personnel to work with the Architect’s personnel to adjust the lighting fixtures. The Architect shall direct representative examples of fixture adjustment for the Contractor, but shall not adjust each individual fixture. The Contractor shall be responsible for adjusting all fixtures.

   a. The Contractor shall provide personnel as required to aim and adjust the light fixtures.

   b. Contractor’s personnel shall be familiar with the installed lighting equipment and the lighting controls for the site.

   c. Lighting fixture adjustments shall occur at night.

   d. The focusing and checkout of the lighting requires that all work lights be turned off in the area of the lighting adjustments.

3. The Contractor shall provide tools and any special equipment needed for the adjustments including walkie-talkies for communication.

4. The Contractor shall provide lifts and/or ladders at heights required to reach all light fixtures.

3.5 CLEANING

A. Coordinate with Division 01 – Execution Requirements.

3.6 DEMONSTRATION

A. Coordinate with Division 01 – Facility Operation.
B. Maintenance personnel shall be advised on replacing the light source, re-lamping and maintenance procedures and be given by the Contractor a list of light sources required for the light fixtures on the project.

3.7 PROTECTION

A. Lighting fixtures, once installed, shall be protected from damage during the remainder of construction period.

3.8 SCHEDULE

A. For additional information, refer to the Exterior Light Fixture Schedule in the Electrical drawings and Product Data Sheets (catalog cuts) following the end of this Section.

END OF SECTION 26 56 00
SECTION 265613
LIGHTING POLES AND STANDARDS

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Poles and accessories for support of luminaires.

1.3 DEFINITIONS
A. EPA: Equivalent projected area.
B. Luminaire: Complete lighting fixture.
C. Pole: Luminaire-supporting structure, including tower used for large-area illumination.
D. Standard: See "Pole."

1.4 ACTION SUBMITTALS
A. Product Data: For each pole, accessory, and luminaire-supporting and -lowering device, arranged as indicated.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers' catalog sheets with complete technical data for each item being furnished.
   7. Include data on construction details, profiles, EPA, cable entrances, materials, dimensions, weight, rated design load, and ultimate strength of individual components.
   8. Include finishes for lighting poles and luminaire-supporting devices.
   10. Manufactured pole foundations.

1.5 INFORMATIONAL SUBMITTALS
A. Pole and Support Component Certificates: Signed by manufacturers of poles, certifying that products are designed for indicated load requirements according to AASHTO LTS-6-M and that load imposed by luminaire and attachments has been included in design. The certification shall be based on design calculations signed and sealed by a professional engineer.
B. Material Test Reports:
   1. For each foundation component, by a qualified testing agency.
   2. For each pole, by a qualified testing agency.
C. Source quality-control reports.
D. Field quality-control reports.
E. Sample Warranty: Manufacturer's standard warranty.
F. Soil test reports.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For poles to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 017800 "Closeout Submittals," include pole inspection and repair procedures.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Pole repair materials.

1.8 QUALITY ASSURANCE
A. Testing Agency Qualifications: Qualified according to ASTM C 1093 for foundation testing.

1.9 DELIVERY, STORAGE, AND HANDLING
A. Package aluminum poles for shipping according to ASTM B 660.
B. Store poles on decay-resistant skids at least 12 inches (300 mm) above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.
C. Retain factory-applied pole wrappings on metal poles until right before pole installation. Handle poles with web fabric straps.

1.10 WARRANTY
A. Special Warranty: Manufacturer agrees to repair or replace components of pole(s) that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within a specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs from special warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.
   2. Warranty Period for Corrosion Resistance: Five years from date of Substantial Completion.
   3. Warranty Period for Color Retention: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014500 "Quality Control," to design pole foundation and pole power system.
B. Structural Characteristics: Comply with AASHTO LTS-6-M.
C. Dead Load: Weight of luminaire and its horizontal and vertical supports, lowering devices, and supporting structure, applied according to AASHTO LTS-6-M.
D. Ice Load: Load of 3 lbf/sq. ft. (145 Pa), applied according to AASHTO LTS-6-M for applicable areas on the Ice Load Map.
E. Wind Load: Pressure of wind on pole and luminaire, calculated and applied according to AASHTO LTS-6-M.
1. Basic wind speed for calculating wind load for poles 50 feet (15 m) high or less is 100 mph (45 m/s)
   a. Wind Importance Factor: 1.0
   b. Minimum Design Life: 25 years
   c. Velocity Conversion Factor: 1.0

F. Strength Analysis: For each pole, multiply the actual EPA of luminaires and brackets by a factor of 1.1 to obtain the EPA to be used in pole selection strength analysis.

G. Luminaire Attachment Provisions: Comply with luminaire manufacturers’ mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.

2.2 STEEL POLES

A. Source Limitations: Obtain poles from single manufacturer or producer.

B. Source Limitations: For poles, obtain each color, grade, finish, type, and variety of pole from single source with resources to provide products of consistent quality in appearance and physical properties.

C. Poles: Comply with ASTM A 240/A 222, stainless steel with a minimum yield of 55,000 psig (379 MPa); one-piece construction up to 40 feet (12 m) in height with access handhole in pole wall.
   1. Shape: Square, straight.
   2. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.

D. Brackets for Luminaires: Detachable, cantilever, without underbrace.
   1. Adaptor fitting welded to pole, allowing the bracket to be bolted to the pole-mounted adapter, then bolted together with galvanized-steel bolts.
   2. Cross Section: Tapered oval, with straight tubular end section to accommodate luminaire. Match pole material and finish.

E. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

F. Fasteners: Galvanized steel, size and type as determined by manufacturer. Corrosion-resistant items compatible with support components.
   1. Materials: Compatible with poles and standards as well as the substrates to which poles and standards are fastened and shall not cause galvanic action at contact points.

G. Grounding and Bonding Lugs: Welded 1/2-inch (13-mm) threaded lug, complying with requirements in Section 260526 “Grounding and Bonding for Electrical Systems,” listed for attaching grounding and bonding conductors of type and size indicated, and accessible through handhole.

H. Handhole: Oval shaped, with minimum clear opening of 2-1/2 by 5 inches (65 by 130 mm), with cover secured by stainless-steel captive screws.

I. Cable Support Grip: Wire-mesh type with rotating attachment eye, sized for diameter of cable and rated for a minimum load equal to weight of supported load multiplied by a 5.0 safety factor.

J. Prime-Coat Finish: Manufacturer’s standard prime-coat finish ready for field painting.

K. Galvanized Finish: After fabrication, hot-dip galvanize according to ASTM A 123/A 123M.

L. Powder-Coat Finish: Comply with NAAMM’s “Metal Finishes Manual for Architectural and Metal Products” recommendations for applying and designating finishes.
1. **Surface Preparation:** Clean surfaces according to SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair powder coat bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, according to SSPC-SP 5/NACE No. 1 or SSPC-SP 8.

2. **Powder Coat:** Comply with AAMA 2604.
   a. Electrostatic-applied powder coating; single application and cured to a minimum 2.5- to 3.5-mils dry film thickness. Coat interior and exterior of pole for equal corrosion protection.

### 2.3 ALUMINUM POLES

**A. Poles:** Seamless, extruded structural tube complying with ASTM B 221, Alloy 6063-T6, with access handhole in pole wall.

**B. Brackets for Luminaires:** Detachable, cantilever, without underbrace.
   1. Adaptor fitting welded to pole, allowing the bracket to be bolted to the pole-mounted adapter, then bolted together with stainless-steel bolts.
   2. **Cross Section:** Tapered oval, with straight tubular end section to accommodate luminaire. Match pole material and finish.

**C. Pole-Top Tenons:** Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.

**D. Grounding and Bonding Lugs:** Bolted 1/2-inch (13-mm) threaded lug, complying with requirements in Section 260526 “Grounding and Bonding for Electrical Systems,” listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.

**E. Fasteners:** Stainless steel, size and type as determined by manufacturer. Corrosion-resistant items compatible with support components.
   1. **Materials:** Compatible with poles and standards as well as to substrates to which poles and standards are fastened and shall not cause galvanic action at contact points.

**F. Handhole:** Oval shaped, with minimum clear opening of 2-1/2 by 5 inches (65 by 130 mm), with cover secured by stainless-steel captive screws.

**G. Prime-Coat Finish:** Manufacturer's standard prime-coat finish ready for field painting.

**H. Powder-Coat Finish:** Comply with NAAMM’s "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.
   1. **Surface Preparation:** Clean surfaces to comply with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair powder coat bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, according to SSPC-SP 5/NACE No. 1 or SSPC-SP 8.
   2. **Powder coat shall comply with AAMA 2604.**
      a. Electrostatic applied powder coating; single application with a minimum 2.5- to 3.5-mils dry film thickness; cured according to manufacturer's instructions. Coat interior and exterior of pole for equal corrosion protection.

### 2.4 MOUNTING HARDWARE

**A. Anchor Bolts:** Manufactured to ASTM F 1554, Grade 55, with a minimum yield strength of 55,000 psi (380,000 kPa).
   1. **Galvanizing:** Hot dip galvanized according to ASTM A 153, Class C
   2. **Threading:** Uniform National Coarse, Class 2A.

**B. Nuts:** ASTM A 563, Grade A, Heavy-Hex
1. Galvanizing: Hot dip galvanized according to ASTM A 153, Class C
2. Two nuts provided per anchor bolt.

C. Washers: ASTM F 436, Type 1.
   1. Galvanizing: Hot dip galvanized according to ASTM A 153, Class C. Two washers provided per anchor bolt.

2.5 GENERAL FINISH REQUIREMENTS

A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

B. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine poles, luminaire-mounting devices, lowering devices, and pole accessories before installation. Components that are scratched, dented, marred, wet, moisture damaged, or visibly damaged are considered defective.

C. Examine roughing-in for foundation and conduit to verify actual locations of installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 POLE FOUNDATION

A. Concrete Pole Foundations: Cast in place, with anchor bolts to match pole-base flange. Structural steel complying with ASTM A 36/A 36M and hot-dip galvanized according to ASTM A 123/A 123 M; and with top-plate and mounting bolts to match pole-base flange and strength required to support pole, luminaire, and accessories. Concrete, reinforcement, and formwork are specified in Section 033000 "Cast-in-Place Concrete."

B. Anchor Bolts: Install plumb using manufacturer-supplied plywood template, uniformly spaced.

3.3 POLE INSTALLATION

A. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on drawing.
   1. Fire Hydrants and Water Piping: 60 inches (1520 mm)
   2. Water, Gas, Electric, Communications, and Sewer Lines: 10 feet (3 m)
   3. Trees: 15 feet (5 m) from tree trunk.

B. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Section 033000 "Cast-in-Place Concrete."

C. Poles and Pole Foundations Set in Concrete-Paved Areas: Install poles with a minimum 6-inch (150-mm-) wide, unpaved gap between the pole or pole foundation and the edge of the adjacent concrete slab. Fill unpaved ring with pea gravel. Insert material to a level 1 inch (25 mm) below top of concrete slab.
D. Raise and set pole using web fabric slings (not chain or cable) at locations indicated by manufacturer.

3.4 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum using insulating fittings or treatment.

B. Steel Conduits: Comply with requirements in Section 260533 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch- (0.254-mm-) thick, pipe-wrapping plastic tape applied with a 50-percent overlap.

3.5 GROUNDING

A. Ground Metal Poles and Support Structures: Comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."
   1. Install grounding electrode for each pole unless otherwise indicated.
   2. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.

3.6 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.7 FIELD QUALITY CONTROL

A. Special Inspections: Engage a qualified special inspector to perform the following special inspections:
   1. Inspect poles for nicks, mars, dents, scratches, and other damage.
   2. System function tests.

3.8 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain luminaire lowering devices.

3.9 CLEANING

A. Clean units after installation. Use methods and materials recommended by manufacturer.

3.10 EXTERIOR LUMINAIRE SCHEDULE

A. See drawings for Luminaire Schedule.

END OF SECTION
SECTION 265619
LED EXTERIOR LIGHTING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Luminaire types.
3. Finishes.
4. Luminaire support components.

B. Related Requirements:
1. Section 260923 “Lighting Control Devices” for automatic control of lighting, including time switches, photoelectric relays, occupancy sensors, and multipole lighting relays and contactors.
2. Section 265613 “Lighting Poles and Standards” for poles and standards used to support exterior lighting equipment.

1.3 DEFINITIONS

A. CCT: Correlated color temperature.
B. CRI: Color rendering index.
C. Fixture: See “Luminaire.”
D. IP: International Protection or Ingress Protection Rating.
E. Lumen: Measured output of lamp and luminaire, or both.
F. Luminaire: Complete lighting unit, including lamp, reflector, and housing.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of luminaire.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers’ catalog sheets with complete technical data for each item being furnished.
   7. Arrange in order of luminaire designation.
   8. Include data on features, accessories, and finishes.
   9. Include physical description and dimensions of luminaire.
   10. Lamps, include life, output (lumens, CCT, and CRI), and energy-efficiency data.
   a. Manufacturer's Certified Data: Photometric data certified by manufacturer’s laboratory with a current accreditation under the NVLAP for Energy Efficient Lighting Products.
   b. Provide certification of one of the following:
      1) LM-79-08 report at T=0 and at T=6000 hours with a summary table showing the percent lumen output change and percent input power change.
      2) LM-80-08 test data for the LEDs at the three temperatures per LM-80-08. Provide extrapolation data using an exponential decay function to show the output at 50,000 hours. Provide the Ts value from the LM-79-08 and where the point falls in relation to the LM-80-08 extrapolated data. Interpolate between the LM-80-08 data for the Ts temperature.

12. Wiring diagrams for power, control, and signal wiring.
13. Photoelectric relays.
14. Means of attaching luminaires to supports and indication that the attachment is suitable for components involved.

1.5 INFORMATIONAL SUBMITTALS
A. Qualification Data: For testing laboratory providing photometric data for luminaires.
B. Product Certificates: For each type of the following:
   1. Luminaire.
   2. Photoelectric relay.
C. Product Test Reports: For each luminaire, for tests performed by manufacturer and witnessed by a qualified testing agency.
D. Source quality-control reports.
E. Sample warranty.

1.6 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For luminaires to include in operation and maintenance manuals.
   1. Provide a list of all lamp types used on Project. Use ANSI and manufacturers’ codes.
   2. Provide a list of all photoelectric relay types used on Project; use manufacturers’ codes.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. LEDs: Provide One for every 100 factory assembled replacement LED package with electrical leads. Furnish at least one of each type. May be unitized with power supply unit/driver.
   2. Power Supply Units/ driver: One for every 100 of each type and rating installed. Furnish at least one of each type. May be unitized with LEDs.
   3. Lamps: Ten for every 100 of each type and rating installed. Furnish at least one of each type.
   4. Glass, Acrylic, and Plastic Lenses, Covers, and Other Optical Parts: One for every 100 of each type and rating installed. Furnish at least one of each type.
   5. Diffusers and Lenses: One for every 100 of each type and rating installed. Furnish at least one of each type.
   6. Globes and Guards: One for every 20 of each type and rating installed. Furnish at least one of each type.
1.8 QUALITY ASSURANCE
A. Luminaire Photometric Data Testing Laboratory Qualifications:
   1. Luminaire manufacturers’ laboratory that is accredited under the NVLAP for Energy Efficient Lighting Products.
B. Provide luminaires from a single manufacturer for each luminaire type.
C. Each luminaire type shall be binned within a three-step MacAdam Ellipse to ensure color consistency among luminaires.
D. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1.9 DELIVERY, STORAGE, AND HANDLING
A. Protect finishes of exposed surfaces by applying a strippable, temporary protective covering prior to shipping.

1.10 FIELD CONDITIONS
A. Verify existing and proposed utility structures prior to the start of work associated with luminaire installation.
B. Mark locations of exterior luminaires for approval by Architect prior to the start of luminaire installation.

1.11 WARRANTY
A. Warranty: Manufacturer and Installer agree to repair or replace components of luminaires that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures, including luminaire support components.
      b. Faulty operation of luminaires and accessories.
      c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
   2. Warranty Period: Two year(s) from date of Substantial Completion.
   3. Warranty Period for Light Sources: Five year replacement material warranty on all light sources (LED package, LED array, or LED module) including, but not limited to the LED die, encapsulate, and phosphor for the LEDs lumen maintenance not achieving L70 after 50,000 hours.

PART 2 PRODUCTS

2.1 MANUFACTURERS
A. Products: Subject to compliance with requirements, [provide product indicated on Drawings] [provide one of the products indicated on Drawings] [available products that may be incorporated into the Work include, but are not limited to, product(s) indicated on Drawings].

2.2 LUMINAIRE REQUIREMENTS
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
B. NRTL Compliance: Luminaires shall be listed and labeled for indicated class and division of hazard by an NRTL.
C. FM Global Compliance: Luminaires for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.
D. UL Compliance: Comply with UL 1598 and listed for wet location.

E. Lamp base complying with ANSI C81.61.

F. Bulb shape complying with ANSI C79.1.

G. Lamps dimmable from 100 percent to 0 percent of maximum light output.

H. Internal driver.

I. Lamp Rating: Lamp marked for outdoor use and in enclosed locations.

J. Source Limitations:
   1. Obtain luminaires from single source from a single manufacturer.
   2. For luminaires, obtain each color, grade, finish, type, and variety of luminaire from single source with resources to provide products of consistent quality in appearance and physical properties.

2.3 LEDS

A. LED sources must meet the following requirements:
   1. Operating temperature rating must be between -40°C and +50°C
   2. Correlated Color Temperature (CCT):
      a. Nominal CCT: 2700 K (2725 ± 145)
      b. Nominal CCT: 3000 K (3045 ± 175)
      c. Nominal CCT: 3500 K (3465 ± 245)
      d. Nominal CCT: 4000 K (3985 ± 275)
      e. Nominal CCT: 4500 K (4503 ± 243)
      f. Nominal CCT: 5000 K (5028 ± 283)
      g. Nominal CCT: 5700 K (5665 ± 355)
      h. Nominal CCT: 6500 K (6530 ± 510)
      i. Du’v’ tolerance of 0.001 ± 0.006
   3. Color Rendering Index (CRI): greater than or equal to 80.
   4. Luminaire manufacturer must submit reliability reports indicating that the manufacturer of the LED (chip, diode, or package) has performed JEDEC (Joint Electron Devices Engineering Council) reliability tests on the LEDs as follows:
      a. High Temperature Operating Life (HTOL)
      b. Room Temperature Operating Life (RTOL)
      c. Low Temperature Operating Life (LTOL)
      d. Powered Temperature Cycle (PTMCL)
      e. Non-Operating Thermal Shock (TMSK)
      f. Mechanical Shock
      g. Variable Vibration Frequency
      h. Solder Heat Resistance (SHR)

2.4 LED DRIVERS / POWER SUPPLYS

A. LED drivers must meet the following requirements:
   1. Drivers must have a minimum efficiency of 85%.
   2. Starting Temperature: -40°C.
   3. Electrical Characteristics.
      a. Volts: as indicated on Luminaire Schedule.
      b. Phase: Single.
      c. Hertz: 60.
   4. Power supplies can be UL Class I or II output.
   5. Drivers must have a Power Factor (PF) of greater than or equal to 0.90.
6. Drivers must have a Total Harmonic Distortion (THD) of less than or equal to 20%.
8. Drivers must be Reduction of Hazardous Substances (RoHS) compliant.
9. Inrush current <2A
10. Sound rating: Inaudible in a 24 dB ambient.
11. Class P thermally protected.
12. Relative humidity: maximum 90% non-condensing.
13. Drivers with 0-10V dimming capability must be isolated and not allow current to leak between the power source and the 0-10V control circuit.

2.5 LED LUMINAIRES
A. Provide luminaires with integral LED thermal management system (heat sinking).
B. Luminaires shall be equipped with an LED driver that accepts 120V through 277V, 50hz to 60hz (UNIV). Component-to-component wiring within the luminaire will carry no more than 80% of rated current and be listed by UL for use at 600 VAC at 302°F/150°C or higher. Plug disconnects shall be listed by UL for use at 600 VAC, 15A or higher.
C. LED modules shall have a minimum L70 service life of 75,000 hours at 25°C ambient temperature and based on IESNA LM-80 methodology.
D. Provide luminaires with individual LED arrays/modules and drivers that are accessible and replaceable from exposed side of the luminaire. Luminaires requiring removal or replacement of entire luminaire to access LEDs and drivers will NOT be accepted.

2.6 MATERIALS
A. Metal Parts: Free of burrs and sharp corners and edges.
B. Sheet Metal Components: Epoxy-coated steel. Form and support to prevent warping and sagging.
C. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses.
D. Diffusers and Globes:
   1. Acrylic Diffusers: 100 percent virgin acrylic plastic, with high resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
   2. Glass: Annealed crystal glass unless otherwise indicated.
   3. Lens Thickness: At least 0.125 inch (3.175 mm) minimum unless otherwise indicated.
E. Lens and Refractor Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
F. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:
   1. White Surfaces: 85 percent.
   2. Specular Surfaces: 83 percent.
   3. Diffusing Specular Surfaces: 75 percent.
G. Housings:
   1. Rigidly formed, weather- and light-tight enclosure that will not warp, sag, or deform in use.
   2. Provide filter/breather for enclosed luminaires.
H. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
1. Label shall include the following lamp characteristics:
   a. "USE ONLY" and include specific lamp type.
   b. Lamp diameter, shape, size, wattage and coating.
   c. CCT and CRI for all luminaires.

2.7 FINISHES

A. Variations in Finishes: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

B. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.

C. Factory-Applied Finish for Aluminum Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
   1. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
   2. Natural Satin Finish: Provide fine, directional, medium satin polish (AA-M32); buff complying with AA-M20 requirements; and seal aluminum surfaces with clear, hard-coat wax.
   3. Class I, Clear-Anodic Finish: AA-M32C22A41 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
   4. Class I, Color-Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: Medium satin; Chemical Finish: Etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker), complying with AAMA 611.
      a. Color: [Light bronze] [Medium bronze] [Dark bronze] [Black] <Insert color>.

D. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
   1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1 or SSPC-SP 8.
   2. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
      a. Color:
         1) As selected from manufacturer's standard catalog of colors.
         2) Match Architect's sample of [manufacturer's standard] [custom] color.
         3) As selected by Architect from manufacturer's full range.

E. Powder-Coat Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" recommendations for applying and designating finishes.
   1. Surface Preparation: Clean surfaces to comply with SSPC-SP 1 to remove dirt, oil, grease, and other contaminants that could impair powder coat bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, according to SSPC-SP 5/NACE No. 1 or SSPC-SP 8.
   2. Powder coat shall comply with AAMA 2604.
      a. Electrostatic applied powder coating; single application with a minimum 2.5- to 3.5-mils dry film thickness; cured according to manufacturer's instructions. Coat interior and exterior of pole for equal corrosion protection.
      b. Color:
         1) As selected from manufacturer's standard catalog of colors.
         2) Match Architect's sample of [manufacturer's standard] [custom] color.
         3) As selected by Architect from manufacturer's full range.
2.8 LUMINAIRE SUPPORT COMPONENTS

A. Comply with requirements in Section 260529 "Hangers and Supports for Electrical Systems" for channel and angle iron supports and nonmetallic channel and angle supports.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for luminaire electrical conduit to verify actual locations of conduit connections before luminaire installation.

C. Examine walls, roofs, and canopy ceilings for suitable conditions where luminaires will be installed.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 TEMPORARY LIGHTING

A. If approved by the Architect, use selected permanent luminaires for temporary lighting. When construction is substantially complete, clean luminaires used for temporary lighting and install new lamps.

3.3 GENERAL INSTALLATION REQUIREMENTS

A. Comply with NECA 1.

B. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.

C. Fasten luminaire to structural support.

D. Supports:
   1. Sized and rated for luminaire weight.
   2. Able to maintain luminaire position after cleaning and relamping.
   3. Support luminaires without causing deflection of finished surface.
   4. Luminaire-mounting devices shall be capable of supporting a horizontal force of 100 percent of luminaire weight and a vertical force of 400 percent of luminaire weight.

E. Wall-Mounted Luminaire Support:
   1. Attached to a minimum 1/8 inch (3 mm) backing plate attached to wall structural members.

G. Install luminaires level, plumb, and square with finished grade unless otherwise indicated. Coordinate layout and installation of luminaires with other construction.

H. Adjust luminaires that require field adjustment or aiming. Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources, favoring a north orientation.

I. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables" and 260533 "Raceways and Boxes for Electrical Systems" for wiring connections and wiring methods.

3.4 INSTALLATION OF BOLLARD LUMINAIRE

A. Align units for optimum directional alignment of light distribution.
1. Install on concrete base with top 4 inches (100 mm) above finished grade or surface at luminaire location. Cast conduit into base, and shape base to match shape of bollard base. Finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 033000 "Cast-in-Place Concrete."

3.5 INSTALLATION OF INDIVIDUAL GROUND-MOUNTED LUMINAIRES

A. Aim as indicated on Drawings.

B. Install on concrete base with top 4 inches (100 mm) above finished grade or surface at luminaire location. Cast conduit into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Section 033000 "Cast-in-Place Concrete."

3.6 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.

B. Steel Conduits: Comply with Section 260533 "Raceways and Boxes for Electrical Systems." In concrete foundations, wrap conduit with 0.010-inch- (0.254-mm-) thick, pipe-wrapping plastic tape applied with a 50 percent overlap.

3.7 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."

3.8 FIELD QUALITY CONTROL

A. Inspect each installed luminaire for damage. Replace damaged luminaires and components.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   
   1. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.
      
      a. If 0-10V dimming does not perform to expectations, the contractor shall provide low pass filters at the 0-10V source to remedy performance issues.
   
   2. Verify operation of photoelectric controls.

C. Illumination Tests:

   1. Measure light intensities at night. Use photometers with calibration referenced to NIST standards. Comply with the following IES testing guide(s):
      
      a. IES LM-5.
      b. IES LM-50.
      c. IES LM-52.
      d. IES LM-64.
      e. IES LM-72.
   
   2. Operational Test: After installing luminaires, switches, and accessories, and after electrical circuitry has been energized, test units to confirm proper operation.

D. Luminaire will be considered defective if it does not pass tests and inspections.

E. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.
3.9 DEMONSTRATION
   A. Train Owner's maintenance personnel to adjust, operate, and maintain luminaires

3.10 CLEANING
   A. Clean units after installation. Use methods and materials recommended by manufacturer.

3.11 EXTERIOR LUMINAIRE SCHEDULE
   A. See drawings for Luminaire Schedule.

END OF SECTION
SECTION 26 99 98
AUDIO/VIDEO TECHNICAL POWER SYSTEMS

PART ONE - GENERAL

1.1 GENERAL REQUIREMENTS
A. Applicable requirements of the Contract Documents and general requirements of other Division 26 Sections apply to the work of this Section.
B. The Electrical Contractor shall refer to the large-format audio & video system drawings for the locations and quantities of all audio & video technical power system circuits, outlets, receptacles, and company switches.

1.2 INTENT
A. It is the intent of this section to inform the Electrical Contractor about specific requirements for the installation of the audio & video technical power system.
B. Certain items related to the audio & video technical power (AVTP) system may require equipment or installation techniques which differ from those normally called out in Division 26.

1.3 SCOPE OF WORK
A. The Electrical Contractor shall furnish and install the audio & video technical power system as outlined in this Section and Division 26.
B. The division of labor between the Electrical Contractor and the Audio & Video Contractor is detailed in the Work Scope Table in Section 27 41 00.

1.4 AUDIO & VIDEO TECHNICAL POWER SYSTEM DETAILS
A. One or more double shielded harmonic mitigating transformers (AVTP System Transformer(s)) are required between the audio & video system equipment and all other building services. All of the AVTP system circuits, outlets, receptacles, and company switches must be fed from the AVTP system transformer(s).
B. Only those circuits, outlets, receptacles, and company switches identified as AVTP may be connected to the AVTP system panels.
C. A totally isolated grounding system is required for all audio & video system equipment on the AVTP system. A separate, insulated ground path is required between all audio & video technical power system locations and the isolated ground source.

1.5 SUBMITTALS
A. A written verification report of the isolated ground system is required.

PART TWO - PRODUCTS

2.0 GENERAL
A. No substitutions are allowed for the specified equipment without the written authorization of the Electrical Engineer and the Audio & Video Designer.

2.1 HIGH HARMONIC LOAD ISOLATION TRANSFORMERS
A. Subject to compliance with requirements, provide UL rated Harmonic Mitigating Transformer with copper windings and double electrostatic shielding.
1. Manufacturer – Hammond Power Solutions
2. Model Series – HPS Centurion

2.2 DISTRIBUTION PANEL BOARDS
A. Subject to compliance with requirements, provide distribution panel board for non-linear loads with 200% rated neutral.
   1. Manufacturer – Square D.
   2. Model Series – I-LINE
B. Each panel board shall contain an isolated ground buss bar.
C. Each panel board shall have a label engraved “AUDIO & VIDEO ONLY - TECHNICAL POWER”.

2.3 COMPANY SWITCHES
A. Subject to compliance with requirements, provide company switch for portable audio & video equipment.
   1. Manufacturer – LEX Products
   2. Model Series – CS-xxxx-C6DS1
B. Each company switch shall contain an isolated ground buss bar.
C. Each company switch shall have a label engraved “AUDIO & VIDEO ONLY - TECHNICAL POWER”.

2.4 WIRING DEVICES
A. Outlets
   1. Subject to compliance with requirements, provide orange-colored isolated ground outlets.
      a. Manufacturer – Hubbell
      b. Model number – IG series as appropriate per power requirement
   2. Each outlet wall plate shall be engraved “AUDIO & VIDEO ONLY - TECHNICAL POWER”.
B. Power Strips
   1. Subject to compliance with requirements, provide power strips as needed.
      a. Manufacturer – LEGRAND-WIREMOLD
      b. Model Series – 20IGxxx
   2. Each power strip shall be engraved “AUDIO & VIDEO ONLY - TECHNICAL POWER”.
C. Auxiliary Receptacle Company Switch
   1. Subject to compliance with requirements, provide auxiliary receptacle company switches as needed.
      a. Manufacturer – LEX Products
      b. Model Series – CS-60F-D5PS1
   2. Each auxiliary receptacle enclosure shall be engraved “AUDIO & VIDEO ONLY - TECHNICAL POWER”.

PART THREE - EXECUTION

3.1 INSTALLATION - GENERAL
1. All of the audio & video technical power system circuits, outlets, receptacles, and company switches must be fed from the AVTP panels.
2. Only those circuits, outlets, receptacles, and company switches identified as AVTP may be connected to the audio & video technical power system panels.
3. A totally isolated grounding system must be maintained for the entire audio & video technical power system.
4. The AVTP system and isolated grounding system are detailed on electrical and audiovisual design drawings.

3.2 INSTALLATION - VOLTAGE

A. The AVTP Transformer(s) must be installed and adjusted so that the Voltage at the audio & video load center panels is 120 VAC +/- 3%.

3.3 INSTALLATION - GROUNDING

1. An isolated ground system is required for all audio & video system equipment. This ground system is in addition to any code requirements for safety ground. This system requires that:
   a. All auxiliary receptacles, load center panels, and company switches are connected, through separate insulated cables, to the isolated ground buss bar located in, or adjacent to, the distribution panel boards.
   b. All individual circuits and outlets are connected, through separate insulated cables, to the isolated ground buss bar located in, or adjacent to, the load center panels.
2. The AVTP system and isolated grounding system are detailed on electrical and audiovisual design drawings.

3.4 INSTALLATION - LOAD CENTER PANELS

1. The Electrical Contractor shall install the customized sequencing load center panels which are provided by the Audio & Video Contractor.

3.5 INSTALLATION - WIRING

1. Circuits and Outlets
   a. AVTP system circuits and outlets are called out on the large-format audio & video system drawings.
   b. Each of the circuits and outlets shall have an individual circuit breaker and may NOT be combined with additional outlets, except as indicated in the large-format audio & video system drawings.
   c. Each of the circuits and outlets shall have a separate, dedicated neutral conductor home run to the load center panel.
   d. Each of the circuits and outlets shall have a separate, insulated, isolated ground conductor home run to the load center panel.
   e. Wire sizes of branch circuit conductors shall be #10 AWG for hot and neutral conductors, and #8 AWG for isolated ground.
   f. All conductors terminating at duplex outlets require crimped spade lugs. Spade lugs shall be secured under the mounting screws. No push-in connections are allowed.
2. Auxiliary Receptacles
   a. Wire size of isolated grounding conductor must be #2 AWG or two wire gauges larger than the supply feeders, whichever is larger.
3. Panels
   a. Wire size of isolated grounding conductor must be #4/0 AWG or two wire gauges larger than the supply feeders, whichever is larger.
4. Equipment Racks
   a. Each audio & video equipment rack location requires a separate isolated ground conductor to the load center panel. The wire size of each conductor must be #2 AWG, minimum.

3.6 INSTALLATION - WIRING DEVICES

A. Circuits and Outlets
1. AVTP system circuits and outlets are called out on the audio & video system location drawings, and in the Power Schedule on the audio & video large format drawings.

2. Individual circuits called out as “deliver circuit to this location” shall be internally wired by the Audio & Video Contractor. They do not require wiring devices.

B. Power Strips

1. All of the outlets in each power strip are wired to one audio & video technical power system circuit. These power strips shall be mounted horizontally as shown on the audio & video system location drawings.

3.7 INSTALLATION - Conduit

A. All AVTP system conduit shall be bonded to the distribution panel boards, company switches, load center panels, receptacle backboxes, and outlet backboxes.

B. The AVTP system conduit shall NOT be connected to the isolated ground system.

C. All AVTP system circuits must run in conduits separate from all other circuits.

3.8 INSTALLATION - ISOLATED GROUND TEST

A. Refer to electrical and audiovisual drawings for details of the AVTP system and isolated grounding system.

1. Verify the integrity of the audio & video isolated ground system, as follows:
   a. Confirm that continuity is measured between each isolated ground receptacle/outlet neutral conductor and the grounding electrode at the AVTP system transformer(s).
   b. Disconnect the neutral bonding link at each AVTP system transformer and confirm that the neutral buss is isolated from the building ground. Locate and remove all connections between the neutral buss and the building ground other than the main bonding jumper. Reconnect the neutral bonding link.
   c. Confirm that continuity is measured between each isolated ground receptacle/outlet ground conductor and the grounding electrode at the AVTP system transformer(s).
   d. Disconnect the isolated ground bonding link at each AVTP system transformer and confirm that the isolated ground buss is isolated from the building ground. Locate and remove all connections between the isolated ground buss and the building ground other than the main bonding jumper. Reconnect the isolated ground bonding link.
   e. Confirm that each isolated ground receptacle/outlet is wired with correct polarity.

END OF SECTION
SECTION 26 99 99
AUDIO/VIDEO CABLE RACEWAY SYSTEMS

PART ONE - GENERAL

1.1 GENERAL REQUIREMENTS
1. Applicable requirements of the Contract Documents and general requirements of other Division 26 Sections apply to the work of this Section.
2. The Electrical Contractor shall refer to the large-format Audio/Video system drawings for the locations and quantities of all Audio/Video devices requiring cable raceway systems, and to the Performance AV Systems specifications, 27 41 00.

1.2 INTENT
1. It is the intent of this section to inform the Electrical Contractor about specific requirements for the installation of the Audio/Video cable raceway systems.
2. Certain items related to the Audio/Video cable raceway systems may require equipment or installation techniques which differ from those normally called out in Division 26.

1.3 SCOPE OF WORK
1. The Electrical Contractor shall furnish and install the Audio/Video cable raceway systems as outlined in this Section and Division 26.
2. The Electrical Contractor does not furnish or install the Audio/Video equipment or cabling. It is supplied by the Audio/Video Contractor.
3. The division of labor between the Electrical Contractor and the Audio/Video Contractor is detailed in the Work Scope Summary Table in Section 27 41 00.

1.4 AUDIO/VIDEO CABLE RACEWAY SYSTEM DETAILS
1. The Audio/Video cable raceway systems consist of the following:
a. The Metallic Conduit System is a network of empty conduits into which the Audio/Video Contractor shall install the cables for the Audio/Video system.
b. The PVC Conduit/Bevway Duct System is a group of empty conduits which are used to conceal temporary Audio/Video cables provided by road show productions.
c. The Cable Sleeve System allows temporary Audio/Video cables to pass through walls and floors.
d. The Cable Tray System allows routing of temporary Audio/Video cables along corridors and over doorways.
2. Unless specifically called out otherwise, all Audio/Video system wiring listed in the Audio/Video schedule of terminations shall be run in metallic conduit.

1.5 SUBMITTALS
A. The Electrical Contractor shall submit a conduit riser diagram for all Audio/Video system wiring.

PART TWO - PRODUCTS

2.1 GENERAL
A. All audio cable raceway products shall conform to the requirements of other Division 26 Sections.
B. No substitutions are allowed without the written authorization of the Electrical Engineer and the Audio/Video Designer.
2.2 METALLIC CONDUIT
   A. Subject to compliance with requirements, provide metallic conduit as specified in Section 260533.

2.3 PVC CONDUIT DUCT
   A. Subject to compliance with requirements, provide PVC conduit as specified in Section 260533.

2.4 CABLE SLEEVES
   A. Subject to compliance with requirements, provide cable sleeves as specified in Section 260533.

PART THREE - EXECUTION

3.1 INSTALLATION - GENERAL
   A. Prior to installation, the Electrical Contractor shall submit a riser diagram for all Audio/Video system conduit.
   B. No installation work shall proceed until the conduit riser has been approved, in writing, by the Electrical Engineer and the Audio/Video Designer.

3.2 INSTALLATION - WIRE GROUPS IN CONDUIT
   A. The Audio/Video location drawings and the Audio/Video schedule of terminations indicate the origins and destinations for all Audio/Video cables. The method of cable routing described in those documents indicates the maximum number of conduit runs required to install the Audio/Video systems.
   B. The actual diameter and path of each conduit run shall be determined by the Electrical Contractor in accordance with field conditions.
   C. Should the Electrical Contractor choose to combine cable runs from individual terminations into a common conduit, then they must conform to the wire grouping, conduit fill, and conduit separation requirements listed in this Section.
   D. To prepare the required conduit riser diagram, the Electrical Contractor must group cables by wiring type; determine the total number of cables in each conduit run; determine the diameter of each conduit run; determine the actual routing of each conduit run.
   E. Refer to Section 27 41 00 and the large format AV drawings for wiring group and conduit separation requirements.
   F. Refer to Section 27 41 00 and the large format AV drawings for Audio/Video cable specifications.

3.3 INSTALLATION - CONDUIT SEPARATION
   A. Audio/Video system wiring is divided into separate groups according to their nominal voltage levels. These wiring groups must never be intermixed within a given conduit run. See Section 27 41 00 and the large format AV drawings for wire type information.
   B. Conduits carrying Audio/Video wiring must maintain a minimum separation from conduits carrying other types of Audio/Video wiring. When necessary, ninety degree crossings in close proximity are acceptable. See Section 27 41 00 and the large format AV drawings for Audio/Video conduit separation requirements.
   C. Conduits carrying Audio/Video wiring must maintain a minimum separation from conduits carrying other types of electrical wiring. Unusually heavy current demands in; or long parallel runs with; electrical services may dictate greater separations to avoid interference with the Audio/Video system. See Section 27 41 00 and the large format AV drawings for electrical conduit separation requirements.
3.4 INSTALLATION - METALLIC CONDUIT SYSTEM
   A. The metallic conduit system is specified by information called out in the large-format Audio/Video system drawings:
      1. The location drawings indicate the position of each Audio/Video device and the method of mounting each device.
      2. The schedule of terminations lists each Audio/Video device; indicates the quantities, types, and groupings of all cables connected to each device; and lists the destination for all cables exiting each device.
   B. Refer to Section 27 41 00 and the large format AV drawings for audio cable specifications and conduit sizing requirements.
   C. In most cases, each run of this conduit system shall be bonded to the audio termination back boxes which are provided by the Audio/Video Contractor. The only exception is conduit which is routed to the audio equipment racks. Conduit runs entering or exiting the audio equipment racks shall be electrically isolated from the racks. PVC or other non-conductive fittings shall be used to isolate the conduit from the Audio/Video equipment racks.
   D. Provide all empty conduits with pull lines.

3.5 INSTALLATION - PVC CONDUIT/BEVWAY DUCT SYSTEM
   A. Install per architectural detail drawings.
   B. Provide all empty conduits with pull lines.

3.6 INSTALLATION - CABLE SLEEVES
   A. Install per architectural detail drawings with threaded cap at each end of sleeve. These caps shall be lubricated for easy removal and held captive by a chain.

3.7 INSTALLATION - CABLE TRAYS
   A. Wall mount cable trays shall be supported from underneath, not suspended from above.

END OF SECTION
SECTION 270010  
TELECOMMUNICATIONS GENERAL REQUIREMENTS

PART 1 GENERAL

A. Drawings
   1. The drawings must show the location of equipment racks and elevations, ladder rack on 3 walls, power outlet locations, general arrangement of equipment, electrical systems and related items. The installation will follow as closely as elements of the construction will permit.
   2. The drawings must show a conduit and cabling riser diagram from MDF and related IDFs. Copper pair and fiber strand counts will be detailed showing the distribution of riser cabling between the MDF and related IDFs.
   3. Deviations from the drawings, with the exception of minor changes in routing and other such incidental changes that do not affect the functioning or serviceability of the systems, shall not be made without the written approval of the architect/engineer and WSU C&IT.

1.2 INSPECTION OF SITE

A. Visit the site, examine and verify existing communications infrastructure conditions under which the work must be conducted before submitting proposal.
B. The submitting of a proposal implies that the Contractor has visited the site and understands the conditions under which the work must be conducted.

1.3 CONTRACT BREAKDOWN

A. WSU Facilities Department retains the installation and coordination for all projects initiated by that department. WSU C&IT retains the design review, installation and coordination for all other voice, data and video projects not initiated by WSU Facilities.

1.4 GUARANTEE

A. Contractor guarantees that the installation is free from defects and agrees to replace or repair, any part of this installation which becomes defective within a period of two year following final acceptance, provided that such failure is due to defects in the equipment, material or installation or to follow the specifications and drawings. File with the owner any and all guarantees from the equipment manufacturers and warranty certificates. FP&M will notify C&IT of substantial completion and deliver all warranty certificates, as-built and test results. This warranty will coincide with the project warranty.

1.5 CODES, PERMITS AND FEES

A. Unless otherwise indicated, all required permits, licenses, inspections, approvals and fees for telecommunications work shall be secured and paid for by the contractor. All work shall conform to all applicable codes, rules and regulations.
B. All work shall be executed in accordance with the rules and regulations set forth in local and state codes. Prepare any detailed drawings or diagrams which may be required by the governing authorities. Where the drawings and/or specifications indicate materials or construction in excess of code requirements, the drawings and/or specifications shall govern.
1.6 STANDARDS OF MATERIALS AND WORKMANSHIP
A. All materials shall be new, never used, reused, reconditioned, or refurbished components. The electrical and physical properties of all materials, and the design, performance characteristics, and methods of construction of all items of equipment, shall be in accordance with the latest issue of the various, applicable Standard Specifications of the following recognized authorities:
- A.N.S.I. American National Standards Institute
- A.S.T.M. American Society for Testing Materials
- BICSI Building Industry Consulting Services International
- I.C.E.A. Insulated Cable Engineer’s Association
- I.E.E.E. Institute of Electrical and Electronics Engineers
- N.E.C. National Electrical Code
- N.E.M.A. National Electrical Manufacturer’s Association
- TIA Telecommunications Industry Association
- U.L. Underwriters Laboratories, Inc. NFPA National Fire Protection Agency
B. All equipment of the same or similar systems shall be by the same manufacturer.

1.7 RECORD DRAWINGS
A. Provide revised telecommunications working drawings indicating “as-built” conditions. Drawings shall indicate all changes that have occurred during construction. Properly and identify backbone and horizontal wiring pathways.
B. Locate all network and workstation devices. Identify all devices on plan with proper labeling. Identify outside plant backbone conduits, man holes and fiber cables installed on a site plan. “As-built” drawings shall be submitted on AutoCAD 2018 or newer electronic DWG file format.
C. Provide a site plan with elevations showing any manholes, handholes or conduit installed outside.

1.8 SHOP DRAWINGS/SUBMITTALS
A. All shop drawings shall be submitted in groupings of similar and/or related items (cable and connectors, equipment cabinets and racks, etc.). Incomplete submittal groupings will be returned unchecked.
B. Provide detailed layout shop drawings (on transparent media) of backbone and horizontal cabling distribution, pathways, equipment room layouts, details and related information necessary of installation and maintenance. After review by the Engineer and WSU C&IT, a copy of Drawings will be stamped and returned to the Contractor.
C. Submit for approval all telecommunications systems or equipment but not limited to the items listed below. Where items are referred to by symbolic designation on the Drawings and Specifications, all submittals shall bear the same designation. Refer to other sections of the Specifications for additional requirements.
   1. Structured cabling system components
   2. Structured cable system raceways and supports
   3. Outside plant cabling and components
   4. Outside plant ducts manholes, hand holes and conduit systems on a site plan with elevations.
   5. Equipment racks and cabinets including management components
   6. Labeling equipment
   7. Telecommunications grounding components
   8. Conduit, inner duct, junction and pullboxes
   9. Surface raceway components
   10. Manholes, hand holes and all accessories
   11. Telephone system components
   12. Data network system components
   13. Audio/video system components
14. Access control system components
15. Security Camera system components

1.9 CONTRACTOR BID ELIGIBILITY QUALIFICATIONS

A. The installing contractor for each communications system shall have a minimum of 5 years of experience with the types of systems specified. The company and employee must be certified to install, test and warranty the product specified. This certification must be produced at the WSU mandatory pre-bid meeting, prior to a bid submittal. No exception to this will be allowed.

B. The installing contractor may be asked to submit a reference list consisting of a minimum of 3 - 5 installations of equivalent size and complexity of this contract. The reference list shall contain the following information for each installation:
   1. Name of project, square footage, location and brief description of systems.
   2. Date of completed installation.
   3. Contact name and phone number of facility representative.
   4. Total bid amount of each system installed.
   5. Final contract amount of each system installed, including all change orders and bulletins.

C. The installing contractor shall submit with the bid the names and registration numbers of members of the firm that have a valid membership and are certified with BICSI as Registered Communications Distribution Designers (RCDD). This Contractor shall identify at least one RCDD assigned to this project in the bid and must be an employee of that company.

PART 2 – NOT USED

PART 3 EXECUTION

3.1 DESIGN VALIDATION

A. The bidding, shop drawing submittal, procurement of materials, the installation as-builds and record documents shall be reviewed and overseen by the RCDD(s) assigned to the project.

B. The Contractor’s bid, shop drawing submittals, as-builds and record documents shall bear the valid seal of the RCDD(s) assigned to this project.

C. All calculations, shop drawings, testing, certification and as-built documents shall be directly supervised by the licensed technician/engineer assigned to the project.

D. The sub-contractor must provide the general contractor a copy of the manufacturer’s certification that the sub-contractor is currently certified to install, test and warranty the proposed system prior to a bid submittal. See Section 27110, 7.5A and section 27010, 1.16A. The owner reserves the right to have the non-certified sub-contractor removed from the job.

3.2 INSTALLATION OF EQUIPMENT

A. Install all equipment in strict accordance with all installation specifications set by the equipment manufacturer. Where such directions are in conflict with the drawings and specifications, report such conflicts to the architect/engineer and WSU C&IT for resolution.

3.3 WORK PERFORMED BY OTHERS

A. Electrical contractor shall install 4” sq. sheet steel wall boxes, minimum 1” trade size conduit (or as indicated on drawings) stubbed 12” above ceiling with 6” radius (or as required by ANSI/TIA-569 C), with a 90-degree bend at top in the direction towards route destination, and plastic bushing for recessed locations.
B. Electrical contractor shall install 4” sq. cast boxes. Minimum 1” trade size conduit (or as indicated on drawings) stubbed up to 10’ AFF (or as indicated on drawings), with 6” radius (or as required by ANSI/TIA-569 C) for surface mounted locations.

3.4 DEMOLITION WORK

A. All demolition of existing telecommunications cable, equipment and materials shall be specified by C&IT and done by this contractor unless otherwise indicated.

B. Include all items such as, but not limited to, cable, patch panels, devices, and wiring back to the source, called out on the drawings and as necessary whether such items are actually indicated on the drawings or not in order to meet NFPA requirements.

C. In general, demolition of old low voltage communications cabling work is indicated on the drawings, however, the contractor shall visit the job site to determine the full extent and character of this work. All existing voice and data jacks demolished need to be documented. A room number, jack number (if still there), approximate location in the room and the communication room where it terminated need to be identified. This information must be returned to C&IT IOPS Networking Engineering Group.

D. None of the recovered material shall be reused in the new work.

E. Where new walls and/or floors are installed which interfere with existing telecommunications outlets, devices, etc., this contractor shall adjust, extend and reconnect such items as required to maintain continuity of same.

F. All electrical work in altered and unaltered areas shall be run concealed wherever possible. Use of surface metal raceway or exposed conduits will be permitted only where approved by the architect/engineer and as specifically indicated on the drawings.

3.5 WORK IN EXISTING BUILDINGS

A. Adequately protect and preserve all existing and newly installed work. Promptly repair any damage to same at this contractor's expense.

B. Consult with the owner's Project Coordinator and C&IT Project Coordinator as to the methods of carrying on the work so as not to interfere with the owner's operation any more than absolutely necessary. Accordingly, all telecommunications services shall be kept in operation as long as possible and the services shall only be interrupted at such time as will be designated by the owner's representative.

3.6 COORDINATION

A. If there is a general contractor, the general contractor is responsible for the construction schedule. All work activities are to be coordinated with the general contractor.

3.7 CHASES AND RECESSES

A. Chases and recesses shall be provided by the architectural trades, but this contractor shall be responsible for coordinating their accurate location and size.

3.8 SLEEVES

A. Provide and install Hilti Speed Sleeve model CP-630 or EZ path fire stop system wherever conduits or cabling pass through fire rated walls, floors or cables pass through openings in walls Sleeves are used in standard walls and floors with no fire rating. All sleeves through the floor are to extend 4 inches above floor, unless otherwise noted. Provide escutcheons at each sleeve in finished areas and adequate spacing between sleeves to accommodate escutcheons.
3.9 ACCESS DOORS

A. Provide access doors for installation by architectural trades. In the walls, provide Milcor No. "DW" or "M" as required to make all controls, electrical boxes and other equipment installed by the Contractor accessible. Minimum size 12 inches x 12 inches. In the ceiling, provide Milcor No. 3210, 3105 or 3206 for accessibility as mentioned above, 24 inches x 24 inches minimum size. The plaster or acoustical tile insert shall be by the architectural trades. Areas with accessible ceilings (ceilings where tiles are not fastened in place and can be individually removed without removal of adjacent tiles) will not require access doors.

B. When access doors are in fire resistant wall or ceilings, they must bear the Underwriters Laboratories, Inc., Label, with time design rating equal to or exceeding that of the wall or ceiling unless they were a part of the tested assembly.

3.10 CLEANING

A. All debris shall be removed daily as required to maintain the work area in a neat, orderly condition.

B. Final cleanup shall include, but not be limited to, cleaning all telecommunications equipment spaces, devices, cover plates, and removing all scrap cable and debris from pathways.

3.11 PROTECTION AND HANDLING OF EQUIPMENT AND MATERIALS

A. Newly installed network equipment shall be protected from theft, dust or damage while construction is going on.

B. Protect conduit openings with temporary plugs or caps.

C. Locks must be installed on communication room doors prior to any equipment installation.

3.12 EXTRA WORK

A. For any extra telecommunications work must be forwarded to the general contractor, an itemized breakdown of the estimated cost of the materials and labor required to complete this work. This contractor shall proceed only after receiving an impact report from the university establishing the agreed price and describing the work to be done. This doesn't amend the language of the main construction contract.

3.13 DRAWINGS AND MEASUREMENTS

A. Final as-built drawings must be delivered at project completion.

3.14 AUTOMATION SYSTEM PROGRAM CODE

A. All automation system uncompiled and compiled program codes, source codes, custom modules, graphical user interface screen shots and any other automation system programming data and material (Program Code) shall be provided to the university in hard copy and on CD-ROM in an unencrypted format acceptable to the university.

B. Copyright for the Program Code shall be assigned to the university for purposes of system maintenance.

C. Provision of and copyright assignment of the program code to the university by the vendor shall be conditions of the purchase order and contract acceptance by the vendor.

D. Provision of and copyright assignment of the program code to the university by the vendor shall be conditions of final system acceptance by the university.

END OF SECTION
SECTION 270110
TELECOMMUNICATIONS INTERIOR PATHWAYS

PART 1 GENERAL

1.1 REFERENCES

A. ANSI/NFPA 70 - National Electrical Code
C. ANSI/TIA 568-C - Commercial Building Telecommunications Cabling Standard
D. ANSI/TIA 569-C - Commercial Building Standard for Telecommunications Pathways and Spaces
E. ANSI JSTD- 607 B - Commercial Building Grounding and Bonding Requirements for Telecommunications
G. BICSI – Building Industry Consulting Services International

1.2 SUBMITTALS

A. Submit all structured cabling system raceways and supports identified in this section under provisions of Section 270010.
B. Product data: Provide for products specified and required.
C. Shop drawings: Indicate project specific part numbers, dimensions, support points, fittings and finishes.

1.3 PROJECT RECORD DOCUMENTS

A. Submit all structured cabling system raceways and supports identified in this section under provisions of Section 270010.
B. Accurately record equipment layout and cable layouts in all telecommunication spaces.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, protect, and handle products to site under provisions of section 270010.
B. Protect products from corrosion and entrance of debris by storing above grade.
C. Provide appropriate covering.
1.5 PROJECT CONDITIONS

A. Verify that field measurements are as shown on drawings.
B. Verify routing and termination locations of conduits, and cable pathways prior to rough-in.

1.6 INSTALLATION OF CABLE SUPPORT SYSTEMS

A. Communications cabling systems pathways shall be installed in accordance with ANSI/TIA 569-C.
B. Intra-building backbone cabling shall be installed in conduit, cable tray or J-hook support system.
C. Horizontal cabling (cabling from the telecommunications room to the work area outlet) pathways shall consist of conduit, cable tray, J-hooks, and accessible ceiling space as indicated on drawings and as required.
D. Where the accessible ceiling systems are used as the primary pathway, cabling shall be installed in main cable tray runs as indicated on the drawings and in J-Hooks, with individual work area cables routed exposed in conduit and supported as specified herein.

PART 2 PRODUCTS

2.1 J-HOOKS

A. Manufacturers:
   1. Erico-Caddy.
   2. B-Line.
B. Horizontal cable routed exposed through ceiling space shall be supported from J-hooks.
   1. J-hooks shall be a minimum of 5/8" wide and shall have a bearing surface that complies with required bend radii of the specified cables to be supported.
C. Inner duct
   1. Install inner duct through conduits and sleeves for optical fiber cabling installations.
   2. Description: UL listed, non-metallic, corrugated flexible conduit for use in plenum or riser installations as applicable. Provide each inner duct with one 1/4" W pull tape with a tensile rating of 900 lbs.

PART 3 EXECUTION

3.1 GENERAL

A. Where cables pass through fire rated walls, the contractor shall provide and install Hilti Speed Sleeve model CP-630 or EZ path fire stop system. This penetration sleeve must match the fire rating of the wall. The penetration shall be sized per ANSI/TIA-569-C.
3.2 ANY OTHER WALL OR FLOOR PENETRATIONS THAT AREN'T FIRE RATED, THE CONTRACTOR SHALL FIRE-STOP THE PENETRATIONS, AFTER FINAL CABLE INSTALLATION, USING ENGINEER-APPROVED MATERIALS. FIRE-STOPPING MATERIALS SHALL BE INSTALLED PER MANUFACTURER'S RECOMMENDATIONS AND SHALL MAINTAIN PARTITION RATING AND INTEGRITY. ALL FIREPROOFING SHALL BE APPLIED IN A NEAT MANNER WITH ALL EXCESS MATERIAL CLEANED FROM ALL WALLS AND SURFACES. CONTRACTOR SHALL REPLACE AND RE-INSTALL ALL FIREPROOFING MATERIALS REMOVED DURING CABLE INSTALLATION.

A. Contractor shall patch and repair any holes or other damage to walls or partitions and paint to match original, as applicable.

B. The communication cabling contractor shall provide plastic and/or grounding bushings, as applicable, on all conduit sleeves, stubs and conduit terminations that may have been missed by the electrical contractor.

C. All cutting, patching and restoration to the original condition of walls, ceilings, floors, etc., shall be the responsibility of the contractor.

D. All ceiling removal and restoration required for the execution of this work shall be the responsibility of the contractor.

E. Any additional existing voice and data jacks demolished need to be documented. A room number, jack number (if still there), approximate location in the room and the communication room where it terminated need to be identified. This information must be returned to C&IT Customer Services Telecommunications department.

F. All cabling installed exposed in accessible ceiling systems shall be supported by cable tray or J-hooks.

G. All J-hooks shall be supported directly from the structure above or wall mounted, as applicable, independent of ceiling framing, electrical conduit, mechanical piping and ductwork. Provide all-thread rod with minimum ¼” diameter or equivalent supporting means with suitable fasteners when attaching to structure or structural members. Increase size of support as required when multiple J-hooks (stacked or tree configuration) are attached to single support based on maximum loading capacity of J-hooks.

H. J-hooks shall be spaced 48” maximum on center.

I. Telecommunications cabling shall be routed in continuous conduit above hard ceilings or between floors in any kind of offset condition.

J. Communications cable pathway routing shall be coordinated with above ceiling work of other contractors to avoid conflicts and potential sources of EMI.

K. Do not route exposed communications pathway within 12” of lighting fixtures and electrical power feeders.

L. Route inner duct for all fiber optic backbone cabling, in cable tray, conduit, and sleeves. Coordinate routings and quantities with drawings.

1.2 SYSTEMS

A. ANSI/TIA 568-C - Commercial Building Telecommunications Cabling Standard.
B. ANSI/TIA 569-C - Commercial Building Standard for Telecommunications Pathways and Spaces.
C. ANSI/TIA 607-B - Commercial Building Grounding and Bonding Requirements for Telecommunications.
E. BICSI – Building Industry Consulting Services International.

PART 2 PRODUCTS

2.1 TWO POST EQUIPMENT RACKS

A. Manufacturers:
   1. Chatsworth Products (CPI)
   2. Homaco
   3. Hubbell
B. Description: Nominal 19” x 84”H equipment rack, with universal EIA hole spacing for mounting equipment and accessories.
C. Material: 6061-T6 heavy-duty aluminum or equivalent.
D. Provide all hardware for floor mounting and anchoring.
E. Provide one (1) equipment shelf and all mounting hardware.

2.2 POWER STRIPS EQUIPMENT RACKS

A. Manufacturers:
   1. APC – Model APC 8841
   2. Triplite – Model PDU30HV3HV2
B. Provide one 208-volt, 30-amp, single phase power strip for each rack installed.
C. Install one 208-volt, 30-amp, single phase power strip on each equipment rack.
D. Mount vertical on side of rack.
E. No Velcro mounting allowed.
F. Plug mates with a L6-30 receptacle.
G. Install the power strip with a 6 to 10-foot cord.
H. Include a temperature and humidity Sensor
I. Provide one 120-volt 20-amp dedicated power circuit for each equipment rack.
J. Provide one 120-volt 20-amp “metered” PDU for each 120-volt circuit.
K. Provide four additional 120-volt 20-amp service outlets, one on each wall.
L. Use factory mounting hardware on the equipment rack whenever possible.

2.3 VERTICAL CABLE MANAGEMENT
A. Manufacturers:
   1. Same as manufacturer of equipment rack.
B. Description:
   C. Duct style cable management panel for mounting on equipment racks with slotted construction to allow multiple cable exits, double sided for front and rear management and fluted to allow cables to pass from front to rear.
   D. Removable solid cover.
   E. Material: ASTM A569 steel or 5052-H32 aluminum.
   F. Provide 10" Wide cable management units between racks and one 6" Wide at ends. Cable management unit shall be 84"High by nominal 6" Deep.
   G. Finish: Electrostatic powder coat, post-fab painted in black.
   H. Provide all hardware required for securely mounting panel to equipment rack.

2.4 HORIZONTAL CABLE MANAGEMENT
A. Manufacturers:
   1. Chatsworth
   2. Homaco

2.5 EQUIPMENT CABINETS
A. Manufacturers:
   1. Chatsworth Products (CPI)
   2. Hubbell.
   3. Great Lakes Cabinets.
B. Standard equipment cabinet, floor mounted, will be nominal 24" W x 30" D x 84" H, fully welded steel construction, lockable front and rear doors (roof fans) cable management, 19" EIA mounting racks and adjustable, fixed shelves as required.
C. The top cover shall accept the mounting of a 250 CFM cooling fan.
D. The cabinet shall be pre-configured for 19" mounting with universal hole spacing per the EIA 310 standard requirements.
E. The cabinet shall feature three sets of rails, front, center, and rear. The front set of rails shall be 20 rack positions high, from the bottom of the cabinet. The rear and center rails shall be the full internal height. The recess of all three sets of rails shall be adjustable forward and back. The rails shall be tapped for a #10-32 screw. The center rails shall be formed in a ‘C’ profile, 3” deep, tapped on both the front and rear flanges so as to provide the functionality of an open frame rack. The front and rear rails shall be of an L shape.
2.6 WALL-MOUNTED EQUIPMENT CABINETS

A. Manufacturers:
   1. Chatsworth Products (CPI)
   2. Hubbell.
   3. Great Lakes Cabinets.

B. Wall mount equipment cabinets shall only be installed where floor space for equipment racks is not available.

C. Equipment cabinet, wall mounted will be nominal 24” W x 48” H x 24” D, with equivalent construction as standard floor mounted cabinet except with double hinged center section.

D. Load capacity of the cabinet shall be 150 lbs.

E. Provide dedicated 120V circuit installed in cabinet.

2.7 BACKBOARDS

A. AC-grade fire rated or better plywood backboard in sheets measuring 4’ W x 8’ H x 3/4”D. Plywood sheets shall be flat and free of all voids. Do not paint the plywood. This voids the fire rating.

2.8 TELECOMMUNICATIONS CABLE RUNWAY

A. Manufacturers:
   1. Chatsworth Products (CPI)
   2. Homaco.
   3. Hubbell.

B. Description: 16-gauge tubular steel stringer style, with rungs 9”-12” O.C.

C. Material: 3/8” x 1-1/2” tubular steel with 1/2” x 1” steel channel rungs, or equivalent.

D. Width: As indicated on drawings.

E. Cable runway must be mounted from the sides. It is not permissible to support the cable runway from the center. No exception to this will be allowed.

PART 3 EXECUTION

3.1 EQUIPMENT RACKS

A. Contractor shall furnish and install wall mounted and floor-mounted equipment racks per manufacturer’s recommendation.

B. The racks shall be labeled according to the drawings and in accordance with specification 270170 “Cable Plant Administration and Testing.”

C. Free standing equipment racks shall be bolted to the floor using anchors in concrete floor and toggle bolts through raised flooring.

D. All racks, cabinets and cable transport hardware shall be bonded to the communications system ground riser.

E. Mount the top of two post equipment racks to the bottom of cable runway for equipment rack support strength and cable flow into equipment rack.

F. All equipment racks and cable runway must be grounded and bonded per BICSI standards.

3.2 CABLE MANAGEMENT

A. Install vertical cable management panels per communication room specifications.
B. Install vertical panels on each side of free-standing equipment racks.

3.3 BACKBOARDS
A. Three walls in communication rooms shall be covered with plywood backboards. A minimum 8’-6” above finished floor.
B. Normally, no plywood is needed on the wall where the door is.

3.4 TELECOMMUNICATIONS CABLE RUNWAY
A. As a minimum, mount runway at each end to wall using appropriate hardware.
B. Where overall length is greater than 10 ft, provide supplemental support from structure above or from equipment racks and cabinets below.
C. Mount runway directly to top of racks unless noted otherwise on drawings for the cable runway to be higher.
D. Runway shall run around 3 sides of perimeter of room and an additional 4th section across the center of the room securing the top of the equipment racks to the cable runway. Normally no cable runway will be needed on the door side wall unless cable sleeves / cable tray entering the communication room are over the door header or noted otherwise on the drawings.

END OF SECTION
SECTION 270150
TELECOMMUNICATIONS CABLELING

PART 1 General

1.1 REFERENCES

C. FCC Part 68 - Connection of Terminal Equipment to the Telephone Network.
D. FCC Part 15 - Radiation Limits
E. FCC Part 76 - Cable Television Service.

1.2 PROJECT CONDITIONS

A. Verify field measurements are as shown on drawings.
B. Verify suitability of all pathways prior to cable installation.

1.3 CABLELING SYSTEM PERFORMANCE

A. General:

1. Cabling system performance shall meet or exceed current industry standards and/or manufacturers’ specifications as specified herein.
2. The cable installed in the walls, connectors, jack, patch panels, and patch cords must be the same manufacture and model that forms the complete cabling system channel. The total system shall meet the performance criteria described below.
3. The cable and connector devices shall be certified compatible by the manufacturer of each component to meet the performance criteria described below. Submit manufacturer’s certification with submittals.
4. The referenced standards describing the performance below shall include all revisions, clarifications and bulletins to the original standard referenced as well as any standards cross-referenced.
5. The referenced standards describing the performance below shall apply to backbone cable, horizontal cabling and connecting hardware performance requirements as well as installation standards and techniques and field testing and verification of performance.
6. A plenum category 5 (CAT5E) cabling in a 25 pair cable bundle is to be utilized for voice (Analog Gateway connected telephone) building backbone riser only. Category 5 performance is defined by ANSI/TIA 568-C for 100-ohm UTP cables and associated connecting hardware whose transmission characteristics are specified up to 100 MHz.
7. Category 6 enhanced (CAT6E) cabling shall be utilized for all voice, data, wireless access points and security camera horizontal wiring. For WSU projects, any one of the following five cat6e structured cabling system products are acceptable:
a. Hubbell NEXTSPEED Cat 6 enhanced
c. Superior-Essex/Ortronics NextGain Cat6EX
d. Beldon DataTwist 600e
e. CommScope Uniprise 7504 Cat6E

1) Category 6e performance is defined by the manufacturers of the above cabling products.

8. Fiber optic cabling shall be utilized for all data building backbone riser. Fiber optic performance is defined as follows:
   a. Multimode: 50/125µm laser optimised fiber optic cable. The cable shall be dual rated for 850nm and 1300nm and meet all performance requirements of TIA/EIA 568-492aaac (OM3) at each transmission wavelength.
      1) Maximum attenuation:
      2) 3.5dB/km @ 850nm
      3) 1.5dB/km @ 1300nm Bandwidth:
      4) 1500 MHz*km @ 850nm
      5) 500 MHz*km @ 1300nm
   b. Singlemode: Provide nominal 9/125µm core/cladding, singlemode dispersion un-shifted fiber optic cable. The cable shall be rated for 1310nm and 1510nm and meet all performance requirements of
      1) ANSI / TIA 568-C at each transmission wavelength.
      2) Maximum Attenuation:
      3) 0.5dB/km @ 1310nm
      4) 0.5dB/km @ 1550nm Bandwidth:
      5) 2GHz*km @ 1310nm
      6) 2GHz*/km @ 1550nm

1.4 CONTRACTOR QUALIFICATIONS

A. The installing contractor shall be certified by the cabling and connector manufacturer of the structured cabling system product selected. A letter of certification from the manufacturer must be included with the bid submittal. No exception to this will be allowed.

1.5 SUBMITTALS

A. Product Data Sheets

1. Submittals can be sent electronically to WSU project managers.
2. The binders shall contain manufacturer’s product data sheets for the specific items to be installed for this project.
3. The Contractor shall indicate specific color, style, configuration, etc., and all accessories specified and required for a complete installation.

1.6 UTP CABLING SYSTEM WARRANTY

A. General

1. The UTP voice and data cabling system is warranted by the manufacturer(s) “Application Warranty” of the components for a period of not less than 20 years from the time the installation is deemed complete, provided certified installation and testing is followed.
2. It shall be the sole responsibility of the low voltage cabling Contractor to register the project with the manufacturer(s) and meet all manufacturers’ “Application Warranty” requirements.
3. It shall be the sole responsibility of the low voltage cabling Contractor shall provide Owner with test results, all manufacturers' warranty certificates with Record Documents including a site plan elevation with outside plant man holes, hand holes and conduit.

1.7 WARRANTY COVERAGE

A. Product - all passive components of the cabling system shall be warranted to be free from defects in material and workmanship for the entire duration of the warranty.

B. Paint or any other material on the UTP cable voids the warranty. If this can’t be removed during the installation, the effected cables will need to be replaced.

C. Any UTP CAT6e cable or component that has been painted and / or not satisfactorily passing tests or failing to meet quality installation standards as described in the standards will be repaired or replaced as directed by C&IT Network Engineering Group at the contractor’s expense.

1.8 WARRANTY REQUIREMENTS

A. Provide a channel warranty for all data drops.

B. Warranty shall cover repair or replacement of all defective components free of charge, including all labor performed by a manufacturer-certified installer. All new or replacement components shall be furnished new. Never used, reused, reconditioned, or refurbished components are allowed by the manufacture.

C. The installing contractor must be certified by the cabling and connector manufacturers as an approved and trained installer of their equipment.

PART 2 PRODUCTS

2.1 INTER-BUILDING FIBER OPTIC BACKBONE

A. Singlemode fiber optic cabling

B. Manufacturers:
   1. Systimax
   2. Corning
   3. BerkTek
   4. CommScope

C. Description:
   1. Nominal 9/125 µm, strand counts as indicated on drawings, loose tube, all-dielectric cable, rated for outdoor use. Cable shall have water-blocking properties to prevent water penetration and fiber damage. Cable shall have maximum 12 stands per tube, and an overall Polyethylene jacket.
   2. Nominal 9/125 µm, strand counts as indicated on Drawings, loose tube, OFNR rated for indoor/outdoor use. Cable shall have water-blocking properties to prevent water penetration and fiber damage. Cable shall have maximum 12 stands per tube, and an overall UV resistant, flame retardant jacket.

2.2 INTRA-BUILDING COPPER BACKBONE (VOICE ONLY)

A. Manufacturers:
1. Superior-Essex
2. BerkTek
3. Beldon
4. Hubbell
5. CommScope

B. Description:
1. Twisted pair copper conductors, 24 AWG, solid annealed copper.
2. Provide pair counts as indicated on Drawings.
3. Cable rated CAT5E voice backbone cable, UL Listed CMP as required.
4. 25 pair binder groups color coded per industry standards.
5. Flame-retardant PVC insulation for riser rated applications, low-smoke PVC insulation for plenum applications, color-coded for each conductor per industry standards.
6. White, flame-retardant PVC outer jacket for riser rated applications, gray low-smoke PVC outer jacket for plenum applications.

2.3 INTRA-BUILDING FIBER OPTIC BACKBONE

A. Multimode fiber optic cabling
1. Manufacturers:
   a. Systimax
   b. Corning
   c. BerkTek
   d. CommScope
2. Description: 50/125 µm OM3, strand counts as indicated on Drawings, tight buffered, OFNP. Cable shall be comprised of individually jacketed, and uniquely identified fibers with an overall aqua sheath.
3. Horizontal and Vertical fiber cable shall be furnished with performance requirements for the system served (voice, video or data) as indicated on the drawings riser diagram.

B. Singlemode fiber optic cabling
1. Manufacturers:
   a. Systimax
   b. Corning
   c. BerkTek
   d. CommScope

C. Description: Nominal 9/125 µm, strand counts as indicated on Drawings, tight buffered, OFNP. Cable shall be comprised of individually jacketed, and uniquely identified fibers with an overall yellow sheath.
1. Horizontal and Vertical fiber cable shall be furnished with performance requirements for the system served (voice, video or data) as indicated on the drawings riser diagram.

2.4 COPPER HORIZONTAL CABLING

A. Manufacturers:
1. CommScope
   a. BerkTek
   b. Superior-Essex
   c. Hubbell
   d. Beldon

B. Description:
1. Horizontal cable shall be furnished with performance requirements for the system served (voice, video or data) as indicated on the drawings riser diagram.
2. Category 6 enhanced: 23 AWG, 4-pair, 100 ohm, UTP, CMP, with green jacket for data and wireless access points, yellow jacket for voice cabling, purple jacket for security camera cabling.

3. Workstation, server, printer etc. data jacks will terminate in their own group of patch panels. Wireless access point and security camera data jacks will terminate in their own separate group of patch panels. All patch panels are installed in the equipment racks.

2.5 UTP JACKS AND CONNECTORS

A. Manufacturers:
   1. CommScope UNJ600.
   2. Ortronics
   3. Leviton
   4. Hubbell
   5. Beldon

B. Modular jacks for UTP cables:
   1. 8 position, 8 conductor, non-keyed, universal modular jack, snap-in type, terminated with a 110 style pc board connector, color coded for T568A and T568B wiring.
   2. Designed to terminate 22-26 AWG solid on insulation-displacement
   3. 110-style connectors.
   4. Contacts shall be minimum 50 micron gold-plated in the contact area.
   5. Rated to match the performance of the cabling system they are installed on.
   6. Color coded for system served as indicated on the Drawings.
   7. Furnish keystones (icons) for jack identification. Keystones for voice, data, wireless access points and security cameras jacks shall be orange.
   8. When installing outdoor cameras, APs, or any type of network device, you must use one of the following Hi-Impact jacks and patch cords.

C. Manufacturers:
   1. CommScope UMP610-24P or UMP610-48P.
   2. Ortronics
   3. Leviton
   4. Hubbell HI6Coupler and Jack. HI603AE Patch Cord
   5. Beldon

D. When installing outdoor cameras, APs or any type of network device, you must use one of the following CAT6E POE compatible lightning, surge protection devices part of the communication room termination:

E. Manufacturers:
   1. ATLAN AT-2210
   2. Phoenix Contact DT-LAN CAT.6+ 2281007
   3. L-COM BT-CAT6-P1-HP

F. UTP patch panels

G. Manufacturers:
   1. CommScope UMP610-24P or UMP610-48P.
   2. Ortronics
   3. Leviton
   4. Hubbell
   5. Beldon

H. UTP patch panel
   1. Patch panel shall serve as data jack, voice jack, security camera and wireless access point system horizontal cross connect.
2. Wireless access point and security camera data jacks will be terminated on their own patch panel separate from the workstation data jack patch panels.
3. Patch panel shall be configured for standard 19” rack mounting.
4. High density type with snap in 24 modular jack ports for every standard rack mount unit (1.75” high).
5. Maximum 6 port groupings of replaceable modules.
6. Terminations for the “building side” cabling on 110-style insulation PC board connectors color-coded for T568B terminations.
7. Horizontal and vertical cable management hardware front and rear.
8. Performance shall meet the performance of the cabling system they are installed on.
9. Constructed of black anodized aluminum with adequate structural integrity so that panel will not deflect when center of panel is pushed with the hand.
10. Provisions for icons and labeling to comply with the labeling requirements in specification 27170, "Cable Plant Administration and Testing".

2.6 CROSS-CONNECT BLOCKS

A. Manufacturers:
   2. Ortronics
   3. Leviton
   4. Hubbell
   5. Belden

B. Cross-connect blocks
   1. Cross connect blocks shall be used for voice connectivity backbone to horizontal cross connects:
   2. Wall-mount 110-type wiring blocks mounted in a modular frame if needed.

2.7 FACE PLATES

A. Manufacturers: Same as jacks and connectors, unless otherwise noted. In almost all cases in labs, stainless steel plates will be called out in lieu of plastic. Reference construction drawings.

B. Face plates for wall mounted workstation outlets shall allow a minimum 2 and maximum of 6 positions and accept snap-in jacks, as specified.

2.8 UTP PATCH CORDS

A. Manufacturers
   1. Shall be the same manufacturer and type as the cable, jacks and patch panels installed in the building.

B. Description
   1. Provide one (1) 1’ patch cord for each data port installed in the patch panel. Provide one (1) 1’ patch cord for each data port installed at the workstation area.
   2. For the workstation room side provide patch cords with stranded conductors and jacketing for greater flexibility.
   3. Patch cords shall be gray color for the workstation, and communication room areas. Patch cords shall be green color for the access point. Patch cords shall be purple color for the security cameras. Coordinate possible different lengths with C&IT.

2.9 FIBER OPTIC CONNECTORS FOR BOTH INTER–BUILDING AND INTRA–BUILDING CABLES

A. Manufacturers:
1. Corning Cable Systems.

B. Multimode OM3 fiber optic connectors shall be:
   1. Field installed LC type in 12/24 port panels for INTRA – BUILDING riser tie cabling between communication rooms. Provide aqua color connector.

C. Single-mode fiber optic connectors shall be:
   1. Field installed LC type in 12/24 port panels for INTRA – BUILDING riser tie cabling between communication rooms. Provide blue color connector.
   2. Field installed LC type in 144 port panels for INTER – BUILDING tie cabling between buildings. Provide blue color connector.

D. Single-mode fiber optic connectors for video shall be:
   1. Field installed LC/APC type in 12/24 port panels for INTRA– BUILDING riser tie cabling between communication rooms. Provide green color connector.
   2. Field installed LC/APC type in 12/24 port panels for INTER – BUILDING tie cabling between buildings. Provide green color connector.

E. Connectors shall be epoxy polish LC/APC type with ceramic ferrule with tool kit.

F. Connectors shall be fusion type. Compression type connectors shall not be allowed.

G. All LC/APC connectors and ferrules shall be green in color.

H. Field Install a Minimum of 2 strands (last 2) or coordinated exact quantities and requirements for LC/APC terminated fiber optic strands with C&IT-IT Customer Services- Telecommunications department prior to installation.

2.10 FIBER OPTIC PATCH PANELS

A. Manufacturers:
   2. Corning
   3. Leviton
   4. Ortronics

B. Description
   1. Rack-mounted, minimum 12-port Maximum 96-port patch panel with modules or panels.
   2. Use factory terminated fusion splice LC pig tail type connectors.

PART 3 EXECUTION

3.1 GENERAL

A. In addition to the notes contained on the Drawings, the following Contractor notes shall apply.

3.2 CABLE ROUTING

A. Route all cables and cable raceways parallel to or perpendicular to building structure.

B. All cables shall be installed as single continuous "home-run" pulls from connector block to connector block, or from patch panel in the telecommunications room to the data workstation outlet in the work area.

C. Cable that is run above a suspended ceiling must be supported per NFPA code requirements. Three choices are, conduits, cable tray or by J-hooks.

D. No tie-raps or bundling allowed.
E. The maximum spacing of cable hangers, supports and the number of data cables per hanger shall not exceed BICSI specification.

F. The installation contractor shall be responsible to replace all fire-proofing materials required for the installation. Any missing fire-proofing materials shall be reported to WSU for repair to maintain required fire rating of structure.

G. Communication cable and infrastructure shall be independently supported.

H. Do not support or tie-wrap any cables to ductwork, plumbing lines, fire suppression, electrical conduits, mechanical systems, or ceiling system.

I. Do not route cables through block wall without a sleeve, directly lay data cables on ductwork, piping and plumbing systems or on top of the lay-in ceiling tile.

J. All cable must be free of tension at both ends as well as over the length of the run.

K. Only Velcro straps are permitted as cable bundle supports. Waterfalls from cable tray shall not pinch, bind, crimp or in any way deform or cause physical damage to the cable jacket, or alter the electrical characteristics of the data cables.

L. Contractor shall take care to assure that during and upon completion of the installation, all cables are free of kinks, sharp bends, twists, gouges, cuts or any other physical damage which may cause physical or electrical characteristic alterations to the cables. The cables must also be installed at the proper room temperature. Any of these conditions will constitute a replacement of the installed cable.

M. Contractor to observe all minimum bend radius and tension limitations, etc., as specified by the cable manufacturer when installing the cables.

N. Contractor shall supply neatly bundled slack loops of length 10 feet for all cabling in telecommunications spaces. Provide neatly bundled slack loop 1 foot above the ceiling at workstation end.

O. Provide Velcro cable ties periodically in all runs and within the telecommunications spaces provide slack loops per BICSI standards.

P. Route all optical fiber cabling in inner duct. Armored fiber cable doesn’t need to be in innerduct. Support inner duct with j-hooks a maximum five feet on center when not routed in conduit or cable tray.

3.3 CABLE TERMINATIONS

A. The contractor who installs the communications cabling must be the one who terminates the communications cabling and test the finished data channel. It is not allowed to have a non-certified electrical contractor install the communications cable and have another certified contractor terminate, test and warranty it. No exceptions to this will be allowed. Terminate all wiring at both ends using the T568B convention. All voice and data cables shall be terminated in accordance with ANSI/TIA 568-C installation guidelines.

B. Terminate all wiring at both ends using the T568B convention. All voice and data cables shall be terminated in accordance with ANSI/TIA 568-C installation guidelines.

C. All data cables shall be terminated on rack mounted, high density, patch panels.

D. Wireless access points, security cameras and all other “internet of things” data jacks will be terminated on their own patch panel separate from the workstation data jack patch panels.

E. All data jacks above ceiling must be orange, securely mounted and labeled. No free floating or double stick mounted jacks are allowed.

F. All cable terminations shall be free of stress or tension when complete.
3.4 OUTLETS  
A. Data jacks are installed in outlet boxes on the wall, approved raceways or directly wired and mounted cubical furniture.

3.5 FACE PLATES  
A. Contractor shall provide standard faceplate with blank inserts for all outlets indicated as "future".

3.6 PATCH PANELS  
A. Mount patch panel according to equipment rack elevations.

3.7 VOICE RISER CONNECTING BLOCKS  
A. If needed, mount 110 style-connecting blocks on plywood backboard.  
B. Provide “D rings” and cable management between blocks.

END OF SECTION
SECTION 270170
CABLE PLANT ADMINISTRATION AND TESTING

PART 1 GENERAL

1.1 REFERENCES
C. ANSI/TIA 568-C - Commercial Building Telecommunications Cabling Standard
D. ANSI/TIA 569-C - Commercial Building Standard for Telecommunications Pathways and Spaces.
E. ANSI/JSTD 607-B - Commercial Building Grounding and Bonding Requirements for Telecommunications.

PART 2 PRODUCTS

2.1 LABELS
A. Manufacturers:
   1. Brady.
   2. Brother P-Touch.
   3. Equivalent by Tester manufacturer.
   4. Equivalent by UTP connectivity manufacturer.

B. Description
   1.1. Machine-printed permanent glossy polyester labels for racks, cabinets, faceplates, and panels. (Brady B-422).

C. Machine-printed, self-laminating vinyl for cabling and patch cords. (Brady B-427)

PART 3 EXECUTION

3.1 LABELING
A. Contractor to install all faceplate and equipment labels in accordance with manufacturer’s recommendations and the specifications. All labels shall be neatly installed and shall be level with the floor and properly aligned on the faceplate.

B. All pieces of voice and data equipment, including wires, cables, fibers and their respective terminations shall be labeled and identified in accordance with ANSI/TIA 606- B.

C. Labels shall meet the requirements of UL 969 as outlined in the ANSI/TIA 606-B.

D. All horizontal and backbone subsystem copper and fiber cables shall be labeled at each end. Labeling is required at intermediate points such as pullboxes and consolidation points (where appropriate).

E. Do not install labels closer than 3” to the termination point.

F. Patch panel labels shall be printed with the associated user data jack number.
G. Contractor shall submit a sample of patch panel label strips to the Engineer for approval prior to installation.

H. Numbering schemes for fiber panels, copper patch panels and voice wall 110 punch blocks will go in ascending order.

I. Intra-building fiber riser cable labeling scheme is for building riser cables between communication rooms, [cable type] - [WSU Building Number] - [floor number] - [communication room number]. Example: BRC-027.03.315

J. Voice and data jack labeling scheme is [Room Number] – [jack number + function]. Ex: 222-V01, 222-D01, 222-V02, 222-D02, 223-V01, 223-D01, etc

K. Labeling shall be consistent at each end of cabling and at workstation outlet and patch panel or connecting block. Data jacks shall be orange located in the outlet bottom position (vertical) or the outlet right position (horizontal). Voice jacks shall be White located in the outlet top position (vertical) or the outlet left position (horizontal). All voice terminates in their own patch panel.

L. Wireless access point jacking labeling scheme is [WAP] - [Room Number]. If the access point is in a corridor, use the closest room number. Labeling shall be consistent at each end of cabling and at WAP outlet and patch panel or connecting block. When a wireless access point is located above the ceiling a label must be placed on the ceiling grid which contains a small red dot and the wireless access point jack number.

M. Security camera jacking labeling scheme is [CAM] - [Last 2 octets of the IP Number]. Elevated cameras must have labeling at the bottom which allows for viewing from ground level. Labeling shall be consistent at each end of cabling and at WAP outlet and patch panel or connecting block.

N. All access point and security camera jacks will be terminated together on their own patch panel separate from the workstation data patch panels.

O. Outdoor fiber cables must be labeled with WSU fiber ownership cable label and unique building or backbone fiber cable name.

P. All labels must be based on the final room numbers. Verify room numbering with Owner prior to installation of labels. Do not use room numbers that appear on construction drawings.

3.2 UTP SYSTEM TESTING

A. Upon completion of the cable installation, the Contractor shall perform complete copper cable certification tests, according to all manufacturer’s requirements for application warranty, testing required by TIA/EIA, including, but not limited to:
   1. Continuity checks on each cable, checking for opens and shorts.
   2. Cable length (Channel and Permanent Link).
   3. Correct pair polarity.
   4. Correct cable labeling at both ends.

B. Tests shall be performed with connectors installed.

C. Any UTP CAT6 cable or component that has been painted and / or not satisfactorily passing tests or failing to meet quality installation standards as described in the specification, shall be repaired and/or replaced as directed by C&IT Network Engineer at the Contractor's expense.

D. The Contractor shall prepare complete cable test reports for all installed cables for review and acceptance by WSU C&IT Network Engineering prior to acceptance and / or use of the cabling system.

E. Category 6E UTP cable patch cords shall be manufacturer made, fully tested and verified in accordance with product specifications. No field made patch cords.

F. All cable testing shall be conducted by a certified technician using a Level III minimum Fluke Networks DSX 8000, or C&IT Network Engineering approved equivalent certification tester.
G. The cable tester calibration must be up to date. Test results must have the operator with company name, WSU building project name and cable type field. The cable type field identifies the cable product type installed and tested.

H. The test results must be submitted in one file to C&IT for approval.

I. The Category 6E Horizontal Cable Certification reports shall have complete testing of channel for voice and data drops, at frequency increments up to 450MHz and set the

J. Cable length limit to 295’ as indicated in ANSI/TIA-568-C and test results will show the following:
   1. Cable ID Number which matches faceplate numbers and patch panel numbers
   2. Tester Calibration Validation Date. Has to be calibrated every year.
   3. Building Project Name, Test Date, operator and company names.
   4. Cable Length
   5. Wire-Map
   6. Network Tests for 100BASE-TX and 1000BASE-T
   7. Attenuation
   8. Near End CrossTalk (NEXT)
   9. Power-sum NEXT (PS-NEXT)
10. Attenuation to Cross Talk Ratio (ACR)
11. Power-sum Attenuation to Cross Talk Ratio (PS-ACR)
12. Equal Level Far End CrossTalk (ELFEXT)
13. Power-sum Equal Level Far End CrossTalk (PS-ELFEXT)
14. Return Loss
15. Propagation Delay
16. Delay Skew
17. Signal to Noise Ratio

K. Upon completion, before final payment the following must be provided:
   1. Provide (1) electronic copy of test results in PDF file format.
   2. Provide the manufacture warranty certificate upon completion.
   3. Test date.
   4. Tester make, model and calibration date.
   5. No exception to this will be allowed.

L. After the horizontal cable tests have been performed, the Contractor shall install the faceplate labels and modular jack dust covers.

3.3 OPTICAL FIBER SYSTEM TESTING

A. Upon completion of the fiber cable installation, the Contractor shall perform complete fiber cable certification tests, according to all manufacturer's requirements for warranty and all testing required by ANSI/TIA-568-C.

B. Test all multimode fiber (100%) using a power meter using the encircled flux testing criteria as stated in the TIA TSB-4979 specification or TIA 526-14-B standard, testing all cables in both directions.

C. Test all singlemode fiber (100%) using a power meter as per the TIA/EIA-526-7-A standard, testing all cables in both directions.

D. Provide test report and include as a minimum the following information for all cables:
   1. Fiber cable number
   2. Fiber length.
   3. Attenuation (loss in dB).
   4. Test date
   5. Tester make and model no.

END OF SECTION
SECTION 270536
CABLE TRAYS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Wire-mesh cable trays.
   2. Cable tray accessories.
   3. Warning signs.
B. Related Requirements:
   1. Section 078400 “Firestopping” for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.
   2. Section 260536 “Cable Trays for Electrical Systems” for cable trays and accessories serving electrical systems.
   3. Section 260526 “Grounding and Bonding for Electrical Systems” for grounding and bonding requirements.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of cable tray.
   1. Include data indicating dimensions and finishes for each type of cable tray indicated.
B. Shop Drawings: For each type of cable tray.
   1. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.
   2. Cable tray layout, showing cable tray route to scale, with relationship between the tray and adjacent structural, electrical, and mechanical elements. Include the following:
      a. Vertical and horizontal offsets and transitions.
      b. Clearances for access above and to sides of cable trays.
      c. Vertical elevation of cable trays above the floor or bottom of ceiling structure.
      d. Load calculations to show dead and live loads as not exceeding manufacturer’s rating for tray and its support elements.
C. Delegated-Design Submittal: For seismic restraints.
   1. Seismic-Restraint Details: Signed and sealed by a qualified professional engineer, licensed in the state where Project is located, who is responsible for their preparation.
   2. Design Calculations: Calculate requirements for selecting seismic restraints.
   3. Detail fabrication, including anchorages and attachments to structure and to supported cable trays.

1.4 INFORMATIONAL SUBMITTALS
A. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
1. Include scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.
2. Vertical and horizontal offsets and transitions.
3. Clearances for access above and to side of cable trays.
4. Vertical elevation of cable trays above the floor or below bottom of ceiling structure.

B. Seismic Qualification Certificates: For cable trays, accessories, and components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

D. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014500 “Quality Control,” to design cable tray supports and seismic bracing.

B. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes in cable tray installed outdoors.
   1. Temperature Change: 120 deg F (67 deg C), ambient; 180 deg F (100 deg C), material surfaces.

2.2 GENERAL REQUIREMENTS FOR CABLE TRAY

A. Cable Trays and Accessories: Identified as defined in NFPA 70 and marked for intended location, application, and grounding.
   1. Source Limitations: Obtain cable trays and components from single manufacturer.

B. Sizes and Configurations: See the Cable Tray Schedule on Drawings for specific requirements for types, materials, sizes, and configurations.

C. Structural Performance: See articles for individual cable tray types for specific values for the following parameters:
   1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to NEMA VE 1.
   2. Concentrated Load: A load applied at midpoint of span and centerline of tray.
   3. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.3 WIRE-MESH CABLE TRAY

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Allied Tube & Conduit; a Tyco International Ltd. Co.
   2. Cablofil
   4. Chatsworth
5. Cooper B-Line, Inc.
7. Mono-Systems, Inc.
8. MP Husky.
9. Niedax-Kleinhuis USA, Inc.
10. TJ Cope.
11. Snaketray.
12. Wiremaid Products Division; Vutec Corporation.
13. WBT, Inc.

B. Description:
2. Width: As indicated on Drawings.
3. Minimum Usable Load Depth: 4 inches (100 mm).
4. Straight Section Lengths: 10 feet (3.0 m), except where shorter lengths are required to facilitate tray assembly.
5. Structural Performance: Capable of supporting a maximum cable load, with a safety factor of 1.5, plus a 200-lb (90-kg) concentrated load, when tested according to NEMA VE 1.
6. Class Designation: Comply with NEMA VE 1, Class 8C.
7. Splicing Assemblies: Bolted type using serrated flange locknuts.
8. Splice-Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

C. Materials and Finishes:
1. Steel:
   a. Straight Sections and Fittings: Steel complies with the minimum mechanical properties of ASTM A 1011/A 1011M, SS, Grade 33.
   b. Steel Tray Splice Plates: ASTM A 1011/A 1011M, HSLAS, Grade 50, Class 1.
   c. Fasteners: Steel complies with the minimum mechanical properties of ASTM A 510/A 510M, Grade 1008.
      1) Hardware: Galvanized, ASTM B 633.

2.4 CABLE TRAY ACCESSORIES

A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.

B. Barrier Strips: Same materials and finishes as for cable tray.

C. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

2.5 WARNING SIGNS

A. Lettering: 1-1/2-inch- (40-mm-) high, black letters on yellow background with legend "Warning! Not To Be Used as Walkway, Ladder, or Support for Ladders or Personnel."

2.6 SOURCE QUALITY CONTROL

A. Testing: Test and inspect cable trays according to NEMA VE 1.
PART 3 EXECUTION

3.1 CABLE TRAY INSTALLATION

A. Install cable trays according to NEMA VE 2.

B. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, and bonding.

C. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.

D. Remove burrs and sharp edges from cable trays.

E. Fasten cable tray supports to building structure and install seismic restraints.

F. Design fasteners and supports to carry cable tray, the cables, and a concentrated load of 200 lb (90 kg).

G. Place supports so that spans do not exceed maximum spans on schedules and provide clearances shown on Drawings. Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.

H. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.

I. Support cable tray assembly to prevent twisting from eccentric loading.

J. Locate and install supports according to NEMA VE 2. Do not install more than one cable tray splice between supports.

K. Support wire-basket cable trays with trapeze hangers or wall brackets.

L. Support trapeze hangers for wire-basket trays with 3/8-inch- (10-mm-) or larger diameter rods.

M. Make connections to equipment with flanged fittings fastened to cable trays and to equipment. Support cable trays independent of fittings. Do not carry weight of cable trays on equipment enclosure.

N. Install expansion connectors where cable trays cross building expansion joints and in cable tray runs that exceed dimensions recommended in NEMA VE 2. Space connectors and set gaps according to applicable standard.

O. Make changes in direction and elevation using manufacturer's recommended fittings.

P. Make cable tray connections using manufacturer's recommended fittings.

Q. Seal penetrations through fire and smoke barriers. Comply with requirements in Section 078400 "Firestopping."

R. Install capped metal sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

S. Install cable trays with enough workspace to permit access for installing cables.

T. Install warning signs in visible locations on or near cable trays after cable tray installation.

3.2 CABLE TRAY GROUNDING

A. Ground cable trays according to NFPA 70 unless additional grounding is specified. Comply with requirements in Section 260526 "Grounding and Bonding for Electrical Systems."
B. Cable trays shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.

C. Cable trays shall be bonded together with a No. 6 AWG grounding conductor run in the tray along with the communications cables and bonded to each section of cable tray.

3.3 CABLE INSTALLATION

A. Install cables only when each cable tray run has been completed and inspected.

B. Fasten cables on vertical runs to cable trays every 18 inches (450 mm).

C. Fasten and support cables that pass from one cable tray to another or drop from cable trays to equipment enclosures. Fasten cables to the cable tray at the point of exit and support cables independent of the enclosure. The cable length between cable trays or between cable tray and enclosure shall be no more than 72 inches (1800 mm).

D. Tie MI cables down every 36 inches (900 mm) where required to provide a 2-hour fire rating and every 72 inches (1800 mm) elsewhere.

E. In existing construction, remove inactive or dead cables from cable trays.

3.4 CONNECTIONS

A. Remove paint from all connection points before making connections. Repair paint after the connections are completed.

B. Connect pathways to cable trays according to requirements in NEMA VE 2.

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. After installing cable trays and after electrical circuitry has been energized, survey for compliance with requirements.
   2. Visually inspect cable insulation for damage. Correct sharp corners, protuberances in cable trays, vibrations, and thermal expansion and contraction conditions, which may cause or have caused damage.
   3. Verify that the number, size, and voltage of cables in cable trays do not exceed that permitted by NFPA 70 and TIA/EIA-569-D. Verify that communications or data-processing circuits are separated from power circuits by barriers or are installed in separate cable trays.
   4. Verify that there are no intruding items such as pipes, hangers, or other equipment in the cable tray.
   5. Remove dust deposits, industrial process materials, trash of any description, and any blockage of tray ventilation.
   6. Visually inspect each cable tray joint and each ground connection for mechanical continuity. Check bolted connections between sections for corrosion. Clean and retorque in suspect areas.
   7. Check for improperly sized or installed bonding jumpers.
   8. Check for missing, incorrect, or damaged bolts, bolt heads, or nuts. When found, replace with specified hardware.
   9. Perform visual and mechanical checks for adequacy of cable tray grounding; verify that all take-off raceways are bonded to cable trays. Test entire cable tray system for continuity. Maximum allowable resistance is 1 ohm.

B. Prepare test and inspection reports.
3.6 PROTECTION

A. Protect installed cable trays and cables.
   1. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.
   2. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.
   3. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.

END OF SECTION
SECTION 270536.13
NON-CONTINUOUS CABLE SUPPORTS FOR COMMUNICATIONS SYSTEMS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. The work covered under this section consists of the furnishing of all necessary labor, supervision, materials, equipment, and services to completely execute the system of non-continuous cable supports as described in this specification.

B. Related Requirements:
   1. Section 270536 "Cable Trays for Communications Systems" for cable trays and accessories serving communications systems.

1.3 DEFINITIONS
A. UTP: Unshielded twisted pair.
B. ANSI: American National Standards Institute
C. ASTM: American Society for Testing and Materials
D. EIA: Electronic Industries Alliance
E. TIA: Telecommunications Industry Association
F. cULus: Listed by Underwriters Laboratories based on both Canadian and US (United States) standards requirements.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include data indicating dimensions and finishes for each type of cable tray indicated.

B. Shop Drawings: For each type of cable tray.
   1. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.

C. Delegated-Design Submittal: For seismic restraints.
   1. Seismic-Restraint Details: Signed and sealed by a qualified professional engineer, licensed in the state where Project is located, who is responsible for their preparation.
   2. Design Calculations: Calculate requirements for selecting seismic restraints.
   3. Detail fabrication, including anchorages and attachments to structure and to supported cable trays.

1.5 INFORMATIONAL SUBMITTALS
A. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved.
1. Include scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.
2. Vertical and horizontal offsets and transitions.
3. Clearances for access above and to side of cable trays.
4. Vertical elevation of cable trays above the floor or below bottom of ceiling structure.

B. Seismic Qualification Certificates: For cable trays, accessories, and components, from manufacturer.

1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and describe mounting and anchorage provisions.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Field quality-control reports.

D. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

1.6 QUALITY ASSURANCE

A. Non-continuous cable supports and cable support assemblies shall be listed by Underwriters Laboratories for both Canadian and US standards (cULus).

B. Non-continuous cable supports shall have the manufacturers name and part number stamped on the part for identification.

C. Manufacturer: Company specializing in manufacturing products specified in this section with a minimum of five years documented experience in the industry, and certified ISO 9000.

A653 G60-Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-coated (Galvannealed) by the Hot-Dip process.
ASTM A666 Standard Specification for Annealed or Cold-Worked Austenitic Stainless Steel Sheet, Strip, Plate, and Flat Bar.

F. ASTM B117 Standard Method of Salt Spray (Fog) Testing
ASTM D610 Standard test Method for Evaluating Degree of Rusting on Painted Steel Surfaces.

G. ANSI/ TIA/ EIA 568 Commercial Building Telecommunications Cabling Standard, current revision level.

H. ANSI/ TIA/ EIA 569 Telecommunications Pathways and Spaces, current revision level.

I. NFPA 70 National Electrical Code®.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with these specifications, non-continuous cable supports shall be manufactured by Pentair, Inc. or approved equal.

2.2 NON-CONTINUOUS CABLE SUPPORT SYSTEMS

A. Non-continuous cable supports

1. Non-continuous cable supports shall provide a bearing surface of sufficient width to comply with required bend radii of high-performance cables; cULus Listed.
2. Non-continuous cable supports shall have flared edges to prevent damage while installing cables.
3. Non-continuous cable supports sized 1 5/16" and larger shall have a cable retainer strap to provide containment of cables within the hanger. The cable retainer strap shall be removable and reusable and be suitable for use in air handling spaces.
4. Non-continuous cable supports shall have an electro-galvanized or G60 finish and shall be rated for indoor use in non-corrosive environments.
5. Stainless Steel non-continuous cable supports are intended for indoor and outdoor use in non-corrosive environments or where only mildly corrosive conditions apply.

B. Adjustable non-continuous cable support sling

1. Constructed from steel and woven laminate; sling length can be adjusted to hold up to 425 4-pair UTP; rated for indoor use in non-corrosive environments. Rated to support Category 5 and higher cable, or optical fiber cable; cULus Listed.
2. Adjustable non-continuous cable support sling shall have a static load limit of 100 lbs.
3. Adjustable non-continuous cable support sling shall be suitable for use in air handling spaces.
4. If required, assemble to manufacturer recommended specialty fasteners including beam clips, flange clips, C and Z purlin clips.
5. Acceptable products: Pentair CADDY CableCat™ CAT425; or approved equal.

C. Multi-tiered non-continuous cable support assemblies:

1. Multi-tiered non-continuous cable support assemblies shall be used where separate cabling compartments are required. Assemblies may be factory assembled or assembled from pre-packaged kits. Assemblies shall consist of a steel angled hanger bracket holding up to six non-continuous cable supports, rated for indoor use in non-corrosive environments; cULus Listed.
2. If required, the multi-tier support bracket may be assembled to manufacturer recommended specialty fasteners including beam clamps, flange clips, C and Z purlin clips.
3. The multi-tiered support bracket shall consist of Pentair CADDY CATHBA and CableCat™ J-Hooks with screws; or approved equal.
D. Non-continuous cable support assemblies from tee bar
   1. Tee bar support bracket with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments; cULus Listed.
   2. Acceptable products: Pentair CADDY CAT12TS, CAT21528, CAT32528; or approved equal.
E. Non-continuous cable support assemblies from drop wire/ceiling
   1. Fastener to wire/rod with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments; cULus Listed.
   2. Acceptable products: Pentair CADDY CAT124Z34, CAT126Z34, CAT214Z34, CAT216Z34, CAT324Z34 or CAT326Z34; or approved equal.
F. Non-continuous cable support assemblies from beam, flange
   1. Fastener to beam or flange with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments; cULus Listed.
   2. Acceptable products: Pentair CableCat™ J-Hook series CAT12, CAT21, CAT32, CAT64 with CADDY beam clamps and CADDY flange clips; or approved equal.
G. Non-continuous cable support assemblies from C & Z Purlin
   1. Fastener to C or Z purlin with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments, cULus Listed.
   2. Acceptable products: Pentair CableCat™ J-Hook series CAT12, CAT21, CAT32, CAT64 with CADDY Purlin hangers; or approved equal.
H. Non-continuous cable support assemblies from wall, concrete, or joist
   1. Fastener to wall, concrete, or joist with one non-continuous cable support, factory or jobsite assembled; rated for indoor use in non-corrosive environments, cULus Listed.
   2. Acceptable products: Pentair CableCat™ J-Hook series CAT12, CAT21, CAT32, CAT64 with CADDY angle bracket; or approved equal.
I. Non-continuous cable support assemblies from threaded rod
   1. Fastener to threaded rod with one non-continuous cable support, factory or jobsite assembled, rated for indoor use in non-corrosive environments, cULus Listed.
   2. The multi-tiered support bracket shall have a static load limit of 300 lbs.
   3. Acceptable products: Pentair CableCat™ J-Hook series CAT12, CAT21, CAT32, CAT64 with CADDY CATHBA series; CAT-CM Double J-Hook CAT100CM, CAT-CM Direct Mount U-Hook, CAT200CMLN, CAT300CMLN; or AFAB Series, or approved equal.
J. Raised floor non-continuous cable support assemblies
   1. Fastener to raised (access) floor pedestal with one non-continuous cable support, factory or jobsite assembled, rated for indoor use in non-corrosive environments; cULus Listed.
   2. Acceptable products: Pentair CADDY CAT12CD1B, CAT21CD1B or CAT32CD1B; CAT64CD1B; or approved equal.
K. Cantilever-Mounted cable supports
   1. U-hook shall be able to be assembled to a wide variety of wall mounted brackets.
   2. Spacing of individual U-hooks as needed, max of 4’ to 5’ apart.
   3. U-hooks may have the optional attachment of a cable roller for ease in pulling cables.
L. Installation accessories for non-continuous cable supports
   1. Cable Pulley
a. Non-continuous cable supports may be used as an installation tool when a removable pulley assembly is included. The pulley shall be made of plastic and be without sharp edges. The pin and bail assembly must be able to be secured to the J-Hook during cable installation. The pulley must remain secured while cables are being pulled.
b. The pin and roller assembly must be removed after cables are installed.
c. Acceptable products: Pentair CADDY CAT32PLR and CAT64PLR; or approved equal.

2. Cable Protector
   a. The protective steel tube shall fit over threaded rod and be at least 4” in length.
   b. The tube shall prevent damage to cables placed in or pulled through CAT-CM™ U-Hooks.
      The tube shall not inhibit the pulling of cables.
   c. Acceptable products: Pentair CAT-CM™ CATTBCM, or approved equal.

2.3 FINISHES
      ASTM B 695 Standard Specification for coatings of Zinc Mechanically Deposited on Iron and Steel
      ASTM A123 Standard Specification for Zinc (Hot-Dip Galvanized) Coatings on Iron and Steel
      Products.
      ASTM A924/A924M Standard Specification for General Requirements for Steel Sheet, Metallic-
      Coated by the Hot-Dip Process.
   B. Non-continuous cable supports used where only mildly corrosive conditions apply shall be stainless steel, AISI type 304.

PART 3 - EXECUTION

3.1 INSTALLATION
   A. Installation and configuration shall conform to the requirements of the current revision levels of
      ANSI/ EIA/TIA Standards 568 & 569, NFPA 70 (National Electrical Code), applicable local codes,
      and to the manufacturer's installation instructions.
   B. Install cables using techniques, practices, and methods that are consistent with Category 6 or
      higher requirements and that supports Category 6 or higher performance of completed and linked
      signal paths, end to end.
   C. Install cables without damaging conductors, shield, or jacket.
   D. Do not bend cables, in handling or in installing, to smaller radii than minimums recommended by
      manufacturer.
   E. Pull cables without exceeding cable manufacturer's recommended pulling tensions. Use pulling
      means that will not damage media.
   F. Do not exceed load ratings specified by manufacturer.
   G. Provide non-continuous cable supports not more than 48” apart.
   H. Adjustable non-continuous support sling shall have a static load limit of 100 lbs.
   I. Unless noted otherwise, provide 4” size non-continuous cable supports.
   J. Seal penetrations through fire and smoke barriers. Comply with requirements in Section 078400
      “Firestopping.”
K. Follow manufacturer’s recommendations for allowable fill capacity for each size non-continuous cable support.

1. Non-continuous support having a ¾” loop shall be rated to support up to 16 UTP 4-pair or 2-strand fiber-optic cables.
2. Non-continuous support having a 1-5/16” loop shall be rated to support up to 50 UTP 4-pair or 2-strand fiber-optic cables or one innerduct.
3. Non-continuous support having a 2” loop shall be rated to support up to 80 UTP 4-pair or 2-strand fiber-optic cables.
4. Non-continuous support having a 4” loop shall be rated to support up to 300 UTP 4-pair or 2-strand fiber-optic cables.
5. Adjustable non-continuous cable support sling shall hold up to 425 UTP 4-pair or 2 strand fiber-optic cables.

END OF SECTION
SECTION 270544
SLEEVES AND SLEEVE SEALS FOR COMMUNICATIONS PATHWAYS AND CABLING

PART 1 GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Round sleeves.
      2. Rectangular sleeves.
      3. Sleeve seal systems.
      5. Pourable sealants.
      6. Foam sealants.
   B. Related Requirements:
      1. Section 078400 "Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.3 ACTION SUBMITTALS
   A. Product Data: For each type of product.
   B. LEED Submittals:
      1. Product Data for Credit EQ 4.1: For sealants, documentation including printed statement of VOC content.
      2. Laboratory Test Reports for Credit EQ 4: For sealants, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services’ "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
   C. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

PART 2 PRODUCTS

2.1 ROUND SLEEVES
   A. Exterior Wall Sleeves, Cast Iron:
      1. Description: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop.
   B. Pipe Sleeves, PVC:
      1. Description: ASTM D1785, Schedule 40.
   C. Molded Sleeves, PVC:
      1. Description: With nailing flange for attaching to wooden forms.
D. Molded Sleeves, PE or PP:
   1. Description: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

E. Sheet Metal Sleeves, Galvanized Steel, Round:
   1. Description: Galvanized-steel sheet; thickness not less than 0.0239-inch (0.6-mm); round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.

### 2.2 RECTANGULAR SLEEVES

A. Sheet Metal Sleeves, Galvanized Steel, Rectangular:
   1. Description:
      b. Minimum Metal Thickness:
         1) For sleeve cross-section rectangle perimeter less than 50 inches (1270 mm) and with no side larger than 16 inches (400 mm), thickness must be 0.052 inch (1.3 mm).
         2) For sleeve cross-section rectangle perimeter not less than 50 inches (1270 mm) or with one or more sides larger than 16 inches (400 mm), thickness must be 0.138 inch (3.5 mm).

B. Sleeves for cables Penetrating Fire rated walls and floors: STI EZ-Path enclosed fire-rated device, containing a built-in fire sealing system sufficient to maintain the hourly fire rating of the barrier being penetrated. The self-contained sealing system shall automatically adjust to the installed cable loading and shall permit cables to be installed, removed, or retrofitted without the need to adjust, remove, or reinstall firestop materials. The pathway shall be UL Classified and/or FM Systems Approved and tested to the requirements of ASTM E814 (UL1479).
   1. Series 22 Fire Rated pathway: 1.5 inches (38 mm) high x 1.5 inches (38 mm) wide x 10.5 inches (267 mm) long, volume expansion of fire seal 40 times, inserts into 2 inch (51 mm) cored hole, maintains rating up to 4 hours installed in wall, capacity of approximately 20 CAT5e cables.
   2. Series 33 Fire Rated pathway: 3.0 inches (76 mm) high x 3.0 inches (76 mm) wide x 10.5 inches (267 mm) long, volume expansion of fire seal 16 times, inserts into 4 inch (102 mm) cored hole, maintains rating up to 4 hours installed in wall, capacity of approximately 108 CAT5e cables, up to seven can be ganged together, can be lengthened in 6 inch (152 mm) increments, attaches to a 4 inch (102 mm) conduit, rated for up to 4 hours installed in floor.
   3. Series 44 Fire Rated pathway: 4 inches (102 mm) high x 4 5/8 inches (118 mm) wide x 14 inches (356 mm) long, volume expansion of fire seal 16 times, inserts into 6 inch (153 mm) cored hole, maintains rating up to 4 hours installed in wall, capacity of approximately 255 CAT5e cables, up to five can be ganged together in walls, up to 16 can be ganged together in floors, rated for up to 4 hours installed in floor.

C. Sleeves for Cables Penetrating Non-Fire rated walls: STI EZ-Path enclosed smoke and acoustical pathway, containing a built-in sealing system sufficient to maintain a barrier to prevent smoke and sound from penetrating through non-fire rated walls. The self-contained sealing system shall automatically adjust to the installed cable loading and shall permit cables to be installed, removed, or retrofitted without the need to adjust, remove, or reinstall materials.
   1. Series 33NEZ Smoke and Acoustical Pathway: 4.5 inches (114 mm) high x 4.5 inches (114 mm) wide x 10.5 inches (267 mm) long, and inserts into 4 inch (102 mm) cored hole.
   2. Series 44NEZ Smoke and Acoustical Pathway: 7-1/2” inches (191 mm) high x 7-1/8" inches (181 mm) wide x 10.5 inches (267 mm) long, and inserts into 6 inch (152 mm) cored hole.
2.3 SLEEVE-SEAL SYSTEMS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and pathway or cable.

1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. Advance Products & Systems, Inc.
   b. CALPICO, Inc.
   c. Metraflex Company (The).
   d. Pipeline Seal and Insulator, Inc.
   e. Proco Products, Inc.

2. Sealing Elements: EPDM or Nitrile (Buna N) rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

3. Pressure Plates: Stainless steel.

4. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.4 GROUT

A. Description: Nonshrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.

2. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.

2.5 POURABLE SEALANTS

A. Description: Single-component, neutral-curing elastomeric sealants of grade indicated below.

1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.

2. Sealant shall have VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

3. Sealant shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.6 FOAM SEALANTS

A. Description: Multicomponent, liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam. Foam expansion must not damage cables or crack penetrated structure.

PART 3 EXECUTION

3.1 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

A. Comply with NECA 1.

B. Sleeves for Conduits Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:

   1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
Sleeves and Sleeve Seals for Communications Pathways and Cabling

3.2 INSTALLATION OF RECTANGULAR SLEEVES AND SLEEVE SEALS

A. Install sleeves in existing walls without compromising structural integrity of walls. Do not cut structural elements without reinforcing the wall to maintain the designed weight bearing and wall stiffness.

B. Install conduits and cable with no crossings within the sleeve.

C. Fill opening around conduits and cables with expanding foam without leaving voids.

D. Provide metal sheet covering at both wall surfaces and finish to match surrounding surfaces. Metal sheet must be same material as sleeve.

3.3 INSTALLATION OF SLEEVE SEAL-SYSTEMS

A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at pathway entries into building.
B. Install type and number of sealing elements recommended by manufacturer for pathway or cable material and size. Position pathway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pathway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

END OF SECTION
SECTION 274100
AUDIO/VIDEO SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to the work specified in this Section.

B. Coordinate work of this Section with work of other Sections as required to properly execute the Work and as necessary to maintain satisfactory progress of the work of other Sections.

1.2 SCOPE OF SPECIFICATION

A. The following terms are defined for this specification section:
   1. “Owner” or “End User” is Wayne State University.
   3. “Systems” are the audio and video systems.
   4. “Designer” or “Systems Designer” is the designer of the audio and video systems: Jaffe Holden Acoustics, Inc.
   5. “Electrical Engineer” is the designer of the Electrical Pathway & Wiring Systems: HGA.
   6. “General Contractor” is the General Contractor or Construction Manager responsible for the construction of the project.
   7. “Contractor” or “Systems Contractor” is the specialty contractor working under the General Contractor, responsible for the installation of the audio and video systems.

B. This specification covers all Systems as described below for the project. The objective is to provide professional systems, installed, acceptance tested, and ready for use.

C. General Contractor to provide associated Division 26 scope of work only. Owner to provide all Division 27 scope of work. Refer to Work Scope Table 1.12 below. Read the full specification thoroughly as the Work Scope Table may not include all the details of required scope of work.

D. The written specification and the large format AV drawings shall be collectively referred to herein as the Contract documents. System features which are mentioned in one part may not be shown in the others. In case of conflict between the written specification and the drawings, Contractor must seek clarification from the Systems Designer. In the event that the Contractor fails to obtain such clarification, the interpretation of the Systems Designer will prevail.

1.3 CONTRACTOR RESPONSIBILITY

A. Specification drawings are detailed only to the extent necessary to show design intent and signal flow. It is understood and agreed by the Contractor that the work herein described shall be complete in every detail to supply a complete working system.

B. Equipment not mentioned herein nor shown on drawings but necessary to meet this requirement shall be provided without claim for additional payment.

1.4 SUMMARY DESCRIPTION

A. Appendix A contains the Summary Systems Description. Specific products to meet the system requirements described in Appendix A will be called out in the contract documents. SCOPE OF WORK

A. Furnish all materials, labor and any engineering services to provide complete and professionally installed Systems in working order as described herein. Labor furnished shall be specialized and experienced in Systems installation.
B. Furnish all back boxes and enclosures.

C. Deliver to the job site all back boxes which are to be installed by others.

D. Furnish and install all wire and cable.

E. Contractor to provide initial DSP and control system programming prior to acceptance testing, one full set of programming changes and adjustments, prior to handover to the Owner, and one additional set of changes and adjustments during the initial warranty period, as part of the base scope of work.

F. Furnish any additional items, not specifically mentioned herein, to meet system requirements as specified, without claim for additional payment. Such items may include, but are not limited to hardware, transformers, signal format converters, line/distribution amplifiers and other devices for proper installation, interface, isolation or gain structure.

G. Furnish shop drawings and receive approval, prior to fabrication and installation.

H. Provide frequency scanning and coordination for all audio/video systems wireless transmitters and receivers. Coordinate with other Contractors and Owner as necessary to account for local frequencies used by others within the building, and to account for available spectrum in the surrounding area.

I. Perform initial adjustments and verification tests. Submit verification test report.

J. Participate in acceptance tests and perform final adjustments.

K. Provide training sessions, as specified in section 3.15, to the Owner.

L. Provide any manufacturer required commissioning and/or training and properly schedule with the manufacturer for their staff to attend. Coordinate schedule and training syllabus with owner and consultant.

M. Provide system documentation including copies of all relevant drawings and equipment manuals.

N. Provide maintenance services for the specified period from the date of acceptance.

O. Guarantee all equipment and components for the specified period from the date of acceptance.

P. Requirements and materials that apply to the work of others related to the Systems are listed to define and establish Systems requirements.

Q. Work scope does not include the AC power system except as specifically called out in these specifications or in the drawings.

R. Coordination with the Electrical Contractor is required to assure correct Systems conduit routing, Systems backbox locations, and clean power circuit locations as specified in Division 26 - Electrical.

S. See Work Scope Summary Table at the end of Part One (Paragraph 1.12).

1.6 SUBMITTALS

A. Pre-Bid Submittals
   1. All Contractors submitting bids for the Systems specified herein must be qualified by the Systems Designer.
   2. Not later than ten (10) days prior to the bid date, Contractor shall submit to the Systems Designer for approval, brochures containing a statement of the Contractor's qualifications. At minimum, this submittal shall include the following:
      a. A list of Systems of comparable size and scope to that described herein, completed by the Contractor in the last five (5) years. Indicate the project name
and address, year of completion, and the name and phone number of a person to contact who is a representative of the Owner or User.

b. A personal resume of formal education and experience, and a copy of the current CTS-I certificate of the staff member who would act as Leader for the Project. A personal resume of formal education and experience, and a copy of the current CTS-D certificate of the staff member who would act as Project Engineer.

c. A description of the Contractor's capabilities and facilities for rack assembly, shop fabrication, repair, and servicing of Systems.

d. A description of the Contractor's capabilities and facilities for generating CAD (or other high quality graphics) documentation for the Shop Drawings and As-Built Drawings.

B. Bid Submittals:

1. Contractors shall examine all drawings and read all divisions of this specification in order to avoid omissions and duplications and to ensure a complete job. No allowances shall be made for failure to read and understand these documents. Discrepancies between drawings and specifications or obvious omissions shall be referred to the Systems Designer for clarification before the bid date. Where discrepancies occur and pre-bid instructions have not been obtained, the contractor agrees to abide by the Systems Designer's decision.

2. Bid proposals shall include all work and all equipment as specified, as well as any other equipment and materials to be used in assembling the system.

3. Requests for clarification of specification intent shall be made, in writing, not later than ten (10) days prior to bid date.

4. No portion of the work herein may be assigned or sub-contracted to others unless the following requirements have been satisfied:
   
a. The names of any proposed sub-contractors shall have been disclosed in the bid proposal.
   
b. A statement of qualifications for each sub-contractor shall have been included with the bid proposal.
   
c. All terms of this contract, including bidding and qualification requirements, shall apply to the sub-contractor.

5. The bid submittals shall include the following:
   
a. The total Contract price
   
b. The total price for any Add-Alternates (See Paragraph 2.02.D)
   
c. An itemized list of all equipment and materials to be used in assembling the system
   
d. Unit pricing for all items on the specified equipment list
   
e. Lot pricing for miscellaneous items not on the specified equipment list
   
f. A breakdown of the number of staff hours allotted for:
      
      1) Preparation of submittals, shop drawings, and system documentation
      2) On site coordination meetings and supervision
      3) In shop engineering, fabrication, and assembly
      4) On site fabrication, assembly, and installation
      5) On site verification and acceptance testing

C. Shop Drawing Submittals:

1. Within thirty (30) days after contract award, submit a Work Scope plan that lists all actions required to complete the work in this section. The Work Scope plan must include a complete schedule of all activities, particularly activities that require coordination with other trades, Architect, Owner, and Systems Designer, and must reference all relevant documents related to each activity. Critical path must be identified, and all key moments relating to procurement and installation must be identified. All points of coordination must be vetted with the other affected parties prior to submittal to the Owner for review.
2. Within sixty (60) days after contract award, submit digital PDF files of detailed shop drawings to the Architect for approval. All shop drawings shall be marked with the related drawing number when submitted. Do not begin installation or fabrication without the approval of the Architect and Systems Designer.

3. Review of shop drawings shall not constitute final approval of system function. Said review does not in any way relieve the Contractor from the responsibility of furnishing material or performing work as required by the Contract documents.

4. Failure of the Contractor to submit shop drawings in ample time for evaluation shall not entitle the Contractor to an extension of contract time, and no claim for extension by reason of such default will be allowed.

5. Systems Designer will review submittals twice only without additional cost being charged to the project. If a submittal or portion of a submittal is rejected after two attempts, the Contractor is liable for additional cost for further reviews.

6. At minimum, the Shop Drawings shall include electronically bound copies of the following:
   a. Table of Contents
   b. Itemized list of all equipment and materials to be used in assembling the system
   c. Catalog cut sheets or data sheets for each listed item.
      1) Product data sheets must not be web page captures of specifications, unless there is no other recourse.
      2) Product data sheets with multiple options or part numbers must clearly be marked with the selection to be used for this project. All options must be called out. Anything the Contractor is not supplying that is shown on the sheet must be called out as an exclusion.
   d. One-line signal flow diagrams for all systems showing point to point wiring interconnection of all equipment with wire run numbers and patch bay designations. Show all transformers, switches, relays, control circuits, and modifications to equipment. Show all equipment items which are required for realization of the functions described herein.
   e. A complete list of all wire run numbers along with the termination location of each end of each wire run
   f. Detailed 3-wire schematic diagrams for any custom circuitry
   g. Detailed 3-wire schematic diagrams for typical connections between audio lines, patch bays, and rack mounted equipment
   h. Drawings of all items which are to be custom fabricated or modified. Drawings shall be of scale suitable for use in fabrication. They shall show materials, finishes and panel/control markings. Submit samples of lettering/label size and typeface to be employed on custom plates, panels and other equipment.
   i. Full size drawings illustrating the physical layout and labeling of patch bays
   j. Mechanical drawings of all assemblies, major sub-assemblies, racks, and enclosures
   k. Mechanical drawings showing proposed mounting details of all loudspeakers and associated rigging, and interface with adjacent architecture
   l. All mounting systems not provided as a complete package from a single manufacturer must be engineered, approved, and have drawings stamped by a professional rigging engineer or licensed structural engineer, as approved by the General Contractor. The engineer shall verify that the design meets or exceeds design criteria for this particular use case. Each mounting system solution must be separately engineered, verified, and stamped.
   m. Provide a detailed written plan for EDID and HDCP management for all video signals and interconnections between video devices.
   n. Provide an IP Address table and addressing protocol in coordination with Owner’s IT department.
   o. Provide a mockup of all system graphical user interface screens and all source code/configuration files required for proper system operation.

7. For the ease of drawing review, the following guidelines must be adhered to:
a. Plot styles should be utilized so that color is only used for emphasis of specific line types.
b. The paper size for all shop drawings must match that of all other construction drawings. All drawings must be legible at ½ size.
c. Drawings should be in black and white but if color is used the drawings must still be legible with all design information easily seen, when printed black and white.
d. CAD drawings should be delivered as PDF prints. Provide DWG files upon request.
e. All revisions of drawings in drawing packages must include a revision number and date, with all changed drawings clearly indicated, with changes clouded and tagged with the revision number. Drawings that have not changed from previous releases should not be marked as revised. Already revised drawings should have revision clouds and tags removed from the previous revision so that current revisions are clear to see.

8. Document release must be simultaneous unless a tiered release is authorized by the Systems Designer. If utilizing a tiered document release system, each release must be a full release of documents within each tier, within the context of the entirety of this scope of work. The required order for tiered review is:
   a. Equipment and Panel Locations, and Conduit Riser (provided as indicated in the Work Scope Table in this section)
   b. Complete project equipment list and Product data sheets
   c. Single-line drawings, Panel details, Rack elevations, and Patchbay layouts
      1) Patchbay layouts must conform to the guidelines for Patchbay layouts included in this specification and on large format drawings.
      2) Panel drawings must indicate each panel and its engraving individually (if two ‘AA’ panels exist, for instance, they must have individual panel drawings showing the connector numbering and other engraving specific to that panel at that location)
      3) All custom rack panels must have a panel drawing as part of this submittal.
   d. Rigging and Mounting Details
   e. Control system and DSP system GUI mockup, functional control narrative, initial DSP programming, other software configuration files, HDCP/EDID plan and IP addressing plan.

9. All drawings shall be produced in AutoCAD, Revit, or in a similar and compatible computer drafting/graphics program. All submittal drawings must be engineered and drafted to represent actual fabrication and installation drawings and details. All details that are graphically unclear must be properly noted to clarify intent. Copies of the Contract Drawings are not acceptable as submittal drawings and will be rejected.

10. The use of electronic files generated by anyone other than the Systems Contractor (e.g., architectural backgrounds, Systems Designer's drawings, etc.) will not release the Contractor of the responsibility to supply Shop Drawings that represent a completely engineered, coordinated, and functional solution. The Contractor has the final responsibility to provide systems that meet or exceed all requirements of the contract documents.

D. Substitutions:
   1. Substitutions may be permitted subsequent to Contract award, but only with the express written permission of the Systems Designer. The proposed substitutes must be equivalent to the specified products in quality, performance, construction, function and conformance to system objectives.
   2. It is the responsibility of the Contractor to prove, to the satisfaction of the Systems Designer, that the proposed substitution is equal to the specified product, as demonstrated by submission of the following:
      a. List of advantages to the Owner
      b. Cost savings
c. Printed specifications or laboratory test data
d. Previous field experience
3. The Contractor shall list the unit price of each item proposed for substitution and indicate which specified items are to be deleted.
4. If the Systems Designer determines that the proposed product is not equal to the specified project, the Contractor shall supply the product specified in the Contract documents.
5. Where substitute materials or methods are approved, the Contractor shall make all adjustments to contingent work necessary to accommodate the substituted equipment, without claim for additional payment.
6. In the event that one or more of the products specified herein is unavailable, the Contractor shall make recommendations to the Systems Designer as to what substitutions are available to meet the intent of the specification.
7. The Systems Designer reserves the right to substitute new products which become available subsequent to the issuance of the Contract Documents, provided that:
a. The Contractor has not yet purchased the originally specified equipment.
b. The substitute equipment shall not materially increase the Contractor's costs.
8. Selected items of the systems are subject to rapid technology changes. Items that have a high likelihood of needing re-evaluation prior to installation are highlighted in the equipment list. The Contractor shall not purchase these items without 30 days prior notice to the Systems Designer.

E. Samples:
1. Submit samples of substitute equipment to the Systems Designer as required to prove equivalency to items specified.
2. Submit samples of custom work, finishes or other materials as required by the Architect or Systems Designer to verify appearance and quality. All panels within direct view of the public may require a custom finish. Provide the Architect with a list of any panels that meet this criteria so that they may specify custom finishes. A sample of every type of finish specified other than standard finish as detailed in this specification must be provided to the Architect for approval.
3. Costs for shipping samples shall be the responsibility of the Contractor.
4. Submitted samples will not be returned.

F. Progress Reports must be submitted to the Owner every two weeks. The progress report will include:
1. Work Scope Plan updates and any schedule changes
2. Overall Project Status
3. Work Completed by percentage complete
4. Work planned for the next two week period
   a. Call out any coordination requirements for each item.
5. Procurement report
   a. Percentage by dollar value of equipment that has been procured to date
   b. Procurement problems or concerns to be addressed by others
6. RFI/Submittal List
   a. List outstanding RFI's and Submittals, showing the assigned document number and the date it was submitted.
   b. Highlight in Yellow any items that are overdue but are not affecting schedule or project quality.
   c. Highlight in red any items that are overdue AND are affecting schedule and/or project quality.

G. Written Guarantee (See Paragraph 1.9)
H. Verification Test Report (See Paragraph 3.13)
I. System Documentation and Operation Manuals (See Paragraph 3.15)
1.7 JOB CONDITIONS

A. Keep the job adequately staffed at all times. Unless illness, loss of personnel or other circumstances beyond the control of the Contractor intervene, keep the same individual in charge throughout.

B. Cooperate with all appropriate parties in order to achieve well-coordinated progress with the overall construction completion schedule and satisfactory final results.

C. Watch for conflicts with work of other contractors on the job and execute, without claim for extra payment, moderate moves or changes as are necessary to accommodate other equipment or to preserve acoustic performance, symmetry, and pleasing appearance.

D. Immediately report to the Architect and Systems Designer any design or installation irregularities, particularly architectural elements that interfere with the intended coverage angles of loudspeakers, or proper open sightlines to projection surfaces or displays so that appropriate action may be taken.

E. Do all cutting, patching and painting for proper and finished installation of the system and repair any damage done as a result of such installation. Clean up and dispose of trash from all Systems work areas.

1.8 QUALITY ASSURANCE

A. Parts listed shall be complete, type numbers accurate and equipment furnished shall conform to manufacturer’s specifications.

B. All materials shall be new and shall conform to applicable provisions of Underwriters Laboratories and the American Standards Association.

C. Procure and pay for all permits, licenses and inspections and observe any requirements stipulated therein.

D. Comply with federal, state and local labor regulations and applicable union regulations.

E. Installation shall conform to latest federal, state and local electrical and safety codes or those of other authorities having jurisdiction. Where conflicts exist, the most stringent code or regulation shall apply.

F. If additional work by the Systems Designer is required as a direct result of deviations from approved drawings and specifications during construction, the General Contractor and/or Systems Contractor will be liable for those additional costs that the Owner may incur.

G. Government Standards: The Systems Contractor is to comply with all government regulations, standards, and laws that apply to the installation and use of the AV equipment and/or other scope of work specified in this section. The following agencies have laws and rules that apply.

1. Federal Communications Commission (FCC): FCC rules are located in Title 47 of the Code of Federal Regulations. The following is a partial list of the FCC regulations that apply to equipment specified in this section of work:
   a. Part 15: Radio frequency devices
   c. Part 24: Personal communications services.
   e. Part 27: Wireless communications service.
   f. Part 51: Interconnection.
   g. Part 74: Experimental radio, special broadcast, and other program distribution services.
   h. Part 95: Personal radio services.
2. Occupational Safety and Health Administration (OSHA) – Follow all applicable standards for health and safety particularly sound pressure level exposure.

3. ANSI Standards: American National Standards Institute (ANSI) standards cover safety, fabrication, assembly, installation, rigging, equipment handling, and testing.

4. Contributing Organizations – The Organizations listed below have published standards used to establish the technical references to be followed under this scope of work.
   a. Acoustical Society of America (ASA) (ASC S1)
   b. Alliance for Telecommunications Industry (ATIS) (ASC T1)
   c. American Society of Safety Engineers (ASSE) (ASC A1264)
   d. Audio Engineering Society (AES) (ASC S4)
   e. Electronics Industry Alliance (EIA) (CEMA)
   f. Entertainment Services and Technology Association (ESTA) (ASC E1)
   g. Institute of Electrical and Electronics Engineers (IEEE) (ASC C136) (802.1)

1) IEEE 802.1AS: This standard specifies the protocol and procedures used to ensure that the synchronization requirements are met for time sensitive applications, such as audio and video, across Bridged and Virtual Bridged Local Area Networks consisting of LAN media where the transmission delays are fixed and symmetrical.

2) IEEE 802.1QAT: This standard specifies protocols, procedures and managed objects, usable by existing higher layer mechanisms, that allow network resources to be reserved for specific traffic streams traversing a bridged local area network. It identifies traffic streams to a level sufficient for bridges to determine the required resources and provides a mechanism for dynamic maintenance of those resources.

3) IEEE 802.1QAV: This standard allows bridges to provide guarantees for time-sensitive (i.e. bounded latency and delivery variation), loss-sensitive real-time audio video (AV) data transmission (AV traffic). It specifies per priority ingress metering, priority regeneration, and timing-aware queue draining algorithms. This standard uses the timing derived from IEEE 802.1AS. Virtual Local Area Network (VLAN) tag encoded priority values are allocated, in aggregate, to segregate frames among controlled and non-controlled queues, allowing simultaneous support of both AV traffic and other bridged traffic over and between wired and wireless Local Area Networks (LANs). Bridges are increasingly used to interconnect devices that support audio and video streaming application. This standard will specify enhancements to bridge relay function to provide performance guarantees to allow for time-sensitive traffic in a local area network and harmonize delay jitter and packet loss for wired (e.g., IEEE 802.3 - "Standard for Information Technology - Telecommunications and Information Exchange Between Systems - Local and Metropolitan Area Networks - Specific Requirements Part 3: Carrier Sense Multiple Access with Collision Detection (CSMA/CD) Access Method and Physical Layer Specifications"), wireless (e.g., IEEE Std 802.11 - "Standard for Information Technology - Telecommunications and information exchange between systems - Local and Metropolitan networks - Specific requirements - Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) specifications"), and mixed wired/wireless L2 networks. Most if not all entertainment media going forward is in digital form. Audio and video streaming and interactive applications over bridged LANs need to be enhanced to have comparable real-time performance of legacy out-of-band analog media distribution. There is significant vendor and end-user interest and market opportunity to consolidate layer 2 solution for both computer networking (e.g. internet access) and audio video services (e.g. home consumer electronics, professional A/V applications, etc) in mixed wired and wireless environments. The use of such consolidated network will realize operational and equipment cost benefits.
This standard defines a set of enhancements to the Virtual Bridged LAN (802.1Q - “Standards for Local and Metropolitan Area Networks - Virtual Bridged Local Area Networks”). This will enable end-to-end quality of service guarantee agreement for audio and video streaming negotiated over SRP protocol to be realized in a bridged LAN, while interoperating with existing 802.1D - "Standard for Local and Metropolitan Area Networks: Media Access Control (MAC) Bridges” and Q bridges. There is currently no interoperability among bridges that support Audio and Video streaming, nor generally accepted means of achieving such service guarantees in a bridged LAN.

4) IEEE 802.3 – 2008: A revision of base standard incorporating the 802.3an/ap/aq/as amendments, two corrigenda and errata. Link aggregation was moved to 802.1AX.

5) IEEE 802.3AZ: Energy Efficient Ethernet is scheduled for release in September 2010.

6) IEEE 802.3bd: Defines a MAC Control Frame to support 802.1Qbb Priority-based Flow Control.

h. International Cable Engineers Association (ICEA) Formerly IPCEA
i. International Standards Organization (ISO)
j. National Electrical Manufacturer’s Association (NEMA) (ASC C119)
k. National Fire Protection Associations (NFPA)
l. National Safety Council (NSC) (ASC A10)
m. Photographic and Imaging Manufacturer’s Association (PIMA)
n. Society of Motion Picture and Television Engineers (SMPTE)
o. Telecommunications Industry Association (TIA)
p. Underwriters Laboratories (UL) (ASC C101) (CE)
q. NTSC
r. National Association of Broadcasters (NAB) – System technical standards for video and RF compliance are listed in the most recent edition of the NAB Handbook

5. Safety Standards – Contractor will adhere to the following Safety Standards for all work identified in Division 27 41 00 and as part of the General and Supplementary sections of the Division-1 Specifications.

a. ANSI A14.2-2000: Safety Requirements for Portable Metal Ladders

e. ANSI Z136.2-1997: Safe Use of Optical Fiber
g. ANSI/PIMA IT7.101-1999: Recommended Practice for the Safe Handling and Operating of Audiovisual Equipment.

h. IEEE 142-1991: Grounding of Industrial and Commercial Power Systems
i. UL 514A: Scrub Water exclusion from AV Floor Boxes
j. UL 1419-1995: Standard for Safety for Professional Video and Audio Equipment in accordance with the National Electrical Code, ANSI/NFPA 70
k. UL 1492-1994: Standard for Safety for Audio-Video Products and Accessories
l. UL 1651-1997: Standard for Safety for single and multiple Optical Fiber Cable

m. UL 1667-1996: Audiovisual Systems Safety Standard for Tall AV Institutional Carts for use with Audio, Video, etc.

n. ANSI E1.1-1999: Construction and Use of Wire Rope Ladders to prevent most injuries
o. ANSI A10.8-2001: Safety Requirements for Scaffolding
6. Applicable Performance Standards – Execute all Division work in accordance with the following standards:
   b. ANSI S4.55-1997: Recommended Practice for conservation of the Polarity of Audio Signals
   c. ANSI S4.56-1997: Recommended Practice for the subjective evaluation of Loudspeakers
   f. ANSI T1.522-2000: Quality of Service (QOS) for Business Multimedia Conferencing. Specifies classes of Service for conferencing on IP Networks
   g. AES15: ANSI S4.49: AES Recommended practice for Sound Reinforcement Systems – Communications Interface PA-422.
   h. AES-R1-1997 AES project report for professional audio: Specifications for audio on high capacity media
   i. AES14-1992 (r1998) AES standard for professional audio equipment -- Application of connectors, part 1, XLR-type polarity and gender
   j. AES24-1-1999. (Revision of AES24-1-1995) AES standard for sound system control - Application protocol for controlling and monitoring audio devices via digital data networks
   k. AES26-2001 (Revision of AES26-1995) AES recommended practice for professional audio -- Conservation of the polarity of audio signals
   l. ANSI/TIA/EIA 606-1993: Standard for the Telecommunications Infrastructure of Commercial Buildings
   m. ANSI/TIA/EIA 607-1994: Commercial Building Grounding and Bonding Requirements for Telecommunications
   n. IEEE 149-1979 (R1990): Test Procedure for Antennas
   o. IEEE 1100-1999: Powering and Grounding Sensitive Electronic Equipment
   p. NEMA 250-2001: Enclosures for Electrical Equipment
   q. SMPTE 292M: SMPTE 292M defines the base 1.485Gbps HD-SDI. Note: This standard can handle all HD formats except 1920*1080 @ 50P and 60P.
   r. SMPTE 372M: Uncompressed Dual-Link HD-SDI for 50P & 60P
   s. SMPTE 424M: 2.97 Gbps HD-SDI for 50P & 60P
   t. TIA/EIA-568-B: Digital audio over Cat5 audio cable
   u. UL 1047-1999: Isolated Power Systems Equipment
   v. UL 1581-1998: Reference Standard for Electrical Wires, Cables, and Flexible Cords
   w. UL 1682-1998: Standard for Safety for Plugs, Receptacles, and Cable Connectors, of the Pin and Sleeve Type up to 800 Amperes and up to 600 volts ac or dc.
   x. UL 467-1998: Grounding and Bonding Equipment
   y. UL 813-1999: Commercial Audio Equipment and accessories for use in commercial enterprises… this standard was originally listed for public review in the October 13, 1995 issue of Standards Action. It is being resubmitted owing to substantive changes in the text.
   z. ANSI/TIA/EIA-568-A: Commercial Building Telecommunications Cabling
   aa. ANSI/TIA/EIA-569-A: Commercial Building Standard for Telecommunications Pathways and Spaces
   bb. ANSI/TIA/EIA-607: Commercial Building Grounding and Bonding Requirements for Telecommunications
   cc. ANSI/TIA/EIA TSB-72: Centralized Optical Fiber Cabling Guidelines
   dd. ANSI/TIA/EIA-526-14A: Optical Power Loss Measurements of Installed Multimode Fiber Cable Plant
1.9 GUARANTEE AND SERVICE

A. All systems and components shall be guaranteed free of defects in materials and workmanship for a period of one (1) year (or to the length of the Manufacturer’s warranty if longer) from the date of acceptance and shall be repaired or replaced within forty-eight (48) hours following report of such defects by the owner.

B. The Contractor shall be available on call and on eight (8) hour notice during the first month following acceptance of the system, to assist the Owner’s representatives in any problems which may arise during the initial period of operation. If corrective measures on-site are required they will be performed within 12 hours of the determination of a need for a site visit.

C. If, during the Guarantee period, any component is out of service for more than seven (7) days due to unavailability of parts or service, Contractor shall supply and install an identical new component. If an identical component is not available, Contractor will substitute equivalent equipment, with the approval of the Owner.

D. During the course of the Guarantee period, the Systems Contractor will provide the Owner with a 24 hour service phone number for emergency calls. A service engineer will respond to all emergency calls within one (1) hour. The personnel answering this call must be fully qualified to troubleshoot problems and propose solutions. A qualifying emergency event is defined as an event that may cause severe hardship or cause the systems to be inoperable or unusable for a scheduled class or event.

E. During the course of the Guarantee period, the Contractor shall provide a minimum of three (3) service visits to the site for inspection and adjustment of equipment. Contractor shall submit proposed schedule for these visits and shall notify Owner and Systems Designer in writing at least one month in advance of each visit.

F. During the course of the guarantee period, the Systems Contractor will supply the Owner with any published updates of manufacturer provided operating programs for any and all software-controlled equipment that are issued to correct “bugs”. During the Guarantee period, the Owner will rely on the Systems Contractor to determine when to update the software, unless it is needed to correct a situation that renders the systems unstable, non-functional, or otherwise affects operations.

G. Repeated device failures, defined as the failure of a device or a single type of device three or more times over three contiguous months, will be considered as a failure of a manufactured system and all items of this type shall be replaced at no charge to the Owner.

H. At least one representative of the Systems Contractor, well versed in the installation and the operation of the systems, shall be on site in support of the Owner for the first significant public event in each space (as determined by the Owner) where the system will be used. The Contractor representative(s) for this event shall also be competent in show operations.

I. Contractor is to coordinate ongoing remote access to AV Systems Networks for support and troubleshooting. Owner to provide the access at their discretion.

1.10 INSURANCE

A. All equipment and materials shall be fully insured against loss or damage up until acceptance of the system by the Owner or until Owner relieves the Contractor in writing of this responsibility, whichever is earlier, regardless of the location of the equipment. All equipment is
deemed to be under the control of the Systems Contractor until acceptance of the system by the Owner or until Owner relieves the Contractor in writing of this responsibility, whichever is earlier.

1.11 EXISTING CONDITIONS

A. Visit the site prior to making a bid. No subsequent allowance will be made due to failure to thus observe and verify conditions which may affect the work. Report to the Architect and Systems Designer any discrepancies among this specification and existing conditions and similarly report obvious omissions.
### 1.12 WORK SCOPE SUMMARY TABLE

◊ Installation criteria to be provided by Systems Contractor
PART 2 EQUIPMENT

2.1 GENERAL EQUIPMENT

A. Whenever any equipment is specified by manufacturer and model number, it is for purposes of establishing a standard of quality, performance, construction and function.

B. All materials and equipment shall be new and of the latest design or model offered for sale by the manufacturer.

C. Equipment models provided shall operate at the required AC line voltage and frequency.

D. Contractor shall provide quantities as indicated in the equipment list, detail drawings, location drawings, schedule of terminations, and as required for a complete installation.

E. Audio & Video Wire and Cable
   1. All wire numbers listed in the drawings are Belden unless otherwise noted.
   2. THHN wire is not an allowable substitute for twisted pair stranded loudspeaker wiring.
   3. Approved manufacturers: Belden, Canare, Gepco, West Penn, Whirlwind
   4. Where conflict exists with any codes or ordinances, such codes and ordinances shall take precedence.
   5. Where conflict exists with electrical specifications, the higher standard or more stringent requirement shall apply.

F. Wiring Devices
   1. Duplex Receptacles: per electrical drawings
   2. AV Technical power plates for receptacles must be labeled with the panel number and breaker number for the circuit(s) they are connected to (to be provided and installed by DIV. 26)

G. AV System Plates and Panels:
   1. Specifications – Rack Mount Panels
      Material: 11 gauge steel or 1/8" Aluminum, minimum thickness
      Finish: Black or to match adjacent equipment
      Size: 19" wide, standard EIA mounting hole spacing, height as specified
   2. Specifications – Back Box Enclosures
      Material: Code grade steel
      Finish: Black or galvanized
      Size: As specified
   3. Specifications – Plug Box and Termination Panels
      Material: 11 gauge steel or 1/8" Aluminum, minimum thickness
      Finish: Black (unless instructed otherwise by Architect)
      Size: As specified
   4. Approved Manufacturers: Steel City, Raco, Hoffman, Whirlwind, Pro Co, Wireworks

H. Audio Transformers
   1. All transformers shall be selected for proper interface and loading in the circuits as required by as-built conditions and per manufacturer's recommendations.

2.2 MAJOR EQUIPMENT

A. Equipment provided shall be that specified herein or approved substitute (see Paragraph 1.6.B).

B. Detailed performance specifications shall be those published by the manufacturer effective on the date of this document for all equipment listed.

C. See spreadsheet of major equipment in Appendix B.
2.3 DETAIL DRAWINGS

A. The drawings herein may detail custom built equipment and system details.

B. Furnish all materials and labor to provide complete and finished work even though not specifically shown on the drawings.

C. Detail drawings are located in large format AV drawings.
PART 3 EXECUTION

3.1 AUDIO SYSTEM REQUIREMENTS

A. Requirements herein refer to materials and work which are related to or part of the Systems. Where conflict exists with other specifications concerning such work or materials, this specification takes precedence unless otherwise approved in writing by the Owner.

3.2 INSTALLATION OF SYSTEMS

A. Locate all apparatus requiring adjustments, cleaning or similar attention so that it will be accessible for such attention. Equipment racks shall be positioned to permit full access for operation and service.

B. Furnish and install brackets, braces and supports. All mounting hardware shall be included.

C. All bolts and fasteners must be Grade 5 or better.

D. All bolted attachments to have lock washers or other self-locking fasteners.

E. Provide all required mounting brackets and framing, hardware and components, safety systems and rigging systems using the following minimum design factors (given as ratio of working load limit (WWL) : rated breaking load):

1. 5:1 – Minimum design factor for all mounting components regardless of mounting condition.

2. 5:1-8:1 – Minimum design factor for manufacturer provided mounts & assemblies where engineered stamped documentation and destructive testing data is provided by manufacturer.

3. 10:1 – For all hardware and connecting assemblies between manufacturer rated assemblies when equipment is hung above the general public. This includes but is not limited to wire rope, bolts, shackles, turnbuckles, beam clamps, supplemental steel provided by Systems contractor and other connecting hardware.

4. Design factor calculations to be provided with all equipment mounting details.

5. Systems Contractor shall coordinate required additional blocking, supplemental steel or channel strut supports with Main Contractor & specific trade contractors.

6. All mounting systems not provided as a complete package from a single manufacturer must be engineered, approved, and have drawings stamped by a professional rigging engineer or licensed structural engineer, as approved by the Main Contractor. The engineer shall verify that the design meets or exceeds design criteria for this particular use case. Each mounting system solution must be separately engineered, verified, and stamped.

F. All supporting structures and enclosures supplied by the Contractor not having a standard factory paint finish shall be painted. Paint specifications will be supplied by the Architect or indicated herein.

G. Provide custom color or finish for any equipment or materials supplied which are exposed to public view. Color and finish of all such equipment or materials shall be approved in writing by the Architect. This does not exclude equipment or materials where standard colors and finishes may be specified herein.

H. Finish of blank panels and custom assembly panels shall match adjacent equipment panels. Verify all panel colors with Architect. All color choices should be clearly indicated on panel drawing submittals, and on the panel schedule.

I. Switches, connectors, jacks, receptacles, outlets, cables and cable terminations shall be logically and permanently marked. Custom panel nomenclature shall be engraved, etched or screened. Markings for these items are detailed in the drawings to ensure consistency and clarity. Verify any changes in working type size and/or placement with the Systems Designer prior to marking.
J. Protect equipment and related wiring where construction conditions may cause damage or environmental conditions exceed manufacturer’s specifications.

K. The standard reference for the layout and construction of the system shall be:

3.3 CONDUIT

A. Review and coordinate Systems conduit installation with the electrical contractor to ensure proper operation of the Systems.

B. All wiring shall be in conduit unless authorized by the Architect, approved by the Systems Designer, and permitted by code. Exceptions are short runs at rack terminations where there is no means of connecting conduit to the equipment.

C. Where installed exposed, conduits shall be parallel with or at right angles to walls or ceilings and shall be supported from walls or ceilings by means of approved galvanized iron clamps or hangers. Conduit connections to equipment racks shall be insulated.

D. Minimum size conduit shall be 3/4 inch. All conduit shall be sized for maximum 40% fill or less if required by code.

E. No conduit run between pull boxes/termination boxes may exceed 100 feet in length.

F. No conduit run shall have more than 180 degrees of combined turns between pull boxes/termination boxes, and no single turn may exceed 90 degrees.

G. Conduit containing STP, UTP, and COAX wire types must be installed so that the final length of the cable runs does not exceed maximum cable lengths as stated in 3.8.N and 3.8.O.

H. All conduits, within 6” of termination box, junction box, gutter or rack/ladder tray, must be labeled with conduit group and destination of the opposite end of that conduit, as follows: “AV - <Group> - <opposite end>”. For example “AV – B – AA stage right”. Permanent marker on the conduit where it can be seen from the ground or nearest access point is acceptable.

3.4 CONDUIT SEPARATION

A. Systems wiring is divided into wiring groups according to their nominal voltage levels (refer to Schedule of Terminations):

<table>
<thead>
<tr>
<th>Wiring Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group A</td>
</tr>
<tr>
<td>Group B</td>
</tr>
<tr>
<td>Group C</td>
</tr>
<tr>
<td>Group D</td>
</tr>
<tr>
<td>Group E</td>
</tr>
<tr>
<td>Group F</td>
</tr>
</tbody>
</table>

Note: These wiring groups must never be intermixed within a given conduit run or junction box.

B. Minimum conduit separation between conduits carrying wiring of different groups is:

<table>
<thead>
<tr>
<th>Group A</th>
<th>Group B</th>
<th>Group C</th>
<th>Group D</th>
<th>Group E</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group A</td>
<td>adjacent</td>
<td>6&quot;</td>
<td>12&quot;</td>
<td>12&quot;</td>
</tr>
<tr>
<td>Group B</td>
<td>-</td>
<td>adjacent</td>
<td>12&quot;</td>
<td>6&quot;</td>
</tr>
<tr>
<td>Group C</td>
<td>-</td>
<td>-</td>
<td>adjacent</td>
<td>6&quot;</td>
</tr>
<tr>
<td>Group D</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>adjacent</td>
</tr>
<tr>
<td>Group E</td>
<td>-</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
<tr>
<td>Group F</td>
<td>12&quot;</td>
<td>12&quot;</td>
<td>12&quot;</td>
<td>12&quot;</td>
</tr>
</tbody>
</table>
Note: Ninety degree crossings in close proximity are acceptable. Separations must be maintained until within six feet of box or gutter entry.

C. Minimum conduit separation between conduits carrying Systems wiring and other electrical service conduit is:

<table>
<thead>
<tr>
<th></th>
<th>Group A</th>
<th>Group B</th>
<th>Group C</th>
<th>Group D</th>
<th>Group E</th>
<th>Group F</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimmer controlled lighting</td>
<td>24&quot;</td>
<td>12&quot;</td>
<td>6&quot;</td>
<td>12&quot;</td>
<td>12&quot;</td>
<td>24&quot;</td>
</tr>
<tr>
<td>SCR controlled services</td>
<td>24&quot;</td>
<td>12&quot;</td>
<td>6&quot;</td>
<td>12&quot;</td>
<td>12&quot;</td>
<td>24&quot;</td>
</tr>
<tr>
<td>220/440V circuits</td>
<td>6&quot;</td>
<td>6&quot;</td>
<td>adjacent</td>
<td>adjacent</td>
<td>adjacent</td>
<td>24&quot;</td>
</tr>
<tr>
<td>All other services</td>
<td>6&quot;</td>
<td>6&quot;</td>
<td>adjacent</td>
<td>adjacent</td>
<td>adjacent</td>
<td>24&quot;</td>
</tr>
</tbody>
</table>

Note: Heavy current demands in or long parallel runs with the above services may dictate greater separations to avoid interference in the Systems. Separations must be maintained until within six feet of box or gutter entry.

D. Contractor must have written authorization from the Systems Designer for any conduit installation which does not conform to these requirements. The conduit separations above are based on the use of EMT conduit for all AV and other signals. Separations where Rigid conduit is utilized for AV systems and/or other adjacent systems may be halved. Separations where PVC conduit is utilized for AV systems and/or other adjacent systems must be doubled. The Contractor must request information on separation adjustments for each instance where a different type of conduit than what is listed above is used.

3.5 ELECTRICAL POWER

A. Review and coordinate electrical power system installation including grounding with the electrical contractor to ensure proper operation of the Systems.

B. Verify that all AC power circuits designated for Systems equipment are wired with correct polarity and isolated ground. Report in writing any discrepancies found to the Architect for corrective action.

C. Provide distribution of electrical power within the equipment racks with a minimum of one spare AC receptacle for each four in use per branch circuit.

3.6 STEEL SUPPORTS

A. Fabricate and install any supports so that the installation does not weaken or overload the building structure. Do not impose the weight of equipment or fixtures on supports provided for other trades or systems. No drilling or cutting of concrete beams, joists, or structural steel, nor welding to structural steel, will be permitted except as authorized, in writing, by the Architect.

3.7 BOXES

A. With the exception of portable equipment, all boxes, conduits, cabinets, equipment and related wiring shall be held in place and the mounting shall be plumb and square.

B. All boxes shall be securely mounted to building structure. All boxes shall be installed so that wiring contained in them is accessible. Install blanking devices or threaded plugs in all unused holes.
C. Wiring groups and circuits shall be isolated as indicated herein. Common pull or junction boxes are not permitted except as authorized, in writing, by the Systems Designer.

D. Clean all box interiors before installing plates, panels or covers.

E. Using permanent marker on the box or on wire tags, indicate the lengths of installed cable for all COAX and Category wiring inside the box.

F. Using permanent marker, inside the box, indicate the box name, for example “AA”.

3.8 WIRING METHODS AND PRACTICES

A. Provide installation of all Systems wire and cable, ensuring proper:
   1. Pulling Tensions
   2. Quantities
   3. Types
   4. Lengths
   5. Routing
   6. Wire Group Separation
   7. Identification

B. The interconnection of equipment in a rack shall use the same wire by type as specified for runs external to racks unless otherwise indicated on AV single line drawings. All wiring within racks shall be direct between devices without splices.

C. Interconnection wire between amplifiers and loudspeaker transition panels will be type LSXFR (refer to wire types on AV0.01).

D. Connector polarity shall be maintained except for terminations at equipment manufactured to other standards. In the event that manufactured equipment can be ordered with, or internally set to, various standards, the equipment shall be configured as follows:
   1. Polarity for XLR style connector shall be: pin 2-high, pin 3-low, and pin 1-shield.
   2. Polarity for TRS style connector shall be: tip-high, ring-low, and sleeve-shield.

E. Spare wire runs of each group and type shall be pulled to each termination location. The number of spares shall be ten percent of those in actual use or one, whichever is greater.

F. Splicing of cables is not permitted between terminations of specified equipment.

G. Do not pull wire or cable through any box fitting or enclosure where change of raceway alignment or direction occurs without written approval from the Systems Designer; do not bend conductors to less than recommended radius. Employ temporary guides, sheaves, and rollers to protect cables from excess tension, abrasion or damaging bending during installation.

H. Provide wire pulling lubricants and pulling tensions in accordance with the wire and cable manufacturer's recommendations.

I. All wires shall be permanently identified at each wire end by marking with self-laminating adhesive labels fully covered with clear heat shrink tubing, and a chart kept of each wire’s function. This applies to wire within a rack assembly as well as wire running in conduit.

J. Wire ends should be wrapped with heat shrink tubing. Each shield or drain wire should be covered with heat shrink to avoid unintentional connections.

K. Use Wago or Entrelec DIN rail mounted terminal blocks for all terminal block wiring connections. Do not exceed one wire per terminal connection point. Do not cut strands from conductors to fit lugs or terminals. Spare terminal blocks, equivalent to 10% of those in actual use, shall be provided.

L. Form, in an orderly manner, all conductors in enclosures and boxes, wire ways and wiring troughs, providing circuit and conductor identification. Tie using wraps of appropriate size and
type. Limit spacing between ties to six (6) inches and provide circuit and conductor identification at least once in each enclosure.

M. Provide service loops, minimum 6', at each termination so that plates, panels, patch bays, and equipment can be dismounted and placed on an adjacent horizontal work surface allowing for safe service and inspection without disconnection.

N. Maximum installed length of Category cables is 200'

O. Maximum installed length of Coaxial cable for HD-SDI, 3G-SDI, 6G-SDI, and 12G-SDI is 200'

P. Provide lengths of installed cables marked inside each termination back box using legible and permanent markings.

3.9 GROUNDING

A. Audio system wiring shall conform to the following procedures:
   1. Audio equipment AC ground pins shall connect to AC isolated ground.
   2. Audio equipment chassis shall connect to AC isolated ground or rack frames.
   3. Audio rack frames shall connect to AC isolated ground bus in panelboard by means of #2 gauge (minimum) conductor.
   4. Audio shields between AC powered pieces of equipment, where signal shield is tied to chassis ground, shall be directly connected to ground at the initiating end only. Capacitively terminate the receiving end with a 0.1µF capacitor.
   5. Audio signal paths between AC powered pieces of equipment shall be connected using balanced lines and/or transformer isolation as required. No unbalanced signal paths may be connected to the patch bay.
   6. Isolate all Systems wiring from racks, back boxes and conduit.
   7. Isolate all Systems racks from conduit and other conductive surfaces. Use insulated bushings for conduit connections and a dielectric plinth between racks and conductive flooring materials.
   8. AC isolated ground system shall be isolated from all other facility grounds except at the single point of connection at the AV isolation Transformer.
   9. All metallic conduit, boxes and enclosures shall be grounded in accordance with the current National Electrical Code.

B. Metallic enclosures containing active equipment shall be grounded with due regard for the minimization of electrical noise. This may include the provision of grounding conductors separate from the AC ground.

3.10 EQUIPMENT RACKS

A. The equipment racks shall be considered as custom assemblies and shall be assembled, wired and tested in the Contractor's shop. Assembly of racks on-site will not be permitted, without written approval from the Systems Designer (except for system wiring which must terminate directly to the patch bays via soldering, punch-down or other non-connectorized termination process).

B. Placement of equipment in equipment racks, as shown in the drawings, is for maximum operator convenience. Verify any changes in placement of the equipment with the Systems Designer before assembly.

C. Racks shall be installed plumb and square without twists in the frames or variations in level between adjacent racks.

D. All wire, cable, terminal blocks, rack mounted equipment, and active slots of card frame systems shall be clearly and logically labeled as to their function, circuit, or system. Labeling on manufactured equipment shall be by engraved plastic laminate or by thermal printer on adhesive tape, with white lettering on black background or dark background that is similar to panel finish.
E. Provide stiffeners to custom panels to prevent panel deformation during normal plugging or switching operations.

F. All wires and cables used in assembling custom panels and equipment racks shall be formed into harnesses which are tied and supported in accordance with accepted engineering practice.

G. Harnessed cables shall be combed straight, wrapped every six (6) to ten (10) inches, and attached to the structure as necessary. Each cable that breaks out from a harness for termination shall be provided with an ample service loop so that panels, patch bays, and equipment can be dismounted and placed on an adjacent horizontal work surface allowing for safe service and inspection without disconnecting.

H. Harnessed cables shall be formed in either a vertical or a horizontal relationship to equipment, controls, components or terminations.

I. Cable shields shall be connected to the isolated ground system with due regard for ground loops. (See Giddings reference book, Chapter 10)

J. All system components and related wiring shall be located with due regard for the minimization of induced electro-magnetic and electrostatic noise, for the minimization of wiring length, for proper ventilation, and to provide reasonable safety and convenience for the operator.

K. All rack mounted equipment, with front panel controls, shall be provided with security covers to avoid tampering with preset levels. If specific security covers are not included in the equipment list, the Contractor will provide the manufacturer's security cover for each specified device or a suitable alternate.

L. Every device shall be installed with regard for proper polarity. Absolute polarity shall be maintained through the entire Systems signal chain.

M. Any permanently mounted electronic device must be balanced. Contractor will provide balancing transformers for unbalanced equipment connections where necessary.

3.11 VERIFICATION TESTS

A. Test each point to point wire segment individually, and test any linkage of multiple point to point cables that form an end to end link.

B. Contractor must document all verification test requirements and results for submission (see 3.13.A below).

C. Confirm that each individual wire and cable run (whether in a rack or in conduit) is identified with a unique number. These numbers are affixed to both ends of each cable and are clearly visible. Provide a complete list of these numbers along with the termination location of each end of the wire run.

D. Verify all circuits and extensions for correct connection, continuity and polarity. Absolute polarity must be maintained between all points in the system.

E. Identify installed length of all copper and fiber cabling.

F. Confirm that all system outputs are free of spurious signals including oscillations and radio frequency signals. A wide band oscilloscope shall be used to verify this condition.

G. Confirm that the system is free of audible clicks, pops, and other noises when any operating control is activated, with or without input signal.

H. For all microphone lines, tie lines, return lines and effect loudspeaker lines, confirm:
   1. Proper circuits appearing at each termination location
   2. Proper circuits appearing at each jack bay position
   3. Continuity of all conductors
   4. Proper polarity is maintained
5. Absence of shorts between conductors within each circuit  
6. Absence of shorts between circuit conductors and conduit  
7. Perform a sweep test to 0.5MHz  

I. For RF Coaxial cabling confirm:  
1. Receptacles output does not exceed +15dBmv (50-400MHz - +6 dBmv minimum, above 400MHz - +3dBmv minimum)  
2. For each modulated video output, tap to meet +9dBmv (+/- 3dBmv)  
3. Verify that all TV channels are visible and free of any interference or signal distortion  
4. Frequency sweep test from 5MHz to 1000MHz.  

J. For all other Coaxial cabling confirm:  
1. Verify that the installed cable meets, at a minimum, the requirements set forth in SMPTE ST 2081 for 6G-SDI single-link and 12G-SDI dual-link.  
2. Verify that TDR impedance is 75 +/-3 ohms  
3. Frequency sweep test from 5MHz to 6GHz.  

K. For Category Cabling:  
1. Use Category 6A cable pair tester to verify compliance with TIA/EIA standards referenced above (including all current addendums)  
2. Test each cable using the permanent link procedure for opens, shorts, reversals, cross twists and mis-wiring. Check NEXT, ELFEXT, Delay Skew, Return Loss, and Alien Crosstalk.  
3. Report all mis-wiring or failures found and report retests as needed.  
4. If any conductors report open or short, replace the entire wire and re-test.  

L. For Fiber cabling:  
1. Using appropriate test devices and proper factory terminated jumpers, measure all fiber optic line attenuations, end to end, as required by TIA/EIA-526-14A.  
2. Optical budget may not exceed the cable performance by length plus splice and connector losses (0.03 dB for each fusion splice, 0.3dB for each mechanical splice, and/or 0.4 dB for each connector).  
3. Overall attenuation must meet TIA/EIA-568B standards. Perform attenuation tests at 850nm and 1300nm.  

M. Confirm that loudspeakers and mountings are free of buzzes and rattles when the loudspeaker is swept with sine wave tones over its rated bandwidth at one-half (1/2) its maximum rated power.  

N. For all permanently mounted loudspeaker terminations, provide impedance measurement of each pair of loudspeaker lines with all loudspeakers connected and all amplifiers disconnected. These measurements shall be documented as editable tabular data listing impedance for each 1/3 octave band from 20 Hz to 20 kHz and shall be accurate to the nearest tenth of an Ohm.  

O. For all intercom terminations, confirm proper operation by initiating and receiving audio communication and call light. For single lines connected to a matrix, test each line with each channel in the matrix. Verify that all channels are quiet and without spurious noise.  

P. For all electronic devices mounted in racks and connected to patch bays, confirm:  
1. Every input and output is balanced.  
2. Proper polarity is maintained throughout the entire audio path.  
3. Tip connection of each TRS jack is connected to the positive terminal of each corresponding input or output.  

Q. For all devices requiring IP addressing:  
1. IP addressing scheme must make use of subnets such that all devices, regardless on which network (Audio, Video, Control, or House) they reside, have a unique IP address to
eliminate the possibility of duplicate IP addresses if networks are inadvertently cross-patched.
2. All devices must have static IP addresses.
3. Create a spreadsheet of all devices and their IP addresses, Subnet Masks, MAC Addresses, and other pertinent IP configuration information.
4. Coordinate all IP addressing schemes with the Owner.

R. If the Audio, Video, and Control network switches are dedicated to these systems and the systems do not rely on Owner furnished and configured network switches:
1. Configure network switches to operate properly and provide the proper network configurations to support the network devices and protocols used by those devices.
2. Configure, as needed, VLANS, IGMP, QOS, and other protocols requiring configuration to provide a fully functioning and robust network system.
3. With all networks configured and operating, and all network devices configured and operating, confirm that the networks are behaving as expected and as required.

S. Electrical Contractor, coordinating with the Systems Contractor must confirm that there are no shorts between the Neutral and Isolated Ground conductors, and between the isolated ground conductor and building ground for each AV Technical Power circuit. Electrical Contractor, coordinating with the Systems Contractor must confirm there are no Bootleg Grounds or Neutral-Ground Reversals on each AV Technical Power circuit.

T. The Contractor is responsible for the programming and configuration of all DSP systems and control systems necessary as specified in this project specification and AV large format drawings.
1. Programming and configuration must be complete and ready prior to System Designer’s arrival for verification of functionality and acceptance testing.
2. Programming for the DSP systems must contain control pages to support normal operations, and to support Acceptance Testing and System Tuning operations, as described in this specification and the large format AV drawings.
3. Programming for the Control Systems must include all master controller code and touch panel code and graphics, working together to provide the function as described in this specification and the large format AV drawings.

U. Test all Audio, Video, and Control system controls, including but not limited to mixing consoles, switchers, routers, touch panels, paging stations, volume controls, and source selectors for proper operation.

V. Test proper operation of any portable controls at each designated control location (Stage Manager’s rack, for example).

3.12 INITIAL ADJUSTMENT

A. All initial adjustments must be documented and submitted as part of the Verification Test Reports (see 3.13).

B. Make all adjustments and modifications so that the system is operational and fully functional including but not limited to:
1. Update all device software and firmware to the latest manufacturer’s recommended release that allows for proper operation with ALL OTHER DEVICES in the systems.
2. Make all adjustments and modifications for system gain structure per recommendations of major component manufacturers.
3. Properly configure all EDID and HDCP settings to allow for proper function of all video systems.
4. Install all programming for digital mixing consoles, DSP, Control and any other software based devices in the systems, and verify that audio and video signal passes as designed through these systems. Verify that control systems function as specified. Contractor to provide initial DSP and control system programming prior to acceptance testing, one full
set of programming changes and adjustments, prior to handover to the Owner, and one additional set of changes and adjustments during the initial warranty period, as part of the base scope of work.

5. Properly balance all 70 Volt loudspeaker zones to be consistent from zone to zone using amplifier settings and loudspeaker taps to adjust for differing loudspeakers or installation height. All 70 Volt loudspeakers within a given zone must not have a broadband SPL variation of greater than +/- 2dB.

6. Properly adjust delay and equalization for all loudspeaker systems using SIM, SMAART or other similar dual FFT type measurement devices. All testing and adjustment shall be in accordance with all manufacturer recommendations and industry standard practice. Contact the Systems Designer for further system delay and equalization requirements.

7. Capture traces showing magnitude and phase response for each loudspeaker or loudspeaker cluster before and after equalization and delay adjustments.

8. Capture traces showing magnitude and phase response for the systems operating as a whole from 3 locations in each major seating area. One of these areas should be the House Mix Position, if applicable.

9. Equalization and timing of the loudspeaker systems shall be further adjusted as required by the Systems Designer and Owner during Acceptance Testing.

3.13 VERIFICATION TEST REPORT

A. Submit written report detailing the results of Initial Adjustments and Verification Tests. Report to include, at minimum, the following:
   1. Copies of all relevant drawings, charts, test instrument data, and photographs.
      a. PDF copies of all available manufacturers’ operation and service literature for each major system component.
      b. Copy of all programming files including, but not limited to, Audio DSP programming and Graphic User Interface (GUI) files, Control system Touch Panel GUI files and control system control programming files including un-compiled source codes.
      c. All other documentation and results of testing and initial settings as referenced in 3.11, and 3.12 above.
      d. Written certification that the installation conforms to the requirements stated herein, is complete in all respects, and is ready for inspection, Acceptance Testing, and tuning.
   2. Prepare and submit an InfoComm standard Commissioning Checklist for each system in this specification.
   3. Prepare and submit a training syllabus for Owner training (see section 3.15).

B. This report shall be completed and submitted to the Systems Designer for review a minimum of five (5) days prior to Acceptance Testing and final tuning.

3.14 ACCEPTANCE TESTING

A. Acceptance Testing shall be performed by the Systems Designer and Contractor during a period designated by the Architect. Contractor shall furnish a minimum of two (2) technicians or one technician per Systems Designer commissioning team, for the acceptance testing period, and one or more engineers fully capable of programming DSP and Control systems, and making any other engineering adjustments to equipment in the systems. Contact Systems Designer for number of commissioning teams that will be deployed. For Bid purposes assume there will be two (2) commissioning team(s).

B. The minimum time required for Acceptance Testing is ten (10) working days, including five (5) days of dedicated quiet time. Coordinate this time period so that free access, work lighting, and electrical power are available on the site.

C. Ensure that Systems areas are in a clean and orderly condition ready for acceptance testing.
D. Provide test equipment (meeting the following minimum specifications) on site, at all times during Acceptance Testing. Prior to Acceptance Testing, provide the Systems Designer with a listing of the specific equipment to be made available (**).

1. Oscilloscope: 10MHz Bandwidth, Sensitivity – 1mV/cm
2. Digital Multi-meter: 1% Accuracy
3. Function Generator: 1MHz Bandwidth, Distortion < 1%
4. Real Time Analyzer: 1/3 Octave with microphone
5. SMAART Analysis package with V.8 software and a minimum of two matching test microphones (Earthworks M30 or better)
6. Pink Noise Source: 20 Hz – 20 kHz Bandwidth
7. Test mic tone calibrator
8. Impedance Sweep Meter: 20 Hz – 20 kHz Range, 1 Ohm – 50 kOhm
9. Polarity Checker: Mic, line, or loudspeaker level
10. Video Test Signal Generator(s): must provide all signals, resolutions, and output formats as needed to fully test the systems.

** Note: Systems Designers may choose to supply some of their own test equipment. Confirm specific requirements prior to commissioning.

E. Be prepared to verify the performance of any portion of the system by demonstration, listening tests and instrumented measurements.

F. Be prepared to facilitate the visual inspection of system components and wiring, including removal of termination panels for inspection of wiring termination and wire management practices.

G. Be prepared to demonstrate all software and control systems.

H. Be prepared to go through the commissioning checklist and verify all items as complete.

I. Make additional mechanical and electrical adjustments within the scope of the work and which are deemed necessary by the Systems Designer as a result of the Acceptance Tests. This may include realigning of loudspeaker systems, changes in system gain structures, grounding, filtering or interfaces.

J. Final acceptance will be contingent upon issuance by the Systems Designer of a letter of acceptance stating that the work has been completed and is in accordance with the contract documents.

K. Contractor will bear any costs incurred for additional Systems Designer's time and expenses due to failure to have the system functioning in accordance with specification requirements at the times scheduled for Systems Designer's Acceptance Testing.

3.15 USER TRAINING

A. Contractor will provide in-depth training in operation and regular maintenance of all systems and on all equipment included in the scope of work contained in this specification and the AV large format drawings.

B. Training to include (but is not limited to):

1. Detailed operation of mixing consoles, video switchers and routers, computer control systems and other essential system elements as relevant to their installation in this project.
2. Maintenance and repair of system equipment, including replacement procedures for user-replaceable parts.
3. Review of Operation and Maintenance Manual (See 3.16)

C. Contractor will provide a minimum of four (4) training sessions of four hours each with times and dates to be approved by the Owner.
D. The first session shall take place in the presence of the Systems Designer and shall occur directly after the completion of Acceptance Testing. If the Systems Designer, Owner, and/or Architect judge any work to be deficient and/or not substantially complete at the time scheduled for training, the training will be postponed until the Systems Designer, Owner, and Architect judge the entire AV system conforms to this specification and the AV large format drawings.

E. Contractor will bear any costs incurred for additional Systems Designer’s time and expenses due to failure to have the system functioning in accordance with specification requirements at the times scheduled for User Training.

3.16 SYSTEM DOCUMENTATION

A. Within thirty (30) days of the Acceptance Testing, prepare and submit a CD-ROM of the preliminary Operation and Maintenance manual for approval by the Systems Designer. Manual to include, at minimum, the following documents in PDF format:
   1. Table of contents
   2. Written Guarantee and service policy
   3. Basic power on/off and operational procedure
   4. Copies of all shop drawings which have been updated to include any changes made during the installation process
   5. All available manufacturers’ operation and service literature for each major system component
   6. One line signal flow diagram with all cable runs and patch points identified by alpha-numeric character
   7. Copy of the Verification Test report
   8. Copy of conduit riser diagram
   9. Copy of the final tuning settings as provided by the Systems Designer
   10. Copy of the IP Addressing table
   11. Copy of all uncompiled source codes and configuration files which have been updated to include any changes made during the installation process.

B. Systems Designer will review the above system documentation. Upon approval, Contractor shall prepare and submit to the Owner:
   1. Five (5) copies of the final Operation and Maintenance manual on CD-ROM or DVD.
   2. Two (2) hard copies of the final Operation and Maintenance manual printed and neatly bound

C. Provide framed or laminated copy of the as-built signal flow diagram for each theater to be mounted in each control room. This diagram shall have all cable runs and patch points identified by alpha-numeric character.

APPENDICIES TO FOLLOW
SECTION 27 41 00 – APPENDIX A
PERFORMANCE AUDIO/VIDEO SYSTEMS FUNCTIONAL DESCRIPTION

INTRODUCTION

This document outlines the AV system criteria for the programmed spaces for the Gateway Theater Complex (GTC) at Wayne State University (WSU). This narrative will offer a general overview of the AV systems included within each venue of the facility.

The AV systems have been designed from programming documentation and discussion with the end users, providing a highly flexible yet easy to use series of systems. These systems are designed to operate 24 hours a day, 7 days a week, and to facilitate continuous and simultaneous use of the entire Gateway Theater Complex, be it for performance or pedagogic need.

To facilitate understanding, the document is broken down into sections. These sections are as follows:

Part Description
1. Facility Wide Systems
2. Public Spaces
3. Valade Jazz Center
4. Proscenium Theater
5. Black Box Theater
6. Theater Support Spaces

1 - FACILITY WIDE SYSTEMS

The Gateway Theater Complex is designed as a fully integrated facility for the music and performing arts. To achieve this goal, many of the AV technical systems are interconnected, allowing fluid exchange of audio and video material for performance and pedagogical use. Systems that overlap operation, as well as systems that bridge performance venues in front-of-house and back-of-house areas are described below:

Isolated Ground for AV systems
All audio and video systems are powered by a separate Audio & Video Technical Power system (AVTP) to ensure noise-free operation. The AVTP system runs on a dedicated transformer and all associated outlets utilize dedicated isolated ground wires and hospital-grade outlets. The AVTP system is used only for audio and video equipment. The AVTP System also includes stage disconnects (company switches) in major performance spaces to facilitate outside events. Design of system and location of transformer (and if it is several) to be coordinated with the EE.

Video Transport & Matrix System
The GTC features a networked video transport and matrix system allowing staff and users a flexible and efficient approach to routing media feeds around the facility, for production, education or future streaming/broadcast use. The system uses a series of networked video encode and decode devices that patch to a facility wide video LAN. Interconnections are achieved through a control software, digitally connecting or disconnecting feeds from and to any room within the Complex.

Digital Intercom & Program/Page Matrix
Communication is key for the creation of performance and music arts. The GTC uses a state of the art digital intercom matrix to allow art makers an efficient, instantaneous ability to connect with other artists through multi-channel communication among technical operating personnel using headsets with boom-mounted microphones. Station and plugin ports are provided for all technical operating positions on the stages, and in booths and backstage support areas. Although each performance space has individual channels of intercom for their respective productions, the system can also combine communication needs
between rooms, allowing the Complex to operate collaboratively – all at once, or in specified zones. Wireless capabilities are also included, allowing flexible and mobile communication needs in each performance space and support space.

The back of house program and page system provides support spaces (control rooms, green & dressing rooms, etc) real time audio monitoring of activities taking place within the performance venues. The volume of the program feed can be adjusted locally, however a priority page system is in place to ensure any and all announcements or calls by the stage management team will be heard by the artists. For those support spaces that serve multiple performance halls, control system assignment is provided allowing personnel to choose which feed is appropriate for the space at that time.

**Owner Furnished Equipment**

The Gateway Theater Complex contains a great deal of owner furnished equipment for performance AV use in the various spaces. Much of this equipment is quite similar in nature and operation. Portable equipment is intended to be assigned to specific areas/rooms, however the operation of the facility relies on the sharing of certain types of equipment when areas/disciplines/halls are not in simultaneous use. This is done to provide the most efficient portable equipment solution for WSU, and limit the amount of doubling up required.

**AV Equipment Racks**

An audio/video equipment rack room is provided as the hub for:

- The digital signal processors ("DSP") used to time align, “tune” and control the main loudspeaker systems. These devices are selected for compatibility with the primary mix console and loudspeakers.
- Control and processing for the auxiliary systems, which includes ADA-compliant listening assistance, production intercom and backstage and lobby program and paging systems.
- The video distribution network system.
- Amplifiers for the main and auxiliary audio systems.

### 2 - PUBLIC SPACES

**Lobby**

Lobbies for performance spaces include monitoring capability (audio and video) to the adjacent performance hall, along with house manager page abilities. Video displays for digital signage, and latecomer show-relay are positioned adjacent to each performance space.

**Front-of-House Support**

The front-of-house support spaces have production intercom capabilities and selectable program and page feeds from the performance venues, allowing staff to monitor and communicate with backstage and stage management personnel as required. Designated front-of-house support spaces are as follows:

- Box Office
- Building Manager Office
- Production & Technical Director Offices

**Donor Lounge**

The Donor Lounge has selectable program and page feeds from designated Theatre performance spaces, allowing flexible use for any event taking place within the Complex. These rooms also have video displays able to show video relay feeds from the assigned performance space, as well as wireless presentation for private events.
3 – VALADE JAZZ CENTER

Performance Audio System
The audio system is designed to provide critical listening at moderately higher outputs for reinforced music.

- Left/right ("LR") main loudspeakers are suspended from the catwalk at the downstage edge of the stage to provide the majority of sound to the audience.
- Supplemental loudspeakers extend the reach and frequency content of the LR arrays. Typically these supplemental loudspeakers are from the same manufacturer as the main arrays to help facilitate uniform voicing.
  - Left and right out fills are located adjacent to the main loudspeakers to provide coverage to the outer edges of the audience chamber.
  - Left and right subwoofers extend low-frequency content for music.
  - Small portable loudspeakers incorporated in the stage lip provide imaging and intelligibility in the first few rows of seating.
- Connections for loudspeakers are provided around the stage and in the catwalks. These are used to connect portable monitor wedges and other loudspeakers, as needed.
- Connections for microphones and other input devices are provided around the stage and in the catwalks.
- A permanent in house mixing area will be located at the rear of the audience chamber.

Hearing Assistance System
This system transmits stage sound or other selected program material by means of radio frequency carrier to individual receivers provided for the hearing impaired. Alternate uses of the system include transmission of a second language or of audio descriptions for the sight impaired.

Intercom System
The system will have the capabilities and connections available to the overall Digital Intercom Matrix for the Gateway Theater Complex as described in the Facility Wide Systems section of this document.

Live Room Microphone System
A stereo microphone suspended in the audience chamber picks up signals from all performances, both amplified and unamplified. Signals from this source are distributed to a number of auxiliary systems, including hearing assistance, intercom, and the Program/Page Matrix. In addition, this source can be used to feed an archival recording system.

Recording Microphone System
To accommodate music performance recording, recording microphone inputs are provided in strategic locations in the catwalk for archival or broadcast recordings. Several studio-quality microphones can be suspended in the venue to pick up the sound of performances for archival and critical recording purposes. Signals from these sources can be patch to recording equipment.
Performance & Production Video

Video functions include lecture projection use, digital video, projected scenery, cinema, archival recording, and local-access broadcast.

- Projectors and screens will be provided by WSU. A number of portable networked video encoders and decoders will be provided to facilitate video input and output between devices and the video network.
- A projector slide can be accessed from the control booth keeping the sound of the projector isolated from the audience chamber.
- Connections for portable video (for temporary displays and camera locations) are provided around the stage and orchestra pit, in the catwalks and around the seating areas. These are used to connect portable devices, as needed such as conductor camera and confidence monitors.
- A permanent high-resolution camera is provided mounted at the back of the audience chamber, along with a lower-resolution camera capable of infrared imaging.

Valade Equipment Rack

An audio/video equipment rack room is provided for:

- The primary patch-bays used to interconnect the various input and output locations around the stage, catwalks, and audience chamber.
- Control and processing for the auxiliary systems, which includes ADA-compliant listening assistance, and backstage and lobby program and paging systems.
- Amplifiers for the main and auxiliary audio systems.

Loose Equipment

Wired and Wireless Microphones, DI boxes, cables, stands, effects loudspeakers and monitor wedges; portable video equipment; portable musical instruments; and other equipment appropriate to the program are provided.

Office/Dressing/Changing Rooms

Each of the rooms contains a program/page feeds from the Valade Jazz Center. This system provides audio relay of activities taking place within the halls, and can accept stage manager page, as discussed in section Facility Wide Systems of this document.

4 - PROSCENIUM THEATRE

Performance Audio System

The audio system is designed to fill multiple requirements — subtle voice lift for lectures and drama, moderately higher outputs for reinforced music, and controlled vocal imaging and sound effects for musical theater.

- Left/center/right (“LCR”) main loudspeakers are installed around the proscenium to provide the majority of sound to the audience.
• Supplemental loudspeakers extend the reach and frequency content of the LCR arrays. Typically these supplemental loudspeakers are from the same manufacturer as the main arrays to help facilitate uniform voicing.
  o Left and right subwoofers extend low-frequency content for music and effects. These are rigged from the forestage catwalk.
  o Small portable loudspeakers can be deployed along the stage lip or along the orchestra pit rail to provide imaging and intelligibility in the first few rows of seating. These speakers will transition between the stage face and the orchestra pit lift to accommodate multiple configurations.
• Connections for surround-sound effects and monitor loudspeakers are provided around the stage and orchestra pit, in the catwalks and around the seating areas. These are used to connect portable loudspeakers, as needed.
• Connections for microphones and other input devices are provided around the stage and in the catwalks.
• A mixing area will be located in the audience chamber at the cross aisle. This allows for in-house mixing of audio-critical shows (musical theatre and popular music events) with minimal loss of seats or sightline issues.

Hearing Assistance System
This system transmits stage sound or other selected program material by means of radio frequency carrier to individual receivers provided for the hearing impaired. Alternate uses of the system include transmission of a second language or of audio descriptions for the sight impaired.

Intercom System
The system will have the capabilities and connections available to the overall Digital Intercom Matrix for the Gateway Theater Complex as described in the Facility Wide Systems section of this document.

Live Room Microphone System
A stereo microphone suspended in the audience chamber picks up signals from all performances, both amplified and unamplified. Signals from this source are distributed to a number of auxiliary systems, including hearing assistance, intercom, and the Program/Page Matrix. In addition, this source can be used to feed an archival recording system.

Performance & Production Video
Video functions include lecture projection use, digital video, projected scenery, cinema, archival recording, and local-access broadcast.

• Projectors and screens will be provided by the owner. A number of portable networked video encoders and decoders will be provided to facilitate video input and output between devices and the video network.
• Power and connection panels in the projector booth allow the setup and operation of multiple projectors through projection rated glass.
• Connections for portable video (for temporary displays and camera locations) are provided around the stage and orchestra pit, in the catwalks and around the seating areas. These are used to connect portable devices, as needed such as conductor camera and confidence monitors.
• A permanent high-resolution camera is provided mounted at the back of the audience chamber, along with a lower-resolution camera capable of infrared imaging.

Theater Booth and Rack Rooms

• The control booth houses live mixing and playback equipment, including:
  o A medium format digital mixing console. This console can be relocated to the house mix position (see above) when needed.
  o Playback and recording on CD as well as hard-disk based effects playback.
  o The primary patch-bays used to interconnect the various input and output locations around the theater.
  o Booth audio, including monitoring for the audio and lighting operators and the stage manager.
• A stage rack is provided for:
  o The primary patch-bays used to interconnect the various input and output locations around the stage, orchestra pit, trap room and loading gallery

Proscenium Theater Loose Equipment

Wired and Wireless Microphones, DI boxes, cables, stands, effects loudspeakers and monitor wedges appropriate to the program are provided by the owner.

5 – BLACK BOX THEATER

Performance Audio System
The audio system is designed chiefly to provide playback of sound effects for theatrical productions. The audio system contains the following equipment:

• Connections for loudspeakers around the stage and at the grid. These are used to connect portable loudspeakers, as needed to suit the production sound design requirements. Loudspeakers will be provided by owner from existing inventory, however, new amplifiers have been provided for ease of patching and future console and loudspeaker upgrades.
• Connections for microphones and other input devices are provided around the stage and at the grid.
• A temporary mixing connection can be patched from the stage deck to the booth equipment rack. This allows for in-house mixing of audio-critical shows.

Hearing Assistance System
This system transmits stage sound or other selected program material by means of radio frequency carrier to individual receivers provided for the hearing impaired. Alternate uses of the system include transmission of a second language or of audio descriptions for the sight impaired.

Intercom System
Along with local intercom capabilities, the system will have the capabilities and connections available to the overall Digital Intercom Matrix for the Gateway Theater Complex as described in the Facility Wide Systems section of this document.
Live Room Microphone System
A microphone suspended in the audience chamber picks up signals from all performances, both amplified and unamplified. Signals from this source are distributed to a number of auxiliary systems, including hearing assistance, intercom, lobby, and the Program/Page matrix.

Performance & Production Video
Video functions include performance and lecture projection use (such as PowerPoint), digital video, cinema, and local-access broadcast.

- Projectors and screens will be provided by the owner. A number of portable networked video encoders and decoders will be provided to facilitate video input and output between devices and the video network.
- A permanent high-resolution camera is provided mounted, along with a lower-resolution camera capable of infrared imaging.
- Connections for portable video (for temporary displays and camera locations) are provided around the stage and at the grid. These are used to connect portable devices, as needed.

Control Booth and Rack Rooms

- The control booth houses live mixing and playback equipment, including:
  - A small format digital mixing console. This console can be relocated to the house mix position when needed.
  - Playback and recording on CD and hard-disk.
  - The primary patch-bays used to interconnect the various input and output locations around the theater.
  - Booth audio, including monitoring for the audio and lighting operators and the stage manager.

Blackbox Theatre Loose Equipment
Wired and Wireless Microphones, DI boxes, cables, stands, effects loudspeakers and monitor wedges appropriate to the program are provided.

6 – THEATER SUPPORT SPACES

Equipment Racks
An audio/video equipment rack room is provided as the hub for:

- The digital signal processors ("DSP") used to time align, “tune” and control the main loudspeaker systems. These devices are selected for compatibility with the primary mix console and loudspeakers.
- Control and processing for the auxiliary systems, which includes ADA-compliant listening assistance, production intercom and backstage and lobby program and paging systems.
- The video distribution network system.
- Amplifiers for the main and auxiliary audio systems.
Dressing Rooms
Each of the dressing rooms contains selectable program/page feeds from the Proscenium Theatre or Black Box Theatre. This system provides audio relay of activities taking place within the halls, and can accept stage manager page, as discussed in section Facility Wide Systems of this document. The Dressing Rooms also have video displays able to show video relay feeds from the assigned performance space.

Warm-Up/Green Room/Lounge
These spaces have production intercom capabilities and selectable program and page feeds from designated Theatre performance spaces, allowing flexible use for any event taking place within the Complex. These rooms also have video displays able to show video relay feeds from the assigned performance space, as well as wireless presentation where designated.

Electrics Shop
The Scene and Electrics Shop space houses the equipment rack to service all terminations in the shop/dressing room portion of the building.

**END OF SECTION**
SECTION 280528
PATHWAYS FOR ELECTRONIC SAFETY AND SECURITY

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Metal conduits, tubing, and fittings.
   2. Nonmetallic conduits, tubing, and fittings.
   3. Optical-fiber-cable pathways and fittings.
   4. Metal wireways and auxiliary gutters.
   5. Nonmetallic wireways and auxiliary gutters.
   8. Handholes and boxes for exterior underground cabling.

B. Related Requirements:
   1. Section 078400 "Firestopping" for firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.
   2. Section 260543 "Underground Ducts and Raceways for Electrical Systems" for exterior duct-banks, manholes, and underground utility construction.
   3. Section 260533 "Raceways and Boxes for Electrical Systems" for conduits, wireways, surface raceways, boxes, enclosures, cabinets, handholes, and faceplate adapters serving electrical systems.

1.3 DEFINITIONS
A. ARC: Aluminum rigid conduit.
B. GRC: Galvanized rigid steel conduit.
C. IMC: Intermediate metal conduit.

1.4 SUBMITTALS
A. Product Data: For surface pathways, wireways and fittings, floor boxes, hinged-cover enclosures, and cabinets.
B. LEED Submittals:
   1. Product Data for Credit IEQ 4.1: For solvent cements and adhesive primers, documentation including printed statement of VOC content.
   2. Laboratory Test Reports for Credit IEQ 4: For solvent cements and adhesive primers, documentation indicating that products comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."
C. Shop Drawings: For custom enclosures and cabinets. Include plans, elevations, sections, and attachment details.
D. Coordination Drawings: Pathway routing plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of items involved:
   1. Structural members in paths of pathway groups with common supports.
   2. HVAC and plumbing items and architectural features in paths of conduit groups with common supports.

E. Qualification Data: For professional engineer.

F. Seismic Qualification Certificates: For pathway racks, enclosures, cabinets, and equipment racks and their mounting provisions, including those for internal components, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   3. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.
   4. Detailed description of conduit support devices and interconnections on which certification is based and their installation requirements.

G. Source quality-control reports.

H. Refer to Section 018113 “Sustainable Design Requirements” for requirements of sealants, primers, paints, adhesives, caulk, aerosols, and coatings.

PART 2 PRODUCTS

2.1 METAL CONDUITS, TUBING, AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. AFC Cable Systems, Inc.
   3. Anamet Electrical, Inc.
   4. Bridgeport Fittings, Inc.
   5. Electri-Flex Company.
   7. Picoma Industries; Subsidiary of Mueller Water Products, Inc.
   8. Republic Conduit.
   9. Robroy Industries
   10. Southwire Company.
   12. Western Tube and Conduit Corporation.

B. General Requirements for Metal Conduits and Fittings:
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Comply with TIA-569-D.

C. GRC: Comply with ANSI C80.1 and UL 6.

D. IMC: Comply with ANSI C80.6 and UL 1242.

E. EMT: Comply with ANSI C80.3 and UL 797.

F. FMC: Comply with UL 1; zinc-coated steel.

G. LFMC: Flexible steel conduit with PVC jacket and complying with UL 360.
H. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.
   1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 886 and NFPA 70.
   2. Fittings for EMT:
      a. Material: Steel or Zinc die cast.
      b. Type: Setscrew or compression.
   3. EMT Fittings Materials:
      a. All Zinc materials shall be ASTM B86 certified.
      b. All Zinc Product shall be ZAMAK #3 and/or #7 formula.
      c. All Steel shall be SAE 1050.
   4. EMT Fittings Design:
      a. Zinc die cast components shall be ball burnished.
      b. Steel parts shall be zinc plated for corrosion protection.
      c. All Locknuts shall have a dual, precision machined-cut thread, reversible and possess a serrated face on each side.
      d. All set screw products shall be manufactured with a tri-drive head and staked or modified to prevent disassembly.
      e. All fitting throat diameters shall be smooth with no sharp edges or slag.
      f. Rain tight products shall have internal sealing rings to create and maintain a rain tight seal.
      g. All fittings shall be tested per UL 514B and be listed by Underwriters Laboratories.
   5. Transition Fittings:
      a. All transitions fittings (go-to or from-to fittings) or fittings used to transition from one raceway type to another must be UL listed for that application.

I. Joint Compound for IMC, or GRC: Approved, as defined in NFPA 70, by authorities having jurisdiction for use in conduit assemblies, and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

2.2 NONMETALLIC CONDUITS, TUBING, FITTINGS AND ACCESSORIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. AFC Cable Systems, Inc.
   3. Anamet Electrical, Inc.
   5. CANTEX Inc.
   6. CertainTeed Corp.
   8. Electri-Flex Company.
   10. Lamson & Sessions; Carlon Electrical Products.
   11. Niedax-Kleinhuis USA, Inc.
   12. RACO; a Hubbell Company.

B. General Requirements for Nonmetallic Conduits and Fittings:
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Comply with TIA-569-D.

C. ENT: Comply with NEMA TC 13 and UL 1653.

D. RNC: Type EPC-40-PVC, complying with NEMA TC 2 and UL 651 unless otherwise indicated.

E. LFNC: Comply with UL 1660.

F. Rigid HDPE: Comply with UL 651A.
G. Continuous HDPE: Comply with UL 651B.

H. RTRC: Comply with UL 1684A and NEMA TC 14.

I. Fittings for ENT and RNC: Comply with NEMA TC 3; match to conduit or tubing type and material.

J. Fittings for LFNC: Comply with UL 514B.

K. Solvent cements and adhesive primers shall have a VOC content of 510 and 550 g/L or less, respectively, when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

L. Solvent cements and adhesive primers shall comply with the testing and product requirements of the California Department of Health Services' "Standard Practice for the Testing of Volatile Organic Emissions from Various Sources Using Small-Scale Environmental Chambers."

2.3 OPTICAL-FIBER-CABLE PATHWAYS AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Alpha Wire Company.
   2. Arnco Corporation.
   3. Endot Industries Inc.
   4. IPEX.
   5. Lamson & Sessions; Carlon Electrical Products.

B. Description: Comply with UL 2024; flexible-type pathway, approved for plenum installation unless otherwise indicated.
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Comply with TIA-569-D.

2.4 SURFACE PATHWAYS

A. General Requirements for Surface Pathways:
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Comply with TIA-569-D.

B. Surface Metal Pathways: Galvanized steel with snap-on covers complying with UL 5. Manufacturer's standard enamel finish in color selected by Architect.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Mono-Systems, Inc.
      b. Niedax-Kleinhuis USA, Inc.
      c. Panduit Corp.
      d. Wiremold / Legrand.

2.5 BOXES, ENCLOSURES, AND CABINETS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Adalet.
   2. Cooper Technologies Company; Cooper Crouse-Hinds.
   3. EGS/Appleton Electric.
   5. Hoffman; a Pentair company.
   6. Hubbell Incorporated; Killark Division.
   7. Lamson & Sessions; Carlon Electrical Products.
8. Milbank Manufacturing Co.
9. Molex, Woodhead Brand
10. Mono-Systems, Inc.
12. RACO; a Hubbell Company.
13. Robroy Industries.
14. Spring City Electrical Manufacturing Company.
15. Stahlin Non-Metallic Enclosures; a division of Robroy Industries.
17. Wiremold / Legrand.

B. General Requirements for Boxes, Enclosures, and Cabinets:
   1. Comply with TIA-569-D.
   2. Boxes, enclosures and cabinets installed in wet locations shall be listed for use in wet locations.

C. Sheet-Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.

D. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy or aluminum, Type FD, with gasketed cover.

E. Box extensions used to accommodate new building finishes shall be of same material as recessed box.

F. Metal Floor Boxes:
   1. Material: Cast metal or sheet metal.
   2. Type: Semi-adjustable.
   3. Shape: Rectangular.
   4. Listing and Labeling: Metal floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

G. Nonmetallic Floor Boxes: Nonadjustable, rectangular.
   1. Listing and Labeling: Nonmetallic floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

H. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.

I. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, cast aluminum or galvanized, cast iron with gasketed cover.

J. Device Box Dimensions: 4-inches square by 2-1/8 inches deep (100 mm square by 60 mm deep).

K. Gangable boxes are prohibited.

L. Nonmetallic Outlet and Device Boxes: Comply with NEMA OS 2 and UL 514C.

M. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250, Type 1 with continuous-hinge cover with flush latch unless otherwise indicated.
   1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
   2. Nonmetallic Enclosures:
      a. Material: Plastic or Fiberglass.
   3. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.

N. Cabinets:
   1. NEMA 250, Type 1, galvanized-steel box with removable interior panel and removable front, finished inside and out with manufacturer's standard enamel.
   2. Hinged door in front cover with flush latch and concealed hinge.
   3. Key latch to match panelboards.
   4. Metal barriers to separate wiring of different systems and voltage.
5. Accessory feet where required for freestanding equipment.
6. Nonmetallic cabinets shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.6 HANDHOLES AND BOXES FOR EXTerior UNDERGROUND CABLEING

A. General Requirements for Handholes and Boxes:
   1. Boxes and handholes for use in underground systems shall be designed and identified as defined in NFPA 70, for intended location and application.
   2. Boxes installed in wet areas shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   3. Comply with TIA-569-D.

B. Polymer-Concrete Handholes and Boxes with Polymer-Concrete Cover: Molded of sand and aggregate, bound together with polymer resin, and reinforced with steel, fiberglass or a combination of the two.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Armorcast Products Company.
      b. Carson Industries LLC.
      d. NewBasis.
      e. Oldcastle Precast, Inc.; Christy Concrete Products.
      f. Synertech Moulded Products; a division of Oldcastle Precast, Inc.
   2. Standard: Comply with SCTE 77.
   3. Configuration: Designed for flush burial with open bottom unless otherwise indicated.
   4. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
   5. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   6. Cover Legend: Molded lettering, "ELECTRIC."
   7. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.
   8. Handholes 12 Inches Wide by 24 Inches Long (300 mm Wide by 600 mm Long) and Larger: Have inserts for cable racks and pulling-in irons installed before concrete is poured.

C. Fiberglass Handholes and Boxes: Molded of fiberglass-reinforced polyester resin, with frame and covers of polymer concrete, reinforced concrete or fiberglass.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. Armorcast Products Company.
      b. Carson Industries LLC.
      d. NewBasis.
      e. Nordic Fiberglass, Inc.
      f. Oldcastle Precast, Inc.; Christy Concrete Products.
      g. Synertech Moulded Products; a division of Oldcastle Precast, Inc.
   2. Standard: Comply with SCTE 77.
   3. Color of Frame and Cover: Green.
   4. Configuration: Designed for flush burial with open bottom unless otherwise indicated.
   5. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure and handhole location.
   6. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   7. Cover Legend: Molded lettering, "ELECTRIC."
8. Conduit Entrance Provisions: Conduit-terminating fittings shall mate with entering ducts for secure, fixed installation in enclosure wall.

9. Handholes 12 Inches Wide by 24 Inches Long (300 mm Wide by 600 mm Long) and Larger: Have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.7 SOURCE QUALITY CONTROL FOR UNDERGROUND ENCLOSURES

A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
   1. Tests of materials shall be performed by an independent testing agency.
   2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
   3. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 EXECUTION

3.1 PATHWAY APPLICATION

A. Outdoors: Apply pathway products as specified below unless otherwise indicated:
   1. Exposed Conduit: GRC, IMC, or RNC, Type EPC-40-PVC.
   2. Concealed Conduit, Aboveground: EMT.
   3. Underground Conduit: RNC, Type EPC-80-PVC direct buried or Type EPC-40-PVC concrete encased.
   4. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC or LFNC.
   5. Boxes and Enclosures, Aboveground: NEMA 250, Type 3R.

B. Indoors: Apply pathway products as specified below unless otherwise indicated:
   1. Exposed, Not Subject to Physical Damage: EMT.
   2. Exposed, Not Subject to Severe Physical Damage: EMT or IMC.
   3. Exposed and Subject to Severe Physical Damage: GRC or IMC. Pathway locations include the following:
      a. Loading dock.
      b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
      c. Mechanical rooms.
      d. Gymnasiums
   4. Concealed in Ceilings and Interior Walls and Partitions: EMT.
   5. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric-Solenoid, or Motor-Driven Equipment): FMC, except use LFMC in damp or wet locations.
   6. Damp or Wet Locations: GRC or IMC.
   7. Pathways for Optical-Fiber or Communications Cable in Spaces Used for Environmental Air: Plenum-type, optical-fiber-cable pathway, Plenum-type, communications-cable pathway or EMT.
   8. Pathways for Optical-Fiber or Communications-Cable Risers in Vertical Shafts: Riser-type, optical-fiber-cable pathway or Riser-type, communications-cable pathway.
   9. Pathways for Concealed General Purpose Distribution of Optical-Fiber or Communications Cable: EMT.
   10. Boxes and Enclosures: NEMA 250, Type 1, except use NEMA 250, Type 4 stainless steel in institutional and commercial kitchens and damp or wet locations.
C. Minimum Pathway Size: 3/4-inch (21-mm) trade size. Minimum size for optical-fiber cables is 1 inch (27 mm).

D. Pathway Fittings: Compatible with pathways and suitable for use and location.
   1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.
   2. EMT: Use setscrew or compression, steel or Zinc die-castmetal fittings. Comply with NEMA FB 2.10.
   3. Flexible Conduit: Use only fittings listed for use with flexible conduit. Comply with NEMA FB 2.20 and UL514B.

E. Do not install aluminum conduits, boxes, or fittings in contact with concrete or earth.

F. Install surface pathways only where indicated on Drawings.

G. Do not install nonmetallic conduit where ambient temperature exceeds 120 deg F (49 deg C).

3.2 INSTALLATION

A. Comply with NECA 1, NECA 101, and TIA-569-D for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NECA 102 for aluminum pathways. Comply with NFPA 70 limitations for types of pathways allowed in specific occupancies and number of floors.

B. Keep pathways at least 6 inches (150 mm) away from parallel runs of flues and steam or hot-water pipes. Install horizontal pathway runs above water and steam piping.

C. Complete pathway installation before starting conductor installation.

D. Comply with requirements in Section 270529 "Hangers and Supports for Communications Systems" for hangers and supports.

E. Arrange stub-ups so curved portions of bends are not visible above finished slab.

F. Install no more than the equivalent of three 90-degree bends in any conduit run except for communications wiring conduits for which only two 90-degree bends are allowed. Support within 12 inches (300 mm) of changes in direction.

G. Conceal conduit and EMT within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.

H. Support conduit within 12 inches (300 mm) of enclosures to which attached.

I. Pathways Embedded in Slabs:
   1. Run conduit larger than 1-inch (27-mm) trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support. Secure pathways to reinforcement at maximum 10-foot (3-m) intervals.
   2. Arrange pathways to cross building expansion joints at right angles with expansion fittings.
   3. Arrange pathways to keep a minimum of 1 inch (25 mm) of concrete cover in all directions.
   4. Do not embed threadless fittings in concrete unless specifically approved by Architect for each specific location.
   5. Change from ENT to IMC before rising above floor.

J. Raceways Embedded in Concrete Slabs on Composite Steel Decking:
   1. All raceways embedded in slabs shall be approved by the Architect and local building official having jurisdiction over the Project prior to installation. In no case shall the installation violate the structural integrity of the slab.
   2. Conduit must be uncoated or galvanized iron or steel not less than standard Schedule 40 steel pipe (RMC).
3. The conduit outside diameter shall not exceed 1/3 the thickness of the slab above the composite deck.

4. Conduit clear spacing must be at least three times the conduit diameter, or 3-inches minimum, whichever is greater.
   a. Maximum group size shall not exceed 6 conduits in any case.
   b. Install conduit in deck low flutes when running parallel to direction of metal deck.

5. Secure raceways to steel deck at 4'-0" o.c. to prevent sagging or shifting during concrete placement with a minimum concrete cover of at least one inch all around.

6. Piping and conduit shall be so fabricated and installed that cutting, bending, or displacement of reinforcement from its proper location will not be required.

7. Install additional layer of WWF 6x6 W2.1xW2.1 slab reinforcement over all embedded conduit groups of three or more and extending at least two feet beyond each side.

K. Raceways Embedded in Elevated Concrete Slabs:

   1. All raceways embedded in slabs shall be approved by the Architect and local building official having jurisdiction over the Project prior to installation. In no case shall the installation violate the structural integrity of the slab.

   2. Conduit must be uncoated or galvanized iron or steel not less than standard Schedule 40 steel pipe (RMC).

   3. The conduit outside diameter shall not exceed 2-inches.

   4. Conduit clear spacing must be at least three times the conduit diameter, or 4-inches minimum, whichever is greater.
      a. Maximum group size shall not exceed 4 conduits in any case.
      b. Install conduit between top and bottom reinforcing with a minimum concrete cover between conduit and reinforcing of at least 1-inch all around.

   5. Chair conduit from formwork at 4'-0" o.c. to prevent sagging or shifting during concrete placement.

   6. Piping and conduit shall be so fabricated and installed that cutting, bending, or displacement of reinforcement from its proper location will not be required.

   7. No embedded conduits of any size are allowed within 48-inches of face of columns without prior approval of Structural Engineer.

   8. Where conduit cannot be installed without violating these provisions, it shall be routed in ceiling space above or below.

L. Raceways Within 1 ½" of Roof Deck:

   1. All raceway shall be installed further from 1 ½" of roof deck or raceway shall be RMC or IMC.

M. Stub-ups to Above Recessed Ceilings:

   1. Use EMT, IMC, or RMC for pathways.

   2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.

N. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of pathway and fittings before making up joints. Follow compound manufacturer's written instructions.

O. Coat field-cut threads on PVC-coated pathway with a corrosion-preventing conductive compound prior to assembly.

P. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install insulated bushings on conduits terminated with locknuts.

Q. Install pathways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus 1/4 turn more.
R. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to conduit assembly to assure a continuous ground path.

S. Cut conduit perpendicular to the length. For conduits of 2-inch (53-mm) trade size and larger, use roll cutter or a guide to ensure cut is straight and perpendicular to the length.

T. Install pull wires in empty pathways. Use polypropylene or monofilament plastic line with not less than 200-lb (90-kg) tensile strength. Leave at least 12 inches (300 mm) of slack at each end of pull wire. Cap underground pathways designated as spare above grade alongside pathways in use.

U. Surface Pathways:
   1. Install surface pathway for surface electrical outlet boxes only where indicated on Drawings.
   2. Install surface pathway with a minimum 2-inch (50-mm) radius control at bend points.
   3. Secure surface pathway with screws or other anchor-type devices at intervals not exceeding 48 inches (1200 mm) and with no less than two supports per straight pathway section. Support surface pathway according to manufacturer’s written instructions. Tape and glue are not acceptable support methods.

V. Pathways for Optical-Fiber and Communications Cable: Install pathways, metal and nonmetallic, rigid and flexible, as follows:
   1. 3/4-Inch (21-mm) Trade Size and Smaller: Install pathways in maximum lengths of 50 feet (15 m).
   2. 1-Inch (27-mm) Trade Size and Larger: Install pathways in maximum lengths of 75 feet (23 m).
   3. Install with a maximum of two 90-degree bends or equivalent for each length of pathway unless Drawings show stricter requirements. Separate lengths with pull or junction boxes or terminations at distribution frames or cabinets where necessary to comply with these requirements.

W. Install pathway sealing fittings at accessible locations according to NFPA 70 and fill them with listed sealing compound. For concealed pathways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install pathway sealing fittings according to NFPA 70.

X. Install devices to seal pathway interiors at accessible locations. Locate seals so no fittings or boxes are between the seal and the following changes of environments. Seal the interior of all pathways at the following points:
   1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
   2. Where an underground service pathway enters a building or structure.
   3. Where otherwise required by NFPA 70.

Y. Comply with manufacturer’s written instructions for solvent welding PVC conduit and fittings.

Z. Expansion-Joint Fittings:
   1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 deg F (17 deg C), and that has straight-run length that exceeds 25 feet (7.6 m). Install in each run of aboveground RMC and EMT conduit that is located where environmental temperature change may exceed 100 deg F (55 deg C) and that has straight-run length that exceeds 100 feet (30 m).
   2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:
      a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F (70 deg C) temperature change.
      b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F (86 deg C) temperature change.
      c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F (70 deg C) temperature change.
      d. Attics: 135 deg F (75 deg C) temperature change.
3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F (0.06 mm per meter of length of straight run per deg C) of temperature change for PVC conduits. Install fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per deg F (0.0115 mm per meter of length of straight run per deg C) of temperature change for metal conduits.

4. Install expansion fittings at all locations where conduits cross building or structure expansion joints.

5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer’s written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.

AA. Flexible Conduit Connections: Comply with NEMA RV 3. Use maximum of 72 inches (1830 mm) of flexible conduit for recessed and semirecessed luminaires, equipment subject to vibration, noise transmission, or movement; and for transformers and motors.

1. Use LFMC in damp or wet locations subject to severe physical damage.

2. Use LFMC or LFNC in damp or wet locations not subject to severe physical damage.

BB. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to top of box unless otherwise indicated.

CC. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surface to provide a flat surface for a rain-tight connection between box and cover plate or supported equipment and box.

DD. Horizontally separate boxes mounted on opposite sides of walls so they are not in the same vertical channel. Do not install boxes back-to-back.

EE. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.

FF. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits.

GG. Set metal floor boxes level and flush with finished floor surface.

HH. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

II. Install hinged-cover enclosures and cabinets plumb. Support at each corner.

JJ. Boxes installed in metal stud and sheetrock walls shall have far-side box support.

KK. Boxes shall be secured to metal studs with spring steel clamp which wraps around the entire face of the stud and digs into both sides of the stud. Clamp shall be screwed into the stud.

LL. Set outlet boxes for flush mounted devices to within 1/8" of finished wall.

MM. Minimum box size to be two gang. For installation of single gang device use properly sized mud ring with thickness to install device within 1/8" of finished wall.

NN. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall.

OO. Firestopping: Provided by Section 078400 “Firestopping”. Coordinate with Section 078400 “Firestopping” for sealing of penetrations through fire and smoke barriers.

### 3.3 INSTALLATION OF UNDERGROUND CONDUIT

A. Direct-Buried Conduit:
1. Excavate trench bottom to provide firm and uniform support for conduit. Prepare trench bottom as specified in Section 312333 "Trenching and Backfilling" for pipe less than 6 inches (150 mm) in nominal diameter.

2. Install backfill as specified in Section 312333 "Trenching and Backfilling."

3. After installing conduit, backfill and compact. Start at tie-in point, and work toward end of conduit run, leaving conduit at end of run free to move with expansion and contraction as temperature changes during this process. Firmly hand tamp backfill around conduit to provide maximum supporting strength. After placing controlled backfill to within 12 inches (300 mm) of finished grade, make final conduit connection at end of run and complete backfilling with normal compaction as specified in Section 312333 "Trenching and Backfilling."

4. Install manufactured duct elbows for stub-ups at poles and equipment and at building entrances through floor unless otherwise indicated. Encase elbows for stub-up ducts throughout the length of elbow.

5. Install manufactured rigid steel conduit elbows for stub-ups at poles and equipment and at building entrances through floor.
   a. Couple steel conduits to ducts with adapters designed for this purpose, and encase coupling with 3 inches (75 mm) of concrete for a minimum of 12 inches (300 mm) on each side of the coupling.
   b. For stub-ups at equipment mounted on outdoor concrete bases and where conduits penetrate building foundations, extend steel conduit horizontally a minimum of 60 inches (1500 mm) from edge of foundation or equipment base. Install insulated grounding bushings on terminations at equipment.

6. Warning Planks: Bury warning planks approximately 12 inches (300 mm) above direct-buried conduits, but a minimum of 6 inches (150 mm) below grade. Align planks along centerline of conduit.

7. Underground Warning Tape: Comply with requirements in Section 260553 "Identification for Electrical Systems."

### 3.4 INSTALLATION OF UNDERGROUND HANDHOLES AND BOXES

A. Install handholes and boxes level and plumb and with orientation and depth coordinated with connecting conduits to minimize bends and deflections required for proper entrances.

B. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1/2-inch (12.5-mm) sieve to No. 4 (4.75-mm) sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas, set so cover surface will be flush with finished grade. Set covers of other enclosures 1 inch (25 mm) above finished grade.

D. Install handholes with bottom below frost line, or with anchors extending below depth of frost line of 48 inches (122 cm) below grade.

E. Install removable hardware, including pulling eyes, cable stanchions, cable arms, and insulators, as required for installation and support of cables and conductors and as indicated. Select arm lengths to be long enough to provide spare space for future cables, but short enough to preserve adequate working clearances in enclosure.

F. Field cut openings for conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

### 3.5 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR ELECTRONIC SAFETY AND SECURITY
PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 280544 "Sleeves and Sleeve Seals for Electronic Safety and Security Pathways and Cabling."

3.6 FIRESTOPPING

A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements in Section 078400 "Firestopping."

3.7 PROTECTION

A. Protect coatings, finishes, and cabinets from damage and deterioration.
   1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
   2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

END OF SECTION
SECTION 28 10 00

COMMUNICATIONS OVRVIEW

PART 1 - GENERAL

1.01 SECTION INCLUDES
   A. This section provides a project overview and general project and Contractor requirements for technology work.
   B. The “Contractor” as referred to in these specifications, shall be the bidder whose bid is eventually chosen as the winner.
   C. The “Engineer” as referred to in these specifications, shall be Commtech Design and its representative on this project.
   D. The “Owner” as referred to in these specifications, shall be Wayne State University and its representatives.
   E. In the detailed specifications and on the contract drawings, the phrases “or equivalent,” “approved equivalent,” “approved equal,” “or equal” and “engineer approved equivalent” shall be used interchangeably and shall mean the same thing.
   F. All equals, equivalents, or alternates shall be approved by the Engineer prior to ordering or installation. Without approval, deviation from the products listed in the specifications and on the drawings, shall be presumed to be nonconforming and shall be removed and replaced at the direction of the Engineer and at the Contractor’s expense.

1.02 DESCRIPTION OF PROJECT
   A. Access Control System
      1. Install access control systems in the building.
         a. Provide and install all equipment shown.
         b. Owner has the servers and software for each system in place.
         c. Work with C&IT on implementation of the systems.
      2. There shall be two distinct systems in the building.
         a. Pegasys system for the exterior doors
         b. OneCard system for the interior doors.
         c. See drawings for which doors and what devices are connected to each system.
         d. These systems shall be an expansion of the existing University systems
      3. Provide raceways as shown on the drawings.
      4. Install all cabling required connect each door to the security panels
         a. Security panels shall be located in each communications room. See drawings.
         b. Wire from each power supply to the panels and to the devices at the doors
      5. Install intercoms. Where the intercom is connected to the data network the contractor shall provide all patch cables and configure the network to support the intercoms
      6. Configure the system as per the owner’s requirements. Meet with them to determine configuration parameters
      7. The extent of the work shall be as shown on the drawing and detailed in these specifications
   B. Video Security System
      1. See drawings and specs for CAT-6 cable installation and who is responsible for installing cabling.
      2. Provide and install all cameras at all locations noted
      3. The owner has existing servers and software.
      4. Owner to provide licenses for all cameras
      5. Owner to install camera software and configure the cameras on the system. Contractor shall configure each camera with the University provided IP addresses.
      6. Provide each MAC address of the cameras to the owner.
7. The extent of the work shall be as shown on the drawing and detailed in these specifications.

C. Post installation documentation
1. Each contractor shall provide post installation documentation as per the specifications. Shall include but not be limited to:
   a. Red-lined as-built drawings
   b. As-built detailed connectivity of AV and Network Systems
   c. As-built cable locations and cable labels at each location.
   d. Mark all splice locations
   e. Update of all access control locations and equipment at each door
   f. Camera locations and camera numbers.
   g. Spreadsheet (hard copy and Excel file) for all network, Wireless, telephones and cameras detailing:
      A) Mfg. Part number
      B) IP Address
      C) MAC Address
      D) Device number (Camera #, Telephone # etc)

1.03 STORAGE OF MATERIALS
A. All materials shall be secured when not in use by the Contractor.
B. It shall be the Contractor’s responsibility to secure all equipment including all material to be installed as part of the contract. No changes shall be made to the contract due to loss or theft of equipment and materials not officially accepted by the Owner.

1.04 PERMITS
A. The State of Michigan requires that the Contractor apply for and obtain permits for data telecommunication installation.
B. This is required under State of Michigan Public Act 230. Only exemptions to the permit requirements are found in Public Act 230 MCL125.1528a.
   1. There is not a license required to apply for a permit per Public Act 407 MCL339.5737(3)(o).
D. People who can obtain the permit include the Owner of the building or a company representing the owner. See Public Act 230 MCL125.1510.
   1. Contractor shall be required to apply for and obtain the permit
   2. Contractor shall be required to install the data telecommunications system to fully meet all code requirements and requirements of the Inspector and Authority Having Jurisdiction (AHJ)
E. The inspection process for data telecommunications is the same as any other inspection by the State of Michigan.
   1. Do not cover or conceal any wiring without approval.
   2. Electrical Inspectors will be conducting the inspections.
   3. Contractor shall be responsible for scheduling the inspections and attending the inspections with the inspector
F. The inspectors will be inspecting for code compliance including manufacture’s installation instructions for the cables and terminations.
G. An installation may not pass inspection if there is any Non-compliance with the code.

1.05 REFERENCE SPECIFICATIONS-CABLING
A. All work applicable shall conform to the following standards:
   B. ANSI/TIA-568-C.0, “Generic Telecommunications Cabling for Customer Premises”,
   C. ANSI/TIA-568-C.1, “Commercial Building Telecommunications Cabling Standard”,

COMMUNICATIONS OVERVIEW 28 10 00 - 2
F. ANSI/TIA/EIA-569-B Commercial Building Standard for Telecommunications Pathways and Spaces

G. IA-606-B: Administration Standard for the Telecommunications Infrastructure of Commercial Buildings including all Updates and Addenda.

H. TIA-607-C: Generic Telecommunications Bonding and Grounding (Earthing) for Customer Premises.

1.07 CONTRACTOR-ALL

A. Each contractor shall be responsible for inspecting their own work and ensuring it meets the project requirements.

B. Contractor shall have a project manager who will be responsible for all work, workers, equipment, cabling and project management for their work. The project manager shall have the authority to make decisions for the contractor and schedule all workers.

C. Contractor shall attend all project meetings throughout the project.

D. All work on the project shall meet all applicable state, federal, local and industry codes and be installed according to the requirements of the Authority Having Jurisdiction (AHJ).

1.08 CONTRACTOR –SECURITY

A. The Contractor shall show proof of an existing contractual relationship with the approved equipment manufacturer of the video security system and access control system and shall pass through the manufacturer's certification to purchaser.

B. All hardware shall be sourced from the certifying manufacturer to assure quality control and validity of the manufacturer's warranty.

C. The Contractor shall accept complete responsibility for the installation, certification, and support of the security system. Contractor must show proof that he has the certifying manufacturer's support on all of these issues.
D. All work shall be performed and supervised by security technicians and project managers who are qualified to install security systems, and to perform related tests as required by the manufacturer in accordance with the manufacturer's methods.

E. The security technicians employed shall be fully trained and qualified by the manufacturer on the installation and testing of the equipment to be installed. Evidence that the vendor is a current certified installer of the manufacturer must be provided in writing prior to work commencing on the video security system.

F. The Contractor (including Subcontractor(s) if any) shall have a proven track record in security projects. This must be shown by the inclusion of details of at least 3 projects similar in scope and requirements which have been completed by the vendor in the last 2 years. Names, addresses, and phone numbers of references for the 3 projects shall be included.

PART 2 - PRODUCTS

2.01 FIRESTOPPING

A. Each contractor shall be responsible for firestopping around their cables and the raceways.

B. Shall be completed inside and around all conduits after cable installation.

C. Firestop for the area between the cable and the edge of the conduit shall be Nelson No. FSP, CLK or LBS+. Contractor shall install the best firestop for each individual installation.
   1. Firestop shall be installed with regard to local and national building codes.
   2. The firestop shall be a putty like substance that expands under heat and will not allow flame to pass for a designated period of time.
   3. Firestop shall conform to all NEC, NFPA, and UL requirements.
   4. Some wall pass-thru’s are shown on the drawings. The Contractor shall utilize these where possible.
   5. Where the contractor must install cables through a wall where there is no pass-thru already provided, the Contractor shall be responsible for installing a fire-rated pass-thru and fire-stopping the conduit after cable installation.

D. Firestopping is required at all riser conduits and all pass thru’s.
   1. Each cable tray penetration of a wall shall be firestopped after cable installation. Use pillow type firestop to allow additional cables to be installed in the future.
   2. Where riser conduits pass through floors, the area between the concrete and the conduit shall be firestopped. This shall be completed with a putty or liquid firestop product. Fill in the space with mineral wool, and then install the firestop on top. All firestop shall be of sufficient thickness to secure the rating required by code.
   3. After final cable installation, install a putty firestop around all cables where they enter and exit conduit pass thru’s and conduit risers.
   4. All firestop shall be installed to provide the fire rating as described by local fire code.
   5. It shall be the responsibility of the Contractor to verify that all conduits, walls, and raceways required to be firestopped have been firestopped.

E. Contractor shall provide a label at each penetration and firestop location detailing the UL rated fireproofing solution that was used in the specific application.
   1. Apply sticker to the wall near the firestopped conduit.
   2. Provide a sample of the label to the designer for review as part of the submittals.

PART 3 - EXECUTION

3.01 INSTALLATION

A. Contractor shall be familiar with the location(s) where the work will be done. No additional compensation will be made for items the Contractor claims he was not aware of during bidding.

B. Work Area:
COMMUNICATIONS OVERVIEW

1. All work areas shall be cleaned at the end of each day. All debris shall be cleaned and removed from the site and disposed of in the approved container for the site.
2. All equipment shall be moved out of common areas and stored in the Contractor's lay down area, or in other approved storage locations on site.
3. Any work that is low hanging or may otherwise impede the general use of the space, and cannot be removed, shall be flagged and cordoned off by the Contractor.

C. All equipment and parts shall be installed in a neat and workmanlike manner. Good installation principles shall be used throughout the project.

D. All cables routed above the drop ceiling or in the ceiling area shall be installed square to the building. Diagonal cable runs are not permissible.

E. All cut edges of conduits, boxes, raceway, etc., shall be trimmed and filed so that no burrs or rough edges will damage cable as it is installed.

F. All surface raceways, including conduits in exposed areas shall be painted to match the existing colors of the surrounding area.

G. If, in the course of the work, the Contractor damages, marks, or misplaces any ceiling tiles, the Contractor shall repair, and/or replace the ceiling tile to the original condition.

1. The Engineer shall decide if ceiling tiles have been damaged. Based on the Contractors proposed fixes, the Engineer shall decide the best course of action to repair any damage done by the Contractor to the ceiling tiles.

H. It shall be the responsibility of the Contractor to repair any damage done to the structure or finishes in the building by the Contractor. The building shall be returned to its original condition prior to final sign off of the project.

I. Firestop shall be installed to meet national and local codes.

3.02 DOCUMENTS

A. The Contractor shall fully read the contract documents including the detailed specifications, and the detailed drawings.

B. No additional compensation shall be made for any portion of the project which the Contractor did not know of or understand prior to providing the bid response.

C. In the case of any discrepancies between the detailed drawings and the detailed specifications, the Contractor shall provide the higher quality or more stringent requirement.

3.03 WORK PLAN-POST BID (CHOSEN CONTRACTOR ONLY)

A. Along with the submittals the Contractor shall provide a work plan for the implementation of the telephone switch and data/wireless network. The plan shall include scheduled dates for major milestones, and all phases required for completion prior to final cutover.

B. The work plan shall list all items that must be completed by the Contractor or Owner to provide a smooth install of the telephone system and data network. The Contractor shall be responsible for all costs associated with the planning and cutover. The Owners only responsibility is to act as a liaison between the Contractor and the users.

C. The work plans shall include a timeline and a cutover date for the systems within each building. Contractor shall be responsible for all aspects of scheduling the work, including notification of the users, the administration, and the telephone service provider.

D. The work shall commence within 10 days of award of the contract. The Contractor shall be responsible for attending weekly project meetings at the Owner's site to report on progress and keep the project team informed of the work being done.

E. The work plan will be reviewed at each weekly meeting for compliance and updates.

F. Work shall immediately begin on site surveys to determine the existing infrastructure and determining placement of new system electronics. The Contractor shall be responsible for moving, relocating, and reconnecting any and all existing equipment required for the installation of the new systems.

G. After work plan and system approval by the Engineer the Contractor can begin work on infrastructure work that does not impede users.
H. The Contractor shall be responsible for working with the Owner’s Information Technology staff and administrators.

END OF SECTION 28 10 00
SECTION 283111
DIGITAL, ADDRESSABLE FIRE-ALARM SYSTEM

PART 1 GENERAL

1.1 RELATED REQUIREMENTS

A. All air-sampling ports installed in decorative and finished ceilings shall be installed discrete and co-
ordinated with architecture for final finish color. Coordinate with architectural reflected ceiling plan
prior to installation. Contact the architect of design where discrepancies and/or conflicts occur with
ceiling finishes, décor and other discipline construction documents.

B. All air-sampling network piping in open ceiling gallery spaces shall be routed in-line with structural
ceiling joists, hidden from view when possible, and be painted to match surrounding finish. Piping
network shall be effectively labeled in accordance with NFPA-72, Chapter 17. Coordinate with ar-
chitectural reflected ceiling plan prior to installation. Contact the architect of design where discrep-
ancies and/or conflicts occur with ceiling finishes, décor and other discipline construction documents.

C. Air-sampling network piping route and sampling port locations shall be included as part of the shop
drawing package and submitted to the electrical engineer of design as well as the architect of de-
sign. Refer to section 1.5 ACTION SUBMITTALS for all shop drawing requirements.

D. All concealable notification devices installed in decorative and finished ceilings shall be coordinated
with architecture for final finish color. Coordinate with architectural reflected ceiling plan prior to in-
stallation. Contact the architect of design where discrepancies and/or conflicts occur with ceiling
finishes, décor and other discipline construction documents. Concealable notification device prod-
uct data and shop drawings shall be submitted to the electrical engineer of design as well as the
architect of design. Refer to section 1.5 ACTION SUBMITTALS for all shop drawing requirements.

1.2 PROJECT SUMMARY

A. Provide a new microprocessor controlled, intelligent reporting fire alarm system serving the new ad-
dition to the Hilberry Theatre, as shown on the drawings and specified herein. The system shall in-
clude, but not be limited to, alarm initiating devices, alarm notification appliances for live and pre-
recorded evacuation instructions, Network Fire Alarm Control Panels (FACP), Network Reporting
Nodes, Network Liquid Crystal Displays, auxiliary control devices, remote power supplies, remote
annunciators, emergency voice/alarm communication equipment, and wiring. All fire alarm equip-
ment shall be provided to form a complete, U.L. listed, coordinated system, ready for operation.

B. Control Equipment:

1. The Fire Alarm Control Panel (FACP) that is programmed to monitor and control all of the build-
ing fire alarm devices and emergency voice control equipment, and a Fire Alarm Network Re-
porting terminal shall be located in the Security Control/Monitoring Room 01.315.
   a. The Fire Alarm Contractor shall provide all firmware and software as required to establish a
      fully functional monitoring and control interface to the Fire Alarm Network Reporting Termi-
nal. All interface equipment provisions, equipment connections, software integration,
      equipment support, and site coordination shall be the responsibility of the Fire Alarm Con-
tractor.

2. Alarm acknowledging, alarm silencing and system resetting shall be accomplished only from
   the main building FACP or Network Reporting Terminal in the Fire Command Room. The sys-
tem shall only be reset by factory trained and authorized personnel for the installed system.
   These three (3) functions shall be password protected.
C. System Supervision: The system shall be electrically supervised and monitor the integrity of all conductors. Each designated initiating point shall simultaneously transmit separate and distinct alarm, supervisory and trouble signals to the fire alarm network.

D. System Monitoring: Provide a digital communicator to connect to Owner provided telephone circuits. Provide 3 output zones, (1) sprinkler waterflow, (2) supervisory signal, (3) alarm other than waterflow.

E. System Wiring Connections: The system shall be a proprietary, low voltage, closed circuit, electrically supervised, non-coded, continuous sounding type as described in NFPA 72. Circuit type and supervision shall be Class A for the fire alarm network connections, Class A for Signaling Line Circuits (SLC’s) from the control panels to the initiation devices, and Class A for the Notification Appliance Circuits (NAC’s).

F. Audible Alarm Indication:
   1. The system shall include a multiplexed emergency voice alarm communication system utilizing distributed amplification and intelligence such that loss of operation by the main emergency control panel will not result in the loss of evacuation signal throughout the balance of the building. Provide remote amplifiers distributed throughout the building as indicated on the construction documents. Connect the speakers on each level to their respective floor amplifier. Provide 25% spare wattage capacity in every amplifier. Provide a distributed standby amplifier for every five (5) primary operating amplifiers. The system shall feature automatic switchover to a standby amplifier in the event of any primary amplifier failure. Amplifiers shall feature volume controls, concealed behind locking or screw-on covers. Amplifiers shall be current limited and constantly monitored.
   2. Pre-recorded messages shall originate from a solid state storage device. Failure of the message system shall result in automatic takeover by alarm tone signal. Voice system will be single channel in design. Provide pre-recorded messages for fire and other public safety messages. Coordinate exact pre-recorded messages with the Owner prior to programming of the system.
   3. The digitized voice messages shall be recorded exclusively for the building per the Owner’s requirements, and shall be factory recorded utilizing a female voice. All messages will be custom programmed to match the building owner’s requirements. The message shall notify building occupants that a fire condition has been detected or alert of other public safety warnings. The message will automatically identify the specific floor location from which the alarm originated. Generalized alarm messages, which do not specifically identify the alarm floor location within the text of the message, are not acceptable.
   4. Emergency manual voice override shall be provided in the main building FACP.
   5. Provide emergency one-way paging capability in the main building FACP. The system shall feature dual microphone preamplifiers and spare power amplifiers for redundancy. The system shall include a hand held type microphone with push-to-talk switch. The microphone cable shall be permanently connected to the control panel. Operation of the system microphone push-to-talk switch shall pre-empt any alarm tone or pre-recorded message in the selected communication zone. System pre-amplifier shall be supervised. Any pre-amplifier failure shall automatically cause a standby pre-amplifier to be substituted and cause a trouble indication on the main control panel.
   6. The amplifier monitoring system shall consist of any UL listed method that does not result in an audible output in the system speakers, but will cause a trouble signal upon detection of any failure which would interfere with amplification and reproduction of alarm tones and evacuation messages. Detection of an amplifier failure shall automatically cause substitution of a standby amplifier and shall activate the trouble indicator and audible signal at the fire alarm network.
   7. Audible notification system Speaker units shall be white in color.

G. Visual Alarm Indication: Complete building visual xenon-strobe type units to provide a synchronized flash rate. The strobe units will conform to the light intensities as indicated on the drawings.
1. Visual notification system strobe units shall be white in color.

H. Interface to other Sections: The fire alarm system contractor shall be responsible for coordination with all Division 21, 22, and 23 contractors for fire protection and suppression system interfaces, as well as the required interface between the fire alarm system and the Building Management System (BMS). This coordination shall include, as a minimum deluge suppression systems, and all other fire protection systems (wet and dry sprinkler systems). The contractor shall provide all necessary devices, wiring, etc.

I. Fire Protection Systems:

1. The system shall monitor the status of the building wet and dry sprinkler fire protection systems. Three levels of monitoring shall be provided:
   a. Alarm: activated when a water flow condition is detected.
   b. Supervisory: activated when a gate valve is closed indicating a tamper switch is activated.
   c. Supervisory: activated when an off - normal system air pressure signal is detected.
   d. Trouble - activated when a short, open, or other fault is detected on the initiation circuit.

J. The system shall control the fire protection sprinkler system exterior horn/strobe. Activation of water flow indicating switch shall automatically activate the exterior horn/strobe. The horn/strobe shall be connected to a non-silenceable circuit so that anytime a water flow condition is detected, the horn/strobe will operate regardless of the status of the fire alarm system. All wiring shall be supervised and the horn/strobe shall operate on 24 VDC power from the fire alarm system.

K. Interface to the Building Management and Control System:

1. The fire alarm system shall include dry contact interfaces to the building BMS System equipment for control and indication of HVAC fan shutdown and damper control and monitoring.

L. Fan Shutdown: The system shall automatically shut down HVAC systems if smoke is detected in the main supply or return ducts of the unit. Duct mounted smoke detectors shall transmit a supervisory signal to the fire alarm network. The network shall then activate an addressable control module that shall interface to the fan control circuit.

M. Security System Interface: The system shall include the following interfaces to the building access control/security system:

1. Automatic Door Closure
   a. Provide programmable monitoring modules to interface to the security system for automatic release of magnetic door holders. Provide one (1) monitoring input per building floor per occupancy separation. The security system shall initiate a signal for door holder release. The fire alarm system shall monitor this signal via monitoring modules, and shall activate the appropriate fire alarm control module(s), which are connected to door holder power circuits.
   b. The fire alarm system shall include dry contact interfaces to the building Access Control System for unlocking of doors and with the 120V auto operators for opening of doors and monitoring door position per the smoke control sequence as described in specification section 230993.

2. Automatic Unlock of Electric Locking Mechanisms
   a. Interface requirements to provide automatic unlocking of electric locking mechanisms controlled by the security system, upon a fire alarm condition as required by applicable codes and the local Authority Having Jurisdiction (AHJ).

3. Monitoring of Fire Alarm Manual Unlock Switch
   a. Interface requirements to provide monitoring of the fire alarm system manual unlock switch for electric locking mechanisms control by the security system, as required by applicable codes and the local Authority Having Jurisdiction (AJH).

4. Auxiliary Monitoring of Fire Alarm and Trouble Conditions
a. Interface requirements to provide auxiliary monitoring of the fire alarm system general alarm and trouble conditions by the security system.

5. System Interface
a. In order to provide the fire alarm/security system interface, the Fire Alarm System Contractor shall provide interface cabinets at each location as indicated below. Each interface cabinet shall contain all terminals required to interface each associated point to the security system as specified herein.

<table>

6. Fire Alarm Interface Cabinet
a. The fire alarm contractor shall provide lockable continuous hinge cover, U.L. listed enclosures with dual-screw barrier terminal strips for each interface point as indicated on the Security Drawings. All terminals shall be labeled to identify their function.
b. The Architect, prior to installation, shall approve the exact style and finish of each enclosure.
c. Each fire alarm interface cabinet shall provide a tamper switch to be monitored by the security system, and shall be keyed as defined by the Architect.

7. Automatic Unlock of Electric Locking Mechanisms
a. The fire alarm contractor shall provide normally closed auxiliary dry output contacts such that upon a general fire alarm condition, the contacts shall open and the security system shall unlock the electric locking mechanism. The contacts shall remain open until the fire alarm system in manually reset.

8. Monitoring of the Manual Unlock Switch
a. The fire alarm contractor shall provide a normally closed, auxiliary dry output contact for security monitoring of the position status of the fire alarm manual unlock switch. The contact shall open when the switch is placed in the unlock position and shall remain open until the switch is returned to the locked position.
b. The fire alarm contractor shall provide any hardware/software required to interface the fire alarm manual unlock switch to the security system.
c. The fire alarm contractor shall provide and terminate all conduit, power and wiring required for the monitoring of the manual unlock switch.

9. Auxiliary Monitoring of Fire Alarm and Trouble Conditions
a. The fire alarm contractor shall provide separate normally closed, auxiliary dry output contacts for general alarm and general trouble conditions. Upon an alarm and/or trouble condition the contact shall open and the security system shall annunciate the associated condition. The contacts shall remain open until the fire alarm system in manually reset.

10. Fire Alarm Interface Cabinet
a. The fire alarm contractor shall provide interface cabinets in readily accessible, concealed locations, no more than 8'0" A.F.F. Coordinate the exact location of the interface cabinet location with the Architect.
b. The fire alarm contractor shall provide any hardware/software, control logic, and/or relays required to interface the fire alarm system to the security system as specified herein.
c. The fire alarm contractor shall provide and terminate all conduit, power, and wiring required for the installation of each interface cabinet.
a. The fire alarm contractor shall provide one (1) spare pair of wires, for future use,
d. The Security Contractor shall provide and terminate all wiring from the interface cabinet to the security system.
e. All wiring shall be U.L. listed for fire alarm applications.
1.3 SUMMARY

A. Section Includes:
   1. Fire-alarm control panel.
   3. System smoke detectors.
   4. Air-sampling smoke detectors.
   5. Heat detectors.
   7. Device guards.
  10. Graphic annunciator.
  11. Addressable interface device.
  12. Digital alarm communicator transmitter.

B. Project Summary

C. System Spare Capacity
   1. Provide spare capacity for fire alarm circuits as required below.
      b. Amplifier Circuits: 25% spare capacity for each circuit installed.
      c. Signaling Line Circuits (SLC): 25% spare capacity for each circuit installed.

D. Related Requirements:
   1. Section 087100 “Door Hardware”
   2. Section 211313 “Wet-Pipe Sprinkler Systems”
   3. Section 230993 “Sequence of Operation for HVAC Controls”
   4. Section 237316 “Air-Handling Units”
   5. Section 280500 “Common Work Results for Electronic Safety and Security”
   6. Section 280513 “Conductors and Cables for Electronic Safety and Security”
   7. Section 260526 “Grounding and Bonding for Electrical Systems”
   8. Section 260533 “Raceways and Boxes for Electrical Systems”
   9. Section 260544 “Sleeves and Sleeve Seals for Electrical Raceways and Cabling”

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product, including furnished options and accessories.
   1. Include construction details, material descriptions, dimensions, profiles, and finishes.
   2. Include rated capacities, operating characteristics, and electrical characteristics.

B. Shop Drawings: For fire-alarm system.
   1. Provide coversheet indicating project title, project location, and vendor contact information.
   2. Organize submittal into logical sections and provide table of contents.
   3. Provide itemized bill of materials indicating model number and quantity for each product.
   4. On datasheets with multiple products, indicate which product is provided under this project.
   5. Combine electronic submittals into one unified PDF document that is organized per the table of contents. The submittal shall be free of copyrighted files and proprietary file formats. Electronic links may be submitted to supplement product datasheets, but may not be used as a substitute for product datasheets that are required to be included in the unified PDF submittal.
   6. Manufacturers’ catalog sheets with complete technical data for each item being furnished.
   7. Comply with recommendations and requirements in the “Documentation” section of the “Fundamentals” chapter in NFPA 72.
   8. Include plans, elevations, sections, details, and attachments to other work.
9. Include details of equipment assemblies. Indicate dimensions, weights, loads, required clearances, method of field assembly, components, and locations. Indicate conductor sizes, indicate termination locations and requirements, and distinguish between factory and field wiring.

10. Detail assembly and support requirements.

11. Include voltage drop calculations for notification-appliance circuits.

12. Include battery-size calculations.

13. Include input/output matrix.

14. Settings for occupant notification
   a. Include wattage taps and decibel (dB) ratings at each speaker and speaker/strobe device.

15. Include statement from manufacturer that all equipment and components have been tested as a system and meet all requirements in this Specification and in NFPA 72.

16. Include performance parameters and installation details for each detector.

17. Include performance parameters and installation details for all each surge suppression module.

18. Verify that each duct detector is listed for complete range of air velocity, temperature, and humidity possible when air-handling system is operating.

19. Provide program report showing that air-sampling detector pipe layout balances pneumatically within the airflow range of the air-sampling detector.

20. Include plans, sections, and elevations of heating, ventilating, and air-conditioning ducts, drawn to scale; coordinate location of duct smoke detectors and access to them.
   a. Show critical dimensions that relate to placement and support of sampling tubes, detector housing, and remote status and alarm indicators.
   b. Show field wiring required for HVAC unit shutdown on alarm.
   c. Locate detectors according to manufacturer’s written recommendations.
   d. Show air-sampling detector pipe routing.

21. Include voice/alarm signaling-service equipment rack or console layout, grounding schematic, amplifier power calculation, and single-line connection diagram.

22. Include floor plans to indicate final outlet locations showing address of each addressable device. Show size and route of cable and conduits and point-to-point wiring diagrams.

C. General Submittal Requirements:

1. Submittals shall be approved by authorities having jurisdiction prior to submitting them to Architect.

2. Shop Drawings shall be prepared by persons with the following qualifications:
   a. Trained and certified by manufacturer in fire-alarm system design.
   b. NICET-certified, fire-alarm technician; Level III minimum, Level IV preferred.
   c. Licensed or certified by authorities having jurisdiction.

D. Delegated-Design Submittal: For notification appliances and smoke and heat detectors, in addition to submittals listed above, indicate compliance with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Drawings showing the location of each notification appliance and smoke and heat detector, ratings of each, and installation details as needed to comply with listing conditions of the device.

2. Design Calculations: Calculate requirements for selecting the spacing and sensitivity of detection, complying with NFPA 72. Calculate spacing and intensities for strobe signals and sound-pressure levels for audible appliances.

3. Indicate audible appliances required to produce square wave signal per NFPA 72.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Field quality-control reports.
1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For fire-alarm systems and components to include in emergency, operation, and maintenance manuals.
   1. Include the following and deliver copies to authorities having jurisdiction:
      a. Comply with the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
      b. Provide "Fire Alarm and Emergency Communications System Record of Completion Documents" according to the "Completion Documents" Article in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
      c. Complete wiring diagrams showing connections between all devices and equipment. Each conductor shall be numbered at every junction point with indication of origination and termination points.
      d. Riser diagram.
      e. Device addresses.
      f. Air-sampling system sample port locations and modeling program report showing layout meets performance criteria.
      g. Record copy of site-specific software.
      h. Provide "Inspection and Testing Form" according to the "Inspection, Testing and Maintenance" chapter in NFPA 72, and include the following:
         1) Equipment tested.
         2) Frequency of testing of installed components.
         3) Frequency of inspection of installed components.
         4) Requirements and recommendations related to results of maintenance.
         5) Manufacturer's user training manuals.
      i. Manufacturer's required maintenance related to system warranty requirements.
      j. Abbreviated operating instructions for mounting at fire-alarm control panel and each annunciator panel.

B. Software and Firmware Operational Documentation:
   1. Software operating and upgrade manuals.
   2. Program Software Backup: On magnetic media or compact disk, complete with data files.
   3. Device address list.
   4. Printout of software application and graphic screens.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Lamps for Remote Indicating Lamp Units: Quantity equal to 10 percent of amount installed, but no fewer than one unit.
   2. Lamps for Strobe Units: Quantity equal to 10 percent of amount installed, but no fewer than one unit.
   3. Smoke Detectors, Fire Detectors: Quantity equal to 10 percent of amount of each type installed, but no fewer than one unit of each type.
   4. Detector Bases: Quantity equal to two percent of amount of each type installed, but no fewer than one unit of each type.
   5. Keys and Tools: One extra set for access to locked or tamper-proofed components.
   6. Audible and Visual Notification Appliances: One of each type installed.
   7. Fuses: Two of each type installed in the system. Provide in a box or cabinet with compartments marked with fuse types and sizes.
   8. Surge Protection devices: 2 of each type installed in the system. Provide in a box or cabinet with compartments marked with fuse types and sizes.
1.8 QUALITY ASSURANCE
A. Installer Qualifications: Personnel shall be trained and certified by manufacturer for installation of units required for this Project.
B. Installer Qualifications: Installation shall be by personnel certified by NICET as fire-alarm Level III technician.
C. NFPA Certification: Obtain certification according to NFPA 72 by an NRTL (nationally recognized testing laboratory).

1.9 PROJECT CONDITIONS
A. Use of Devices during Construction: Protect devices during construction unless devices are placed in service to protect the facility during construction.

1.10 WARRANTY
A. Special Warranty: Manufacturer agrees to repair or replace fire-alarm system equipment and components that fail in materials or workmanship within specified warranty period.
   1. Warranty Extent: All equipment and components not covered in the Maintenance Service Agreement.
   2. Warranty Period: Two years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION
A. Provide a new non-coded, intelligent, addressable system, with multiplexed signal transmission and voice/strobe evacuation.
B. Automatic sensitivity control of certain smoke detectors.
C. All components provided shall be listed for use with the selected system.
D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

2.2 SYSTEMS OPERATIONAL DESCRIPTION
A. Fire Alarm Systems Operation Matrix

### TYPE of SIGNAL

- **X₁** = Alarm Signal
- **X₂** = Common supervisory signal
- **X₃** = Common trouble signal
- _ = Action not required.

### SYSTEM OPERATION

- **A** = Annunciate specific device at FACP and remote annunciators FAAP.
- **B** = Annunciate specific device at graphic video terminals on Fire Alarm Network
- **C** = Transmit to Central Station/Monitoring.
- **D** = Activate notification appliances as described in specification.
- **E** = Activate relay to close damper.
- **F** = Activate relay to shutdown AHU/MAU fan, unless specifically noted otherwise.
- **G** = Activate Exterior Bell/Horn/Strobe.
- **I** = Release all the hold open smoke doors indicated on the drawings.
- **J** = Recall elevator in designated bank.
- **K** = Transmit status to elevator controller
M = Transmit status to access control panel, refer to 281300 for access control system protocol
N = Record events in system memory

MATRIX GENERAL NOTES:

*After a time delay of 200 seconds, transmit trouble or supervisory signal to the remote alarm receiving station.

** Where a paging system is provided shall cease/mute operation during notification appliance activation and reset to normal when the fire alarm system is reset to normal.

2.3 FIRE-ALARM CONTROL PANEL

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Notifier. Inc, a Honeywell company
   3. SimplexGrinnell LP.

B. General Requirements for Fire-Alarm Control Unit:
   1. Field-programmable, microprocessor-based, modular, power-limited design with electronic modules, complying with UL 864.
      a. System software and programs shall be held in nonvolatile flash, electrically erasable, programmable, read-only memory, retaining the information through failure of primary and secondary power supplies.
      b. Include a real-time clock for time annotation of events on the event recorder and printer.
      c. Provide communication between the FACP and remote circuit interface panels, annunciators, and displays.
      d. The FACP shall be listed for connection to a central-station signaling system service.
      e. Provide nonvolatile memory for system database, logic, and operating system and event history. The system shall require no manual input to initialize in the event of a complete power down condition. The FACP shall provide a minimum 500-event history log.
   2. Addressable Initiation Device Circuits: The FACP shall indicate which communication zones have been silenced and shall provide selective silencing of alarm notification appliance by building communication zone.
   3. Addressable Control Circuits for Operation of Notification Appliances and Mechanical Equipment: The FACP shall be listed for releasing service.

C. Alphanumeric Display and System Controls: Arranged for interface between human operator at fire-alarm control panel and addressable system components including annunciation and supervision. Display alarm, supervisory, and component status messages and the programming and control menu.
   1. Annunciator and Display: Liquid-crystal type, three line(s) of 80 characters, minimum.
   2. Keypad: Arranged to permit entry and execution of programming, display, and control commands and to indicate control commands to be entered into the system for control of smoke-detector sensitivity and other parameters.

D. Initiating-Device, Notification-Apppliance, and Signaling-Line Circuits:
   1. Pathway Class Designations: NFPA 72, Class A.
   3. Install no more than 256 addressable devices on each signaling-line circuit.
   4. Serial Interfaces:
      a. One dedicated RS 485 port for central-station operation using point ID DACT.
      b. One RS 485 port for remote annunciators, Ethernet module, or multi-interface module (printer port).
      c. One USB or RS 232 port for PC configuration.
d. One RS 232 port for VESDA HLI connection.
e. One RS 232 port for voice evacuation interface.

E. Notification-Appliance Circuit:
1. Audible appliances shall sound in a three-pulse temporal pattern, as defined in NFPA 72.
2. Visual alarm appliances shall flash in synchronization where multiple appliances are in the same field of view, as defined in NFPA 72.

F. Elevator Recall:
1. Elevator recall shall be initiated only by one of the following alarm-initiating devices:
   a. Elevator lobby detectors except the lobby detector on the designated floor.
   b. Smoke detector in elevator machine room.
   c. Smoke detectors in elevator hoistway.
2. Elevator controller shall be programmed to move the cars to the alternate recall floor if lobby detectors located on the designated recall floors are activated.
3. Water-flow alarm connected to sprinkler in an elevator shaft and elevator machine room shall shut down elevators associated with the location without time delay.
   a. Water-flow switch associated with the sprinkler in the elevator pit may have a delay to allow elevators to move to the designated floor.

G. Door Controls: Door hold-open devices that are controlled by smoke detectors at doors in smoke-barrier walls shall be connected to fire-alarm system.

H. Remote Smoke-Detector Sensitivity Adjustment: Controls shall select specific addressable smoke detectors for adjustment, display their current status and sensitivity settings, and change those settings. Allow controls to be used to program repetitive, time-scheduled, and automated changes in sensitivity of specific detector groups. Record sensitivity adjustments and sensitivity-adjustment schedule changes in system memory, and print out the final adjusted values on system printer.

I. Transmission to Remote Alarm Receiving Station: Automatically transmit alarm, supervisory, and trouble signals to a remote alarm station.

J. Voice/Alarm Signaling Service: Central emergency communication system with redundant microphones, preamplifiers, amplifiers, and tone generators provided in a separate cabinet located in the fire command center.
1. Indicate number of alarm channels for automatic, simultaneous transmission of different announcements to different zones or for manual transmission of announcements by use of the central-control microphone. Amplifiers shall comply with UL 1711.
   a. Allow the application of, and evacuation signal to, indicated number of zones and, at the same time, allow voice paging to the other zones selectively or in any combination.
   b. Programmable tone and message sequence selection.
   c. Standard digitally recorded messages for "Evacuation" and "All Clear."
   d. Generate tones to be sequenced with audio messages of type recommended by NFPA 72 and that are compatible with tone patterns of notification-appliance circuits of fire-alarm control panel.
2. Status Annunciator: Indicate the status of various voice/alarm speaker zones and the status of firefighters' two-way telephone communication zones.
3. Preamplifiers, amplifiers, and tone generators shall automatically transfer to backup units, on primary equipment failure.

K. Primary Power: 24-V dc obtained from 120-V ac service and a power-supply module. Initiating devices, notification appliances, signaling lines, trouble signals, supervisory and digital alarm communicator transmitters shall be powered by 24-V dc source.
1. Alarm current draw of entire fire-alarm system shall not exceed 80 percent of the power-supply module rating.
L. Secondary Power: 24-V dc supply system with batteries, automatic battery charger, and automatic transfer switch.

M. Instructions: Computer printout or typewritten instruction card mounted behind a plastic or glass cover in a stainless-steel or aluminum frame. Include interpretation and describe appropriate response for displays and signals. Briefly describe the functional operation of the system under normal, alarm, and trouble conditions.

2.4 MANUAL FIRE-ALARM BOXES
   A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1. Notifier. Inc., a Honeywell company
      3. SimplexGrinnell LP.
   B. General Requirements for Manual Fire-Alarm Boxes: Comply with UL 38. Boxes shall be finished in red with molded, raised-letter operating instructions in contrasting color; shall show visible indication of operation; and shall be mounted on recessed outlet box. If indicated as surface mounted, provide manufacturer’s surface back box.
      1. Double-action mechanism requiring two actions to initiate an alarm, pull-lever type; with integral addressable module arranged to communicate manual-station status (normal, alarm, or trouble) to fire-alarm control panel.
      2. Station Reset: Key- or wrench-operated switch.
      3. Indoor Protective Shield: Factory-fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm. Lifting the cover actuates an integral battery-powered audible horn intended to discourage false-alarm operation.
      4. Weatherproof Protective Shield: Factory-fabricated, clear plastic enclosure hinged at the top to permit lifting for access to initiate an alarm.

2.5 SYSTEM SMOKE DETECTORS
   A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      1. Notifier. Inc., a Honeywell company
      3. SimplexGrinnell LP.
   B. General Requirements for System Smoke Detectors:
      1. Comply with UL 268; operating at 24-V dc, nominal.
      2. Detectors shall be two-wire type.
      3. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control panel.
      4. Base Mounting: Detector and associated electronic components shall be mounted in a twist-lock module that connects to a fixed base. Provide terminals in the fixed base for connection to building wiring.
      5. Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
      6. Integral Visual-Indicating Light: LED type, indicating detector has operated and power-on status.
      7. Remote Control: Unless otherwise indicated, detectors shall be digital-addressable type, individually monitored at fire-alarm control panel for calibration, sensitivity, and alarm condition and individually adjustable for sensitivity by fire-alarm control panel.
         a. Multiple levels of detection sensitivity for each sensor.
         b. Sensitivity levels based on time of day.
C. Photoelectric Smoke Detectors:
   1. Detector address shall be accessible from fire-alarm control panel and shall be able to identify the detector's location within the system and its sensitivity setting.
   2. An operator at fire-alarm control panel, having the designated access level, shall be able to manually access the following for each detector:
      a. Primary status.
      b. Device type.
      c. Present average value.
      d. Present sensitivity selected.
      e. Sensor range (normal, dirty, etc.).

D. Ionization Smoke Detector:
   1. Performance Criteria:
      a. Regulatory Requirements:
         1) NFPA 72.
         2) UL 268.
      b. General Characteristics:
         1) Detectors must be two-wire type.
         2) Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to FACU.
         3) Base Mounting: Detector and associated electronic components must be mounted in twist-lock module that connects to fixed base. Provide terminals in fixed base for connection to building wiring.
         4) Self-Restoring: Detectors do not require resetting or readjustment after actuation to restore them to normal operation.
         5) Integral Visual-Indicating Light: LED type, indicating detector has operated and power-on status.
         6) Detector address must be accessible from FACU and must be able to identify detector's location within system and its sensitivity setting.
         7) Operator at FACU, having designated access level, must be able to manually access the following for each detector:
            (a) Primary status.
            (b) Device type.
            (c) Present average value.
            (d) Present sensitivity selected.
            (e) Sensor range (normal, dirty, etc.).
         8) Detector must have functional humidity range within 10 to 90 percent relative humidity.
         9) Color: White.
      10) Remote Control: Unless otherwise indicated, detectors must be digital-addressable type, individually monitored at FACU for calibration, sensitivity, and alarm condition and individually adjustable for sensitivity by FACU.
      11) Rate-of-rise temperature characteristic of combination smoke- and heat-detection units must be selectable at FACU for 15 or 20 deg F (8 or 11 deg C) per minute.
      12) Fixed-temperature sensing characteristic of combination smoke- and heat-detection units must be independent of rate-of-rise sensing and must be settable at FACU to operate at 135 or 155 deg F (57 or 68 deg C).
      13) Multiple levels of detection sensitivity for each sensor.
      14) Sensitivity levels based on time of day.

E. Duct Smoke Detectors: Photoelectric type complying with UL 268A.
   1. Detector address shall be accessible from fire-alarm control panel and shall be able to identify the detector's location within the system and its sensitivity setting.
2. An operator at fire-alarm control panel, having the designated access level, shall be able to manually access the following for each detector:
   a. Primary status.
   b. Device type.
   c. Present average value.
   d. Present sensitivity selected.
   e. Sensor range (normal, dirty, etc.).
3. Weatherproof Duct Housing Enclosure: NEMA 250, Type 4X; NRTL listed for use with the supplied detector for smoke detection in HVAC system ducts.
4. Each sensor shall have multiple levels of detection sensitivity.
5. Sampling Tubes: Design and dimensions as recommended by manufacturer for specific duct size, air velocity, and installation conditions where applied.

2.6 HEAT DETECTORS
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Notifier. Inc., a Honeywell company
   3. SimplexGrinnell LP.
B. General Requirements for Heat Detectors: Comply with UL 521.
   1. Temperature sensors shall test for and communicate the sensitivity range of the device.
C. Heat Detector, Combination Type: Actuated by either a fixed temperature of 135 deg F (57 deg C) or a rate of rise that exceeds 15 deg F (8 deg C) per minute unless otherwise indicated.
   1. Mounting: Twist-lock base interchangeable with smoke-detector bases.
   2. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control panel.
   3. Control Unit: Two-zone or multizone unit as indicated. Provide same system power supply, supervision, and alarm features as specified for fire-alarm control panel.
   4. Signals to Fire-Alarm Control Unit: Any type of local system trouble shall be reported to fire-alarm control panel as a composite "trouble" signal. Alarms on each detection zone shall be individually reported to central fire-alarm control panel as separately identified zones.
   5. Integral Addressable Module: Arranged to communicate detector status (normal, alarm, or trouble) to fire-alarm control panel.

2.7 NOTIFICATION APPLIANCES
A. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. Cooper Wheelock.
   2. Notifier.
   4. SimplexGrinnell LP.
B. General Requirements for Notification Appliances: Individually addressed, connected to a signaling-line circuit, equipped for mounting as indicated, and with screw terminals for system connections.
C. General Requirements for Notification Appliances: Connected to notification-appliance signal circuits, zoned as indicated, equipped for mounting as indicated, and with screw terminals for system connections.
   1. Combination Devices: Factory-integrated audible and visible devices in a single-mounting assembly, equipped for mounting as indicated, and with screw terminals for system connections.
D. Visible Notification Appliances: Xenon strobe lights complying with UL 1971, with clear polycarbonate lens mounted on an white (UNO) faceplate. The word “FIRE” is raised lettering or engraved in minimum 1-inch- (25-mm-) high letters on the faceplate, below or on side of the lens.
   1. Mounting: Wall mounted unless otherwise indicated.
   2. For units with guards to prevent physical damage, light output ratings shall be determined with guards in place.
   3. Flashing shall be in a temporal pattern, synchronized with other units.
   5. Mounting Faceplate: Factory finished white.

E. Voice/Tone Notification Appliances:
   1. Comply with UL 1480.
   2. Speakers for Voice Notification: Locate speakers for voice notification to provide the intelligibility requirements of the “Notification Appliances” and “Emergency Communications Systems” chapters in NFPA 72 and Annex D.
   3. High-Range Units: Rated 2 to 15 W.
   4. Low-Range Units: Rated 1 to 2 W.
   5. Frequency Range: 300Hz to 8000Hz.
   7. Matching Transformers: Tap range matched to acoustical environment of speaker location.

F. Concealable Notification Devices:
   1. Manufacturers: Subject to compliance with requirements, provide products by the following:
      a. Concealite #FA100 #FAFX
      b. Pre-Approved Equivalent
   2. Provide concealable notification devices as indicated on floor plans with device cover to match ceiling finish. Concealment device shall be UL listed for the application and shall conform to NFPA 72 standards. Concealment device shall be self-contained and shall interface with the fire alarm system. Provide fire-alarm system notification device that is compatible with the fire alarm system and concealment device system and has a similar appearance to the building notification appliances.

2.8 REMOTE DEVICE LOCATION-INDICATING LIGHTS AND IDENTIFICATION PLATES
A. Remote status and alarm indicator and test stations, with LED indicating lights. Light is connected to flash when the associated device is in an alarm or trouble mode. Lamp is flush mounted in a single gang wall plate. A red, laminated, phenolic-resin identification plate at the indicating light identifies, in engraved white letters, device initiating the signal and room where the smoke detector or valve is located. For water-flow switches, the identification plate also designates protected spaces downstream from the water-flow switch.

2.9 MAGNETIC DOOR HOLDERS
A. Connection: Provide connection to the fire-alarm system door holders provided under Division 08. Coordinate location, rough-in requirements, and voltage with hardware supplier.
B. Provide a local switch for hold open release.
C. Description: Units are equipped for wall or floor mounting as indicated and are complete with matching doorplate.
   1. Electromagnets: Require no more than 3 W to develop 25-lbf (111-N) holding force.
   2. Wall-Mounted Units: Flush mounted unless otherwise indicated.
   3. Rating: 120-V ac.
D. Material and Finish: Match door hardware.
E. Provide a local switch for hold open open release.

2.10 REMOTE ANNUNCIATOR
A. Description: Annunciator functions shall match those of fire-alarm control panel for alarm, supervisory, and trouble indications. Manual switching functions shall match those of fire-alarm control panel, including acknowledging, silencing, resetting, and testing.
   1. Mounting: Flush cabinet, NEMA 250, Type 1.
B. Display Type and Functional Performance: Alphanumeric display and LED indicating lights shall match those of fire-alarm control panel. Provide controls to acknowledge, silence, reset, and test functions for alarm, supervisory, and trouble signals.

2.11 ADDRESSABLE INTERFACE DEVICE
A. General:
   1. Include address-setting means on the module.
   2. Store an internal identifying code for control panel use to identify the module type.
   3. Listed for controlling HVAC fan motor controllers.
B. Monitor Module: Microelectronic module providing a system address for alarm-initiating devices for wired applications with normally open contacts.
C. Integral Relay: Capable of providing a direct signal to elevator controller to initiate elevator recall.
   1. Allow the control panel to switch the relay contacts on command.
   2. Have a minimum of two normally open and two normally closed contacts available for field wiring.
D. AHU shutdown relays shall be provided where air handler shutdown is required. The shutdown relay shall be controlled by either a supervised NAC circuit, independently controlled programmable supervised duct detector output circuit, or I/O point circuit. The shutdown relay shall not be controlled by an electronic control module. Each shutdown relay shall have two sets of form C contacts, the first set to be used for the shutdown signal and the second set used for notification to the building automation system.
E. Control Module:
   1. Operate notification devices.
   2. Operate solenoids for use in sprinkler service.

2.12 DIGITAL ALARM COMMUNICATOR TRANSMITTER
A. Digital alarm communicator transmitter shall be acceptable to the remote central station and shall comply with UL 864.
B. Functional Performance: Unit shall receive an alarm, supervisory, or trouble signal from fire-alarm control panel and automatically capture two telephone line(s) and dial a preset number for a remote central station. When contact is made with central station(s), signals shall be transmitted. If service on either line is interrupted for longer than 45 seconds, transmitter shall initiate a local trouble signal and transmit the signal indicating loss of telephone line to the remote alarm receiving station over the remaining line. Transmitter shall automatically report telephone service restoration to the central station. If service is lost on both telephone lines, transmitter shall initiate the local trouble signal.
C. Local functions and display at the digital alarm communicator transmitter shall include the following:
   1. Verification that both telephone lines are available.
2. Programming device.
3. LED display.
5. Communications failure with the central station or fire-alarm control panel.

D. Digital data transmission shall include the following:
1. Address of the alarm-initiating device.
2. Address of the supervisory signal.
3. Address of the trouble-initiating device.
4. Loss of ac supply.
5. Loss of power.
6. Low battery.
7. Abnormal test signal.

E. Secondary Power: Integral rechargeable battery and automatic charger.

F. Self-Test: Conducted automatically every 24 hours with report transmitted to central station.

2.13 EXTERIOR DEVICE SURGE PROTECTOR
A. Provide surge protection for exterior/outdoor initiating and notification devices.
B. SLC and NAC surge protectors shall have 10AWG max screw terminals.
C. Minimum Specifications:
   1. Service Voltage: 48V
   2. Maximum Continuous Operational Voltage: 64V
   3. Clamping Voltage: 76V
   4. Peak Surge Current: 20000A
   5. Operating Temperature: -40 degrees F to 158 degrees F
   6. UL Listed: UL497B
D. Manufacturer Warranty: 10 Years
E. Manufacturer: Ditek #DTK-2MHLP or pre-approved equivalent

2.14 DIALER SURGE PROTECTOR
A. Provide fire-alarm dialer (DACT) surge protection for both primary and secondary communications with central station monitoring.
B. Dialer surge protector shall have 10AWG max screw terminals.
C. Minimum Specifications:
   1. Service Voltage: 110V
   2. Maximum Continuous Operational Voltage: 130V
   3. Clamping Voltage: 200V
   4. Peak Surge Current: 14000A @ 8/2000us impulse
   5. Operating Temperature: -40 degrees F to 158 degrees F
   6. UL Listed: UL497B
D. Manufacturer Warranty: 10 Years
E. Manufacturer: Ditek #DTK-2MHTP or pre-approved equivalent

20
2.15  120V FIRE-ALARM CONTROL PANEL SURGE PROTECTOR

A. Provide fire-alarm control panel 120V surge protection between the FACP and branch-circuit over-current protection device. Coordinate with division 26 for installation.

B. Minimum Specifications:
   1. Service Voltage: 120V
   2. Maximum Continuous Operational Voltage: 130V
   3. Protection Modes: L-N, L-G, N-G
   4. Peak Surge Current: 18000A
   5. Operating Temperature: -40 degrees F to 185 degrees F
   6. UL Listed: UL1449 3rd Edition

C. Manufacturer Warranty: 10 Years

D. Manufacturer: Ditek #120 Series or pre-approved equivalent

2.16  SECONDARY POWER SUPPLIES

A. Basis-of-Design Product: Subject to compliance with requirements, provide comparable product by one of the following:
   1. Honeywell Power Supplies
   2. Altronix Power Supplies
   3. Life Safety Power

B. Standby power supply shall be an electrical battery with capacity to operate the system under maximum supervisory load for 24-hours and capable of operating the system for fifteen 15-minutes of evacuation alarm on all devices, operating at maximum load.

C. The system shall include a charging circuit to automatically maintain the electrical charge of the battery and supervise the integrity of the battery. The system shall automatically adjust the charging rate of the battery to compensate for temperature.

D. All system power supplies shall be capable of recharging their associated batteries, from a fully discharged condition to a capacity sufficient to allow the system to perform consistent with the requirements of this section, in 48 hours maximum.

E. Secondary power supplies shall also meet the minimum specifications:
   1. The power supply shall meet or exceed the following specifications:
      a. The design shall consist of grey or red steel wall-mount housing with a locking door.
      b. The power supply shall provide with isolated 24 VAC outputs.
      c. The power supply shall provide resettable fuses for each output.
      d. PTC protected outputs shall meet Class 2, power limited, requirements.
      e. Notification Appliance Circuit (NAC) power extenders shall have the capability to synchronize all strobe and audible signals in accordance with NFPA-72.
      f. All power supplies shall be electrically supervised and report a trouble signal for all fault and failure conditions.
   2. The electrical specifications for the power supply shall be as follows:
      a. Input voltage: 120 VAC
      b. Output voltage: 24 VAC
2.17 FIRE ALARM WIRING

A. Wiring Circuit Class and Style
   1. Initiating Device, Notification Appliance, and Signaling Line Circuits as defined in 2010 Edition of NFPA.
      a. Separate signaling line circuits (SLC) shall be provided for the following:
         1) Initiating Device Circuits: Class A
         2) Initiating Device Circuits for elevator recall: Class A
         3) Initiating Device Circuits for fire-protection riser: Class A
      b. Notification Appliance Circuits: Class A.
      c. Amplifier (Speaker) Circuits: Shielded, class A
      d. Class A circuit routing shall be physically separated and shall be not be run in the same cable assembly, enclosure, or raceway. Separate circuits a minimum of 2’ for vertical runs and 4’ for horizontal runs.
      e. Riser/backbone cabling between fire-alarm panels and nodes: Class A.

B. Wiring Type: Fire alarm wiring shall be red, plenum rated, and as required per system manufacturer where free air is allowed. When installed in approved raceways, use of FPL (THHN/THWN) is permitted.

PART 3 INSTALLATION

3.1 EXAMINATION

A. Examine areas and conditions for compliance with requirements for ventilation, temperature, humidity, and other conditions affecting performance of the Work.
   1. Verify that manufacturer's written instructions for environmental conditions have been permanently established in spaces where equipment and wiring are installed, before installation begins.

B. Examine roughing-in for electrical connections to verify actual locations of connections before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 EQUIPMENT INSTALLATION

A. Comply with NFPA 72, NFPA 101, and requirements of authorities having jurisdiction for installation and testing of fire-alarm equipment. Install all electrical wiring to comply with requirements in NFPA 70 including, but not limited to, Article 760, "Fire Alarm Systems."
   1. Devices placed in service before all other trades have completed cleanup shall be replaced.
   2. Devices installed but not yet placed in service shall be protected from construction dust, debris, dirt, moisture, and damage according to manufacturer's written storage instructions.

B. Equipment Mounting: Install fire-alarm control panel on concrete base. Comply with requirements for concrete base specified in Section 033000 "Cast-in-Place Concrete."
   1. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch (460-mm) centers around the full perimeter of concrete base.
   2. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   3. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   4. Install anchor bolts to elevations required for proper attachment to supported equipment.

C. Equipment Mounting: Install fire-alarm control panel on finished floor.
D. Install wall-mounted equipment, with tops of cabinets not more than 78 inches (1980 mm) above the finished floor.

E. Manual Fire-Alarm Boxes:
   1. Install manual fire-alarm box in the normal path of egress within 60 inches (1520 mm) of the exit doorway.
   3. The operable part of manual fire-alarm box shall be between 42 inches (1060 mm) and 48 inches (1220 mm) above floor level. All devices shall be mounted at the same height unless otherwise indicated.

F. Smoke- or Heat-Detector Spacing:
   1. Comply with the "Smoke-Sensing Fire Detectors" section in the "Initiating Devices" chapter in NFPA 72, for smoke-detector spacing.
   2. Comply with the "Heat-Sensing Fire Detectors" section in the "Initiating Devices" chapter in NFPA 72, for heat-detector spacing.
   3. Smooth ceiling spacing shall not exceed 30 feet (9 m).
   4. Spacing of detectors for irregular areas, for irregular ceiling construction, and for high ceiling areas shall be determined according to Annex A in NFPA 72.
   5. HVAC: Locate detectors not closer than 36 inches (910 mm) from air-supply diffuser or return-air opening.
   6. Lighting Fixtures: Locate detectors not closer than 12 inches (300 mm) from any part of a lighting fixture and not directly above pendant mounted or indirect lighting.

G. Install a cover on each smoke detector that is not placed in service during construction. Cover shall remain in place except during system testing. Remove cover prior to system turnover.

H. Duct Smoke Detectors: Comply with NFPA 72 and NFPA 90A. Install sampling tubes so they extend the full width of duct. Tubes more than 36 inches (9100 mm) long shall be supported at both ends.
   1. Do not install smoke detector in duct smoke-detector housing during construction. Install detector only during system testing and prior to system turnover.
   2. Duct detectors shall be installed within 5' of the HVAC unit, smoke damper or fire/smoke dampers that they are interfaced with.

I. Elevator Shafts: Coordinate temperature rating and location with sprinkler rating and location. Do not install smoke detectors in sprinklered elevator shafts.

J. Theatrical Spaces: Provide detection devices which are able to be utilized with theatrical fog effects without requiring any shunting of notification alarms.

K. Remote Status and Alarm Indicators: Install in a visible location near each smoke detector, sprinkler water-flow switch, and valve-tamper switch that is not readily visible from normal viewing position.

L. Audible Alarm-Indicating Devices: Install wall mounted devices not less than 6 inches (150 mm) below the ceiling. Install bells and horns on flush-mounted back boxes with the device-operating mechanism concealed behind a grille. Install all devices at the same height unless otherwise indicated.

M. Ceiling Mounted Audible/Visual and Visual Only Alarm-Indicating Devices: Install flush on ceiling in approximate location indicated. Coordinate with all ceiling mounted diffusers, lights, devices, etc. Provide concealed mounting where noted with UL listed device.
N. Concealable notification devices as indicated on floor plans with device cover to match ceiling finish as determined by architect. Coordinate with Architectural ceiling plans prior to final placement of concealable notification devices. Contact the architect of design where discrepancies and/or conflicts occur with ceiling finishes, décor and other discipline construction documents.

O. Visible Alarm-Indicating Devices: Install wall mounted devices adjacent to each alarm bell or alarm horn and at least 6 inches (150 mm) below the ceiling. Install all devices at the same height unless otherwise indicated.

P. Device Location-Indicating Lights: Locate in public space near the device they monitor.

Q. Fire-Alarm Control Unit: Surface mounted, with tops of cabinets not more than 72 inches (1830 mm) above the finished floor.

R. Annunciator: Install with top of panel not more than 72 inches (1830 mm) above the finished floor

S. Provide addressable monitor modules with 120V relays for each smoke damper connection to provide individual programmed control of damper(s).

T. Provide addressable monitor modules for elevator controller to initiate elevator recall.

U. Provide addressable monitor modules for elevator circuit breaker shunt-trip for power shutdown.

V. Provide addressable monitor modules for AHU for power shutdown. The shutdown relay shall be located adjacent to the controller for the AHU.

W. Provide 2-input or 10-input addressable monitor modules when applicable.

X. Mini addressable monitor modules shall not be used without prior approval by the engineer of design.

3.3 PATHWAYS

A. Conductors and Cables above recessed ceilings and in non-accessible locations may be routed exposed.
   1. Exposed pathways located less than 96 inches (2440 mm) above the floor shall be installed in EMT.

B. Conductors and Cables within open ceilings shall be routed in conduit to a location with an accessible ceiling.

C. Conductors and Cables shall be installed in EMT.

D. Minimum Pathway Size: 3/4-inch (21-mm) trade size.

E. Exposed EMT shall be painted to match surrounding finish.

3.4 CONNECTIONS

A. For fire-protection systems related to doors in fire-rated walls and partitions and to doors in smoke partitions, comply with requirements in Section 087100 "Door Hardware." Connect hardware and devices to fire-alarm system.
   1. Verify that hardware and devices are listed for use with installed fire-alarm system before making connections.

B. Make addressable connections with a supervised interface device to the following devices and systems. Install the interface device less than 36 inches (910 mm) from the device controlled. Make an addressable confirmation connection when such feedback is available at the device or system being controlled.
   1. Smoke dampers in air ducts of designated HVAC duct systems.
2. Magnetically held-open doors.
3. Electronically locked doors and access gates.
4. Alarm-initiating connection to elevator recall system and components.
5. Supervisory connections at valve supervisory switches.
7. Data communication circuits for connection to building management system.

3.5 IDENTIFICATION
A. Identify system components, wiring, cabling, and terminals. Comply with requirements for identification specified in Section 260553 "Identification for Electrical Systems."
B. Install framed instructions in a location visible from fire-alarm control panel.

3.6 GROUNDING
A. Ground fire-alarm control panel and associated circuits; comply with IEEE 1100. Install a ground wire from main service ground to fire-alarm control panel.
B. Ground shielded cables at the control panel location only. Insulate shield at device location.

3.7 FIELD QUALITY CONTROL
A. Field tests shall be witnessed by authorities having jurisdiction.
B. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.
C. Perform tests and inspections.
D. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Visual Inspection: Conduct visual inspection prior to testing.
      a. Inspection shall be based on completed record Drawings and system documentation that is required by the "Completion Documents, Preparation" table in the "Documentation" section of the "Fundamentals" chapter in NFPA 72.
      b. Comply with the "Visual Inspection Frequencies" table in the "Inspection" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72; retain the "Initial/Reacceptance" column and list only the installed components.
   3. Test audible appliances for the public operating mode according to manufacturer's written instructions. Perform the test using a portable sound-level meter complying with Type 2 requirements in ANSI S1.4.
   4. Test audible appliances for the private operating mode according to manufacturer's written instructions.
   5. Test visible appliances for the public operating mode according to manufacturer's written instructions.
   6. Factory-authorized service representative shall prepare the "Fire Alarm System Record of Completion" in the "Documentation" section of the "Fundamentals" chapter in NFPA 72 and the "Inspection and Testing Form" in the "Records" section of the "Inspection, Testing and Maintenance" chapter in NFPA 72.
E. Reacceptance Testing: Perform reacceptance testing to verify the proper operation of added or replaced devices and appliances.
F. Fire-alarm system will be considered defective if it does not pass tests and inspections.
G. Prepare test and inspection reports.
H. Maintenance Test and Inspection: Perform tests and inspections listed for weekly, monthly, quarterly, and semiannual periods. Use forms developed for initial tests and inspections.
I. Annual Test and Inspection: One year after date of Substantial Completion, test fire-alarm system complying with visual and testing inspection requirements in NFPA 72. Use forms developed for initial tests and inspections.

3.8 MAINTENANCE SERVICE
A. Initial Maintenance Service: Beginning at Substantial Completion, maintenance service shall include 12 months’ full maintenance by skilled employees of manufacturer’s designated service organization. Include preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper operation. Parts and supplies shall be manufacturer’s authorized replacement parts and supplies.
   1. Include visual inspections according to the “Visual Inspection Frequencies” table in the “Testing” paragraph of the “Inspection, Testing and Maintenance” chapter in NFPA 72.

3.9 SOFTWARE SERVICE AGREEMENT
A. Comply with UL 864.
B. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.
C. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
   1. Upgrade Notice: At least 30 days to allow Owner to schedule access to system and to upgrade computer equipment if necessary.

3.10 DEMONSTRATION
A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain fire-alarm system.

END OF SECTION
PART 1 - GENERAL

1.01 SECTION INCLUDES
A. This section includes parts and equipment required for installation and termination of a building-wide Access Control and intrusion detection system. This system shall be referred to as the “security system” throughout these specifications.
B. The systems is for doors noted on the drawings as “OneCard”
   1. These are primarily interior doors. The access control equipment at these doors shall be connected to the CBORD panels. See floorplans for locations.

1.02 SYSTEM DESCRIPTION
A. The security system shall be supplied and installed by a Contractor able to show examples of similar projects and installations within the last 3 years.
B. The security system shall be an extension of the existing system at the WSU Campus
C. The Security System shall provide a solution for access control systems
D. Contractor shall provide all software required for connection of the security system to the in-house data network and associated control PC’s and existing OneCard Gold server.
E. The security system client-server architecture shall communicate with native TCP/IP over an existing Ethernet TCP/IP enterprise network.

1.03 COORDINATION
A. All cables shall be coordinated with the doors and door hardware being installed as part of this project.
B. Access Control cables shall be a unique color from the Telecommunications cable, fire alarm cable and lighting control cable. Coordinate this with the Electrical Contractor prior to ordering the equipment and installation of the cables.

1.04 PROJECT PLAN
A. The contractor shall provide a project plan to the owner and contractor that describes the system and its capabilities and the possible configurations.
B. Provide a project approach which describes the installation and implementation plan and schedule and all sequencing.
C. Meet with the owner numerous times to determine how the system should work and how it should be monitored. Configure the system prior to installation to meet these requirements. Demonstrate the system use to the owner prior to installation and obtain approval to move forward with the installation.
D. Contractor shall conduct numerous site reviews to establish pathways and routes for all raceways required. Contractor shall install all raceways required for connection of the security system.
E. Provide shop drawings showing all configuration and connectivity of the system.
F. Generate a testing plan and have that plan approved by the owner and engineer prior to installing the system.
G. The system shall be installed and tested prior to cutting over any doors to the system. Provide and install temporary card readers, door contacts etc to the system for testing. Demonstrate that this works prior to cutover.

1.05 RELATED STANDARDS
A. The security system shall conform to the following international and national standards:
1. FCC Rules and Regulations
2. UL 294 Access Control Systems
3. UL 1076 Line Supervision
4. 21 CFR part 11
5. Part 15, Radio Frequency Devices
6. National Electrical Manufacturers Association (NEMA.
7. Applicable Federal, State and Local laws, regulations, codes
8. Americans with Disabilities Act (ADA.
9. National Electrical Code (NEC.

PART 2 - PRODUCTS

2.01 MANUFACTURERS
A. Approved vendors for security cables are:
   1. General Cable.
   2. Belden.
   3. West Penn Wire and Cable.
   4. Equivalent manufacturers.
B. Approved vendor for access control/intrusion detection equipment is:
   1. Cbord CSGold system

2.02 MATERIALS
A. All security and control cables shall be plenum rated.
   1. Contractor shall provide all appropriate cable from the door security hardware to the
      security system. All cabling shall be plenum rated.
   2. Some locations require outdoor rated cabling. The contractor shall provide the cabling
      to match the required area.
   3. There will be requirements for many different types of cabling and the contractor shall
      provide for each.
   4. Provide a coil of cable at each location for moves and maintenance.

2.03 SECURITY SYSTEM SERVER
A. Management Server:
   1. Server is existing at the owner’s data center
   2. Provide all work and any additional software from Cbord CS Gold system as required
      to connect all new devices and make then fully operate.

2.04 SECURITY SYSTEM SOFTWARE
A. Software shall be an extension of the existing campus Cbord system and shall be installed
   for the interior controlled doors and doors noted as “OneCard” on the drawings.

2.05 SECURITY ENCLOSURE
A. Shall be provided to hold power supplies, controllers, access control panels, card reader
   panels, input/output cards (now to be referred to as security panels) and any other
   components required for a complete access control system.
B. Security enclosures are the physical boxes and cabinets that support the intelligent
   controllers, I/O boards, power supplies and power distribution equipment.
C. Security panels shall be wall mounted and large enough to hold power equipment and access
   control system controllers and cards.
D. Security panel shall be:
   1. UL: Listed: UL 294 approved
   2. Enclosure shall accommodate power supply and sub-assemblies such s controllers
      and security cards to be provided as part of the project.
   3. Primary power input shall be 115VAC
   4. Physical
      a. Size enclosure as required to hold power supplies and security panels. Provide
         multiple enclosures where required.
b. Made of 16 AWG sheet metal

c. Shall have conduit knockouts or custom cut holes for access to the panels for cabling.

d. Be equipped with an internal cam lock

e. Be equipped with a tamper switch that shall be wired to the I/O for software alarm when the panel is opened.

f. Shall have space for batteries to support the access control system.

5. Equip with a backplate that shall support direct mounting of the security panels and power devices.

6. Equip with magnetic cable supports that attach to the backplate to support cables.

E. Security Enclosure shall be Altronix Trove series or equal.

2.06 POWER SUPPLIES AND POWER DISTRIBUTION

A. Power supplies and power equipment shall be provided that support the entire access control system, security panels/controllers, door locks and all other field equipment of the access control system.

B. All power supplies shall be connected to 120VAC power with a hardwired connection. Install cable and connect to power.

1. Provide and install conduit, wiring and connections required for 120-volt power connectivity.

C. Power supply shall be mounted to the enclosure. Shall include:

1. Shall provide power to the panels in the enclosure and field devices.

2. Shall include multiple 12- or 24-volt outputs. Shall be settable in

3. Input voltage of 120VAC with a fuse

4. Classified as a Power-Limited stand-alone power supply with stand-by battery and suitable to power sensors and electro-mechanical devices (e.g. electric door strikes), as defined in the National Electrical Code/NFPA70/NFPA72

5. Shall be sized for outputs of 1 thru 16 unique outputs.

6. Battery connection for charging on-board batteries.

7. Fire alarm disconnect

a. Shall support Normally Open or Normally Closed trigger

b. Shall be set to latching or non-latching

8. LED indicators for:

a. AC input

b. DC output

c. Battery discharged or no battery

9. Over Voltage protection

10. Short Circuit protection

11. Power supply shall be Altronix #eFlow series or equal.

a. Provide actual part that provides for all power and control of the system as required to meet the manufacturers requirements and these specifications.

12. Equip with an Ethernet Module for panel control and monitoring:

a. Shall support remote supervision, control and monitoring over an Ethernet connection.

b. Connect to the owner’s network and setup monitoring.

c. Altronix #Linq2 or equal

D. Access Power Controllers

1. The Power Controller shall have the following characteristics:

a. Powered by 12 VDC or 24 VDC from the power supply/charger board or via 8-Pin connector to stack with Voltage Regulator for dual voltage (12VDC & 24VDC) outputs from a single 24VDC input, up to 6 Amps

b. Spade lug connectors to facilitate the transfer or sharing of 12VDC and/or 24VDC power between Access Power Controllers or Power Distribution Modules
c. 8 trigger inputs to correspond with similarly numbered triggered controlled outputs, with each trigger input being in one of the following forms:
   1) Normally open (NO) contact
   2) Open collector

d. 8 independently trigger-controlled outputs with the following output options:
   1) Fail-Safe filtered and electronically regulated power outputs
   2) Fail-Secure filtered and electronically regulated power outputs
   3) Form "C" relay outputs, rated 5 amps @ 28 VDC/VAC.
   4) For each triggered output, LED indication of an active output.
   5) Bi-colored LEDs for visual verification of voltage (12VDC or 24VDC) per output
   6) An unswitched auxiliary power output, rated at 2.5 amps (fused) or 2 amps (PTC), used in lieu of a trigger-controlled output.
   7) Fuse protected

e. FACP (Fire Alarm Control Panel) interface
   1) input options from the FACP:
      A) polarity reversal
      B) Normally Open - Non-Latching or Latching with reset
      C) Normally Closed - Non-Latching or Latching with reset
   2) Ability for the FACP to trigger any of the trigger-controlled outputs
   3) Trigger indications:
      A) LED indicator on the module
      B) Form "C" output relay contact rated 1 amp @ 24 VDC

f. Current protection
   1) access control module: 10 amp fuse
   2) individual outputs: 2.5-amp Class 2 rated PTC device

2. Access power controller shall be Altronix #ACMS8 or equal.

E. Power Distribution board with voltage regulator.
   1. The Power Distribution Module shall be a UL Listed Sub-Assembly board level product comprised of fused protected outputs to furnish 12 VDC, 24 VDC or 24 VAC power to surveillance, security, access control systems and components, and other security-related equipment.
   2. Power distribution module shall include:
      a. The Power Distribution Module shall employ a single distribution board.
      b. The Power Distribution Module shall output 5VDC to 24VDC up to 10A each or 16VAC to 28VAC up to 14A each.
      c. Fused protected outputs.
      d. Individual voltage LEDs indicate 12VDC (Green) or 24VDC (Red and Green)

3. Modules shall provide for:
   a. Dual Power Supply Inputs.
   b. Outputs shall be switch selectable as to route power via Input 1 or Input 2.
   c. Shall be stacked with a voltage regulator and connected via eight (8) pin connector.
   d. Individual voltage LEDs indicate 12VDC (Green) or 24VDC (Red and Green).
   e. Eight (8) individually fused device protected outputs.

4. Power distribution board shall be Altronix #PDS8 or equal
   a. Equip with a voltage regulator Altronix #VR6 or equal.

F. Battery Backup
   1. The enclosure shall have battery backup UPS circuit with built-in battery charger that shall provide automatic battery backup UPS power in event of AC line failure.
   2. Each controller enclosure panel shall have a battery for power failure. Battery shall be fully enclosed in a metal cabinet.
   3. The battery shall provide for full UPS operation for a minimum of 30 minutes

2.07 MASTER CONTROLLER
A. See floorplans for controllers and locations

B. Provide controller as required to connect panels in each separate room where panels are installed. No RS-485 connections are allowed between comm rooms.
   1. Master Network controller
      a. Shall be Cbord #V-1000
   2. Master Controllers shall communicate to the existing OneCard software via the University Ethernet Network.
      a. Install CAT-6 cables to connect the controllers to the Ethernet network.
   3. Connect to power distribution in the enclosure.

2.08 2-DOOR CONTROLLER
A. 2-door panel. Connect to the Master Controller
   1. Provide as many of these as are required for system connectivity of all doors and access control devices.
   2. Shall be Cbord #V-100

2.09 CARD READER
A. Card Readers: “CR” on drawings
   1. Card readers shall be mounted on a single-gang backbox.
   2. Card reader shall be Schlage #MTMS15
   3. Shall have proximity reading and swipe magnetic reader

2.10 DOOR LOCKING DEVICES
A. Electric Latch “EL” on drawings
   1. The door hardware installer will install an Electric Latch device at each door equipped with a card reader or as shown on the drawings. The security contractor shall wire from the EL device to a power supply in the communications room and then to the door controller in the communications room.
   2. Provide cards in the controller panel and equipment to allow the security system to interface with the EL.
   3. The EL shall be able to be held open based upon a time schedule put forth in the security system. It shall also be able to be retracted upon presentation of a valid card or fob to the card reader.
   4. Wire to the Electric Latch and fully integrate it into the security system.
   5. Wire from the EL to the controller in the comm room to allow control of each individual door.
   
B. Latch Retraction device: “LR” on drawings
   1. The door hardware installer will install a Latch Retraction device as shown on the drawings.
   2. Provide and install a power supply in the communications room to power the LR device. Review the door hardware and match the power supply to the Latching Retraction devices. Provide quantity as required to power all LR devices
   3. The security contractor shall wire from the LR device to a power supply in the communications room and then to the controller panel in the communications room.
   4. Provide cards in the controller panel and equipment to allow the security system to interface with the LR.
   5. The LR shall be able to be held open based upon a time schedule put forth in the security system. It shall also be able to be retracted upon presentation of a valid card or fob to the card reader.
   6. See door hardware specifications for transfer hinge and wiring harness provision plans.
      a. If wiring harness is provided as part of door hardware:
         1) Wire from door harness, through raceway and back to the power supply in the comm room. Wire to security panel for control of the door.
         2) Provide custom wiring and connectors to connect to the wiring harness
      b. If no wiring harness is provided as part of the door hardware.
1) Wire from the LR, through the hinge and back to the Power Supply in the comm room. Wire to security panel for control of the door.

c. Provide manufacturers recommended cabling type and wire gauge.

C. Magnetic Lock “ML” on drawings
1. The door hardware contractor shall install the Magnetic locks.
2. The contractor shall wire from the ML to the security panel. Provide cabling to control the ML and power the ML.
3. Provide power supply in the comm room to power the ML.
4. Connect panel to the Fire alarm so that when there is a fire alarm event the Magnetic locks disengage.

2.11 DEVICES AT THE DOOR
A. Door Contacts; “DC” on drawings
1. Contractor shall install magnetic door contacts in the top of each door required to be monitored. See drawings for door contact “DC” locations.
2. Contacts are provided as part of the door hardware specification.
3. Contacts shall connect back to the controller via wire installed by the Contractor.
4. In locations where there are double doors, two contacts shall be installed, and the connections shall be made so that the opening of each door is detected.
5. When the contact is installed in the recessed part of a metal doorframe, an appropriate, solidly attached metal support shall be used. The tolerance “gap” shall be adjusted to the frame and the door.
6. Wire door contacts back directly to an I/O card in the controller panel. DC’s shall not be wired through Request to Exit devices.

B. Hard-wired Request to Exit devices “RX” on drawings
1. These devices are located in the latch retraction devices or electric lock devices.
2. These devices are provided and installed by the door hardware contractor.
3. Security contractor shall wire from the RX to the I/O panel in the network controller.

C. Door Position Switch. “DP” on drawings
1. Door position switch is in the door hardware, provided as part of the lock.
2. Wire from this device to the security system to inform the system to the status of a lock.
3. Configure to allow other functions to happen or not happen. Talk with owner regarding requirements.

2.12 WIRES AND CABLES
A. The contractor shall be responsible for supplying and installing all cabling to make the system operational.
1. All cabling shall be Plenum rated
2. All cabling shall be installed in raceways and in accessible ceiling spaces through cable supports.
3. Provide manufacturer specified cabling based on use and length of signal transmission from panel to device.
4. Generate drawings showing the cables required and get those reviewed by the designer prior to installation.

B. PVC-Jacketed, RS-232 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; PVC jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.
1. NFPA 70, Type CM.
2. Flame Resistance: UL 1581 Vertical Tray.

C. Plenum-Type, RS-232 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, plastic insulation, and individual aluminum foil-polyester tape shielded pairs with 100 percent shield coverage; plastic jacket. Pairs are cabled on common axis with No. 24 AWG, stranded (7x32) tinned copper drain wire.
1. NFPA 70, Type CMP.

D. RS-485 communications require 2 twisted pairs, with a distance limitation of 4000 feet (1220 m).

E. PVC-Jacketed, RS-485 Cable: Paired, 2 pairs, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, PVC insulation, unshielded, PVC jacket, and NFPA 70, Type CMG.

F. Plenum-Type, RS-485 Cable: Paired, 2 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and fluorinated-ethylene-propylene jacket.
   1. NFPA 70, Type CMP.

G. Multi-conductor, Readers and Wiegand Keypads Cables: No. 22 AWG, paired and twisted multiple conductors, stranded (7x30) tinned copper conductors, semirigid PVC insulation, overall aluminum foil-polyester tape shield with 100 percent shield coverage, plus tinned copper braid shield with 65 percent shield coverage, and PVC jacket.
   1. NFPA 70, Type CM.
   2. Flame Resistance: UL 1581 Vertical Tray.
   3. For TIA/EIA-RS-232 applications.

H. Paired Readers and Wiegand Keypads Cables: Paired, 3 pairs, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, individual aluminum foil-polyester tape shielded pairs each with No. 22 AWG, stranded tinned copper drain wire, 100 percent shield coverage, and PVC jacket.
   1. NFPA 70, Type CM.
   2. Flame Resistance: UL 1581 Vertical Tray.

I. Paired Readers and Wiegand Keypads Cable: Paired, 3 pairs, twisted, No. 20 AWG, stranded (7x28) tinned copper conductors, polyethylene (polyolefin) insulation, individual aluminum foil-polyester tape shielded pairs each with No. 22 AWG, stranded (19x34) tinned copper drain wire, 100 percent shield coverage, and PVC jacket.
   1. NFPA 70, Type CM.
   2. Flame Resistance: UL 1581 Vertical Tray.

J. Plenum-Type, Paired, Readers and Wiegand Keypads Cable: Paired, 3 pairs, No. 22 AWG, stranded (7x30) tinned copper conductors, plastic insulation, individual aluminum foil-polypropylene tape shielded pairs each with No. 22 AWG, stranded tinned copper drain wire, 100 percent shield coverage, and fluorinated-ethylene-propylene jacket.
   1. NFPA 70, Type CMP.

K. Plenum-Type, Multiconductor, Readers and Keypads Cable: 6 conductors, No. 20 AWG, stranded (7x28) tinned copper conductors, fluorinated-ethylene-propylene insulation, overall aluminum foil-polyester tape shield with 100 percent shield coverage plus tinned copper braid shield with 85 percent shield coverage, and fluorinated-ethylene-propylene jacket.
   1. NFPA 70, Type CMP.

L. Paired Lock Cable: 1 pair, twisted, No. 16 AWG, stranded (19x29) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.
   1. NFPA 70, Type CMG.
   2. Flame Resistance: UL 1581 Vertical Tray.

M. Plenum-Type, Paired Lock Cable: 1 pair, twisted, No. 16 AWG, stranded (19x29) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.
   1. NFPA 70, Type CMP.

N. Paired Lock Cable: 1 pair, twisted, No. 18 AWG, stranded (19x30) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.
   1. NFPA 70, Type CMG.
   2. Flame Resistance: UL 1581 Vertical Tray.

O. Plenum-Type, Paired Lock Cable: 1 pair, twisted, No. 18 AWG, stranded (19x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and plastic jacket.
1. NFPA 70, Type CMP.

P. Paired Input Cable: 1 pair, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, polypropylene insulation, overall aluminum foil-polyester tape shield with No. 22 AWG, stranded (7x30) tinned copper drain wire, 100 percent shield coverage, and PVC jacket.
1. NFPA 70, Type CMR.

Q. Plenum-Type, Paired Input Cable: 1 pair, twisted, No. 22 AWG, stranded (7x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, aluminum foil-polyester tape shield (foil side out), with No. 22 AWG drain wire, 100 percent shield coverage, and plastic jacket.
1. NFPA 70, Type CMP.

R. Paired AC Transformer Cable: 1 pair, twisted, No. 18 AWG, stranded (7x26) tinned copper conductors, PVC insulation, unshielded, and PVC jacket.
1. NFPA 70, Type CMG.

S. Plenum-Type, Paired AC Transformer Cable: 1 pair, twisted, No. 18 AWG, stranded (19x30) tinned copper conductors, fluorinated-ethylene-propylene insulation, unshielded, and plastic jacket.
1. NFPA 70, Type CMP.

T. Elevator Travel Cable: Steel center core, with shielded, twisted pairs, No. 20 AWG conductor size.
1. Steel Center Core Support: Preformed, flexible, low-torsion, zinc-coated, steel wire rope; insulated with 60 deg C flame-resistant PVC and covered with a nylon or cotton braid.
   c. Braid: Rayon or cotton braid applied with 95 percent coverage.
   d. Jacket: 60 deg C PVC specifically compounded for flexibility and abrasion resistance. UL VW-1 and CSA FT1 flame rated.

PART 3 - EXECUTION

3.01 EXAMINATION
   A. Examine all pathways prior to installation of all cables and raceways.
   B. Install all conduits, pass-thru’s, raceways and surface mounted raceways prior to installing the security system devices and cabling.

3.02 PREPARATION
   A. Locate main path for all cables and install J-hooks where cable tray is not provided.
   B. Coordinate with other trades to install a clear, straight path down major corridors for the routing of security/access cables back to the communications closet.
   C. Plan installation of cables along wallfield in communications room. Provide finger-duct and D-rings for support of cables. See drawings

3.03 INSTALLATION-GENERAL
   A. Security/access cable shall be installed per industry standards.
      1. Install all cabling required for complete system connectivity. Cabling shall be plenum rated.
2. Care shall be taken to avoid crimping or bending the cable past the manufacturer’s recommended bend radius.
3. During installation, the cables shall not be pulled across the ceiling tiles or the structure of the building. This may cause damage to the cable jacket.
4. Adhere to all pulling tensions and bend radii during installation.
5. All cables shall route neatly in the ceiling. Whether they route in cable tray or J-hooks, the cables shall be neat and orderly.
6. Support cables at a minimum of every 5 feet.
7. When routing security/access cables parallel to electrical conduits and lighting ballasts, the cable shall maintain a clearance of at least 12 inches. When running perpendicular to electrical conduits and lighting ballasts the cable shall maintain 6 inches of clearance.
8. Provide a short coil of extra cable where the cable enters the vertical conduit. The coil shall consist of no less than 1-1/2 feet.
9. When installing cables in the communications room, all cable shall route neatly through the cable tray and cable ladder.
10. Provide a service loop of the cables on the wallfield.
11. Each cable shall have a self adhesive, self laminating, laser printed label at each end. The label shall show the location identifier of that cable. Labels shall be installed no more than 4 inches from the termination point of the cable.

B. Firestopping is required at all riser conduits, and all pass thru’s.
1. Each cable tray penetration of a wall shall be firestopped after cable installation. Use pillow type firestop to allow additional cables to be installed in the future.
2. Where riser conduits pass through floors, the area between the concrete and the conduit shall be firestopped. This shall be completed with a putty or liquid firestop product. Fill the space with mineral wool, and then install the firestop on top. All firestop shall be of sufficient thickness to secure the rating required by code.
3. After final cable installation, install a putty firestop around all cables where they enter and exit conduit pass thru’s and conduit risers.
4. Firestop as per AHJ requirements.

C. Cabling at the Panel.
1. Contractor shall coil all spare cable from the door devices outside the security panel and shall neatly coil the cable on the wall. Provide 5’ minimum in the coil for future movement of the panel.
2. Cables shall route into the panels through a grommeted hole that is sized for the cables entering.
3. All cables shall be installed in a neat and workmanlike manner.
4. Cables shall be terminated and shall allow for removal of a card without un-terminating the cables.
5. All cables shall be neatly distributed to the card in the panel.
6. All labels shall be visible inside the panel near the termination point. Label cables equidistant from their termination point.

D. Proper support of cables is of paramount importance when installing a cable infrastructure. All cables not in conduit or cable tray shall be supported via J-hooks a minimum of every 5 feet.
   1. Routes of cables shall be parallel or perpendicular to the walls of the building.
   2. Install the J-hooks to minimize changes in the level of the cables as they route through the J-hooks.
   3. All communications shall route as high in the ceiling as possible while still being accessible and staying away from other utilities.
   4. When installing the cable through the J-hooks, they shall all have relatively the same droop between hooks. All cables shall be installed neatly and squarely.
   5. Secure the J-hooks to the building structure with beam clamps and threaded rod as required to support the cables.
   6. J-hooks shall never be attached to drop ceiling support wires. Cables shall never be supported by drop ceiling wires.

E. Raceways.
   1. Shall be mechanically attached to the wall or door.

3.04 SERVER AND SOFTWARE INSTALLATION

A. Management Server:
   1. Server is existing
   2. Provide and apply any software required to support the new devices being installed.

B. Control Software:
   1. Contractor shall schedule meetings with the Owner prior to installation to determine the working of the security/access system.
   2. Configuration of the security software shall include but not be limited to the following:
      a. Users are already in the system.
      b. Number each door and any input and outputs associated with that door and associate it with a standard door name for easy review.
      c. Meet with the owner to determine how they will use the system. Take information from them that will allow all custom settings of the software system. This shall include but not be limited to:
         1) User groups based on building and administrative group
         2) Access levels based on groups and times.
         3) Door Groups for access and locking and unlocking schedules.
         4) Building locking and unlocking schedules for each building
         5) Administrative levels and super administrators
         6) Building arming and disarming schedules of door contacts
         7) Alarm level setting for different doors based on time of day and day of week.
         8) Normal locking schedules.
      d. Generate customized maps for each building.
         1) Create maps from the owner that have multiple levels such as entire building and then subdivided into different areas.
         2) The maps shall show icons for each door. The icons shall be green or red based on open or closed door.
         3) Setup all icons to allow the owner to click on a door and then have direct access to lock or unlock or pulse the lock on a door.
      e. Setup all user accounts and install the user software on the owner’s PC’s.
         1) Setup the user accounts based on the doors or buildings they will be allowed to control.
         2) Work with the owner to determine which panels, doors, maps or buildings the user will be able to see and control.

3.05 CONTROL PANEL INSTALLATION
A. Enclosure and power
   1. Contractor shall mount the enclosure on top of ¾” fireproof plywood.
   2. Mount enclosure in the location noted. Coordinate other equipment and wallfield systems.
   3. Locate the 120 volt power outlet and install enclosure in relation to power.
   4. Size the enclosure to support all PACS devices noted on the drawings and in the specifications.
   5. Provide magnetic cable support devices in the panel to route cables inside the pane to the controllers and power devices.
   6. Power.
      a. Install cabling and raceway to connect the power supply in the enclosure to the 120 volt power outlet.
      b. Shall be hard-wired power. Plug-in power is not allowed.
      c. Provide an electrician for connection of the power supplies if required by AHJ.
   7. Battery backup
      a. Provide and connect the batteries to the power supply for the enclosure.
      b. Test the battery supports the panel by removing 120 volt power after the system is fully up and operational.
   8. Network connectivity
      a. Provide and install CAT-6 cable from the enclosure for the power supply to the communications rack. Connect to the Ethernet switch.
   9. Other Controllers and I/O Board connectivity.
      a. Provide and install cabling to connect the Ethernet controller to the other controllers and I/O boards via RS-485.
      b. Do not install RS-485 between communications rooms. Each comm room shall have an Ethernet attached Controller.

B. Controller:
   1. Controller(s). shall be mounted in the enclosure as shown on the drawings.
   2. Controller shall be sized for all security, access, control, and monitoring points existing on the drawings and shall be expandable.
   3. Controller shall be able to be linked to additional controllers in other communications rooms/buildings via the Ethernet network.
   4. Each port in the controller that is connected to a security point shall be labeled inside the controller box.
   5. Label the outside of the panel with the door numbers and list of devices that are connected in that panel. Shall be laser printed adhesive labels.
   6. Label the inside of the panel door with the layout of the panel and which controllers attach to which devices. Include door numbers on the diagram.
   7. Depending on the type of panel the contractor shall provide cable routing hardware and equipment to neatly install cabling.
      a. Route cable to allow easy change and replacement of the individual control cards in the panel.
      b. Cabling shall be neatly bundled. See example below of adequate cabling being routed into a panel.
   8. Network connectivity
      a. Provide and install CAT-6 cable from the controller to the communications rack. Connect to the Ethernet switch.
      b. Connect on the Ethernet to the Switch.
   9. Wire and install the panel to look like this:
10. Fire Alarm integration “FA
   1. Wire from the enclosure/controller to the Fire Alarm system
   2. Provide all cabling and i/o ports to accept inputs from the fire alarm or trigger the fire alarm panel.
   3. Work with the fire alarm provider to support integration between the PACS and Fire alarm. That may include:
      a. Release of Hold opens for doors in a lockdown
      b. Release of magnetic locks during a fire alarm event
      c. Release of electronic locks during a fire alarm event.
      d. Others as defined by the owner.

3.06 DOOR LOCKING CONNECTIVITY
   A. Electric Latch “EL”, Magnetic Lock “ML” on drawings
      1. The note devices shall be installed by the door hardware contractor.
      2. Power supplies shall be located in the comm room. Provide and install power supplies.
         Connect power supplies to the controller panel.
      3. Install all cables required to be connected this device to the security system
      4. Review door hardware specifications to determine if a wiring harness is being provided by the door hardware supplier.
         a. Install cables from the controller panel and power supply in the comm room to the wiring harness. Connect to harness
         b. For EL devices, install harness from door hardware EL to the hinge, through the hinge and to the connection point for cables from the controller.
         c. For ES devices, install cabling from security panel to the Electric strike in the latch side of the frame.
         d. Wire from device, through frame and back to controller/power supply in the comm room.

3.07 READER INSTALLATION
   A. Card Readers “CR” on drawings
1. Card readers shall be installed at locations shown on the drawings.
2. Review site and drawings and coordinate the wall mounted readers and frame mounted readers. Order the correct reader for each location.
a. Conduct a site visit prior to ordering card readers.
b. If the wrong reader is ordered then the contractor shall provide the correct reader.
3. Coordinate installation of all card readers with the doors and walls.
4. Where the reader is mounted on the door, coordinate the installation with the installation of the door to allow all cable for security/access.
5. Locate all card readers at ADA compliant heights and locations.
6. Wire and configure the card readers so that when the lock is engaged the light on the reader is red and when the door is unlocked the light is green.
7. Garage Doors and Pedestals: At the garage doors and at pedestals the card readers shall be installed with a box that has a cover for the top of the card reader.

3.08 DEVICES AT THE DOOR
A. Door Contacts “DC”:
   1. Install contacts where shown on the drawings. For door contacts, install them at the top of the door.
   2. Work with door provider and installer on timing of door contact installation.
   3. Install raceways to allow installation of the door contacts if no raceway is provided inside the wall.
   4. Drill into the door frame and door to allow installation of the door contact and the associated cable. No cable shall be visible after installation.
   5. Where door frames are filled, they shall be drilled out to allow installation of the door contact. Surface mount contacts are not allowed at any student accessible doors.
B. Request to Exit Devices “RX” on drawings
   1. When the RX is shown, wire from this device in the lock/pushbar, back to the controller in the comm room.
   2. Set this up to shunts the door contact when triggered.

END OF SECTION 28 35 00
PART 1 - GENERAL

1.01 SECTION INCLUDES
A. This section includes parts and equipment required for installation and termination of a building-wide Access Control and Intrusion Detection System. This system shall be referred to as the "security system" throughout these specifications.
B. The owner utilizes Johnson Controls Cardkey Pegasys 2000 as the access control system and intrusion detection. No other systems are allowed

1.02 SYSTEM DESCRIPTION
A. The security system shall be supplied and installed by a Contractor able to show examples of similar projects and installations within the last 3 years.
B. The security system shall be an extension of the existing system at the WSU Campus.
C. The Security System shall provide a solution for access control and intrusion detection systems.
D. Contractor shall provide all software required for connection of the security system to the in-house data network and associated control PC’s and existing Pegasys server.
E. The security system client-server architecture shall communicate with native TCP/IP over an existing Ethernet TCP/IP enterprise network.

1.03 COORDINATION
A. All cables shall be coordinated with the doors and door hardware being installed as part of this project.
B. Access Control/Intrusion detection cable shall be a unique color from the Telecommunications cable, fire alarm cable and lighting control cable. Coordinate this with the Electrical Contractor prior to ordering the equipment and installation of the cables.

1.04 PROJECT PLAN
A. The contractor shall provide a project plan to the owner and contractor that describes the system and its capabilities and the possible configurations.
B. Provide a project approach which describes the installation and implementation plan and schedule and all sequencing.
C. Meet with the owner numerous times to determine how the system should work and how it should be monitored. Configure the system prior to installation to meet these requirements. Demonstrate the system use to the owner prior to installation and obtain approval to move forward with the installation.
D. Contractor shall conduct numerous site reviews to establish pathways and routes for all raceways required.
E. Provide shop drawings showing all configuration and connectivity of the system.
1. Include elevation view of panels and which doors each panel will support
2. Include one-line connectivity including devise at each door and all other devices to be controlled or monitored.
F. Generate a testing plan and have that plan approved by the owner and engineer prior to installing the system.
G. The system shall be installed and tested prior to cutting over any doors to the system. Provide and install temporary card readers, door contacts etc to the system for testing. Demonstrate that this works prior to cutover.
1.05 RELATED STANDARDS
A. The security system shall conform to the following international and national standards:
1. FCC Rules and Regulations
2. UL 294 Access Control Systems
3. UL 1076 Line Supervision
4. 21 CFR part 11
5. Part 15, Radio Frequency Devices
7. Applicable Federal, State and Local laws, regulations, codes
8. Americans with Disabilities Act (ADA).

PART 2 - PRODUCTS

2.01 MANUFACTURERS
A. Approved vendors for security cables are:
1. General Cable.
2. Belden.
3. West Penn Wire and Cable.
4. Equivalent manufacturers.
B. Approved vendor for access control/intrusion detection systems equipment is:
1. Cardkey Pegasys 2000

2.02 MATERIALS
A. All security and control cables shall be plenum rated.
1. Contractor shall provide all appropriate cable from the door security hardware to the security system. All cabling shall be plenum rated.
2. Some locations require outdoor rated cabling. The contractor shall provide the cabling to match the required area.
3. There will be requirements for many different types of cabling and the contractor shall provide for each.
4. Provide a coil of cable at each location for moves and maintenance.
B. The system shall be fully configurable and compartmentalized so that any user can be assigned, and they will only see the status of doors at one building.
1. Based on a user’s login, the system shall be configurable to restrict persons from seeing or controlling doors and lock schedules at building that they do not have permission to see or control.

2.03 SECURITY SYSTEM SERVER
A. Management Server:
1. Server is existing at the owner’s data center. It is a Pegasys P2000 server.
2. Provide all work and any additional software from Pegasys as required

2.04 SECURITY SYSTEM SOFTWARE
A. Software shall be an extension of the Cardkey Pegasys 2000 system,

2.05 ENCLOSURE
A. Shall be provided to hold power supplies, controllers, access control processors, card reader boards, input/output cards (now to be referred to as security panels) and any other components required for a complete access control system.
B. Security enclosures are the physical boxes and cabinets that support the intelligent controllers, I/O boards, power supplies and power distribution equipment.
C. Security panels hall be wall mounted and large enough to hold power equipment and access control system controllers and cards.
D. Security panel shall be:
1. Enclosure shall accommodate power supply and sub-assemblies such as controllers and security cards to be provided as part of the project.
2. Primary power input shall be 120VAC
3. Physical
   a. Size enclosure as required to hold power supplies and security panels. Provide multiple enclosures where required.
   b. Made of 16 AWG sheet metal
   c. Shall have conduit knockouts or custom cut holes for access to the panels for cabling.
   d. Be equipped with an internal cam lock
   e. Be equipped with a tamper switch that shall be wired to the I/O for software alarm when the panel is opened.
   f. Shall have space for batteries to support the access control system.
4. Equip with a backplate or DIN Rail that shall support direct mounting of the security panels and power devices.
5. Equip with magnetic cable supports that attach to the backplate to support cables.
6. Use # 237 cam lock for JCI Cardkey panels.

E. Security Enclosure for Pegasys equipment shall be Johnson Control S300-DIN series.
F. Any other enclosures provided shall be metal and shall be marked for what they contain.

1. Equip any non-Johnson Controls enclosures with a Tamper Switch, GE #3012-N. connect to Control Board for monitoring.
2. Monitor power failure of the power supplies in these enclosures.
   a. Power fail circuits must be configured to monitor for extended power loss, not power “bumps”. Circuit/device protection (fuses) must be included and designed to expedite troubleshooting of the alarm system.
3. Use CCL # 15748-US26D-C4L-KA4T3252 for terminal cabinets.
   a. Terminal Cabinet Locks may require Brass Spacer CCL # 2540 x US4 for proper operation of tamper switch.

2.06 ACCESS CONTROL PROCESSOR (ACP)
A. See floorplans for controllers and locations, a minimum of one per building.
B. The ACP is the main control processor for each building and stores all the pertinent data for that respective building i.e.
   1. Card holders,
   2. Monitor points,
   3. Output control points,
   4. Time schedules, locking and unlocking schedules etc.
C. The ACP shall interface with multiple terminal boards (e.g. reader boards, input boards, and output boards) and also communicates directly with the P2000 Server.
D. Each building is equipped with an access control processor, Johnson Controls # CK721A ACP.

2.07 POWER SUPPLIES
A. Power supplies and power equipment shall be provided that support the entire access control system, security panels/controllers, door locks and all other field equipment of the access control system.
B. All power supplies shall be connected to 120VAC power with a hardwired connection. Install cable and connect to power.
   1. Provide and install conduit, wiring and connections required for 120-volt power connectivity.
C. Power supply shall be mounted to the enclosure. Shall include:
   1. Shall provide power to the panels in the enclosure and field devices.
   2. Shall include multiple 12 or 24 volt outputs. Shall be settable in
   3. Input voltage of 120VAC with a fuse
4. Classified as a Power-Limited stand-alone power supply with stand-by battery and suitable to power sensors and electro-mechanical devices (e.g. electric door strikes), as defined in the National Electrical Code/NFPA70/NFPA72
5. Shall be sized for outputs of 1 thru 16 unique outputs.
6. Battery connection for charging on-board batteries.
7. LED indicators for:
   a. AC input
   b. DC output
   c. Battery discharged or no battery
8. Over Voltage protection
9. Short Circuit protection
10. Power supply shall be Altronix #AL60ULX.

D. Battery Backup
   1. The enclosure shall have battery backup UPS circuit with built-in battery charger that shall provide automatic battery backup UPS power in event of AC line failure.
   2. Each controller enclosure panel shall have a battery for power failure. Battery shall be fully enclosed in a metal cabinet.
   3. The battery shall provide for full UPS operation for a minimum of 30 minutes
   4. A 12v/7Ah gel cell battery must be provided with every equipment cabinet containing a power supply for controllers or terminal boards. Install and connect inside the enclosure.

2.08 CARD READER BOARD
A. The Contractor shall provide intelligent controller modules / boards for the security system that utilize a true distributed processing technology with local processing at each controller.
B. One module per communications room or immediate adjacent enclosures shall provide for communications with the server/software via on-board 10BaseT/100BaseTX Ethernet port and support TLS encryption as a minimum-security implementation.
C. In the event system communications is lost or the server/cloud fails, all networked intelligent controller, (controllers or security panels or modules, terms will be used interchangeably) shall provide complete control, operation, and supervision of all monitoring and control points based on the latest database information.
D. Two-reader/door boards shall be Johnson Controls S300-DIN-RDR2SA.
E. Eight-reader/door boards shall be Johnson Controls S300-DIN-RDR8SA
   1. This shall serve as the interface between the card reader and the ACP.

2.09 CONTROL BOARDS
A. Input / Output I/O control boards shall be installed in the enclosures and attached to the ACP to allow input and output to the field devices throughout the building(s).
B. I/O boards shall monitor both supervised and non-supervised devices. Each board can be configured and terminated for supervision to support critical device, such as the reporting of Fire Alarm, Fire Trouble and Fire Supervisory alarms to WSU PD
   1. One board in each building shall be on Terminal 1 inputs 1, 2 & 3 as noted:
      a. Terminal 1 -Fire Alarm,
      b. Terminal-2 -Fire Trouble
      c. Terminal-3 -Fire Supervisory alarms
   2. Non-supervised devices that may be connected to these boards include but not limited to
      a. Perimeter doors,
      b. Roof hatches and roof doors,
      c. Environmental alarm devices,
      d. Glassbreak detectors,
      e. Motion detectors,
      f. Water detectors etc.
      g. Each building on campus is required to have at minimum (1) S300-DIN-I8O4 input board configured to report supervised alarms.
3. The S300-DIN-I8O4 or S300-DIN-I32O16 input/output control board shall be utilized to control devices remotely (e.g. unlocking perimeter doors on time schedules, resetting glass break detectors, shunting alarm points during business hours).

4. Provide additional modules or boards to support all control, access and security points shown on the drawings and described in the specifications.

5. Modules shall be installed to connect to the field devices, including but not limited to:
   a. Door contacts,
   b. Request to exit devices,
   c. Push buttons/Panic buttons
   d. Toggle Switches
   e. Assisted door opener devices and door opener buttons
   f. Motion sensors.
   g. Strobe lights
   h. Glass Break Sensors
   i. Embarrassment alarms / exit alarms
   j. Lockdown buttons with Lockdown Status Light
   k. Other field devices noted
   l. All other security devices required and shown on the drawings.

6. Control Boards shall translate information from the field devices to the controller and thus the server for records and access control.

C. 8-input and 4 output control board shall be Johnson Controls #S300-DIN-I8O4
D. 3-input and 16 output control board shall be Johnson Controls #S300-DIN-I32O16

2.10 FIBER OPTIC CONVERTER
A. Each building that has an access control system shall be connected to Wayne State University (WSU) police for monitoring.
B. The fiber optic converter shall connect to the APC with a CAT-6 able
C. Install the converter in the communications rack.
D. Equip with a UPS for power. Install the UPS on a shelf in the rack.
E. Connect the Fiber converter to the APC in the room and the WSU network at the other end of the connection.
   1. Provide all fiber and copper patch cables.
F. Fiber converter shall be Radiant Communications #DLL-SM-RE3 with SC type connectors
G. UPS Shall be APC #BK350 or equal

2.11 INPUTS AND MONITORING REQUIREMENTS
A. The system must have perimeter security using door switches shunted for request to exit (RX) and glass break protection rather than motion detection.
B. Perimeter security will monitor all doors for both door position and latch position.
C. Use RX (Request to Exit) switches mounted inside (latch retraction) rim/panic device.
D. All security devices shall be monitored for tampering, including all card readers, all alarm control keypads, all motion sensors and all glass break sensors.
   1. Tamper alarms for security devices shall be wired to separate input points than their respective security device's input point.

2.12 CARD READERS
A. Refer to the drawings for locations where card readers “CR” are required.
B. Card readers shall be combo readers that read standard 125 khz readers for standard prox and 13.56 MHz “smart” cards and 2.4Ghz (Bluetooth) compatibility.
C. Card readers shall be completely compatible with the security/access system.
D. Card readers shall be mountable in a single gang box or in the frame of a door. Refer to drawings for locations.
E. Readers shall be sealed to allow outdoor installation.
F. Reader shall be 3-stripe magnetic reader
G. Card reader shall be Mercury Security #MS-BR20-OW-T3
   1. Equip with a Magnetic switch, Sentrol #1035W
2. Equip with a Weatherized rain hood

2.13 BUILDING PERIMETER DOORS
A. Exterior doors shall be equipped with Latch Retraction pushbars.
B. Latch Retraction device: "LR" on drawings
   1. The door hardware installer will install a Latch Retraction device at each door equipped with a card reader or as shown on the drawings.
      a. Vertical rod exit devices are not allowed.
   2. The security contractor shall wire from the LR device to a power supply in the ceiling and then to the door controller in the communications room.
   3. LR devices are to be fitted with
      a. LR (Electric Latch Retraction) functionality,
      b. RX (Request to Exit) monitoring switch,
      c. DS (Latch Bolt monitor switch, Sentrol #1078
      d. LC (Low Current) - rated contacts.
      e. All LR devices shall be mounted to doors per Allegion specifications which include using 10x24x1" pan head Phillips-type machine screws with holes drilled and tapped to accommodate said machine screws. Case covers and end caps shall be secured with the Phillips-type screws provided with the rim device.

2.14 ROOF AND MECHANICALROOM DOORS
A. Equip each with a door contact "DC". Sentrol #1028.wire to security system
B. Doors to be monitored on a schedule. Consult WSU Police alarm system administrator for specific times.
C. Custom Signage shall be installed at roof hatch indicating the hatch is armed and to contact WSU Police before opening.

2.15 PERIMETER OVERHEAD GARAGE DOORS.
A. Equip each with a garage contact “GC”. Sentrol 2205AL x 1912L surface-mounted overhead magnetic door switch.
B. Custom signage shall be installed at the garage door indicating that the garage door is armed and to contact WSU Police before opening.

2.16 ROOF HATCHES
A. Equip each with a door contact “DC”. Sentrol 2505A x 1912L surface-mounted, magnetic door switch to be installed on all roof hatches.
B. Roof hatches are to be monitored on a schedule. Consult WSU Police alarm system administrator for specific times.
C. Custom Signage shall be installed at roof hatch indicating the hatch is armed and to contact WSU Police before opening.

2.17 ADA AT DOORS
A. ADA assisted Openers
   1. At some doors there are assisted openers. At these doors the access control system shall completely work with the opener. Include equipment and programming to allow the doors to function as per below:
      2. Exterior ADA actuators must be disabled whenever the electrified hardware is locked and enabled only after the card and/or PIN have been presented at the reader to allow access.
         a. When approaching from the exterior and doors are locked:
            A) Present a card and then door shall be unlocked. Push the auto opener and the door shall open.
         b. When approaching from the exterior and doors are unlocked:
            A) Push the auto opener button and the door opens.
         c. When approaching from the interior and doors are locked:
            A) Push the auto opener button and the door shall unlock and open.
         d. When approaching from the interior and doors are unlocked:
A) Push the button and the door opens.

2.18 PERIMETER BUILDING PROTECTION.

A. All perimeter glass accessible from grade or some other nearby elevated platform (e.g. overhangs, canopies, half story roofs, second story roofs, adjacent buildings, trees, etc.) are to be protected with Glassbreak Sensors or PIR Motion Sensors.

B. Perimeter monitoring devices shall be interfaced with the building ACP input and output boards and are monitored and controlled by WSU Police via the P2000 Server.

C. All perimeter sensors are connected to individual inputs on JCI I/O boards. WSU Police must have the ability to shunt, arm and disarm all perimeter sensors via outputs on the JCI I/O boards. Consult with WSU Police alarm system administrator for specific intrusion alarm programming configurations.

D. Acceptable sensors are as follows:

1. Glass Break Sensors “GB” on drawings
   a. Install glass break sensors as noted on the drawings.
   b. Install based on manufacturers recommendations
   c. Wire to the access control/intrusion detection system.
   d. Perimeter monitoring devices shall be interfaced with the building ACP input and output boards and are monitored and controlled by WSU Police via the P2000 Server.
   e. All perimeter sensors shall be connected to individual inputs on JCI I/O boards. WSU Police must have the ability to shunt, arm and disarm all perimeter sensors via outputs on the JCI I/O boards.
   f. Consult with WSU Police alarm system administrator for specific intrusion alarm programming configurations. Acceptable sensors are as follows:
      g. GB (Glassbreak Sensor) shall be Honeywell #FG-1625/T break sensors.
         A) Where multiple glass break sensors are located in close proximity to each other, they must be wired to a nearby centrally-located junction box.
         B) The glass break sensors must be wired in series with each other to said junction box with a single cable pair wired to the JCI I/O board.
         C) This configuration reduces the number of required inputs. The junction box must contain termination strips and associated components required for proper monitoring and control of the sensors. Junction boxes must be documented on s-Bult drawings as a single zone and include all termination points, cable colors, cable types, etc.
         D) Sensors wired in a daisy chain configuration are not acceptable. A dedicated output on the JCI I/O board controlled by WSU Police is required to remotely reset power to sensors after activation.

2. Vestibule Glassbreak Sensor “GB-V” shall be DSC BV-502GB
   a. This glassbreak sensor to be used when protecting entryway vestibule glass doors.
   b. GB-V sensors must be home run to the JCI I/O board and not part of a zone configuration. Motion sensor shall shunt glassbreak sensor when pedestrians are exiting the building.

3. PIR Motion Sensor “MD” shall be Visonic SRN-2000 PIR Motion Sensors.
   a. PIR sensors are only acceptable when interior spaces are not occupied after normal business hours and building is armed by scheduled output from P2000 Server.

2.19 SECURITY CONTACTS/CONTACT CLOSURES: “SC”

A. Contractor shall provide an interface in the controller for connections to dry contact closures of other systems.
   1. Dry contact shall cause an alarm on open or closed state depending on Owner required configuration of the controller.
   2. Contractor shall provide all cabling and configuration required interfacing the security/access system with all security contacts.
3. Contacts shall be provided as per the drawings and shall interface with the other systems as shown.
4. Equip each LCD and video projector with an SC device
5. Security Contacts for LCD Displays and Projectors shall be Sentrol #MagnaPull

2.20 INTERCOM – IP BASED
A. Intercom at doors; “IC” on drawings
   1. At locations shown on the drawings, the Contractor shall install audio (IC) Intercom devices to allow visitors to contact the office to announce themselves and to gain entry into the building.
      a. Connectivity of the components shall be via CAT-6 cables from the Intercom to the doorphone Controller
      b. This shall be from the exterior interfaces, throughout the system and to the communications room where the doorphone controller shall be located.
      c. Doorphone controller shall connect to the Ethernet network and provide a SIP connection to the owner’s telephone system.
      d. Doorphone controller shall connect to the access control system to support unlocking of the door associated with the Intercom
      e. Provide cabling required for connectivity of this device to the network and access control system
   2. Audio intercoms “IC” at the door shall have the following characteristics:
      a. Device shall have a single, 1-touch, push-button for calling into the telephone system. This shall open a 2-way communications path between devices.
      b. Include the backbox for custom mounting. Provide weatherproof equipment outdoors.
   3. Surface mounted audio intercom with doorphone controller shall be Algo #8028

2.21 BLUE-LIGHT EMERGENCY PHONES
A. Blue light phones shall be VoIP connectivity. TalkaPhone is the approved manufacturer.
B. The following are the components that are approved for Blue Light telephones:

<table>
<thead>
<tr>
<th>Item</th>
<th>Part Number</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SIP Phone</td>
<td>VOIP-500E</td>
<td>VOIP-500 Series Call Station with EMERGENCY Signage</td>
</tr>
<tr>
<td>Stanchion Enclosure</td>
<td>ETM-MT/R-QP4P-PCS-001 (001 is the Ramtel Mounting Pattern) ETP-MT/R Series Tower Mount with LED Blue Light, LED panel light, and camera arm with provision for a dome camera (camera not included) and built-in 2.5-inch O.D. post (located at the top of the camera arm) for pole mounting other devices.(e.g. wireless radios) Includes internal shelf and mounting panel. Emergency Phone is purchased separately</td>
<td></td>
</tr>
<tr>
<td>Ramtel Adapter</td>
<td>ADAPT-56-GA-RM</td>
<td>Required if mounting Talkaphone VOIP-500E in existing Ramtel Tower</td>
</tr>
</tbody>
</table>

2.22 WIRES AND CABLES
A. All cables shall be plenum rated

<table>
<thead>
<tr>
<th>Application</th>
<th>Wire Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fiber converter to Cardkey panel</td>
<td>24 AWG x 4 Pair – Solid Jacketed Copper Plenum CAT – 5</td>
</tr>
<tr>
<td>Fire &amp; Fire Trouble inputs to board</td>
<td>18 AWG x 1 Pair - Solid Jacketed Fire Rated Plenum</td>
</tr>
<tr>
<td>Auto operator or temp probe to board</td>
<td>22 AWG x 4 Cond. w/Stranded Flexible Jacketed Plenum</td>
</tr>
<tr>
<td>Cabinet tamper / glass break reset</td>
<td>22 AWG x 2 Cond. w/Stranded Flexible Jacketed Plenum</td>
</tr>
</tbody>
</table>
PART 3 - EXECUTION

3.01 EXAMINATION
A. Examine all pathways prior to installation of all cables and raceways.
B. Install all conduits, pass-thru’s, raceways and surface mounted raceways prior to installing the security system devices and cabling.

3.02 PREPARATION
A. Locate main path for all cables and install J-hooks where cable tray is not provided.
B. Coordinate with other trades to install a clear, straight path down major corridors for the routing of security/access cables back to the communications closet.
C. Plan installation of cables along wallfield in communications room. Provide finger-duct and D-rings for support of cables. See drawings.

3.03 INSTALLATION-GENERAL
A. Security/access cable shall be installed per industry standards.
1. Install all cabling required for complete system connectivity. Cabling shall be plenum rated.
2. Care shall be taken to avoid crimping or bending the cable past the manufacturer’s recommended bend radius.
3. During installation, the cables shall not be pulled across the ceiling tiles or the structure of the building. This may cause damage to the cable jacket.
4. Adhere to all pulling tensions and bend radii during installation.
5. All cables shall route neatly in the ceiling. Whether they route in cable tray or J-hooks, the cables shall be neat and orderly.
6. Support cables at a minimum of every 5 feet.
7. When routing security/access cables parallel to electrical conduits and lighting ballasts, the cable shall maintain a clearance of at least 12 inches. When running perpendicular to electrical conduits and lighting ballasts the cable shall maintain 6 inches of clearance.
8. Provide a short coil of extra cable where the cable enters the vertical conduit. The coil shall consist of no less than 1-1/2 feet.
9. When installing cables in the communications room, all cable shall route neatly through the cable tray and cable ladder.
10. Provide a service loop of the cables on the wallfield.
11. Each cable shall have a self adhesive, self laminating, laser printed label at each end. The label shall show the location identifier of that cable. Labels shall be installed no more than 4 inches from the termination point of the cable.
B. Firestopping is required at all riser conduits, and all pass thru’s.
   1. Each cable tray penetration of a wall shall be firestopped after cable installation. Use pillow type firestop to allow additional cables to be installed in the future.
   2. Where riser conduits pass through floors, the area between the concrete and the conduit shall be firestopped. This shall be completed with a putty or liquid firestop product. Fill in the space with mineral wool, and then install the firestop on top. All firestop shall be of sufficient thickness to secure the rating required by code.
   3. After final cable installation, install a putty firestop around all cables where they enter and exit conduit pass thru’s and conduit risers.
   4. Firestop as per AHJ requirements.
C. Cabling at the Panel.
   1. Contractor shall coil all spare cable from the door devices outside the security panel and shall neatly coil the cable on the wall. Provide 5’ minimum in the coil for future movement of the panel.
   2. Cables shall route into the panels through a grommeted hole that is sized for the cables entering.
   3. All cables shall be installed in a neat and workmanlike manner.
   4. Cables shall be terminated and shall allow for removal of a card without un-terminating the cables.
   5. All cables shall be neatly distributed to the card in the panel.
   6. All labels shall be visible inside the panel near the termination point. Label cables equidistant from their termination point.
D. Proper support of cables is of paramount importance when installing a cable infrastructure. All cables not in conduit or cable tray shall be supported via J-hooks a minimum of every 5 feet.
   1. Routes of cables shall be parallel or perpendicular to the walls of the building.
   2. Install the J-hooks to minimize changes in the level of the cables as they route through the J-hooks.
   3. All communications shall route as high in the ceiling as possible while still being accessible and staying away from other utilities.
   4. When installing the cable through the J-hooks, they shall all have relatively the same droop between hooks. All cables shall be installed neatly and squarely.
   5. Secure the J-hooks to the building structure with beam clamps and threaded rod as required to support the cables.
   6. J-hooks shall never be attached to drop ceiling support wires. Cables shall never be supported by drop ceiling wires.
E. Raceways.
   1. Shall be mechanically attached to the wall or door.

3.04 SERVER AND SOFTWARE INSTALLATION
A. Management Server:
   1. Server is existing.

B. Control Software:
   1. Contractor shall schedule meetings with the Owner prior to installation to determine the working of the security/access system.
   2. Configuration of the security software shall include but not be limited to the following:
      a. Number each door and any input and outputs associated with that door and associate it with a standard door name for easy review.
      b. Meet with the owner to determine how they will use the system. Take information from them that will allow all custom settings of the software system. This shall include but not be limited to:
         A) User groups based on building and administrative group
         B) Access levels based on groups and times.
         C) Door Groups for access and locking and unlocking schedules.
         D) Building locking and unlocking schedules for each building
         E) Administrative levels and super administrators
         F) Building arming and disarming schedules of door contacts
         G) Alarm level setting for different doors based on time of day and day of week.
         H) Snow-Day override schedule that shall change when doors unlock and lock and which users or user groups are allowed to access the building during a snow day. Snow day shall revert back to regular scheduling after 11 PM that day.
         I) Setup all user logins to allow specific viewing of portions of the system based on login ID.
            1) Detail in the setup that persons rights in working in the system.
      c. Lockdowns and Secure
         A) Create different locking schedules and processes for Lockdowns and Secure situations.
         B) Work with the owner to determine what doors are locked or unlocked in a lockdown or secure situation.
         C) Make all settings and groups required for each situation.
      d. Set all alarm levels and outgoing calling attributes such as central station outcalls, paging and email alerts.
         A) Add users and all those that are to be notified on a building basis.
         B) Set levels for all door contacts such that the owner is notified of a door open when the system is armed but is not alerted during the day unless they ask for this type of configuration.

3.05 CONTROL PANEL INSTALLATION

A. Enclosure and power
   1. Contractor shall mount the enclosure on top of ¾” fireproof plywood.
   2. Mount enclosure in the location noted. Coordinate other equipment and wallfield systems.
   3. Locate the 120 volt power outlet and install enclosure in relation to power.
   4. Size the enclosure to support all PACS devices noted on the drawings and in the specifications.
   5. Provide magnetic cable support devices in the panel to route cables inside the panel to the controllers and power devices.
   6. Power.
      a. Install cabling and raceway to connect the power supply in the enclosure to the 120 volt power outlet.
      b. Shall be hard-wired power. Plug-in power is not allowed.
      c. Provide an electrician for connection of the power supplies if required by AHJ.
   7. Battery backup.
a. Provide and connect the batteries to the power supply for the enclosure
b. Test the battery supports the panel by removing 120 volt power after the system is fully up and operational.

8. Network connectivity
   a. Provide and install CAT-6 cable from the enclosure for the power supply to the communications rack. Connect to the Ethernet switch
   b. Install fiber adapter and connect to the fiber optic patch panel
   c. Ensure connectivity to the WSU network for Police Department monitoring.

9. Other Controllers and I/O Board connectivity.
   a. Provide and install cabling to connect the Ethernet controller to the other controllers and I/O boards via RS-485.
   b. Do not install RS-485 between communications rooms. Each comm room shall have an Ethernet attached Controller.

B. ACP
   1. ACP shall be mounted in the enclosure as shown on the drawings.
   2. ACP shall be sized for all security, access, control, and monitoring points existing on the drawings and shall be expandable.
   3. Controller shall be able to be linked to additional controllers in other communications rooms/buildings via the Ethernet network.
   4. Each port in the controller that is connected to a security point shall be labeled inside the controller box.
   5. Label the outside of the panel with the door numbers and list of devices that are connected in that panel. Shall be laser printed adhesive labels.
   6. Label the inside of the panel door with the layout of the panel and which controllers attach to which devices. Include door numbers on the diagram.
   7. Depending on the type of panel the contractor shall provide cable routing hardware and equipment to neatly install cabling.
      a. Route cable to allow easy change and replacement of the individual control cards in the panel.
      b. Cabling shall be neatly bundled. See example below of adequate cabling being routed into a panel.
   8. Network connectivity
a. Provide and install CAT-6 cable from the controller to the communications rack.  
   Connect to the Ethernet switch
b. Connect on the Ethernet to the Switch.

C. Fire Alarm integration “FA
   1. Wire from the enclosure/controller to the Fire Alarm system
   2. Provide all cabling and i/o ports to accept inputs from the fire alarm or trigger the fire alarm panel.
   3. Work with the fire alarm provider to support integration between the PACS and Fire alarm. That may include:
      a. Release of Hold opens for doors in a lockdown
      b. Release of magnetic locks during a fire alarm event
      c. Release of electronic locks during a fire alarm event.
      d. Others as defined by the owner.

3.06 DOOR LOCKING CONNECTIVITY
A. Latch Retraction device. “LR” on drawings
   1. For wiring in the actual push bar and in the door frame just behind the EPT power transfer.
      a. The contractor shall install Molex receptacle (mfg. part # 03-06-1062) with female pin connectors (mfg. part# 02-06-1103-C) where cable from EPT enters exit device.
      b. Use Molex receptacle (mfg. part # 03-06-2061) with male pin connectors (mfg. part # 02-06-2103-C) on exit device solenoid and switch wires.
      c. EPT wires transmitting power should be doubled up at both frame and exit device side to accommodate high current loads.
   2. Power Supply
      a. LR exit devices are to be powered with Von Duprin PS914-2RS power supply only. Not more than two EL devices shall be connected to a single PS914-2RS.
   3. Von Duprin EPT-10 (Electric Power Transfer) to be used for the transferring of power and data signals from door frame to door.
      a. Use Molex receptacle (mfg. part # 03-06-1062) with female pin connectors (mfg. part# 02-06-1103-C) where cable from door frame meets EPT. Use Molex receptacle (mfg. part # 03-06-2061) with male pin connectors (mfg. part # 02-06-2103-C) on door frame side of EPT wires.
      b. Molex connectors used on exterior door EPT must be lubricated with dielectric lubricant (white petrolatum) and must be wrapped in electrical tape to protect pin connectors and wire from exposure to moisture.
      c. Red and Green wires shall be doubled up for 24 VDC Positive signal
      d. Black and Brown wires shall be doubled up for 24VDC Negative signal
   4. Provide cards in the controller panel and equipment to allow the security system to interface with the LR.
   5. The LR shall be able to be held open based upon a time schedule put forth in the security system. It shall also be able to be retracted upon presentation of a valid card or fob to the card reader.
   6. Wire to the latch retractor and full integrate it into the security system.
   7. Wire from the LR to the Power Supply in the ceiling near the door.
   8. Wire from the power supply to the security panel in the comm room to allow control of each individual door.

3.07 READER INSTALLATION
A. Card Readers “CR” on drawings
   1. Card readers shall be installed at locations shown on the drawings.
   2. Review site and drawings and coordinate the wall mounted readers and frame mounted readers. Order the correct reader for each location.
      a. Conduct a site visit prior to ordering card readers.
b. If the wrong reader is ordered, then the contractor shall provide the correct reader.
3. Coordinate installation of all card readers with the doors and walls.
4. Where the reader is mounted on the door, coordinate the installation with the installation of the door to allow all cable for security/access.
5. Locate all card readers at ADA compliant heights and locations.
6. Wire and configure the card readers so that when the lock is engaged the light on the reader is red and when the door is unlocked the light is green.
7. Garage Doors and Pedestals: At the garage doors and at pedestals the card readers shall be installed with a box that has a cover for the top of the card reader.

3.08 DEVICES AT THE DOOR
A. Door Contacts “DC” and Garage contacts “GC”:
   1. Install contacts where shown on the drawings. For door contacts, install them at the top of the door.
   2. Work with door provider and installer on timing of door contact installation.
   3. Install raceways to allow installation of the door contacts if no raceway is provided inside the wall.
   4. Drill into the door frame and door to allow installation of the door contact and the associated cable. No cable shall be visible after installation.
   5. Where door frames are filled, they shall be drilled out to allow installation of the door contact. Surface mount contacts are not allowed at any student accessible doors.
B. Request to Exit Devices “RX” on drawings
   1. When the RX is shown, wire from this device in the lock/pushbar, back to the controller in the comm room.
   2. Set this up to shunt the door contact when triggered.
C. Door Position switch. “DP”
   1. Wire back to the access control system.
   2. Configure the system to note and use the position of the door to allow or disallow different events
   3. Work with the owner on configuring the system to act, alarm or not allow something based on the door position switch state.

3.09 ASSISTED OPENER FOR ADA
A. Assisted Opener: “AO” and assisted button “AB” on drawings
   1. Where an assisted opener is shown the contractor shall wire to this opener to work as noted on the drawings and as below:
      a. If the person presents a valid card then the latch shall retract inside the exterior door.
      b. The door shall hold unlocked for 15 seconds.
      c. The control board shall allow the exterior push button to be energized. Once the push button is energized then the exterior door shall be opened of the button is pushed.
   3. Operation sequence when the doors are unlocked entering from outside
      a. Push the ADA button Exterior door opens
   4. Operation sequence when the doors are locked entering from outside -no card or invalid card
      a. If the person pushes the exterior opener button, then the auto opener shall not engage because the opener button is not energized.
      b. The exterior opener button is not energized unless the PACS notes that the door is unlocked.
   5. Operation sequence when the doors are locked, exiting from interior
      a. When a person pushes the interior opener button then that shall communicate with the interior auto opener and open that door.
b. The control board of the auto opener shall communicate with the access control system and instruct it to retract the latch on the interior door.

6. Operation sequence when the doors are locked, exiting from vestibule
   a. When a person pushes the vestibule opener button then that shall communicate with the exterior auto opener and open that door.
   b. The control board of the exterior auto opener shall communicate with the access control system and instruct it to retract the latch on the exterior door.

3.10 ALARM DEVICES
   A. The contractor shall connect the alarm devices to the Pegasys
   B. Pegasys shall take input from the alarm devices and trigger an output or event. Work with the owner to setup the event or output.
      1. Output may be one of the following:
         a. Trigger of a light or strobe
         b. SMS message output
         c. Email message to owner defined group of users.
         d. Output to an alarm system.
   C. Glass Break “GB”
      1. Install glass break sensors as noted on the drawings.
      2. Install based on manufacturers recommendations. Wire to PACS controller
         a. Where multiple glass break sensors are located in close proximity to each other, they must be wired to a nearby centrally located junction box.
         b. The glass break sensors must be wired in series with each other to said junction box with a single cable pair wired to the access control/intrusion detection system.
   D. Security Contacts “SC”
      1. Install and attach these to the AV devices.
      2. Leave a spare coil of cable for short movement of the AV device.
      3. Test contact and document test.
   E. Testing
      1. Fully test alarming and outputs of the system with the owners SMS and Email systems and/or the owner’s security office.
      2. Test interaction with the access control system where they are connected.

3.11 INTERCOMS AT THE DOORS
   A. IP Intercoms
      1. Intercom at the door shall be installed based on the type chosen and specified in specs and drawings.
      2. Where the Intercom is surface mounted.
         a. Surface mounted units shall be connected to the interior of the building with a conduit and steel backbox.
         b. Where possible route the cables through the door or wall framing and extend to the intercom.
         c. Install raceway from bottom of intercom to lower pushbutton.
         d. Ensure installation of lower button to meet ADA requirements
      3. The intercom device shall be located at a place where it is accessible and where it can be mounted to see the person calling.
         a. Camera shall be positioned to cover the maximum area possible.
         b. Install a connection cable from the exterior interface to the interior unit and door lock.
         c. Install any baluns, adapters, or other devices required to send the signal from the exterior intercom to the network.
         d. Provide CAT-6 patch cables
      4. IP Programmable Relay (doorphone controller)
         a. This device shall be mounted in the main communications room.
         b. Connect to the Ethernet network with appropriate CAT-6 cabling
c. Connect to the controllers to allow the base station to unlock the associated door.
d. Integrate so that the base station only controls the door that the call was initiated from.

END OF SECTION 28 35 00
SECTION 28 37 00
SECURITY CAMERAS

PART 1 - GENERAL

1.01 SECTION INCLUDES
A. This section includes parts, cameras and equipment required for installation of the video surveillance cameras.
B. This shall include new IP video cameras and their software/configuration equipment as shown on the drawings and detailed in the specifications.

1.02 COORDINATION
A. All cables shall be coordinated with the installation of the raceways.
B. All cameras shall be installed in the ceilings in relation to the lights and other obstructions.

1.03 DESCRIPTION
A. Provide new IP cameras for video surveillance. See the detailed security drawings for location and quantities.
B. Cameras shall be pure IP cameras without the use of external encoders/decoders where possible.
C. Power for interior and exterior cameras shall be provided via the POE switch or via a centralized power supply in the communications room.
   1. The switches installed provide standard Type 3 PoE (15.4 watts) on each port. If a camera requires additional power above Type 3 PoE then the contractor shall provide that power supply and any additional required power cables.
D. PTZ and other cameras that require additional power above that provided from a Type 3 PoE connections shall be provided with a power supply.
   1. Provide any and all camera, power and control cables required for complete system connectivity and functionality.
E. It shall be the Contractor’s responsibility to provide all power to cameras based on the above methods. Take into account the Manufacturers recommendations.

1.04 EXISTING SYSTEM
A. The owner has an existing Video Management System and Storage and processing for the cameras being installed as part of this project.
B. Owner will configure the existing VMS to support the new cameras.

PART 2 - PRODUCTS

2.01 2.01 MANUFACTURERS
A. Approved Manufacturers for IP cameras:
   1. Axis

2.02 CAMERAS GENERAL REQUIREMENTS
A. Cameras shall provide full color images, and some shall change to black and white in low light.
B. Cameras shall support text overlay of image in viewing to allow naming/numbering of each camera on the screen and when video is offloaded.
C. The Contractor shall review the site with the Owner prior to ordering the lens for each camera.
   1. Finalize the needs of the Owner with the camera position to ensure that the correct lens is purchased for the camera.
D. Where noted on the drawings, provide a vandal resistant dome to the camera.
E. Where cameras require more power than PoE 802.af then the contractor shall provide power to the camera from a centralized power supply in the comm. room.

F. External Cameras
   1. Each exterior camera shall be equipped with a heater/blower or other device to keep camera functional and keep lens/casing from fogging or condensation from forming.
   2. Provide mounts for exterior cameras based on their installation location. Provide fully enclosed mounts. See drawings and conduct a field survey prior to ordering to ensure that he correct mounts are provided.
      a. Exterior mounts shall allow cable entry to the dome via the support. No cables shall be exterior to the mount or dome.

2.03 CAMERAS -
A. Cameras shall provide full color images, and some shall change to black and white in low light.
B. Cameras shall support text overlay of image in viewing to allow naming/numbering of each camera on the screen and when video is offloaded.
C. The Contractor shall review the site with the Owner prior to ordering the lens for each camera.
   1. Finalize the needs of the Owner with the camera position to ensure that the correct lens is purchased for the camera.
   2. Purchase the correct mount for each camera. Review the mounts for each camera with the owner prior to ordering.
   3. For drop ceiling locations provide a recessed mount and support all cameras from the T-bar of the grid and not just from the drop ceiling tile.
D. Where cameras require more power than PoE 802.af then the contractor shall provide power to the camera from a centralized power supply in the comm. room.
E. Camera shall be capable of the following:
   1. Plenum-rated backbox for indoor
   2. Weatherproof box for exterior installations.
   3. Wide temperature range for indoor and outdoor.
   4. Adjustable fixed camera mounting bracket that allows 360-degree mounting.
   5. Dome shall be clear exterior, smoked on interior cameras
   6. Power through PoE 802.af
   8. Compatible with the Video Recording System
   9. Minimum frame rate capability shall be 20 frames per second at maximum camera resolution. 30 FPS at all other camera resolutions.
   10. Compression shall be H.264, or motion-JPEG.
   11. Outdoor camera temp range shall be -40F to140F
   12. Some cameras shall have multiple lenses and shall be configurable and aimed as per the owners requirements
F. Cameras shall be as shown on the drawings.
   1. Provide all equipment and mounting for all cameras
   2. Default for exterior camera shall include a mount to extend the camera from the wall and install horizontally.
      a. The owner may ask to have the cameras flat against the wall. Verify with the owner prior to ordering.
   3. Provide a patch cable for each camera. Install and connected.
   4. Label each camera with a number that is approved by the owner. Label shall be visible and legible when standing on the floor, looking at the camera.

2.04 CAMERA ACCESSORIES
A. Camera Mounts:
   1. The Contractor shall provide all appropriate camera mounts. Refer to the drawings and conduct a site survey to determine each camera mounting type required.
      a. Complete this prior to ordering cameras.
      b. Review Reflected ceiling drawings from architect.
2. Exterior cameras will be mounted to the wall of the building in most cases.
   a. Where the camera is to look along the wall of a building the contractor shall provide a pendant mount that mounts the camera parallel to the ground.
   b. Mount shall extend the camera out from the building a few inches to allow viewing in 360 horizontal degrees.

3. The security cameras shall be mounted to building structure where shown on the drawings.
   a. Contractor shall provide a mount that best corresponds to the structure and can be securely mounted.
   b. Mount the camera at a height as shown on the drawings or at the optimum height to allow the best field of view and future service via extension ladder.
      1) Unless specified the cameras on the exterior of a building should not be installed more than 15’ above grade.
   c. When mounting the cameras, take into account the light and mount the camera so that it does not block light.
   d. The camera mount shall provide a route for cables extending from the raceway to the camera. Cables shall not be installed outside the camera dome or camera mount.
   e. The Contractor shall install a conduit to allow cable installation to the camera.
      1) This shall include installing conduits from the inside of the building to the outside of the building to support exterior cameras.
      2) Core through the outside of the building. Coordinate location with owner and architect prior to drilling.
      3) Install ¾ conduit or sized as per the mount.
      4) Except for corner and parapet mounts no conduits shall be visible after installation.
      5) At no time shall a cable be visible. Install flexible conduit and seal appropriately around holes made in the building.
      6) Repair wall after installation.
      7) No cable shall be visible after camera installation.

4. Dome-type cameras interior to a building may be installed in the lay-in ceiling.
   a. Provide supports so that the camera’s weight is supported from the “T” bars of the drop ceiling.
   b. Provide a backbox and escutcheon to make a tight fit from the dome to the drop ceiling tile.
   c. Locate the cameras to cover the area required by the Owner. Work with the Owner prior to installation.

5. Dome-type cameras interior to a building may be installed as a pendant mount from the building structure.
   a. Provide a backbox at the building structure. Install a down pipe and camera mount to attach the camera to the downpipe. Size the pipe as required.
   b. The camera mount shall keep the camera level and shall extend down to a level of no more than 11’ AFF.
   c. Locate the cameras to cover the area required by the Owner. Work with the Owner prior to installation.

6. Dome-type cameras interior to the building may be required to be mounted to a wall.
   a. Where there is a wall mount requirement, the Contractor shall install a wall-mount. Ensure that it is securely mounted.
   b. Route the cable through the wall and through the mount to connect to the camera.

7. Pole mount cameras shall be completely secured to the pole with manufacturer’s specified mounts.
   a. Shall attach to the pole with straps or screws based on the type of pole installed.
   b. Mount shall keep the cable as it routes from the pole to the camera totally enclosed and shall not subject the cable to the weather.
c. When mounting the camera, the cable shall route through the pole. Drill a hole into the pole. Install oxidizing gel around the steel. Then install a rubber grommet.

B. Camera and Power Cable:
1. Cables for transmission of the image and to provide power to the camera shall be plenum-rated.
2. Power cable (if required) shall be sized based upon the power requirements of the camera and other components in the camera, such as PTZ motors and heater.
3. See the drawings for the contractor responsible for installing CAT-6 cabling from the comm room to the camera.
4. The Security contractor shall install all patch cables between the termination of the user CAT-6 cable and the camera as well as the patch cable from the patch panel to the Ethernet switch in the comm. room.

C. All cables shall be supported in the ceiling a minimum of every 5 feet. Support can be provided by installing cable inside cable tray or conduit, or by installing J-hooks every 5 feet.
1. J-hooks shall provide a smooth steel support for cables as they route through the ceiling.
2. Each hook shall have a galvanized finish.
3. Steel, UL listed, ultimate static load limit 50 pounds, rated to support Category-3 and higher cables, and optical fiber cables.

D. Power Supplies:
1. For interior PTZ cameras and external cameras (where PoE Power is insufficient) the power supply shall be centrally located in a communications room.
2. Provide all power supplies and cabling for connection to the electrical circuit.

2.05 CAMERA INSTALLATION ACCESSORIES
A. Firestopping shall be completed inside and around all conduits after cable installation. Contractor shall install the best firestop for each individual installation.
1. Firestop shall be installed with regard to local and national building codes.
2. The firestop shall be a putty-like substance that expands under heat and will not allow flame to pass for a designated period of time.
3. Firestop shall conform to all NEC, NFPA, and UL requirements.
4. Some wall pass-thru’s are shown on the drawings. The Contractor shall utilize these where possible.
5. Where the contractor must install cables through a wall where there is no pass-thru already provided, the Contractor shall be responsible for installing a fire-rated pass-thru and fire-stopping the conduit after cable installation.

B. Weatherproofing shall be completed inside and around all conduits supporting exterior cameras after cable installation. Contractor shall install the best weatherproof for each individual installation.
1. Weatherproof around all conduits that extend through the building to the cameras on the exterior wall or soffit.
2. Seal all cameras so that all camera housing does not allow water into the conduit or into the building.
3. Seal so there is no infiltration of water or condensate.

PART 3 - EXECUTION

3.01 EXAMINATION
A. Examine all pathways prior to installation of all cables.
B. Identify locations of all user conduits and backboxes prior to cable installation.
C. Review site and note locations of cameras and conduits prior to installation.

3.02 PREPARATION
A. Visit each camera installation location to verify the type of mount prior to ordering the cameras.
B. If another contractor is installing the CAT-6 cabling then the contractor shall coordinate cable location with that contractor.
C. Green Tape walk thru.
   1. Contractor shall walk the entire site with the owner and identify each camera location with the owner prior to installation.
   2. Discuss the type of camera and its proposed field of view.
   3. Make adjustments as required by the owner and by the building structure to minimize interference and blocking of the camera image.
   4. Install a piece of green tape on the wall or ceiling at each camera location after agreement on the location is reached.
   5. Remove green tape after installation of cameras
D. Camera naming spreadsheet.
   1. Create an Excel spreadsheet showing the following:
      a. Camera number
      b. Camera part number
      c. IP address
      d. MAC address
      e. Owners chosen camera name
      f. Provide to the owner and designer.

3.03 INSTALLATION
A. Each camera shall be installed to provide maximum field of view and security.
B. Exterior cameras shall be mounted securely to the structure and shall be sealed to prevent water or any other environmental condition to enter the camera.
   1. Provide the correct mount for the location of each exterior camera.
   2. Where the mount is to the outside of a building then the contractor shall install a conduit from the exterior camera to the inside of the building for the camera cable(s).
   3. Review mounting location to determine optimum height of camera to cover all areas and provide the clearest pictures. Mount at appropriate height.
   4. Work with the Owner to focus and align all cameras for maximum coverage.
   5. Contractor shall change lenses for different focal lengths based on the actual installation location of the cameras and the requirements of the Owner.
   6. Seal around all conduit openings and the camera mount to seal from water and air infiltration.
   7. Install patch cable through the conduit and connect to the CAT-6 cable on the interior of the building.
C. Interior cameras shall be mounted in the lay-in ceiling, supported from the open ceiling or to the wall with a structural mount.
   1. The Contractor shall work with the Owner to determine the location of all the cameras.
   2. Work with the Owner to determine the direction of the lens and its focal length.
   3. Ensure that the camera is mounted securely to the drop ceiling and is supported from the T-bar.
   4. Where interior cameras are mounted to the wall, the Contractor shall provide a mount that will allow all cables to route through the mount. Cables shall not be “free-floating” from the wall to the camera.
   5. When a camera is pendant mounted the contractor shall install a down-pipe and conduit support to mount the camera at the correct height as determined by the owner.
D. Contractor shall focus and aim all cameras
   1. Camera aiming and focusing shall be a process where the owner has input at each stage.
   2. The process for aiming and focusing shall be as follows:
      a. Meet with the owner and determine the desired view of each camera. Determine where images shall overlap and what they are focusing etc.
1) Add this information to the camera naming spreadsheet.

b. Install the cameras and aim as per the meeting notes.

c. Meet with the owner and review each camera view on the monitor. Make notes of any changes required.

d. Schedule a time to make all changes.
   1) Changes shall be made while the owner is reviewing the live image through the VMS Software. The contractor shall have a person at the camera that can aim and focus the camera.
   2) Once the owner agrees on the image aim and focus generate a still picture of that image and keep it in a file.
   3) Print the aimed view and provide as part of the submittal at project substantial completion.

E. Camera naming

1. The contractor shall work with the owner and engineer to determine the naming and numbering convention for the cameras.

2. Determine the naming and then apply that to each camera. Enter the designation of the camera into the video security system.

3. On all cameras the contractor shall affix a label with the camera number to the exterior case of the camera. This shall be visible when standing near the camera.

END OF SECTION 28 37 00
SECTION 28 72 00
TECHNOLOGY SUBMITTALS

PART 1 - GENERAL

1.01 SECTION INCLUDES
A. This section provides the Contractor with requirements regarding Product Data Sheets, Shop Drawings and Product Samples collectively referred to as “Submittals”.
B. This section provides the Contractor requirements regarding As-Built Documentation after installation and prior to Final Completion and Final Payment
C. The requirements of this section deal only with those submittals that are required to be provided by the chosen contractor after bid award. No submittals in this section are required to be provided with the Bid Response.
D. The requirements contained herein should be considered bound and apply to all technology and security specification sections per this contract.

1.02 PRE-INSTALLATION SUBMITTALS
A. The contractor shall provide material submittals to the Construction Manager or directly to the designer, whichever is managing the project.
B. Prior to beginning work, the chosen Contractor shall provide PDF files of all material submittals.
   1. Highlight the part number of each item specifically. Submittals that are not highlighted will be rejected and sent back immediately.
   2. Include an Excel spreadsheet in .xls format to the designer for use in reviewing the submittals. Shall include all part numbers and manufacturers. Match camera submittals with the camera type on the drawings
   3. Provide an Excel Spreadsheet listing the following:

<table>
<thead>
<tr>
<th>Description</th>
<th>Manufacturer</th>
<th>Part Number</th>
<th>Mark</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enet Switch</td>
<td>Rainbos</td>
<td>XR-243T</td>
<td>Cam type “CA”</td>
</tr>
</tbody>
</table>

   4. Provide the PDF with the following file names
      a. Site - Spec Section - Description
      b. In Example: Kent City 28 1600: Data Cabling submittal

1.03 AS-BUILT DOCUMENTATION
A. The contractor shall provide As-Built documentation to the Construction Manager or directly to the designer, whichever is managing the project.
B. Provide the As-BuILts in hard and soft copy
   1. Hard Copy shall include one or more three-ring binders that include all documents listed below. Include a cover page on the front of the binder(s) detailing the client, the project, date of submission and project name/number
   2. Soft copy on USB Drives (PDF or Microsoft Word or Excel) shall include all documents provided in the hard copy plus any configuration or data files. Include XLS files for all spreadsheets.

PART 2 - PRE-INSTALLATION SUBMITTALS

2.01 PRODUCT DATA SHEETS
A. Product data sheets shall consist of the manufacturers detailed specification sheets or “cut-sheets” for each product that is to be installed by the contractor or any subcontractors.
B. Product data sheets shall minimally include, but shall not be limited to:
   1. Part Number
2. Manufacturer
3. Description of the product
4. Physical dimensions and characteristics of the product
5. Picture or manufacturers drawing of the item, where applicable
6. Electrical characteristics of the product including heat-load for active electronics.
7. Optical characteristics of the product for Fiber-Optic equipment and cable.

C. Provide product data sheets for all equipment and cabling that is to be installed by the contractor

2.02 SHOP DRAWINGS
A. Shop Drawings shall consist of detailed drawings showing actual connectivity and cable types for the systems noted below:
   1. Access Control system connectivity
B. Shop drawings shall also be provided for systems that the contractor intends to connect differently than what is shown on the contract drawings or where no connectivity is shown.

2.03 PRODUCT SAMPLES
A. Product Samples shall consist of a sample of the actual product that is to be installed.
B. Samples shall be tagged with the part number and specification section to which it pertains.
C. Product Samples shall be provided for the following:
   1. None at this time.

2.04 SUBMITTAL DOCUMENTS
A. The Contractor shall provide all Submittals to the Construction Manager or the designer
B. The Contractor shall provide PDF and Excel Files for all Product Data Sheets.
   1. All Product Data sheets shall be PDF files grouped via specification section or drawings number
   2. The data sheets in the file shall be segmented to match the specification section and page number they pertain.
   3. The Contractor shall highlight the actual part number on the sheet of the component that they are submitting.
   4. If no part number is highlighted or marked with an arrow, then the entire submittal package will be rejected and sent back for re-submission.
   5. Contractor shall submit an electronic copy of the Excel spreadsheet with their data sheets that details the manufacturer, part number and common name of the products that they are submitting.
C. The Contractor shall provide 1 set of PDF and one hard copy set of Shop Drawings.
   1. Shop drawings shall be marked for the specification section of the bid documents to which they pertain.
   2. All shop drawings that are required to be drawn on the building background shall be provided on full-size drawings the same scale as those in the bid documents.
   3. All lines on the shop drawings shall be highlighted or completed in ink that is not the same color as that provided in the bid documents.
   4. The contractor shall provide a drawing legend detailing all symbols used in creation of the shop drawings.
D. The Contractor shall provide one of each product sample required to be submitted.
   1. Provide a cutsheet with each product sample detailing the specifics of the product and what it is proposed to be used for.

2.05 SUBMITTAL REQUIREMENTS
A. Submittals shall be provided for approval prior to installation of the work.
B. Any equipment installed that does not have an approved submittal associated with it can and will be removed from the project and replaced with other equipment as defined by the Designer. All replacement costs shall be the responsibility of the Contractor.
C. It shall be the responsibility of the Contractor to provide the submittals for review in sufficient time to not delay the installation. Work with the Construction manager on the schedule.

D. It shall be the responsibility of the contractor to ensure they have provided and have on hand “Reviewed” or “Furnish as Corrected” submittals for all equipment they install.

PART 3 - AS-BUILT DOCUMENTATION

3.01 MATERIALS

A. The Contractor shall provide the following to the Designer prior to the issuance of the final payment.
   1. Approved submittals and equipment user manuals.
   2. As-Built Documentation as detailed below.
   3. All spare parts and cover plates for all components of the systems
   4. Manufacturer warranty cards for all components.
   5. (2) spare of each kind of audio and video patch cable installed as part of the project.

3.02 AS-BUILT PROCESS

A. The Contractor shall provide all project as-builts to the designer at substantial completion.
   1. Provide them to the designer for review
   2. Make any required changes the designer requests
   3. Re-submit at the time of Final Completion / final payment. Final Payment is not possible without a complete post installation deliverable package

3.03 PREPARATION

A. All binders for As-Builts and test results shall be neat and clearly labeled with listing of the project and documents included in each binder.

B. Quantity:
   1. Submit one (1) set of three-ring binder(s) with hard paper copies of project closeout submittals.
      a. Provide a clear label or cover sheet with the following information:
         A) Client name.
         B) Project name.
         C) Manual title (e.g., “Project Close-out Manual for security system upgrade”).
         D) Date; date format: <month> <day>, <year> (e.g., “January 1, 20xx”).
         E) Installer and General Contractor names and contact information

3.04 PROJECT DELIVERABLES

A. Provide a copy of all submittals and manuals and pamphlets. Shall be separated by equipment type with dividers in the binders.

B. All spare parts shall be provided in a box. The Contractor shall detail which component each spare part is for.

C. The contractor shall provide one set of full sized as-built prints. Provide a PDF of the as-built prints on the USB drives.
   1. Provide a clean set of the latest drawings with red lines marked for all field changes or bulletins.

D. The As-Built drawings shall include:
   1. Changes to be reflected on the drawings for Video Security Systems shall include:
      a. Camera locations
      b. Cabling Paths
      c. Camera numbers
      d. Comm room where camera connects to.
2. Changes to be reflected on the drawings for Access Control/Alarm Systems shall include:
   a. Changes to hardware installed at each door. Update each door for all devices installed and connected
   b. Changes to the panel locations
   c. Door numbers
   d. Changes to the schematic connectivity of any system shown on the drawings.

E. Documentation for the specific systems shall include. Provide the following for each system:
   1. Contractor warranty dates based on Substantial completion date and contact information for warranty work.
   2. Video Security
      a. Picture of focused and approved camera image labeled with the camera number and IP address
      b. Master user password list
      c. Spreadsheet of each camera that shall include:
         A) Camera Part number
         B) Firmware revision
         C) IP address
         D) MAC Address
         E) Camera Name
         F) Building where it is located
      d. Training “Cheat Sheet”
      e. Manufacturers Camera Warranty
      f. Server/NVR Warranty
      g. Manufacturer contact information for warranty work
      h. Software Upgrade Protection (SUP) warranty including end date
      i. Warranty certificate for all PC’s
   3. Access Control
      a. Part list/diagram for each access control panel. To include
         A) Panel name and IP address (if applicable)
         B) Doors which are connected to this panel
         C) Panel location. Building and room number
      b. Diagram showing which devices and doors that are attached to each panel
      c. Training “Cheat Sheet”
      d. Server Warranty
      e. Software Upgrade Protection (SUP) warranty including end date
      f. Warranty certificate for all PC’s

END OF SECTION 28 72 00
SECTION 28 76 00
TECHNOLOGY LABELING

PART 1 - GENERAL

1.01 WORK INCLUDED
   A. This section provides direction on labeling of cables and devices.

PART 2 - PRODUCTS

2.01 CABLE LABELING PRODUCTS INTERIOR
   A. CAT-6 and access control
      1. Laser-printed, self-adhesive wrap around shall be Brady LAT-18-361 or equivalent.
      2. Label shall be 1.00-inch width x 1.33 inch high.
      3. Labels shall come on a sheet with 7 labels per row with a white and transparent matte finish.
      4. Sheet size shall be 8-1/2 inch x 11 inch.
      5. Printable area shall be a minimum of 1.00-inch width x 0.50 inch high.
      6. All labels shall be printed through a laser printer using labeling software.
      7. The Contractor shall submit a proposal for the labeling scheme for all audio and video wiring. The Engineer shall approve of the scheme prior to all labeling.

2.02 SECURITY CAMERA LABELING
   A. Laser-printed, labels shall be used to label all Security Cameras
      1. Label the camera with a White or Clear label with black lettering.
      2. Label shall include the camera number.
      3. May include the IP address. Consult with owner to determine if this is required
      4. Label shall be a minimum of 3/4 inch tall and legible when standing beneath or near the camera as long as camera is not above 15; AFF

2.03 ACCESS CONTROL PANEL LABELING
   A. Label the front of each access control panel to detail the doors that are connected to the panel.
      1. Label the front panel and detail each door number
      2. Label shall include the panel name and IP address
      3. Text shall be a minimum of 3/8 inch tall
      4. White label with black numbers

PART 3 - EXECUTION

3.01 PREPARATION
   A. Terminate all cables in proper color code sequence.
   B. Clean any surfaces where an adhesive label is to be installed.
   C. Prior to beginning the work, the contractor shall submit to the engineer a plan for labeling all the cables. This shall take into account to what components each cable is connected.

3.02 GENERAL LABELING
   A. Everything shall be labeled as per the specs and drawings.
   B. All labels shall be installed to more easily identify the cables and ports on all panels. If there are any questions regarding labeling, contact the Engineer prior to installation.
C. Engraved lamacoid labels shall be provided and installed whenever there is no location for paper inserts on faceplates, power poles, poke thru's, floor boxes, modular furniture and surface raceway.
   1. Engraved lamacoid labels shall provide the same labeling as the paper inserts, but they shall be self-adhesive.
   2. These labels shall be adhered to the location closest to the modular jack.
   3. Individual letters shall be provided for each cable. An overall location identifier can be provided for all the cables at that faceplate or floor box.
   4. Engraved labels for rack shall be at least 1-1/2-inch-high with letters 1 inch high.
   5. These labels shall be affixed to the top and front of each rack or cabinet. Verify that the label will fit the rack or cabinet prior to purchasing.

3.03 VIDEO SECURITY LABELING
A. Cameras shall be labeled with the camera number in a visible location.
   1. Affix a label to the camera housing that details the camera number
   2. Shall be in a location that is visible from a standing position.
   3. Shall be laser printed.
   4. Label the camera cable patch panel to include the number of each camera connected to that cable. This camera cable label at the patch panel shall be by video security contractor
      a. Install an adhesive sticker below the cable in the patch panel as the factory number (1-24) is most likely on top of the panel.
B. Label the CAT-6 Patch Panel for security Cameras in each comm room
   1. Install an adhesive label on each port on the patch panel that attached so the security camera cable.

C. CAT-6 Patch panels for security cameras shall be labeled for the camera number
   1. See below diagram:
      a. Install labels at each end detailing the panel number.

<table>
<thead>
<tr>
<th>Panel A</th>
<th>01</th>
<th>02</th>
<th>03</th>
<th>04</th>
<th>05</th>
<th>06</th>
<th>07</th>
<th>08</th>
<th>09</th>
<th>10</th>
<th>11</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>101</td>
<td>102</td>
<td>107</td>
<td>108</td>
<td>201</td>
<td>105</td>
<td>208</td>
<td>145</td>
<td>146</td>
<td>147</td>
<td>174</td>
</tr>
</tbody>
</table>

D. All labels shall be installed to more easily identify the cables and ports on all panels. If there are any questions regarding labeling, contact the Engineer prior to installation.

3.04 ACCESS CONTROL SECURITY LABELING
A. Security Panels shall be labeled on the outside to indicate panel number and communications room number

<table>
<thead>
<tr>
<th>Security panel</th>
<th>IP address 111.111.10.112</th>
</tr>
</thead>
<tbody>
<tr>
<td>Panel 04</td>
<td>Comm room XXX</td>
</tr>
</tbody>
</table>

   1. Install a label on the inside of the panel that details:
      a. Door numbers that are connected to this panel
      b. Diagram of panel showing where each door is connected to the panel.
      c. Panel name as shown in the access control system
      d. IP address of the panel
B. Access Control cables shall be labeled.
   1. The cables at the door devices shall be labeled where they connect to the device at the door
   2. The cables at the panels in the communications rooms shall be labeled with the door number
3. Cable labels shall be installed within 3 inches of the end of the cable sheath.
   a. The cable label shall be similar to the label below:

   | 125A-DC |
   | 125A-DC |
   | 125A-DC |

   b. Provide a sample label to the Engineer for approval prior to installation of all labels.

   125A-DC

   The 125A stands for the Door Number.
   The DC stands for Door Contact. This could be any of the field devices: RX, ES, EL, MX, KP etc.

END OF SECTION 28 76 00
SECTION 28 77 00
TECHNOLOGY TESTING

PART 1 - GENERAL

1.01 WORK INCLUDED
   A. This section provides direction on
      1. Testing of copper and fiber cable,
      2. Testing and commissioning of the technology systems

PART 2 - PRODUCTS

2.01 PUNCHLIST PROCESS
   A. The contractor shall be required to go through a punchlist process prior to substantial completion and final completion/payment of each project
   B. Contractor shall be responsible for reviewing their own work and checking to ensure it has met the project requirements.
   C. The contractor shall:
      1. Review your work in each room
      2. Review the specifications and drawing and review their work to ensure it meets requirements
      3. Create a punchlist document showing what work is not yet done and what as-builds are yet to be completed. Send document to designer.
         a. Provide a date when contractor punchlist work will be completed.
      4. Schedule a punchlist and substantial completion meeting with designer.
      5. Present updated punchlist document to the owner
      6. Walk the site with the contractor and demonstrate all systems and review the work completed. Demonstrate how all work is completed
   D. Designer will create an "Owner Punchlist" document
      1. This will be provided to the contractor
      2. Contractor shall review the list, fix/upgrade/replace all equipment and cabling and finish work on the punchlist
      3. Return punchlist to the designer showing when the work was fixed/completed and a signature on the sheet showing that the contractor has reviewed each item.
   E. Meet onsite with the designer to review the finished work.

PART 3 - EXECUTION

3.01 EXAMINATION
   A. Testing shall be completed after fiber is installed inside the fiber patch panel and the fiber panel has been put together.
   B. All cables and panels where cables terminate shall be labeled with the cable label or name of each individual cable. Identify how each cable and panel will be labeled.

3.02 SECURITY SYSTEM COMMISSIONING
   A. After all Work is completed, and prior to requesting the Acceptance test, Contractor shall conduct a final inspection, and pre-test all equipment and system features. Contractor shall correct any deficiencies discovered as the result of the inspection and pre-test.
   B. Contractor shall submit a request for the Acceptance test in writing to the owner no less than fourteen days prior to the requested test date. The request for Acceptance test shall be
accompanied by a certification from Contractor that all Work is complete and has been pre-tested, and that all corrections have been made.

C. During Acceptance test, Contractor shall demonstrate all equipment and system features to the owner. Contractor shall remove covers, open wiring connections, operate equipment, and perform other reasonable work as requested by the owner.

D. If the contractor has submitted all necessary paperwork and the system seems to be in working order according to the engineer, then the system can be considered Substantially Complete after the engineer puts that in writing.

E. Security System Substantial Completion.

1. The access control system shall be considered substantially complete as soon as:
   a. All doors are connected, configured in the system and are working as required.
   b. All security devices are connected and have been tested and shown to be fully functional. All cables are labeled at each end.
   c. Intercoms are functioning and able to release lock on a door.
   d. All users are entered into the system and all cards/fobs have been distributed.
   e. All locking and unlocking schedules are defined and are working.
   f. User accounts are setup.
   g. As-built drawings have been updated to reflect any changes in the connectivity.
   h. All manufacturer literature has been turned over to the Owner.
   i. Maps are setup and populated in the system.
   j. Training has been completed.
   k. Copy of the system configuration has been provided to the owner via a CD or thumb drive.

2. The video security system shall be considered substantially complete as soon as:
   a. All cameras are connected and functional.
   b. The system is fully configured and recording images as required.
   c. User accounts are setup.
   d. As-built drawings have been updated to reflect any changes in the connectivity.
   e. All manufacturer literature has been turned over to the Owner.
   f. Maps are setup and populated in the system.
   g. Training has been completed.

3. The contractor shall schedule a substantial completion meeting where all security systems shall be demonstrated and shown to be in working order and configured as per the specs and the owner’s requirements.
   a. If the system is deemed to be in working order then the engineer shall sign a letter stating that the systems are Substantially Complete. The system is not Substantially Complete until a letter is provided to the contractor and owner.

4. After substantial completion the systems shall be in good working order for a period of 30 days.
   a. In the event that the system or systems should fail or not work as required during the 30-day period, the Contractor shall be on site the same day to fix and configure the system to make it work as designed.
   b. A new 30-day period will begin as soon as the system has been demonstrated to be in good working order and the engineer acknowledges in writing that the system has been fixed and is again considered substantially complete.

5. Once the system has been considered Substantially Complete and has been working for 30 consecutive days with no interruption in service, the system shall be thought of as “Finally Complete.”

6. Warranty shall begin immediately after the system is deemed Finally Complete.
SECTION 28 78 00
TECHNOLOGY WARRANTY

PART 1 - GENERAL

1.01 SECTION INCLUDES
A. This section includes directions for the Contractor regarding system and equipment warranties.

1.02 SYSTEM DESCRIPTION
A. The project is not complete until all paperwork has been provided.
B. The Contractor shall warranty his work and all the products installed for a minimum of 1 year from day of Substantial Completion.

1.03 COORDINATION
A. Coordinate as-built drawings and records with the Engineer and Owner.

PART 2 - PRODUCTS

2.01 MANUFACTURERS
A. Provide manufacturers’ warranty for all equipment installed
B. Provide contractor warranty for workmanship and equipment
C. Provide software upgrade protection (SUP) warranty as detailed in the specifications.

2.02 MATERIALS
A. The Contractor shall provide the following to the designer at Substantial Completion and any updates prior to the issuance of the final payment
   1. Manuals and pamphlets on all electronic equipment.
   2. All spare parts and cover plates for all components of the network.
   3. Red lined set of as-built drawings for the entire project.
B. Updated hard copy and soft copy of the As-Built Documentation. See associated spec section.

PART 3 - EXECUTION

3.01 EXAMINATION
A. Contractor shall fully examine all components of the system to make sure that all manuals and paperwork are included in the final submittal.

3.02 GENERAL WARRANTY
A. The Contractor shall warranty the installation and all the parts contained therein for a period of not less than 1 year after receipt of a completely signed copy of the Notice of Substantial Completion.
B. This shall include each and every part, cable or software system provided as part of this project. This includes cabling, Networking, Wireless, Audio/Video systems and Access Control and Video Security systems.
   1. If any part is broken due to a manufacturing defect or installation defect, the Contractor shall fix and/or replace the broken item at their own expense.
2. If any equipment loses connectivity or fails for any reason the contractor shall be onsite to diagnose and fix or replace equipment and upgrades software.
3. The Contractor shall also supply all configuration and programming necessary to keep all electronic equipment to the latest revision of software during the year.
4. If the “system” goes down, and needs configuration to be brought back up, the Contractor shall be liable for any programming or reconfiguration.
5. During the year, the Contractor shall make the Owner aware of any software upgrades that are available.
6. Contractor shall install all software upgrades for that year or as detailed below for specific systems.
7. If the system does not run well during the year the contractor shall be onsite to diagnose and fix the system.

C. The contractor shall be onsite within 24 hours after a call from the owner or designer regarding system or equipment issues.

**END OF SECTION**
SECTION 311000 - SITE CLEARING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. CAD files will be made available for use in construction staking. Contact the engineer regarding applicable fee and requirements for signing of the CAD File Transfer Agreement.

1.2 SUMMARY

A. This Section includes the following:

1. Protecting existing trees, shrubs and other vegetation to remain.
2. Removing existing trees, shrubs and other vegetation.
3. Clearing and grubbing.
4. Stripping and stockpiling topsoil.
5. Removing above-grade and below-grade site improvements.
6. Disconnecting, capping or sealing, and abandoning site utilities in place or removing site utilities.
7. Temporary erosion and sedimentation control measures.

B. Related Sections include the following:

1. Division 31 2000 Section “Earth Moving” for soil materials, excavating, backfilling, and site grading.
2. Division 32 9200 Section “Turf and Grasses” for finish grading including preparing and placing planting soil mixes and testing of topsoil material.

1.3 DEFINITIONS

A. Topsoil: Natural or cultivated surface-soil layer containing organic matter and sand, silt, and clay particles; friable, pervious, and black or a darker shade of brown, gray, or red than underlying subsoil; reasonably free of subsoil, clay lumps, gravel, and other objects more than 2 inches in diameter; and free of subsoil and weeds, roots, toxic materials, or other nonsoil materials.

B. Tree Protection Zone: Area surrounding individual trees or groups of trees to be protected during construction, and defined by the drip line of individual trees or the perimeter drip line of groups of trees, unless otherwise indicated.
1.4 MATERIAL OWNERSHIP

A. Except for stripped topsoil or other materials indicated to remain Owner's property, cleared materials shall become Contractor's property and shall be removed from Project site unless otherwise noted on the plans.

1.5 SUBMITTALS

A. Photographs or videotape, sufficiently detailed, of existing conditions of trees and plantings, adjoining construction, and site improvements that might be misconstrued as damage caused by site clearing.

B. Record drawings, according to Division 01 Sections.
   1. Identifying and accurately locating capped utilities and other subsurface structural, electrical, and mechanical conditions.

1.6 QUALITY ASSURANCE

A. Preinstallation Conference: Conduct conference at Project site to comply with requirements in Division 01 Sections.

1.7 PROJECT CONDITIONS

A. Traffic: Minimize interference with adjoining roads, streets, walks, and other adjacent occupied or used facilities during site-clearing operations.
   1. Do not close or obstruct streets, walks, or other adjacent occupied or used facilities without permission from Owner and authorities having jurisdiction.
   2. Provide alternate routes around closed or obstructed traffic ways if required by owner or authorities having jurisdiction.

B. Improvements on Adjoining Property: Authority for performing site clearing indicated on property adjoining Owner's property will be obtained by Owner before award of Contract. Contractor is to confirm that this authority has been obtained before beginning work on adjoining property.

C. Salvable Improvements: Carefully remove items indicated to be salvaged and store on Owner's premises where indicated.

D. Utility Locator Service: Notify utility locator service for area where Project is located before site clearing.

E. Do not commence site clearing operations until temporary erosion and sedimentation control measures are in place.
PART 2 - PRODUCTS

2.1 SOIL MATERIALS

A. Satisfactory Soil Materials: Requirements for satisfactory soil materials are specified in Division 31 2000 Section “Earth Moving.”

1. Obtain approved borrow soil materials off-site when satisfactory soil materials are not available on-site. Contractor is responsible for doing an independent earthwork computation and including all necessary import and/or export of materials in their bid.

2. Per plan notes, all backfill under and within a 1-on-1 influence of paved areas shall be Class II sand, compacted to 95% of maximum density.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect and maintain benchmarks and survey control points from disturbance during construction. If said points will be disturbed, establish new points prior to removal.

B. Locate and clearly flag trees and vegetation to remain or to be relocated.

C. Protect existing site improvements to remain from damage during construction.

1. Restore damaged improvements to their original condition, as acceptable to Owner.

3.2 TEMPORARY EROSION AND SEDIMENTATION CONTROL

A. Provide temporary erosion and sedimentation control measures to prevent soil erosion and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways, according to requirements of authorities having jurisdiction and the sediment and erosion control drawings, whichever is more stringent.

B. Inspect, repair, and maintain erosion and sedimentation control measures during construction until permanent vegetation has been established.

C. Remove erosion and sedimentation controls only after all areas are restored and stabilized.

3.3 TREE PROTECTION

A. Erect and maintain temporary fencing around tree protection zones before starting site clearing. Remove fence when construction is complete.

1. Do not store construction materials, debris, or excavated material within fenced area.

2. Do not permit vehicles, equipment, or foot traffic within fenced area.

3. Maintain fenced area free of weeds and trash.

B. Do not excavate within tree protection zones, unless otherwise indicated.
C. Where excavation for new construction is required within tree protection zones, hand clear and excavate to minimize damage to root systems. Use narrow-tine spading forks, comb soil to expose roots, and cleanly cut roots as close to excavation as possible.

   1. Cover exposed roots with burlap and water regularly.
   2. Temporarily support and protect roots from damage until they are permanently redirected and covered with soil.
   3. Coat cut faces of roots more than 1-1/2 inches in diameter with an emulsified asphalt or other approved coating formulated for use on damaged plant tissues.
   4. Backfill with soil as soon as possible.

D. Repair or replace trees and vegetation indicated to remain that are damaged by construction operations, in a manner approved by Architect.

3.4 UTILITIES

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary utility services according to requirements indicated:

   1. Notify Architect not less than two days in advance of proposed utility interruptions.
   2. Do not proceed with utility interruptions without Architect's written permission.

B. Excavate for and remove underground utilities indicated to be removed.

3.5 CLEARING AND GRUBBING

A. Remove obstructions, trees, shrubs, grass, and other vegetation to permit installation of new construction.

   1. Do not remove trees, shrubs, and other vegetation indicated to remain or to be relocated.
   2. Cut minor roots and branches of trees indicated to remain in a clean and careful manner where such roots and branches obstruct installation of new construction.
   3. Grind stumps and remove roots, obstructions, and debris extending to a depth of 18 inches below exposed subgrade.
   4. Use only hand methods for grubbing within tree protection zone.

B. Fill depressions caused by clearing and grubbing operations with satisfactory soil material unless further excavation or earthwork is indicated.

   1. Place fill material in horizontal layers not exceeding a loose depth of 8 inches, and compact each layer to a density equal to adjacent original ground.

3.6 TOPSOIL STRIPPING

A. Remove sod and grass before stripping topsoil.

B. Strip topsoil to whatever depths are encountered in a manner to prevent intermingling with underlying subsoil or other waste materials.
1. Remove subsoil and nonsoil materials from topsoil, including trash, debris, weeds, roots, and other waste materials.

C. Stockpile topsoil materials away from edge of excavations without intermixing with subsoil. Grade and shape stockpiles to drain surface water. Cover to prevent windblown dust.

   1. Stockpile topsoil material in locations approved by the Owner or Architect.

3.7 SITE IMPROVEMENTS

A. Remove existing above- and below-grade improvements as indicated and as necessary to facilitate new construction.

B. Remove slabs, paving, curbs, gutters, and aggregate base as indicated.

   1. Unless existing full-depth joints coincide with line of demolition, neatly saw-cut length of existing pavement to remain before removing existing pavement. Saw-cut faces vertically.

   2. Paint cut ends of steel reinforcement in concrete to remain to prevent corrosion.

3.8 DISPOSAL

A. Disposal: Remove surplus soil material, obstructions, demolished materials, other vegetation and waste materials including trash and debris, and legally dispose of them off Owner's property.

   1. Burning of materials on project property is prohibited.

END OF SECTION 311000
SECTION 311012 - FINE GRADING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Attention is directed to Bidding and Contract Requirements, and General and Supplemental Requirements which are hereby made a part of this section.

B. CAD files will be made available for use in construction staking. Contact the engineer regarding applicable fee and requirements for signing of the CAD File Transfer Agreement.

1.2 SUMMARY

A. Work included: All labor, materials, necessary equipment and services to complete the Fine Grading work, as indicated on the drawings, as specified herein or both, except as for items specifically indicated as not in contract on the plans.

B. Related work specified elsewhere:
   1. Division 31 2000 Section “Earth Moving.”
   2. Division 32 9200 Section “Turfs and Grasses.”

1.3 SITE INSPECTION

A. The Contractor shall visit the site and acquaint himself with all existing conditions. The Contractor shall be responsible for his own subsurface investigations, as necessary, to satisfy requirements of this Section. All subsurface investigations shall be performed only under time schedules and arrangements approved in advance by the landscape Architect or Owner’s Representative.

1.4 UTILITIES

A. Before starting site operations verify that the earlier Contractors have disconnected all temporary utilities which might interfere with the fine grading work.

B. Locate all existing, active utility lines traversing the site and determine the requirements for their protection. Preserve in operating condition all active utilities adjacent to or transversing the site that are designated to remain.

C. Observe rules and regulations governing respective utilities in working under requirements of this section. Adequately protect utilities from damage, remove or relocate as indicated, specified or required. Remove, plug or cap inactive or abandoned utilities encountered in excavation. Record location of active utilities.

D. Contact “Miss Dig” for existing utilities survey confirmation.

1.5 QUALITY ASSURANCE

A. Requirements of all applicable building codes and other public agencies having jurisdiction upon the work.

B. Primary emphasis should be given to the aesthetic appearance and functioning of berms and swales, as directed by the Landscape Architect or Owner’s Representative. The Contractor shall
employ skilled personnel and any necessary equipment to insure that finish grading is smooth, aesthetically pleasing, drains well and is ideal for receiving sod and plant materials.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Existing Soil:

1. Strip existing topsoil for new construction unless otherwise directed by Owner's Representative, free from debris, sod, biodegradable materials and other deleterious materials. The Contractor shall insure that all existing soil has sufficient percolation and surface drainage to support grasses and plant material and that extreme compaction occurs only in areas to receive paving.

2. In areas to receive seed, verify that soil is scarified to depth of 3 inches and that soil contains enough organic matter to support and encourage rooting of seeded lawn.

PART 3 - EXECUTION

3.1 EXAMINATION

B. Job Conditions

1. Dust control: Use all means necessary to prevent dust from construction operations from being a nuisance to adjacent property owners and from damaging finish surfaces on adjacent building, paving, etc. Methods used for dust control are subject to approval by the Architect or Owner's Representative.

2. Burning: On-site burning will not be permitted.

3. Protection: Use all means necessary to protect curbs, gutters, sprinklers, utilities and vegetation designated to remain, and, in the event of damage, immediately make all repairs, replacements and dressings to damaged plants necessary to the approval of the Landscape Architect. Contractor shall incur all cost for the replacement of damaged objects and vegetation.

3.2 SCHEDULING

A. Schedule all work in a careful manner with all necessary consideration for adjoining property owners and the public.

B. Coordinate schedule with other Contractors to avoid conflicts with their work.

3.3 EXCAVATION

A. Excavate where necessary to obtain subgrades, percolation and surface drainage as required.

B. Materials to be excavated are unclassified.

C. Remove entirely any existing obstructions after approval by the Architect's or Owner's Representative.

D. Remove from site and dispose of debris and excavated material not required.
3.4 GRADING

A. The Contractor shall establish finished grades as shown on the construction plans and as directed by the Architect, including areas where the existing grade has been disturbed by other work. All disturbed areas are to be restored to their original grades.

B. Finished grading shall be smooth, aesthetically pleasing, drain well and ready to receive sod and other plant material to full satisfaction of the Owner's Representative, Architect and Construction Manager.

3.5 COMPACTION

A. Compact each layer of fill in designated areas with approved equipment to achieve a maximum density at optimum moisture, AASHTO T 180 - latest edition.

1. Under buildings, roadways, curbs, walks and other paved areas: compaction shall be to 95% of maximum density.

2. Under landscaped area, compaction shall not exceed 85% of maximum density.

B. No backfill shall be placed against any masonry or other exposed building surface until permission has been given by the Owner's Representative, and in no case until the masonry has been in place seven days.

C. Compaction in limited areas shall be obtained by the use of mechanical tampers or approved hand tampers. When hand tampers are used, the materials shall be deposited in layers not more than four inches thick. The hand tampers used shall be suitable for this purpose and shall have a face area of not more than 100 square inches. Special precautions shall be taken to prevent any wedging action against masonry or other exposed building surfaces.

3.6 CORRECTION OF GRADE

A. Bring to required grade levels areas where settlement, erosion or other grade changes occur. Adjust grades as required to carry drainage away from buildings and to prevent ponding around the buildings and on pavements.

B. Remove all rock or objectionable material larger than 1 inch in any direction prior to commencing landscaping.

C. Contractor shall be responsible for stabilizing grades by approved methods prior to landscaping, and shall be responsible for correction of grades as mentioned above, and clean up of any wash outs or erosion.

END OF SECTION 311012
SECTION 311018 - SOIL EROSION CONTROL

PART 1 - GENERAL

1.1 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. CAD files will be made available for use in construction staking. Contact the engineer regarding applicable fee and requirements for signing of the CAD File Transfer Agreement.

1.2 SUMMARY

A. The work under this Section includes, but not limited to all work necessary for effective soil erosion control in conformance with Part 91, Act 451, PA 1994, the Soil Erosion and Sedimentation Control Act, Michigan Department of Natural Resources Environmental Protection Act guidelines and all pertinent local enforcing agency rules and regulations, having jurisdiction.

B. Related Sections include the following:

1. Division 31 2000 Section "Earth Moving."

1.3 STANDARDS

A. General: Perform all work under this Section in accordance with all pertinent rules and regulations, including, but not necessarily limited to those mentioned above and these Specifications.

B. Conflicts: Where provisions of pertinent rules and regulations conflict with these Specifications, the more stringent provisions shall govern.

PART 2 - PRODUCTS

2.1 SEED, FERTILIZER, MULCH

A. Refer to other Specification Section in Part 3.

PART 3 - EXECUTION

3.1 GENERAL

A. Standards: Provide all materials and promptly take all actions necessary to achieve effective erosion control in accordance with the Soil Erosion and Sedimentation Control Act, Michigan Department of Natural Resources guidelines, local enforcing agency guidelines and these Specifications.

B. Site evaluation: Prior to start of the Work, conduct a field evaluation of the site along with representatives of the Engineer/Architect and the local enforcing agency.
C. Permits: Soil erosion permit is not required on either project due to limited disturbance area.

3.2 SEEDING AND MULCHING

A. General

1. All bare soil, unless otherwise required by the Contract Documents, shall be seeded, fertilized and mulched to create a protected condition. Use seed mix as indicated on the plans (if different seed mixes are indicated on the civil and landscape plans, the mix indicated on the landscape plans shall override). Critical areas shall be sodded as approved by the Engineer/Architect and as shown on the plans.

2. Seeding and mulching shall be performed immediately upon completion of a phase or section of the Work or as approved by the Engineer/Architect.

3. In all cases, seeding and mulching shall be performed within thirty (30) calendar days from the time the area was first disturbed.

4. During any period of time which the soil is unprotected, provide erosion control structures as necessary to minimize erosion and to keep any eroded soils on the site and out of ditches, rivers, storm sewers and wetlands.

5. Refer to the plans for notes regarding the use of turf reinforcement matting and/or mulch blankets (on all slope exceeding 1 vertical to 10 horizontal).

B. Seed: Seed shall be applied uniformly at a minimum rate of 48 pounds per acre.

C. Fertilizer: Fertilizer shall be applied uniformly at a minimum rate of 250 pounds per acre.

D. Mulch: Mulch shall be uniformly applied at a rate of two (2) tons per acre, or equal, on all seeded areas that have a slope of less than 1 vertical to 10 horizontal. Refer to note A5. above for additional slope stabilization requirements.

3.3 STEEP SLOPES

A. Emulsion

1. On slopes greater than 10%, but not immediately adjacent to a stream or ditch, use erosion control blankets or turf reinforcement matting to hold seed in place. Refer to plan notes.

3.4 SITE IMPROVEMENTS CONSTRUCTION

A. During construction of the site improvements conform to the following general rules:

1. Minimize the amount of earth disturbed at any one time.

2. Establish a construction sequence which includes adequate erosion control.

3. Provide ground cover, even if only temporary, so as to stabilize an area and minimize erosion.

4. As much as practicable, direct storm water away from the construction area. Direct diverted storm water to any stable area.

5. Collect runoff from the site in sediment basins, traps or through filters.

6. Establish an inspection and maintenance schedule, paying special attention to the beginning of the various stages of construction. Employ a certified storm water operator and keep a log of the soil erosion and sedimentation control measures in accordance with the NPDES requirements.
7. Keep in mind that the primary objective is to keep the soil on the site.
8. Once final stabilization of the site is complete, and the governing agency has granted its approval, remove all temporary erosion control structures.
9. Control site runoff during all periods of site construction to ensure that excess surface runoff does not reach adjacent properties. This is especially critical during stages when the land has been stripped but not yet graded.

3.6 CLEANING

A. Perform cleaning of all areas affected by work under this section and leave the site in a neat and tidy state. Contractor shall keep Adjacent Roads clean and free of debris.

END OF SECTION 311018
SECTION 312000 - EARTH MOVING

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. All earthwork operations shall conform to the current Michigan Department of Transportation standards and specifications.

C. CAD files will be made available for use in construction staking. Contact the engineer regarding applicable fee and requirements for signing of the CAD File Transfer Agreement.

1.2 SUMMARY

A. This Section includes the following:
   1. Preparing subgrades for slabs-on-grade, walks, pavements, lawns, and plantings.
   2. Subbase course for concrete walks and pavements.
   3. Base course for asphalt paving.

B. Related Sections include the following:
   1. Division 31 1000 Section "Site Clearing" for site stripping, grubbing, removing topsoil, and protecting trees to remain.
   2. Division 32 9220 Section "Topsoil (Landscaping)" for finished and fine grading, including placing and preparing topsoil for lawns and plantings.

1.3 DEFINITIONS

A. Backfill: Soil materials used to fill an excavation.

B. Base Course: Layer placed between the subbase course and asphalt paving.

C. Bedding Course: Layer placed over the excavated subgrade in a trench before laying pipe.

D. Borrow: Satisfactory soil imported from off-site for use as fill or backfill.

E. Drainage Course: Layer supporting slab-on-grade used to minimize capillary flow of pore water.

F. Engineered Fill: Fill placed and compacted to densities specified herein, in a controlled manner using lift thickness limited herein, monitored and tested by the Testing Agency or independent Geotechnical Inspector.

G. Excavation: Removal of material encountered above subgrade elevations.

H. Fill: Soil materials used to raise existing grades.
I. Rock: Rock material in beds, ledges, unstratified masses, and conglomerate deposits and boulders of rock material 3/4 cu. yd. (0.57 cu. m) or more in volume.

J. Structures: Buildings, footings, foundations, retaining walls, slabs, tanks, curbs, mechanical and electrical appurtenances, or other man-made stationary features constructed above or below the ground surface.

K. Subbase Course: Layer placed between the subgrade and base course for asphalt paving, or layer placed between the subgrade and a concrete pavement or walk.

L. Subgrade: Surface or elevation remaining after completing excavation, or top surface of a fill or backfill immediately below subbase, drainage fill, or topsoil materials.

M. Undercutting: Necessary excavation of poor quality soils which occur below the existing Topsoil and any uncontrolled fill soils as described in the Geotechnical Investigation.

N. Utilities include on-site underground pipes, conduits, ducts, and cables, as well as underground services within buildings.

1.4 SUBMITTALS

A. Product Data: For the following:
   1. Drainage fabric if required for the project.
   2. Separation fabric if required for the project.

B. Test Reports: Testing Agency shall submit the following reports directly to the architect and shall copy the contractor:
   1. Analysis of soil materials, whether procured on or off site, and including fill, backfill, and borrow materials.
   2. Verification of each footing subgrade.
   3. In-place density test reports.
   5. Compressive strength or bearing test reports.

C. Material Test Reports: Interpreting test results for compliance of the following with requirements indicated:
   1. Classification according to ASTM D 2487 of each on-site or borrow soil material proposed for fill and backfill.

1.5 QUALITY ASSURANCE

A. Testing Agency Services
   1. The Owner will secure and pay for the services of a qualified, independent geotechnical engineer to classify existing soil materials, to recommend and to classify proposed borrow materials when necessary, to verify compliance of materials with specified requirements, and to perform required field and laboratory testing. Geotechnical engineer shall be acceptable to the architect and the owner and shall be licensed to practice in the state in which the project is located.

B. Pre-excavation Conference: Conduct conference at Project site to comply with requirements in Division 01 3100 Section "Project Management and Coordination" for meetings.
1.6 PROJECT CONDITIONS

A. Existing Utilities: Do not interrupt utilities serving facilities occupied by Owner or others unless permitted in writing by Architect or Owner and then only after arranging to provide temporary utility services according to requirements indicated:

1. Notify Architect and Owner not less than three (3) calendar days in advance of proposed utility interruptions.
2. Do not proceed with utility interruptions without Architect's or Owner's written permission.
3. Contact utility-locator service for area where Project is located before excavating.

B. Demolish and completely remove from site existing underground utilities indicated to be removed. Coordinate with utility companies to shut off services if lines are active.

PART 2 – PRODUCTS

2.1 SOIL MATERIALS

A. General: Provide borrow soil materials without additional cost to Owner when sufficient satisfactory soil materials are not available from excavations. Contractor is responsible for doing an independent earthwork calculation and including any import of appropriate fill material required to bring the site to the proposed grades.

B. Satisfactory Soil Material (ASTM D 2487): Free of stones larger than 2 inches in any dimension, trash, debris, organic material, other objectionable material and classified as follows:

1. GP (poorly graded gravel).
2. GM (silty gravel).
3. GC (clayey gravel).
4. SW (well-graded sand).
5. SP (poorly graded sand).
6. SM (silty sand).

C. Unsatisfactory Soil Material (ASTM D 2487):

1. SC (clayey sand).
2. CL (lean clay).
3. ML (silt).
4. OL (organic clay).
5. OL (organic silt).
6. CH (fat clay).
7. MH (elastic silt).
8. OH (organic clay).
9. OH (organic silt).
10. PR (peat).

D. Backfill and Fill: Satisfactory soil materials.

E. Subbase: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; Generally either an MDOT Class II sand or 21AA gravel will meet this requirement.
F. Base: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; Generally either an MDOT Class II sand or 21AA gravel will meet this requirement.

G. Engineered Fill: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; ASTM D 2940; Generally either an MDOT Class II sand or 21AA gravel will meet this requirement.

1. Clean granular fill meeting MDOT Class II grading requirements.
2. On-site granular deposits within the excavation can be used as engineered fill if approved by the geotechnical engineer and if selective excavation procedures are employed to manage existing clay deposits.
3. Import fill as required to make-up volumes necessary to raise the building site.

H. Bedding: Naturally or artificially graded mixture of natural or crushed gravel, crushed stone, and natural or crushed sand; Generally either an MDOT 3G, 5G, 6A, or 34R will meet this requirement. Bedding requirements of the agencies having jurisdiction over the utility installation take precedence over these specifications.

I. Drainage Fill: Washed, narrowly graded mixture of crushed stone, or crushed or uncrushed gravel; ASTM D 448; Generally either an MDOT 6A or 34R will meet this requirement. Refer to the plans for specific requirements.

J. Impervious Fill: Clayey gravel and sand mixture capable of compacting to a dense state.

2.2 ACCESSORIES

A. Drainage Fabric: Nonwoven geotextile, specifically manufactured as a drainage geotextile; made from polyolefins, polyesters, or polyamides; with minimum properties determined according to ASTM D 4759 and referenced standard test methods.

B. Separation Fabric: Woven geotextile, specifically manufactured for use as a separation geotextile; made from polyolefins, polyesters, or polyamides; with minimum properties determined according to ASTM D 4759 and referenced standard test methods.

PART 3 – EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.

B. Protect subgrades and foundation soils against freezing temperatures or frost. Provide protective insulating materials as necessary.

C. Provide erosion-control measures approved by agency having jurisdiction to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.2 DEWATERING
A. Prevent surface water and ground water from entering excavations, from ponding on prepared subgrades, and from flooding Project site and surrounding area.

B. Protect subgrades from softening, undermining, washout, and damage by rain or water accumulation.
   1. Reroute surface water runoff away from excavated areas. Do not allow water to accumulate in excavations. Do not use excavated trenches as temporary drainage ditches.
   2. Install a dewatering system to keep subgrades dry and convey ground water away from excavations. Maintain until dewatering is no longer required.

3.3 EXPLOSIVES

A. Explosives: Explosives are prohibited for use on the Project site.

3.4 EXCAVATION, GENERAL

A. General: Excavation includes the removal of any materials necessary to achieve the required subgrade elevations and includes reuse or disposal of such materials.

B. Unnecessary Excavation: The expense of excavation of materials outside of limits indicated or ordered in writing by the architect and the correction thereof to the satisfaction of the architect shall be borne by the contractor.
   1. Unnecessary excavation under footings: Either deepen footings to bear on actual subgrade elevation without changing top elevations or place concrete fill up to required elevation, as required by the architect.
   2. Unnecessary excavation other than under footings: Either place compacted fill or otherwise correct conditions, as required by the architect.

C. Approval of Subgrade: Notify the Testing Agency when required elevations have been reached.
   1. When required by the architect due to the unforeseen presence of unsatisfactory materials or other factors, perform additional excavation and replace with approved compacted fill material in accordance with the architect’s or geotechnical engineer’s instructions.
   2. Payment for unforeseen additional work will be made in accordance with established unit prices or, if none, in accordance with provisions for changes in the work. No payment will be made for correction of subgrades improperly protected against damage from freeze-thaw or accumulation of water, or for correction of otherwise defective subgrades.

D. Excavation Stabilization: Slope faces of excavations to maintain stability in compliance with requirements of governing authorities. Do not use shoring and bracing where faces can be sloped.

E. Provide appropriate support and protection for deep excavations in close proximity to buildings.

3.5 EXCAVATION FOR UTILITY TRENCHES

A. Excavate trenches to indicated gradients, lines, depths, and elevations.
B. Excavate trenches to uniform widths to provide a working clearance on each side of pipe or conduit. Excavate trench walls vertically from trench bottom to 12 inches (300 mm) higher than top of pipe or conduit, unless otherwise indicated.

C. Trench Bottoms: Excavate and shape trench bottoms in accordance with the plans and standard details. Excavate trenches a minimum 4 inches (100 mm) deeper than bottom of pipe elevation to allow for bedding course (excavate deeper as required by the regulating agency). Hand excavate for bell of pipe. Remove projecting stones and sharp objects along trench subgrade.

1. Excavate trenches a minimum 4 inches (100 mm) deeper than bottom of pipe elevation to allow for bedding course (excavate deeper as required by the regulating agency). Hand excavate for bell of pipe. Remove projecting stones and sharp objects along trench subgrade. Provide bedding course per the plan notes and/or details.

3.6 SUBGRADE PREPARATION AND INSPECTIONS

A. Perform mass earthwork operations to remove all existing topsoil and other organic materials in their entirety within the footprint of the proposed building and pavement areas. Buried objects should be removed in their entirety.

B. Notify Testing Agency when excavations have reached required subgrade elevations.

C. Proof-roll subgrade in the presence of the Testing Agency to identify soft pockets and areas of excess yielding. Do not proof-roll wet or saturated subgrades.

1. Completely proof-roll subgrade in one direction repeating proof-rolling in direction perpendicular to the first direction. Limit vehicle speed to 3 mph.
2. Proof-roll subgrade with heavy pneumatic-tired equipment or loaded 10-wheel, tandem-axle truck weighing not less than 15 tons.
3. Excavate soft spots, unsatisfactory soils, and areas of excessive pumping or rutting, as determined by the Testing Agency, and replace with engineered fill as directed.

D. If Testing Agency determines that unsatisfactory soil is present, continue excavations and replace with compacted backfill or fill materials as directed.

1. Additional excavation and replacement material will be paid for according to Contract provisions for changes in the Work.

E. Reconstruct subgrades damaged by freezing temperatures, frost, rain, accumulated water, or construction activities.

3.7 UNAUTHORIZED EXCAVATION

A. Fill unauthorized excavation under foundations or wall footings by extending bottom elevation of concrete foundation or footing to excavation bottom, without altering top elevation. Lean concrete fill may be used at no additional cost to the Owner.

3.8 STORAGE OF SOIL MATERIALS
A. Stockpile borrow materials and satisfactory excavated soil materials. Stockpile soil materials without intermixing. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.

1. Stockpile soil materials away from edge of excavations. Do not store within drip line of remaining trees.

3.9 BACKFILL

A. Place and compact backfill in excavations promptly, but not before completing the following:

1. Construction below finish grade including, where applicable, dampproofing, waterproofing, and perimeter insulation.
2. Surveying locations of underground utilities for record documents.
3. Inspecting and testing underground utilities.
4. Removing concrete formwork.
5. Removing trash and debris.
6. Removing temporary shoring and bracing, and sheeting.
7. Installing permanent or temporary horizontal bracing on horizontally supported walls.

3.10 UTILITY TRENCH BACKFILL

A. Place and compact bedding course on trench bottoms and where indicated. Shape bedding course to provide continuous support for bells, joints, and barrels of pipes and for joints, fittings, and bodies of conduits.

B. Place and compact initial backfill of subbase material, free of particles larger than 1 inch (25 mm), to a height of 12 inches (300 mm) over the utility pipe or conduit. All pipe backfill to be done according to the details shown on the plans or the requirements of the regulating agency.

C. Fill voids with approved backfill materials while shoring and bracing, and as sheeting is removed.

3.11 FILL

A. Preparation: Remove vegetation, topsoil, debris, unsatisfactory soil materials, obstructions, and deleterious materials from ground surface before placing fills.

B. Plow, scarify, bench, or break up sloped surfaces steeper than 1 vertical to 4 horizontal so fill material will bond with existing material.

C. Place and compact fill material in layers to required elevations as follows:

1. Under grass and planted areas, use satisfactory soil material.
2. Under walks and pavements, use satisfactory soil material as long as the geotechnical engineer deems the material to be suitable and the compaction requirements can be met.
3. Under steps and ramps, use engineered fill.
4. Under building slabs, use engineered fill.
5. Behind walls, use engineered drainage fill.
6. Under footings and foundations, use engineered fill.
7. Over excavated areas, use engineered fill or lean concrete.
3.12 MOISTURE CONTROL

A. Uniformly moisten or aerate subgrade and each subsequent fill or backfill layer before compaction to within two (2) percent of optimum moisture content.

1. Do not place backfill or fill material on surfaces that are muddy, frozen, or contain frost or ice.

3.13 COMPACTION OF BACKFILLS AND FILLS

A. Place backfill and fill materials in layers not more than 8 inches (200 mm) in loose depth for material compacted by heavy compaction equipment, and not more than 4 inches (100 mm) in loose depth for material compacted by hand-operated tampers.

B. Place backfill and fill materials evenly on all sides of structures to required elevations, and uniformly along the full length of each structure.

C. Compact soil to not less than the following percentages of maximum dry unit weight according to ASTM D 698 and ASTM D 1557:

1. Under structures, building slabs, steps, and pavements, scarify and recompact top 12 inches (300 mm) of existing subgrade and each layer of backfill or fill material at 95 percent.
2. Under walkways, scarify and recompact top 6 inches (150 mm) below subgrade and compact each layer of backfill or fill material at 95 percent.
3. Under lawn or unpaved areas, scarify and recompact top 6 inches (150 mm) below subgrade and compact each layer of backfill or fill material at 88 percent.

3.14 GRADING

A. General: Uniformly grade areas to a smooth surface, free from irregular surface changes. Comply with compaction requirements and grade to cross sections, lines, and elevations indicated.

1. Provide a smooth transition between adjacent existing grades and new grades.
2. Cut out soft spots, fill low spots, and trim high spots to comply with required surface tolerances.

B. Site Grading: Slope grades to direct water away from buildings and to prevent ponding. Finish Subgrades to required elevations within plus or minus 1 inch.

C. Grading Inside Grading Lines: Finish subgrade to a tolerance of ½ inch, when tested with a 10 foot straight-edge.

D. Contractor shall confirm that the proposed grades shown on the plans will not create a ponding water condition (i.e. an unintended low spot or pavement grades of less than 1%).

3.15 SUBSURFACE DRAINAGE

A. Drainage Piping: Drainage pipe is specified in Division 33 Section “Subdrainage” for foundation drainage and under-slab drainage systems.

B. Subsurface Drain: Place a layer of drainage fabric around perimeter of drainage trench. Place a 6 inch course of filter material on drainage fabric to support drainage pipe. Encase drainage
in a minimum of 12 inches of filter material and wrap in a drainage fabric, overlapping sides and ends at least 6 inches.

1. Compact each course of filter material to 95 percent of maximum dry unit weight according to ASTM D 698.

C. Drainage Backfill: Place and compact filter material over subsurface drain, in width indicated, to within 12 inches of final subgrade. Overlay drainage backfill with one layer of drainage fabric, overlapping sides and ends at least 6 inches.

1. Compact each course of filter material to 95 percent of maximum dry density according to ASTM D 698.

3.16 SUBBASE AND BASE COURSES

A. If indicated on the plans or deemed necessary by the geotechnical engineer, install separation fabric on prepared subgrade according to manufacturer’s written instructions, overlapping sides and ends.

B. Under pavements and walks, place subbase course on separation fabric according to fabric manufacturer’s written instructions if fabric is called for on the plan or deemed necessary by the geotechnical engineer.

C. Under pavements and walks, place base on prepared subbase or subgrade as follows:
   1. Place base course material over subbase (or subgrade if subbase is not indicated).
   2. Compact subbase and base courses at optimum moisture content to required grades, lines, cross sections, and thickness to not less than 95 percent of maximum dry unit weight according to ASTM D 1557.
   3. When thickness of compacted subbase or base course exceeds 6 inches, place materials in equal layers, with no layer more than 6 inches thick or less than 3 inches thick when compacted.

D. Pavement Shoulders: Place shoulders along edges of subbase and base course to prevent lateral movement. Construct shoulders, at least 12 inches wide, of satisfactory soil materials and compact simultaneously with each subbase and base layers to not less than 95 percent of maximum dry unit weight according to ASTM D 1557.

3.17 DRAINAGE COURSE

A. Under slabs-on-grade, if indicated on the plans, place drainage fabric on prepared subgrade according to manufacturer’s written instructions, overlapping sides and ends.

B. Under slabs-on-grade, place drainage course on prepared subgrade and as follows:
   1. Compact drainage course to required cross sections and thickness to no less than 95 percent of maximum dry unit weight according to ASTM D 698.
   2. When compacted thickness of drainage course exceeds 6 inches, place materials in equal layers, with no more than 6 inches thick or less than 3 inches thick when compacted.

3.20 FIELD QUALITY CONTROL
A. Testing Agency: Construction Manager/Owner will engage a qualified independent Geotechnical engineering testing agency to perform field quality-control testing.

B. Allow testing agency to inspect and to test any subgrades and each fill or backfill layer. Proceed with subsequent earthwork only after test results for previously completed work. Comply with requirements.

C. Testing agency will test compaction of soils in place according to ASTM D 1556, ASTM D 2167, ASTM D 2922, and ASTM D 2937, as applicable.

D. When testing agency reports that subgrades, fills, or backfills have not achieved degree of compaction specified, scarify and moisten or aerate and remove and replace soil to depth required, recompact and retest until specified compaction is obtained.

3.21 PROTECTION

A. Protecting Graded Areas: Protect newly graded areas from traffic, freezing, and erosion. Keep free of trash and debris.

B. Repair and reestablish grades to specified tolerances where completed or partially completed surfaces becomes eroded, rutted, settled, or where they lose compaction due to subsequent construction operations or weather conditions.

C. Protect all existing trees, bushes, plants, etc. indicated to remain during construction activities.

3.22 DISPOSAL OF SURPLUS AND WASTE MATERIALS

A. Disposal: Unless otherwise indicated on the drawings, remove surplus satisfactory soil and waste materials, including unsatisfactory soil, trash, and debris, and legally dispose of it off the Owner’s property.
   1. Do not burn materials on the Owner’s property.

END OF SECTION 312000
SECTION 321216 - HOT-MIX ASPHALT CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.
   B. All paving materials and construction methods shall conform to the current standards and specifications of the Michigan Department of Transportation. Where these specifications are less stringent than the requirements of MDOT, the MDOT standards shall govern.

1.2 SUMMARY
   A. This Section includes installation of the following:
      1. Hot-mix asphalt concrete paving.
   B. Related Sections include the following:
      1. Division 32 1415 Section "Pavement Markings."
      2. Division 31 2000 Section "Earth Moving" for aggregate subbase and base courses.

1.3 DEFINITIONS
   A. Hot-Mix Asphalt Paving Terminology: Refer to ASTM D 8 for definitions of terms.
   B. MDOT: Michigan Department of Transportation.

1.4 REQUIREMENTS
   A. Provide hot-mix asphalt paving according to materials, workmanship, and other applicable requirements of MDOT’S most current Standard Specifications for Construction. Where notes in this specification section differ from the MDOT standards, the MDOT standards shall govern.
   B. Do not place asphalt when ambient air or base surface temperature is less than 40 degrees F (4 degrees C), or surface is wet or frozen.
   C. Place bitumen mixture when temperature is not more than 15 F degrees (8 C degrees) below bitumen supplier’s bill of lading and not more than maximum specified temperature.

1.5 SUBMITTALS
   A. Submit aggregate and bituminous mix designs for review. Contractor shall confirm that the materials provided meet the required specifications, and provide material certification to the engineer. Material certification shall state that the products meet or exceed the requirements indicated on the plans and the requirements of the regulating authority.
B. Submittals and Resubmittals: Engineer will review each of Contractor's shop drawings and/or submittal data the initial time and, should resubmittal be required, one additional time to verify that reasons for resubmittal have been addressed by Contractor and corrections made. Resubmittal changes/revisions/corrections shall be circled. Engineer will review only circled items and will not be responsible for non-circled changes/revisions/corrections and additions. Should additional resubmittals be required, Contractor shall reimburse Owner for all costs incurred, including the cost of Engineer's services made necessary to review such additional resubmittals. Owner will in turn reimburse Engineer.

C. Requests for Information
   1. Engineer reserves the right to reject, any Request for Information (RFI) that the Engineer, at its sole discretion, deems frivolous.
   2. Engineer reserves the right to reject, any RFI that the Engineer, at its sole discretion, deems already answered in the Contract Documents.
   3. RFI process shall not be used for requesting substitutions. Procedures for substitutions are clearly specified elsewhere in the Contract Documents.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: A qualified manufacturer.
   1. Manufacturer shall be a paving-mix manufacturer registered with and approved by authorities having jurisdiction or the DOT of the state in which Project is located.

B. Testing Agency Qualifications: Qualified according to ASTM D 3666 for testing indicated, as documented according to ASTM E 548.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not apply asphalt materials if subgrade is wet or excessively damp or if the following conditions are not met:
   1. Prime and Tack Coats: Minimum surface temperature of 60 deg F.
   2. Slurry Coat: Comply with weather limitations of ASTM D 3910.
   3. Asphalt Base Course: Minimum surface temperature of 40 deg F and rising at time of placement.
   4. Asphalt Surface Course: Minimum surface temperature of 60 deg F at time of placement.

B. Pavement-Marking Paint: Apply pavement marking only on clean, dry surfaces and at a minimum ambient or surface temperature of 40 deg F for oil-based materials, 50 deg F (10 deg C) for water-based materials, and not exceeding 95 deg F.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Asphalt Cement: ASTM D 946.
B. Aggregate for Base Course: Conform with DOT standards.
C. Aggregate for Leveling Course: Conform with DOT standards.
D. Aggregate for Wearing Course: Conform with DOT standards.
E. Fine Aggregate: Conform with DOT standards.
F. Mineral Filler: Conform with DOT standards.
G. Tack Coat: Conform with DOT standards.
H. Asphalt Materials
   I. Asphalt Binder: Conform with DOT standards.
   J. Asphalt Cement: Conform with DOT standards.
   K. Prime Coat: Conform with DOT standards.
   L. Prime Coat: Conform with DOT standards.
   M. Tack Coat: Conform with DOT standards.

2.2 AUXILIARY MATERIALS
   A. Paving Geotextile: AASHTO M 288, nonwoven polypropylene; resistant to chemical attack, rot, and mildew; and specifically designed for paving applications.
   B. Joint Sealant: ASTM D 3405 or AASHTO M 301, hot-applied, single-component, polymer-modified bituminous sealant.
   C. Pavement-Marking Paint: Refer to section 32 1415 “Pavement Marking”.
      1. Color: As indicated on Drawings or in accordance with MDOT.

2.3 ASPHALT MIX DESIGNS
   A. Hot-Mix Asphalt: Conform with DOT standards:

PART 3 - EXECUTION

3.1 EXAMINATION
   A. Verify that compacted subgrade is dry and in suitable condition to support paving and imposed loads.
   B. Proof-roll subbase under observation by the testing agency. Use heavy, pneumatic-tired rollers to locate areas that are unstable or that require further compaction. Proof-roll as indicated in “Earth Moving” section 31 2000.
   C. Verify that gradients and elevation of base are correct.
3.2 REPAIRS

A. Leveling Course: Install and compact leveling course consisting of hot-mix asphalt surface course to level sags and fill depressions deeper than 1 inch in existing pavements.
   1. Install leveling wedges in compacted lifts not exceeding 3 inches thick.

B. Crack and Joint Filling: Remove existing joint filler material from cracks or joints to a depth of 1/4 inch minimum or as indicated.
   1. Use hot-applied joint sealant to seal cracks and joints more than 1/4 inch wide. Fill flush with surface of existing pavement and remove excess.

3.3 SURFACE PREPARATION

A. General: Immediately before placing asphalt materials, remove loose and deleterious material from substrate surfaces. Ensure that prepared compacted subgrade is ready to receive paving.

B. Prime Coat: Apply uniformly over surface of compacted unbound-aggregate base course at a rate of 0.15 to 0.50 gal./sq. yd. Apply enough material to penetrate and seal but not flood surface. Allow prime coat to cure for 72 hours minimum.

C. Tack Coat: Apply uniformly to surfaces of existing pavement at a rate of 0.05 to 0.15 gal./sq. yd.

3.4 HOT-MIX ASPHALT CONCRETE PLACING

A. Machine place hot-mix asphalt on prepared surface, spread uniformly, and strike off. Place asphalt mix by hand to areas inaccessible to equipment in a manner that prevents segregation of mix. Place each course to required grade, cross section, and thickness when compacted.
   1. Place hot-mix asphalt base course in number of lifts and thicknesses indicated.
   2. Place hot-mix asphalt surface course in single lift.
   3. Spread mix at minimum temperature of 250 deg F.
   4. Install work in accordance with Michigan Department of Transportation (MDOT) standards.
   5. Compact pavement by rolling to density specified. Re-roll as necessary to achieve even and smooth finish without roller marks.

B. Place paving in consecutive strips not less than 10 feet wide unless infill edge strips of a lesser width are required.

C. Promptly correct surface irregularities in paving course behind paver. Fill depressions with hot-mix asphalt to prevent segregation of mix; use suitable hand tools to smooth surface.

3.5 JOINTS

A. Construct joints to ensure a continuous bond between adjoining paving sections. Construct joints free of depressions with same texture and smoothness as other sections of hot-mix asphalt course.
   1. Clean contact surfaces and apply tack coat to joints.
   2. Construct transverse joints as described in AI MS-22, "Construction of Hot Mix Asphalt Pavements."
3.6 COMPACTION

A. General: Begin compaction as soon as placed hot-mix paving will bear roller weight without excessive displacement. Compact hot-mix paving with hot, hand tampers or vibratory-plate compactors in areas inaccessible to rollers.
   1. Complete compaction before mix temperature cools to 185 deg F.

B. Breakdown Rolling: Complete breakdown or initial rolling immediately after rolling joints and outside edge. Examine surface immediately after breakdown rolling for indicated crown, grade, and smoothness.

C. Intermediate Rolling: Begin intermediate rolling immediately after breakdown rolling while hot-mix asphalt is still hot enough to achieve specified density. Continue rolling until hot-mix asphalt course has been uniformly compacted to the following density:
   1. Average Density: 96 percent of reference laboratory density according to AASHTO T 245, but not less than 94 percent nor greater than 100 percent.

D. Finish Rolling: Finish roll paved surfaces to remove roller marks while hot-mix asphalt is still warm.

E. Edge Shaping: While surface is being compacted and finished, trim edges of pavement to proper alignment. Bevel edges while asphalt is still hot; compact thoroughly.

F. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened.

G. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

3.7 INSTALLATION TOLERANCES

A. Thickness: Compact each course to produce the thickness indicated within the following tolerances:
   1. Base Course: Plus or minus 1/2 inch.
   2. Surface Course: Plus 1/4 inch, no minus.

B. Surface Smoothness: Compact each course to produce a surface smoothness within the following tolerances as determined by using a 10-foot straightedge applied transversely or longitudinally to paved areas:
   1. Base Course: 1/4 inch.
   2. Surface Course: 1/8 inch.
   3. Crowned Surfaces: Test with crowned template centered and at right angle to crown. Maximum allowable variance from template is 1/4 inch.

C. Confirm minimum 1% slopes on asphalt pavement surfaces. Notify engineer prior to asphalt placement if minimum 1% slope is not met in any areas.

3.8 PAVEMENT MARKING
A. Refer to note 12 on the City of Detroit Standard Detail "HMA Surface on Concrete Base Utility Trench Construction Pavement Restoration" on sheet C2.4. Impacted pavement areas shall be restriped to match existing per City requirements.

3.9 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Thickness: In-place compacted thickness of hot-mix asphalt courses will be determined according to ASTM D 3549.

C. Surface Smoothness: Finished surface of each hot-mix asphalt course will be tested for compliance with smoothness tolerances.

D. In-Place Density: Testing agency will take samples of uncompacted paving mixtures and compacted pavement according to ASTM D 979 or AASHTO T 168.

1. Reference maximum theoretical density will be determined by averaging results from four samples of hot-mix asphalt-paving mixture delivered daily to site, prepared according to ASTM D 2041, and compacted according to job-mix specifications.

2. In-place density of compacted pavement will be determined by testing core samples according to ASTM D 1188 or ASTM D 2726.
   
   a. One core sample will be taken for every 1000 sq. yd. (836 sq. m) or less of installed pavement, with no fewer than 3 cores taken.
   b. Field density of in-place compacted pavement may also be determined by nuclear method according to ASTM D 2950 and correlated with ASTM D 1188 or ASTM D 2726.

E. Replace and compact hot-mix asphalt where core tests were taken.

F. Remove and replace or install additional hot-mix asphalt where test results or measurements indicate that it does not comply with specified requirements.

3.10 DISPOSAL

A. Except for material indicated to be recycled, remove excavated materials from Project site and legally dispose of them in an EPA-approved landfill.

1. Do not allow excavated materials to accumulate on-site.

END OF SECTION 321316
SECTION 321313 - CEMENT CONCRETE PAVEMENTS, CURBS AND GUTTERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 1 Specification sections, apply to work of this section.

B. All paving materials and construction methods shall conform to the current standards and specifications of the Michigan Department of Transportation. Where these specifications are less stringent than the requirements of MDOT, the MDOT standards shall govern.

1.2 SUMMARY

A. This Section includes exterior cement concrete pavement for the following:

1. Driveways and roadways.
2. Parking lots.
3. Curbs and gutters.
4. Sidewalks and platforms.
5. Wheel stops.

B. Related Sections include the following:

1. Division 31 1415 Section “Pavement Marking.”
2. Division 31 2000 Section “Earth Moving” for subgrade preparation, grading and subbase course.

1.3 PERFORMANCE REQUIREMENTS

A. Refer to MDOT’s current Standard Specifications for Construction.

1.4 SUBMITTALS

A. Submit aggregate and concrete mix designs for review. Contractor shall confirm that the materials provided meet the required specifications, and provide material certification to the engineer. Material certification shall state that the products meet or exceed the requirements indicated on the plans and the requirements of the regulating authority.

1.5 QUALITY ASSURANCE
A. Installer Qualifications: An experienced installer with at least three (3) years in business who has completed pavement work similar in material, design, and extent to that indicated for this Project.

B. Manufacturer Qualifications: Manufacturer of ready-mixed concrete products complying with ASTM C 94 requirements for production facilities and equipment and approved by authorities having jurisdiction or the DOT of the state in which Project is located.

1. Manufacturer must be certified according to the National Ready Mix Concrete Association’s Plant Certification Program.

C. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.

D. Source Limitations: Obtain each type or class of cementitious material of the same brand from the same manufacturer’s plant and each aggregate from one source.

1.6 PROJECT CONDITIONS

A. Traffic Control: Maintain access for vehicular and pedestrian traffic as required for other construction activities.

B. Do not place concrete when base is wet or frozen. Protect concrete pavement from damage by rain or inclement weather.

C. Protect the concrete from freezing until it attains a compressive strength of at least 1,000 PSI. Do not place concrete pavement until the ambient air temperature away from artificial heat is at least 25 degrees Fahrenheit and rising. At the time of concrete placement, ensure a concrete temperature from 45 degrees Fahrenheit to 90 degrees Fahrenheit.

PART 2 - PRODUCTS

2.1 FORMS

A. Form Materials: Plywood, metal, metal-framed plywood, or other approved panel-type materials to provide full-depth, continuous, straight, smooth exposed surfaces.

1. Use flexible or curved forms for curved conditions.

B. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces.

2.2 STEEL REINFORCEMENT

A. Plain-Steel Welded Wire Fabric: ASTM A 185, fabricated flat sheets, unfinished.

B. Reinforcement Bars: ASTM A 615/A 615M, Grade 60, deformed billet steel, unfinished.
C. Epoxy-Coated Reinforcement Bars: ASTM A 775/A 775M; with ASTM A 615/A 615M, Grade 60, deformed bars.

D. Steel Bar Mats: ASTM A 184/A 184M; with ASTM A 615/A 615M, Grade 60, deformed bars; assembled with clips.

E. Joint Dowel Bars: Plain steel bars, ASTM A 615/A 615M, Grade 60. Cut bars true to length with ends square and free of burrs.

F. Epoxy-Coated Joint Dowel Bars: ASTM A 775/A 775M; with ASTM A 615/A 615M, Grade 60, plain steel bars.

G. Tie Bars: ASTM A 615/A 615M, Grade 60, deformed.

H. Hook Bolts: ASTM A 307, Grade A, internally and externally threaded. Design hook-bolt joint assembly to hold coupling against pavement form and in position during concreting operations, and to permit removal without damage to concrete or hook bolt.

I. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcement bars, welded wire fabric, and dowels in place. Manufacture bar supports according to CRSI's "Manual of Standard Practice" from steel wire, plastic, or precast concrete or fiber-reinforced concrete of greater compressive strength than concrete.

J. Epoxy Repair Coating: Liquid two-part epoxy repair coating, compatible with epoxy coating on reinforcement.

2.3 CONCRETE MATERIALS

A. General: Use the same brand and type of cementitious material from the same manufacturer throughout the Project. All material to meet current MDOT specifications.

2.4 CURING MATERIALS

A. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately 9 oz./sq. yd. dry where indicated on Contract Documents.

B. Evaporation Retarder: Waterborne, monomolecular film forming, manufactured for application to fresh concrete.

C. White Membrane Curing Compound: ASTM C 309, Type 2.

2.5 RELATED MATERIALS

1. Thickness: ½ inch minimum and thicker where indicated.

B. Coloring Agent: Where indicated, ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, nonfading, and resistant to lime and other alkalis.
1. Color: n/a

C. Wheel Stops (use only if indicated on the plans): Precast, air-entrained concrete; 2500-psi minimum compressive strength; approximately 6 inches high, 9 inches wide, and 84 inches long. Provide chamfered corners and drainage slots on underside, and provide holes for dowel-anchoring to substrate.

1. Dowels: Galvanized steel, diameter of 3/4 inch, minimum length 18 inches.

D. Slip-Resistive Aggregate Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive aggregate of fused aluminum-oxide granules or crushed emery with emery aggregate containing not less than 50 percent aluminum oxide and not less than 25 percent ferric oxide; unaffected by freezing, moisture, and cleaning materials.

E. Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.

F. Epoxy Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class and grade to suit requirements.

2.6 CONCRETE MIXES

A. Prepare design mixes, proportioned according to ACI 211.1 and ACI 301, for each type and strength of normal-weight concrete determined by either laboratory trial mixes.

B. Use a qualified independent testing agency for preparing and reporting proposed mix designs for the trial batch method.

C. Concrete mix design shall meet the requirements of MDOT Concrete Grade P1, with compressive strength, maximum water-cementitious materials ratio, slump limit, and air content per MDOT specifications. Maximum aggregate size in coarse aggregate gradation shall be 1.5 inches.

D. Cementitious Materials: Limit percentage, by weight, of cementitious materials other than portland cement according to ACI 301 requirements for concrete exposed to deicing chemicals.

E. Add air-entraining admixture at manufacturer’s prescribed rate to result in concrete at point of placement having an air content of 5.0 to 8.5 percent.

F. Use appropriate treatment per MDOT specifications where concrete will be placed under freezing conditions. Obtain approval of Engineer prior to placing concrete in freezing conditions. Concrete accelerators may be used in cold temperatures as noted below:

1. In concrete with steel reinforcement, a non-chloride accelerating admixture may be used. Admixture product shall be approved by MDOT per their current Qualified Products List (QPL) and the dosage shall be per manufacturer’s instructions. Admixtures containing calcium chloride shall not be used in concrete containing steel reinforcement.

2. In concrete without steel reinforcement, calcium chloride concrete accelerators may be used and shall meet the requirements of MDOT Specification Section 903.04.
G. Coloring Agent: Where indicated, add coloring agent to mix according to manufacturer’s written instructions.

2.7 CONCRETE MIXING

A. Ready-Mixed Concrete: Comply with requirements and with ASTM C 94 and ASTM C 1116.

1. When air temperature is between 85 deg F and 90 deg F, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above 90 deg F, reduce mixing and delivery time to 60 minutes.

B. Project-Site Mixing: Comply with requirements and measure, batch, and mix concrete materials and concrete according to ASTM C 94. Mix concrete materials in appropriate drum-type batch machine mixer.

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof-roll prepared subbase surface to check for unstable areas and verify need for additional compaction and repair as required.

B. Verify that grades are correct.

3.2 EDGE FORMS AND SCREED CONSTRUCTION

A. Set, brace, and secure edge forms, bulkheads, and intermediate screed guides for pavement to required lines, grades, and elevations.

B. Clean forms after each use and coat with form release agent to ensure separation from concrete without damage.

3.3 STEEL REINFORCEMENT

A. General: Comply with CRSI’s "Manual of Standard Practice" for fabricating reinforcement and with recommendations in CRSI's "Placing Reinforcing Bars" for placing and supporting reinforcement.

B. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during concrete placement. Maintain minimum cover to reinforcement.

C. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh, and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

D. Install fabricated bar mats in lengths as long as practicable. Handle units to keep them flat and free of distortions. Straighten bends, kinks, and other irregularities, or replace units as required before placement. Set mats for a minimum 2-inch overlap to adjacent mats.

3.4 JOINTS
A. General: Construct construction, isolation, and contraction joints and tool edgings true to line with faces perpendicular to surface plane of concrete. Construct transverse joints at right angles to centerline, unless otherwise indicated.

B. At all locations where new concrete abuts existing concrete, building wall, or supported slabs, place expansion joint and joint sealant.

C. Construction Joints: Set construction joints at side and end terminations of pavement and at locations where pavement operations are stopped for more than one-half hour, unless pavement terminates at isolation joints.

1. Provide preformed galvanized steel or plastic keyway-section forms or bulkhead forms with keys, unless otherwise indicated. Embed keys at least 1-1/2 inches into concrete.

D. Isolation Joints: Form isolation joints of preformed joint-filler strips abutting concrete curbs, catch basins, manholes, inlets, structures, walks, other fixed objects, and where required.

1. Terminate joint filler 1 inch below finished surface to allow placement of joint sealant.

2. Joint sealant is required for all projects even if not indicated on the plans.

E. Expansion Joints: Place 1 inch (25 mm) wide expansion joints at maximum 40 foot intervals, if not indicated on drawings. Joints to be full depth of pavement. Place joint sealant at all expansion joints.

F. Install dowel bars and support assemblies at joints if indicated on the plans. Lubricate or asphalt-coat one-half of dowel length to prevent concrete bonding to one side of joint.

G. Contraction Joints: Form weakened-plane contraction joints, sectioning concrete into areas. Construct ¼ inch wide contraction joints for a depth equal to at least one-third of the concrete thickness. Maximum spacing of contractions joints shall be 8’.

1. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with grooving tool to a 3/8-inch (10-mm) radius. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover marks on concrete surfaces.

2. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut 1/8-inch wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before developing random contraction cracks.

3. Doweled Contraction Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or asphalt coat one-half of dowel length to prevent concrete bonding to one side of joint.

H. Edging: Tool edges of pavement, gutters, curbs, and joints in concrete after initial floating with an edging tool to the following radius.

1. Radius: 3/8 inch (10 mm).
3.5 CONCRETE PLACEMENT

A. Inspection: Before placing concrete, inspect and complete formwork installation, reinforcement steel, and items to be embedded or cast in. Notify other trades to permit installation of their work.

B. Remove snow, ice, or frost from subbase surface and reinforcement before placing concrete. Do not place concrete on frozen surfaces.

C. Do not add water to concrete during delivery, at Project site, or during placement.

D. Consolidate concrete by mechanical vibrating equipment supplemented by hand-spading, rodding, or tamping. Use equipment and procedures to consolidate concrete according to recommendations in ACI 309R.

E. Cold-Weather Placement: Comply with ACI 306.1. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.

F. Hot-Weather Placement: Place concrete according to recommendations in ACI 305R when hot-weather conditions exist.

3.6 CONCRETE FINISHING

A. General: Wetting of concrete surfaces during screeding, initial floating, or finishing operations is prohibited.

B. Float Finish: Float surface with power-driven floats, or by hand floating if area is small or inaccessible to power units. Finish surfaces to true planes. Cut down high spots, and fill low spots.

   1. Area Paving: Light broom, texture perpendicular to pavement direction.
   2. Curbs and Gutters: Light broom, texture parallel to pavement direction.
   3. Direction of Texturing: Parallel to pavement direction.
   4. Inclined Vehicular Ramps: Heavy broomed perpendicular to slope.
   5. Place sealer on exposed concrete surfaces immediately after finishing. Apply in accordance with manufacturer’s instructions.

C. Provide detectable warning surface at all handicap ramps to meet ADA requirements in accordance with ANSI sections 406.13 and 705.

3.7 CONCRETE PROTECTION AND CURING

A. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and follow recommendations in ACI 305R for hot-weather protection during curing.
B. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching 0.2 lb/sq. ft. x h (1 kg/sq. m x h) before and during finishing operations. Apply according to manufacturer’s written instructions.

C. Curing Methods: Cure concrete by moisture curing, moisture-retaining-cover curing, curing compound, or a combination of these as follows:

1. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
   a. Water.
   b. Continuous water-fog spray.
   c. Absorptive cover, water saturated, and kept continuously wet. Cover concrete surfaces and edges with 12-inch lap over adjacent absorptive covers.

2. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer’s written instructions.

3.8 PAVEMENT TOLERANCES

A. Comply with tolerances of ACI 117 and as follows:

1. Elevation Variation: 1/4 inch.

3. Surface Variation: Gap below 10-foot- long, unleveled straightedge not to exceed 1/4 inch.

4. Maximum cross slope for walks, ramps, platforms: 2%

5. Maximum longitudinal walk slopes not requiring landings and handrails: 5%

6. Maximum longitudinal ramp slopes: 8.33% (1 on 12 slope)

3.9 PAVEMENT MARKING

A. Do not apply pavement-marking paint until layout, colors, and placement have been verified with Engineer.

B. Allow concrete pavement to cure for 28 days and be dry before starting pavement marking.

C. Sweep and clean surface to eliminate loose material and dust.

D. Apply paint with mechanical equipment to produce pavement markings of dimensions indicated with uniform, straight edges. Apply at manufacturer’s recommended rates to provide a minimum wet film thickness of 15 mils.
1. If indicated on the plans, spread glass beads uniformly into wet pavement markings at a rate of 6 lb/gal.

3.10 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified independent testing and inspection agency to sample materials, perform tests, and submit test reports during concrete placement according to requirements specified.

B. Testing Services: Testing shall be performed according to the following requirements:

1. Compression Test Specimens: ASTM C 31/C 31M; one set of four standard cylinders for each compressive-strength test. Cylinders shall be molded and stored for laboratory-cured test specimens unless field-cured test specimens are required.

2. Compressive-Strength Tests: ASTM C 39; one set for each day's pour of each concrete class exceeding 5 cu. yd., but less than 25 cu. yd., plus one set for each additional 50 cu. yd. One specimen shall be tested at 7 days and two specimens at 28 days; one specimen shall be retained in reserve for later testing if required.

C. Test results shall be reported in writing to Engineer, concrete manufacturer, and Contractor within 24 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing agency, concrete type and class, location of concrete batch in pavement, design compressive strength at 28 days, concrete mix proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.

D. Additional Tests: Testing agency shall make additional tests of the concrete when test results indicate slump, air entrainment, concrete strengths, or other requirements have not been met. Testing agency may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C 42, or by other methods as directed.

3.11 REPAIRS AND PROTECTION

A. Remove and replace concrete pavement that is broken, damaged, or defective, or does not meet requirements as directed by the Engineer.

B. Remove and replace concrete sidewalks and/or ramps that do not comply with maximum slopes indicated in Section 3.8A above.

C. Protect concrete from damage. Exclude traffic from pavement for at least fourteen (14) calendar days after placement.

END OF SECTION 321313
SECTION 321373 - CONCRETE PAVING JOINT SEALANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. All paving materials and construction methods shall conform to the current standards and specifications of the Michigan Department of Transportation. Where these specifications are less stringent than the requirements of MDOT, the MDOT standards shall govern.

1.2 SUMMARY

A. General – all expansion joints are to receive joint sealant. Contraction and other joints receive sealant only if indicated on the plan.

B. This Section includes the following:

1. Expansion and contraction joints within cement concrete pavement.
2. Joints between cement concrete and asphalt pavement.

C. Related Sections include the following:

1. Division 32 Section "Hot-Mix Asphalt Concrete Paving" for constructing joints between concrete and asphalt pavement.
2. Division 32 Section "Cement Concrete Pavements, Curbs and Gutters" for constructing joints in concrete pavement.

1.3 SUBMITTALS

A. Product Data, shop drawing submittals are not required. Contractor shall confirm that the materials provided meet the required specifications, and provide material certification to the engineer. Material certification shall state that the products meet or exceed the requirements indicated on the plans and the requirements of the regulating authority. Shop drawings will not be reviewed.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain each type of joint sealant through one source from a single manufacturer.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials to Project site in original unopened containers or bundles with labels indicating manufacturer, product name and designation, color, expiration date, pot life, curing time, and mixing instructions for multicomponent materials.
B. Store and handle materials to comply with manufacturer’s written instructions to prevent their deterioration or damage due to moisture, high or low temperatures, contaminants, or other causes.

1.6 PROJECT CONDITIONS

A. Do not proceed with installation of joint sealants under the following conditions:

1. When ambient and substrate temperature conditions are outside limits permitted by joint-sealant manufacturer.
2. When joint substrates are wet or covered with frost.
3. Where joint widths are less than those allowed by joint-sealant manufacturer for applications indicated.
4. Where contaminants capable of interfering with adhesion have not yet been removed from joint substrates.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Products: Use products meeting MDOT’s current specifications.

2.2 MATERIALS, GENERAL

A. Compatibility: Provide joint sealants, backing materials, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer based on testing and field experience.

B. Colors of Exposed Joint Sealants: Gray.

2.3 COLD-APPLIED JOINT SEALANTS

A. Type NS Silicone Sealant for Concrete: Single-component, low-modulus, neutral-curing, nonsag silicone sealant complying with ASTM D 5893 for Type NS.

1. Products:
   a. Crafco Inc.; RoadSaver Silicone.
   b. Dow Corning Corporation; 888.
   c. Approved equal.

B. Type SL Silicone Sealant for Concrete and Asphalt: Single-component, low-modulus, neutral-curing, self-leveling silicone sealant complying with ASTM D 5893 for Type SL.

1. Products:
   a. Crafco Inc.; RoadSaver Silicone SL.
   b. Dow Corning Corporation; 890-SL.
c. Approved equal.

2.4 HOT-APPLIED JOINT SEALANTS

A. Elastomeric Sealant for Concrete: Single-component formulation complying with ASTM D 3406.
   1. Products:
      c. Approved equal.

B. Sealant for Concrete and Asphalt: Single-component formulation complying with ASTM D 3405.
   1. Products:
      a. Koch Materials Company; Product No. 9005.
      b. Koch Materials Company; Product No. 9030.
      d. Approved equal.

2.5 JOINT-SEALANT BACKER MATERIALS

A. General: Provide joint-sealant backer materials that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by joint-sealant manufacturer based on field experience and laboratory testing.

B. Round Backer Rods for Cold- and Hot-Applied Sealants: ASTM D 5249, Type 1, of diameter and density required to control sealant depth and prevent bottom-side adhesion of sealant.

C. Backer Strips for Cold- and Hot-Applied Sealants: ASTM D 5249; Type 2; of thickness and width required to control sealant depth, prevent bottom-side adhesion of sealant, and fill remainder of joint opening under sealant.

D. Round Backer Rods for Cold-Applied Sealants: ASTM D 5249, Type 3, of diameter and density required to control sealant depth and prevent bottom-side adhesion of sealant.

2.6 PRIMERS

A. Primers: Product recommended by joint-sealant manufacturer where required for adhesion of sealant to joint substrates indicated, as determined from preconstruction joint-sealant-substrate tests and field tests.
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine joints indicated to receive joint sealants, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting joint-sealant performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing joint sealants to comply with joint-sealant manufacturer's written instructions.

B. Joint Priming: Prime joint substrates where indicated or where recommended in writing by joint-sealant manufacturer, based on preconstruction joint-sealant-substrate tests or prior experience. Apply primer to comply with joint-sealant manufacturer's written instructions. Confine primers to areas of joint-sealant bond; do not allow spillage or migration onto adjoining surfaces.

3.3 INSTALLATION OF JOINT SEALANTS

A. General: Comply with joint-sealant manufacturer's written installation instructions for products and applications indicated, unless more stringent requirements apply.

B. Sealant Installation Standard: Comply with recommendations in ASTM C 1193 for use of joint sealants as applicable to materials, applications, and conditions indicated.

C. Install backer materials of type indicated to support sealants during application and at position required to produce cross-sectional shapes and depths of installed sealants relative to joint widths that allow optimum sealant movement capability.

1. Do not leave gaps between ends of backer materials.
2. Do not stretch, twist, puncture, or tear backer materials.
3. Remove absorbent backer materials that have become wet before sealant application and replace them with dry materials.

D. Install sealants using proven techniques that comply with the following and at the same time backings are installed:

1. Place sealants so they directly contact and fully wet joint substrates.
2. Completely fill recesses provided for each joint configuration.
3. Produce uniform, cross-sectional shapes and depths relative to joint widths that allow optimum sealant movement capability.

E. Tooling of Nonsag Sealants: Immediately after sealant application and before skinning or curing begins, tool sealants according to requirements specified below to form smooth, uniform beads of configuration indicated; to eliminate air pockets; and to ensure contact and adhesion of sealant with sides of joint.
1. Remove excess sealants from surfaces adjacent to joint.
2. Use tooling agents that are approved in writing by joint-sealant manufacturer and that do not discolor sealants or adjacent surfaces.

F. Provide joint configuration to comply with joint-sealant manufacturer's written instructions, unless otherwise indicated.

G. Provide recessed joint configuration for silicone sealants of recess depth and at locations indicated.

3.4 CLEANING

A. Clean off excess sealants or sealant smears adjacent to joints as the Work progresses by methods and with cleaning materials approved by manufacturers of joint sealants and of products in which joints occur.

3.5 PROTECTION

A. Protect joint sealants during and after curing period from contact with contaminating substances and from damage resulting from construction operations or other causes so sealants are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealants immediately and replace with joint sealant so installations with repaired areas are indistinguishable from the original work.

END OF SECTION 321373
SECTION 323119
DECORATIVE METAL FENCES AND GATES

PART 1 GENERAL

1.1 SUMMARY
   A. Section Includes: Aluminum louver fences (FNC-1) and manually-operated swing gates (FNC-2).

1.2 ACTION SUBMITTALS
   A. Product Data: For each type of product indicated.
   B. Shop Drawings: For gates. Include plans, elevations, sections, details, and attachments to other work.
   C. Samples: 18 inches square, including louver infill, with specified finish.

1.3 CLOSEOUT SUBMITTALS
   A. Maintenance Data: For gate operators to include in maintenance manuals.

1.4 QUALITY ASSURANCE
   A. Installer Qualifications: Fabricator of products.
   B. Welding Qualifications: Qualify procedures and personnel according to the following:
      1. AWS D1.1/D1.1M, "Structural Welding Code - Steel"
      2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
   C. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
      1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

PART 2 PRODUCTS

1.5 ALUMINUM LOUVER FENCES
   A. General: Provide decorative aluminum fencing system consisting of vertical, fixed louver, modular fence panels fabricated with extruded aluminum framing bars and supported by extruded aluminum fence posts.
   B. Inclined, flanged louver blade providing 80 percent visual blocking.
      2. Fence Panel:
         a. Fixed louver bars: Extruded aluminum louver bars, 1-31/32 inches wide, spaced at 2-1/16 inches. Extend louver flange to allow 80 percent direct visual screening.
         b. Cross bars: 1/2 by 1/8 inch flat bars welded perpendicular to back side of louver bars and spaced at 18 inches
      3. Posts: 3-inch square extruded tubular aluminum sections with solid aluminum caps.
   C. Inclined, flanged louver blade providing 100 percent visual blocking.
      2. Fence Panel:
a. Fixed louver bars: Extruded aluminum louver bars, 1-31/32 inches wide, spaced at 1-13/16 inches. Extend louver flange to allow 100 percent direct visual screening.
b. Cross bars: 1/2 by 1/8 inch flat bars welded perpendicular to back side of louver bars and spaced at 18 inches.
3. Posts: 3-inch square extruded tubular aluminum sections with solid aluminum caps.

D. V-shaped louver blade providing 100 percent visual blocking.
   2. Fence Panel:
      a. Fixed louver bars: V-shaped extruded aluminum louver bars, 1-3/4 inches wide by 2-1/2 inches high, spaced at 2-5/8 inches and providing 100 percent direct visual screening.
      b. Framing bars: Extruded aluminum flat bars welded to ends of louvers.
   3. Posts: 3-inch square extruded tubular aluminum sections with solid aluminum caps.

E. Extruded tubular aluminum blades providing with either 80 or 100 percent visual blocking.
   2. Fence Panel: Height and width of panels as shown.
      a. Fixed louver blades: Extruded tubular aluminum louver blades, inclined at 45 degrees, and spaced at 2.83 inches and to provide 100 percent direct visual screening. [spaced at 3.4 inches to provide 80 percent direct visual screening.]
         1) Size: 1/2 by 4 inches.
         2) Material thickness: 0.09 inch.
      b. Framing bars: Extruded aluminum flat bars welded to ends of louvers.
   3. Posts: 3-inch square extruded tubular aluminum sections with solid aluminum caps.

2.1 SWING GATES

A. Aluminum Frames and Bracing: Fabricate members from square extruded-aluminum tubes [1-1/2 by 1-1/2 inches] [2 by 2 inches] [2-1/2 by 2-1/2 inches] <Insert size> with [0.100-inch] [0.125-inch] [0.140-inch] [0.154-inch] wall thickness.

B. Frame Corner Construction: Welded and 5/16-inch diameter, adjustable truss rods for panels 5 feet wide or wider.

C. Additional Rails: Provide as indicated, complying with requirements for fence rails.

D. Infill: Comply with requirements for adjacent fence.

E. Hardware: Latches permitting operation from both sides of gate, hinges, and keepers for each gate leaf more than 5 feet wide. Provide [center gate stops] [and] [cane bolts] for pairs of gates. [Fabricate latches with integral eye openings for padlocking; padlock accessible from both sides of gate.]
   1. <Insert requirements for padlocks and chains if not Owner furnished>.

F. Spring Hinges: BHMA A156.17, Grade 1, suitable for exterior use.
   1. Function: [320 - Gate spring pivot hinge. Adjustable tension] [321 - Gate spring pivot hinge. Fixed tension].

G. Hinges: BHMA A156.1, Grade 1, suitable for exterior use.
   2. Material: Wrought steel, forged steel, cast steel, or malleable iron.

H. Rim Locks: BHMA A156.5, Grade 1, suitable for exterior use.
1. **Function:** [621 - Latchbolt by key from outside and by turn from inside. Latchbolt is held retracted by device from inside] [622 - Deadbolt by key from outside and by turn from inside] [629 - Deadlocking latchbolt by key from outside and by turn from inside] [626 - Interlocking deadbolt operated by key from either side] [627 - Interlocking deadbolt operated by key from outside and by turn from inside]

2. **Material:** Cast, forged, or extruded brass or bronze.

3. **Mounting Plate:** Configuration necessary for mounting locks. Fabricate from 1/8-inch-thick, [steel] [aluminum] plate.

**I. Mortise Locks:** BHMA A156.13, Grade 1, suitable for exterior use.

1. **Function:** [F06 - Holdback lock] [F07 - Storeroom or closet lock] [F09 - Apartment, exit, or public toilet lock] [F16 - Double-cylinder dead lock] [F17 - Dead lock] <Insert function>.

2. **Material:** Brass or bronze.

3. **Levers:** Cast, forged, or extruded brass or bronze.

4. **Mounting Box:** Configuration necessary to enclose locks. Fabricate from 1/8-inch-thick, [steel] [aluminum] plate.

**J. Cane Bolts:** Provide for inactive leaf of pairs of gates. Fabricated from [1/2-inch-] [3/4-inch-] diameter, round steel bars, hot-dip galvanized after fabrication. Finish to match gates. Provide galvanized-steel pipe strikes to receive cane bolts in [closed position] [both open and closed positions].

**K. Aluminum Finish:** Baked enamel or powder coating.

### 2.2 ALUMINUM

**A. Aluminum, General:** Provide alloys and tempers with not less than the strength and durability properties of alloy and temper designated in paragraphs below for each aluminum form required.

**B. Extrusions:** ASTM B 221, Alloy 6063-T5.

**C. Tubing:** ASTM B 429, Alloy 6063-T6.

**D. Plate and Sheet:** ASTM B 209, Alloy 6061-T6.

**E. Die and Hand Forgings:** ASTM B 247, Alloy 6061-T6.

**F. Castings:** ASTM B 26/B 26M, Alloy A356.0-T6.

### 2.3 FINISH

**A. Baked-Enamel or Powder-Coat Finish for Aluminum:** AAMA 2603 except with a minimum dry film thickness of 2 mils. Comply with coating manufacturer's written instructions for cleaning, conversion coating, and applying and baking finish.

1. **Color and Gloss:** Custom Color as selected by Architect.

**B. Polyester powder coating:** Electrostatically applied colored polyester powder coating heat cured to chemically bond finish to metal substrate.

1. **Minimum hardness measured in accordance with ASTM D3363:** 2H.

2. **Direct impact resistance tested in accordance with ASTM D2794:** Withstand 160 inch-pounds.

3. **Salt spray resistance tested in accordance with ASTM B117:** No undercutting, rusting, or blistering after 500 hours in 5 percent salt spray at 95 degrees F and 95 percent relative humidity and after 1000 hours less than 3/16 inch undercutting.

4. **Weatherability tested in accordance with ASTM D822:** No film failure and 88 percent gloss retention after 1 year exposure in South Florida with test panels tilted at 45 degrees.
2.4 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
   1. For aluminum, provide type and alloy as recommended by producer of metal to be welded and as required for strength and compatibility in fabricated items.

B. Concrete: Normal-weight, air-entrained, ready-mix concrete complying with requirements in Division 03 Section “Cast-in-Place Concrete” with a minimum 28-day compressive strength of 3000 psi, 3-inch slump, and 1-inch maximum aggregate size or dry, packaged, normal-weight concrete mix complying with ASTM C 387 mixed with potable water according to manufacturer’s written instructions.

C. Nonshrink Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107 and specifically recommended by manufacturer for exterior applications.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for site clearing, earthwork, pavement work, construction layout, and other conditions affecting performance of the Work.

B. Do not begin installation before final grading is completed unless otherwise permitted by Architect.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install fences according to manufacturer's written instructions.

B. Install fences by setting posts as indicated and fastening rails and infill panels to posts.

C. Post Setting: Set posts in concrete at indicated spacing into firm, undisturbed soil.
   1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting with concrete or mechanical devices.
   2. Concrete Fill: vibrate or tamp for consolidation. Protect aboveground portion of posts from concrete splatter.
   3. Posts Set in Concrete: Extend post to within 6 inches of specified excavation depth, but not closer than 3 inches to bottom of concrete.
   4. Posts Set into Concrete in Sleeves: Use galvanized-steel pipe sleeves with inside diameter at least 3/4 inch larger than outside diagonal dimension of post, preset and anchored into concrete for installing posts.
      a. Extend posts at least 5 inches into sleeve.
      b. After posts have been inserted into sleeves, fill annular space between post and sleeve with nonshrink grout, mixed and placed to comply with grout manufacturer’s written instructions; shape and smooth to shed water. Finish and slope top surface of grout to drain water away from post.
   5. Posts Set into Voids in Concrete: Form or core drill holes not less than 3/4 inch larger than outside diagonal dimension of post.
      a. Extend posts at least 5 inches into concrete.
      b. Clean holes of loose material, insert posts, and fill annular space between post and concrete with nonshrink grout, mixed and placed to comply with grout manufacturer's written instructions. Finish and slope top surface of grout to drain water away from post.
3.3 **GATE INSTALLATION**

A. Install gates according to manufacturer’s written instructions, level, plumb, and secure for full opening without interference. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

3.4 **INSTALLED WORK**

A. Gates: Adjust gates to operate smoothly, easily, and quietly, free of binding, warp, excessive deflection, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range. Confirm that latches and locks engage accurately and securely without forcing or binding.

B. Lubricate hardware and other moving parts.

**END OF SECTION**
SECTION 32 31 19
METAL FENCES AND GATES

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Maintenance Area Fencing.
   2. Maintenance Area Gates.

1.2 REFERENCES

A. ASTM-A82: Cold Drawn steel wire , Plain, for Concrete Reinforcement.
B. ASTM-A185: Steel Welded Wire Fabric, Plain, for Concrete Reinforcement.
C. ASTM-A1008 Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy (HSLA) and HSLA with Improved Formability
E. ASTM-A513-00: Standard Specification for Electric-Resistance-Welded Carbon and Alloy Steel Mechanical Tubing
F. ASTM-A653: Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process

S. ASTM-F2919: Standard Specification for Welded Wire Mesh Fence Fabric (Metallic-Coated or Polymer Coated) with Variable Mesh Patterns or Meshees Greater than 6 sq. in. [3871 mm2] in Panels

T. ASTM-F626: Standard Specification for Fence Fittings

1.3 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.4 ACTION SUBMITTALS

A. Product Data: Material descriptions, construction details, dimension of individual components and profiles, and finishes for:
   1. Fence and gate posts, rails, and fittings.
   2. Gates and hardware.

B. Shop Drawings: locations of fence, each gate, posts, rails, and details of gate swing, or other operation, hardware, and accessories. Indicate materials, dimensions, sizes, weights, and finishes of components. Include plans, elevations, sections, gate swing and other required installation and operational clearances, and details of post anchorage, attachment and bracing. Installation procedures and instructions by manufacturer describing all details for a typical fence and gate.

C. Samples: For each fence material and for each color specified.

1.5 INFORMATIONAL SUBMITTALS

A. Field quality-control reports.

B. Product test reports.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance data.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: An experienced insta ller who has completed fences and gates similar in material, design, and extent to those indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Source Limitations: Obtain each color, grade, finish, type, and variety of components for fences and gates from one source with resources to provide fences and gates of consistent quality in appearance and physical properties.

1.8 PROJECT CONDITIONS

A. Field Measurements: verify layout information for fences and gates shown on drawings in relation to property survey and proposed and existing structures. Verify dimensions by field measurements.
PART 2 - PRODUCTS

2.1 MECHANICAL AREA FENCING

A. Manufacturer: Omega II [https://www.omegafence.com] or approved equal.

B. Fences
   1. Product: Omega Architectural
   2. Panel Widths: As indicated in Drawings
   3. Height: As indicated in Drawings, utilizing multiple stacked panels

C. Gates
   1. Product: Omega Architectural
   2. Width: Standard 8’ swing gate (two 4-foot leafs)
   3. Hardware: Manufacturer-provided lock (LAKQ U2)

D. Posts
   1. 3” square posts, embedded

E. Color: Custom RAL code per Architect

F. Accessories: All manufacturer-provided posts, brackets, hardware and accessories as required per drawings and manufacturer’s installation details.

G. Manufacturer’s Materials:
   1. The wire mesh fence panel is welded by resistance using 6 gauge - 0.192 pre-galvanized steel wire, welded at each crossing to form rectangles of 2 in. x 6 in. The cold rolled wire shall have a tensile strength of at least 75,000 psi and a 2 172 lbs break strength as per ASTM A185 & A853. One end of the vertical wires of the panel shall exceed 1” (25 mm) from the last or the first horizontal wire thereby creating a spiked top or bottom depending of its position when installed. The other end is cut flush. Panels shall have a number of folds according to the table 2 below depending on the respective height of the panel. Note: Panel camber may not exceed 0.094” (2.5 mm).
   2. Fence and gate posts are cold rolled from 1008 grade steel and meet ASTM 500 and ASTM A787-01. Fence posts are to be minimum 11 gauge, as recommended by the manufacturer based on post height.
   3. Post bracket kits include 16 gauge steel collar and wire retaining plate, nut, washer and carriage bold, all galvanized steel.
   4. Post caps are made out of an aluminum alloy.
   5. Gate frames shall be made in accordance with ASTM F900 (1984) using galvanized square steel tube 16 ga, welded.
   6. Gate hardware conforms with ASTM F900 (1984) for hinges, latch, drop rods, and shall be hot-dip galvanized steel, and sized to assure proper gate operation. Non moving parts shall be powder-coated.

H. Manufacturer’s Coatings:
   1. The wire meshes is coated with 0.5 oz./sq.ft. (150 g/m2) zinc in conformity with ASTM A 641 (1989) Class 1
   2. The fence posts, the swing gate frame and the posts are zinc coated (galvalum process) with a minimum of 0.9 oz/sq.ft.(275 g/m2) as per ASTM A653 G90.
   3. Polyester coating to be minimum 4 mils applied by an electrostatic method. Coating shall cover all surfaces of the wire and post sections. Coating shall be capable of withstanding the following tests:
      a. Mechanical adhesion test as per ASTMD 3359 (1990) - Method B.
c. Salt spray testing with a min. of 1,000 hrs without red rust appearance, as per ASTM B 117 (1990).
e. Exposure to ultraviolet light with exposure of 1000 hours using apparatus Type E and 63°C as per ASTM D1499

2.2 MISCELLANEOUS MATERIALS

A. Concrete: Normal-weight, air-entrained, ready-mix concrete complying with requirements in Section 033000 "Cast-in-Place Concrete" with a minimum 28-day compressive strength of 3000 psi (20 MPa), 3-inch (75-mm) slump, and 1-inch (25-mm) maximum aggregate size or dry, packaged, normal-weight concrete mix complying with ASTM C 387/C 387M mixed with potable water according to manufacturer's written instructions.

B. Nonshrink Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M and specifically recommended by manufacturer for exterior applications.

2.3 FABRICATION

A. Posts and fence panels shall be pre-cut to specified lengths by manufacturer. No field cutting is permitted.

B. The manufactured panels and posts shall be subjected to an inline electrode position coating (E-Coat) process consisting of a multi-stage pretreatment/wash (with zinc phosphate), followed by a duplex application of an epoxy primer and an acrylic topcoat. The minimum cumulative coating thickness of epoxy and acrylic shall be 2 mils (0.058 mm).

C. The manufactured fence system shall be capable of meeting the vertical load, horizontal load, and infill performance requirements for Commercial weight fences under ASTM F2408.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions, with Installer present, for compliance with requirements for site clearing, earthwork, pavement work, and other conditions affecting performance.

B. Do not begin installation before final grading is completed, unless otherwise permitted by Architect.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Stake locations of fence lines, gates, and terminal posts. Indicate locations of utilities, lawn sprinkler system, underground structures, benchmarks, and property monuments.

3.3 FENCE INSTALLATION

A. Post Excavation: Drill or hand-excavate holes for posts to diameters and spacing indicated in firm, undisturbed or compacted soil.

B. Post Setting: Set posts in concrete footing.

1. Verify that posts are set plumb, aligned, and at correct height and spacing, and hold in position during setting. Use of mechanical devices to set posts is not permitted.
2. Concrete Fill: Place concrete around posts and vibrate or tamp for consolidation. Protect aboveground portion of posts from concrete splatter.

3. Concealed Concrete Footings: Stop footings below grade as indicated on Drawings to allow covering with surface material.

C. Install fence panels and brackets according to manufacturer's written instructions.

3.4 GATE INSTALLATION

A. Install gates according to manufacturer's written instructions, level, plumb, and secure for full opening without interference. Attach hardware using tamper-resistant or concealed means. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubricate where necessary.

END OF SECTION 32 31 19
SECTION 32 33 00
SITE FURNISHINGS

PART 1 - GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Bike Racks.
   2. Pedestrian Bollards.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Samples: For each exposed product and for each color and texture specified.

1.3 CLOSEOUT SUBMITTALS
A. Maintenance data.

PART 2 - PRODUCTS

2.1 BIKE RACKS
A. Manufacturer: Landscape Forms Inc., (800) 521-2546, www.landscapeforms.com
B. Product: Bola Bike Rack
C. Finish: Stainless Steel
D. Mounting: Embedded

2.2 PEDESTRIAN BOLLARDS
B. Product: 8-2C2 Bollard
C. Finish: Polyester Powdercoat,
D. Color: “Cast Iron Grey”
E. Mounting: Embedded

PART 3 - EXECUTION

3.1 INSTALLATION
A. Comply with manufacturer's written installation instructions unless more stringent requirements are indicated. Complete field assembly of site furnishings where required.
B. Unless otherwise indicated, install site furnishings after landscaping and paving have been completed.
C. Install site furnishings level, plumb, true, and securely anchored at locations indicated on Drawings.

END OF SECTION 32 33 00
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Pipe and fittings.
2. Sleeving.
3. Wire and wire connectors.
5. Sprinklers.
6. Isolation valves.
7. Automatic control valves.
8. Quick couplers.

1.3 DESCRIPTION OF WORK

A. Extent of irrigation system work is shown on the drawings and by provisions of this Section.

B. The scope of work includes connecting to two different watersources for the irrigation systems at MacKenzie House and Hillberry Theater.

C. The sprinkler systems shall be constructed using the isolation valves, sprinklers, quick coupling valves, piping, fittings, controllers, wiring, etc. of sizes and types as shown on the drawings and as called for in these specifications. The system shall be constructed to grades and conform to areas and locations as shown on the drawings.

D. Piping and valve locations shown on the drawings are essentially diagrammatic. Spacing of the valves and sprinklers are shown on the drawings and shall be exceeded only with the permission of the Owner's Representative.

E. Unless otherwise specified or indicated on the drawings, the construction of the sprinkler system shall include the furnishing, installing and testing of all mains, laterals, fittings, sprinklers, quick coupling valves, automatic control valves, controllers, electric wire, backflow preventer, master valve/flow sensor, rain sensor, valve boxes, isolation valves, and other necessary specialties and the removal and/or restoration of existing improvements, excavation and backfill, and all other work in accordance with plans and specifications as required for a complete system.
1.4 PERFORMANCE REQUIREMENTS

A. Irrigation zone control shall be automatic operation with controller and automatic control valves.

B. Location of irrigation valves, piping, and other system components: Design location is approximate. Make minor adjustments necessary to avoid plantings and obstructions such as signs and light standards. Maintain 100 percent irrigation coverage of landscape areas indicated.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Submit product information on sprinklers, nozzles, bubblers, plastic isolation valves (upstream of zone valves), quick coupling valves and stabilizers, schedule 80 three elbow swing joint with O-Ring seals, 14 AWG two-wire cable, 14 AWG single strand wire, decoders, surge arrestors, moisture sensors, rain sensors, wire connectors, valve boxes, PVC pipe and fittings, pipe primer and glue, polyethylene lateral pipe and fittings, stainless steel pipe clamps master valve and flow meter, and control timers. Include manufacturer granted Contractor Training Certification Certificate for the controller to be used.

C. Operation and Maintenance Data: Submit operation and maintenance manuals for sprinklers, controllers, automatic control valves, and quick coupling valves.

1.6 QUALITY ASSURANCE

A. The Contractor shall maintain continuously a competent superintendent, satisfactory to the Owner, with authority to act for him in all matters pertaining to the work.

B. The Contractor shall coordinate his work with the other trades.

C. The Contractor shall confine his operations to the areas to be improved and to the areas allotted him by the Owner's representative for material and equipment storage.

D. The Contractor shall have a minimum of five years experience installing irrigation systems of comparable size and complexity.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver plastic piping in bundles, packaged to provide adequate protection of pipe ends, both threaded or plain.

B. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

C. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

D. Deliver irrigation system components in manufacturer's original undamaged and unopened containers with labels intact and legible.
E. Store and handle materials to prevent damage and deterioration.

F. Provide secure and locked storage for all brass, copper, bronze and stainless-steel items including all valves, pipe fittings, wire, pipe, sprinklers and similar components that cannot be immediately replaced, to prevent installation delays.

1.8 PROJECT CONDITIONS

A. The bidder acknowledges that he has examined the site, plans and specifications, and the submission of a proposal shall be considered evidence that examination has been made.

B. It shall be the contracting installer's responsibility to report to the Owner's authorized representative any deviations between drawings, specifications and the site. Failure to do so prior to the installing of equipment and resulting in replacing and/or relocation of equipment shall be done at the Contractor's expense.

C. The exact location of existing utilities and structures and underground utilities are not indicated on the drawings; their locations shall be determined by the Contractor, and he shall conduct his work so as to prevent interruption of service or damage to them. The Contractor shall protect existing structures and utility services and be responsible for their replacement if damaged by him.

D. Minor adjustments in system layout will be permitted to clear existing fixed obstructions. Final system layout shall be acceptable to Owner's Representative.

E. Do not willfully install the sprinkler system as shown on the drawings when it is obvious in the field that unknown obstructions, grade differences or differences in the area dimensions exist that might not have been considered in the engineering. Such obstructions or differences should immediately be brought to the attention of the owner's authorized representative. In the event this notification is not performed, the irrigation contractor shall assume full responsibility for any revisions necessary.

F. Landscaping shall supersede irrigation locations wherever there is a conflict between the two.

1.9 EXTRA MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.

1. Quick coupling valve keys and hose swivels: Provide owner with two (2) valve keys and hose swivels for use with quick coupling valve models installed as part of this work.

1.10 SERVICE AND MAINTENANCE

A. The Contractor shall service both systems at the Owner's request during the guarantee period and shall be paid for work performed which is not covered by the guarantee.

B. Contractor shall winterize the both systems the first year as part of this contract and will provide written instructions to the Owner for future service and maintenance.
C. Return to the site during the subsequent spring season and demonstrate to the Owner the proper procedures for the system start-up, operation and maintenance.

D. After completion, testing and acceptance of the system, the Contractor will instruct the Owner's personnel in the operation and maintenance of both systems.

1.11 OWNER’S ACCEPTANCE

A. The completion of the contract will be accepted and Notice of Completion recorded only when the entire contract is completed to the satisfaction of the Owner’s authorized representative.

B. Within ten (10) days of the Contractor’s notification that the installation is complete, the Owner, or his Representative, will inspect the installation and if a final acceptance is not given, will prepare a "Punch List" which, upon completion by the Contractor, will signify acceptance by the Owner.

C. Provide AutoCad plan with dimensions from two fixed points for mainline and wire routings, all valves, watersource and controller location per the Owner requirements.

D. Provide a reproducible, 30” x 42” irrigation system record drawing and flashdrive with Autocad drawing of GPS information listed in Section C., above, along with drawing saved as a pdf.

   1. Legibly mark drawings to record actual construction.

   2. Locate horizontal locations, with a minimum of two dimensions to permanent surface improvements, for each automatic valve, isolation valve, all wire splice boxes, extra wire locations and quick coupling valves.

   3. Identify field changes with dimensions and details as required as well as changes made by Change Order.

E. Provide a zone identification drawing indicating with color, the different zones. Include table on drawing with zone description. Drawing shall be 11” x 17” laminated.

F. Final payment will not be made without the receipt of accurate as-built drawings and zone identification drawings by The Owner’s Representative.

G. Provide four hours to assist landscape contractor in setting zone operation times for all zones on both controllers. Irrigation system will not be considered complete until control system is in complete working order.

1.12 WARRANTY

A. It shall be the Contractor's responsibility to ensure and guarantee satisfactory operation of both systems and the workmanship and restoration of the area. The both systems shall be guaranteed to be complete and perfect in every detail for a period of one year from the date of its acceptance and he thereby agrees to repair or replace any such defects occurring within that year, free of expense to the Owner. Minor maintenance and adjustment shall be by the Owner.
B. Contractor is to guarantee that all trenches and other disturbed areas be free from heaving or settling more than one-quarter inch (1/4”). Should it become necessary to adjust the grade, regrade the trench and reseed. This no settlement clause shall extend over the entire period of guarantee of the job.

C. One month prior to the conclusion of the warranty period, the Contractor and landscape contractor shall meet at the site and adjust the zone watering times on the controllers to reflect run times for established plant material.

PART 2 - PRODUCTS

2.1 GENERAL

A. All material to be incorporated in this system shall be new and without flaws or defect and quality and performance as specified. All material overages at the completion of the installation are the property of the Contractor and are to be removed from site.

B. The Contractor shall use materials as specified. Material other that specified will be permitted only after written application by the Contractor and written approval by the Owner's Representative. Substitutions will only be allowed when in the best interest of the Owner.

2.2 PIPE, SLEEVEING, AND FITTINGS (2.5" and smaller and all sleeving)

A. Pipe sizes shall conform to those shown on the drawings. No substitutions of smaller pipe sizes will be permitted, but substitutions of larger size may be approved. All pipe damaged or rejected because of defects shall be removed from the site at the time of said rejection.

B. Provide pipe continuously and permanently marked with manufacturer's name or trademark, size, schedule and type of pipe, working pressure at seventy-three (73) degrees Fahrenheit and National Sanitation Foundation (NSF) approval.

C. All PVC piping, 2” size, and all sleeves, shall be ASTM D2241, rigid, unplasticized Polyvinyl chloride, extruded from virgin parent material. Provide pipe homogeneous throughout and free from visible cracks, holes, foreign materials, blisters, wrinkles, and dents.

D. All pipe, and all sleeves shall be SDR 21, 200 PSI, PVC unless specifically noted on the drawings.

E. Sleeves shall be solvent weld PVC pipe.

F. PVC pipe shall be solvent weld type.

G. PVC pipe fittings for sizes two and one half inch (2.5") and smaller shall be ASTM D2466 schedule 40 PVC molded fittings suitable for solvent weld, except all threaded PVC pipe fittings as noted on the drawings shall be ASTM D2467, schedule 80 PVC.

H. PVC pipe fittings shall be schedule 40 PVC, solvent weld.

I. Primer and solvent for use with PVC pipe to conform to ASTM D2564. Primer to be purple in color. Solvent to be appropriate for pipe and fitting type and weather conditions.
J. Polyethylene Pipe with Controlled ID: ASTM F 771, PE 3408 compound; SIDR 15.
   1. Insert Fittings for PE Pipe: ASTM D 2609, nylon or propylene plastic with barbed ends. Include stainless steel worm gear clamps with stainless steel screw.

K. All copper pipe shall be type "L" hard copper. Fittings shall be cast brass or wrought copper.

L. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

M. Dielectric Unions: Assembly of copper alloy and ferrous materials or ferrous material body with separating nonconductive insulating material suitable for system fluid, pressure, and temperature. End Connections to be solder-joint copper alloy and threaded ferrous.

N. PE Pipe with Controlled ID: ASTM F 771, PE 3408 compound; SIDR 11.5.

O. Insert Fittings for PE Pipe: ASTM D 2609, nylon or propylene plastic with barbed ends. Include stainless steel worm gear clamps.

P. Ductile-Iron Pipe with Mechanical Joints: AWWA C151, with mechanical-joint bell and spigot ends.
   1. Mechanical-Joint, Ductile-Iron Fittings: AWWA C110, ductile- or gray-iron standard pattern or AWWA C153, ductile-iron compact pattern.
      a. Glands, Gaskets, and Bolts: AWWA C111, ductile- or gray-iron glands, rubber gaskets, and steel bolts.

2.3 WIRE AND WIRE CONNECTORS (HILLBERRY SYSTEM)

A. All two-wire cable shall be Type UL approved, for direct burial.

B. Control system shall be either Baseline, Hunter, Rainbird. Cable, decoders, surge arrestors and sensors shall be those manufactured by Baseline, Hunter, Rainbird.

C. Two wire cable shall be size AWG fourteen (14) and be manufactured for use with Baseline, Hunter, or Rainbird control systems.

D. Decoders shall be those manufactured for use with Baseline, Hunter, or Rainbird control systems.

E. All control cable shall be run next to the mainline pipe. Where wire cannot be installed next to mainline pipe, install wire inside 1" conduit.

F. Low voltage wire connectors to be made using wire nuts and 3M DBYR connectors. Refer to Baseline, Hunter, or Rainbird requirements.

G. One hundred and twenty volt (120 v) or heavier splices made underground are to be made using wire nuts and 3M brand Scotch-Lok.
2.4 WIRE AND WIRE CONNECTORS (MACKENZIE HOUSE SYSTEM)

A. All wire shall be single strand Type UL approved, for direct burial.

B. Control system shall be either Hunter, Rainbird, or Toro.

C. Wire shall be size AWG fourteen (14) for use with irrigation systems and direct burial installations.

D. All wire shall be run next to the mainline pipe. Where wire cannot be installed next to mainline pipe, install wire inside 1” conduit.

E. Low voltage wire connectors to be made using wire nuts and 3M DBYR connectors.

F. One hundred and twenty volt (120 v) or heavier splices made underground are to be made using wire nuts and 3M brand Scotch-Lok.

2.5 SPRINKLERS

A. Install fittings and sprinkler heads in accordance with manufacturer's instructions, except as otherwise indicated.

B. Set sprinkler heads perpendicular to finished grades, except as otherwise indicated, and positions to prevent contact with grounds maintenance equipment. Locate sprinkler heads to assure proper coverage of indicated areas. Do not exceed sprinkler head spacing distances indicated.

C. Provide pop-up spray heads with a two elbow swing joint riser as shown on Drawings.

D. Refer to legend on irrigation sheet for models and manufacturers.

2.6 CONTROL SYSTEM

A. Hillberry system: Control timer is to be a Baseline, Hunter, Rainbird two-wire system. Refer to notes and details on irrigation detail sheet and legend.

B. MacKenzie system: Control timer is to be a Hunter, Rainbird, or Toro conventionally wired controller system.

2.7 AUTOMATIC CONTROL VALVES

A. Automatic valves shall be globe-type diaphragm valves of normally closed design, self-cleaning, with plastic bodies and covers and manual flow control. Operation shall be controlled by a slow-closing integrally mounted heavy-duty 24-volt AC solenoid complying with National Electrical Code, Class II Circuit; solenoid coil shall be completely waterproof, potted in epoxy resin within a plastic-coated stainless-steel housing.

B. Refer to details on irrigation detail sheet.

C. Plastic ball valves shall be installed upstream of automatic valves. Size shall equal automatic valve size.
D. Install automatic valves inside 11” x 19” rectangular valve boxes, one valve per box.

2.8 QUICK COUPLING VALVE

A. Quick coupling valves shall have cast brass bodies with spring-loaded, self-closing thermoplastic locking covers and 1-inch IPS inlet.

B. Quick coupling valve model to be as noted in the irrigation legend and include schedule 80 three elbow swing joint with O-ring seals, stabilizer and concrete support.

C. Refer to detail on irrigation detail sheet.

2.9 VALVE BOXES

A. Valve Access Boxes to be tapered enclosure of rigid plastic material comprised of fibrous components chemically inert and unaffected by moisture, corrosion, and temperature changes.

B. Boxes to be size as noted in the details on the detail sheet. Side walls to extend at least two inches (2") below the bottom of the valve body; use extensions as necessary.

C. Accessories:
   1. Drainage fill to be 3/4” crushed stone.
   2. Fill shall be clean soil, free of stones larger than two inches (2") in diameter, foreign matter, organic material and debris.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine final grades and installation conditions. Do not start irrigation system work until unsatisfactory conditions are corrected.

B. All city and state laws, rules and regulation governing or relating to any portion of this work are hereby incorporated into and made a part of these specifications and their provisions shall be carried out by the contractor

C. It is the responsibility of the irrigation contractor to familiarize himself with all grade differences, location of walls, retaining walls, structures and utilities. The irrigation contractor shall repair or replace all items damaged by his work at no expense to the owner. He shall coordinate his work with other contractors for the location and installation of pipe sleeves and lateral lines through walls, under roadways, drives, and paving, etc.

D. The contractor shall obtain the pertinent engineering, landscape, or architectural plans before beginning work.

E. The contractor shall obtain all necessary permits required to perform the work indicated herein before beginning work.
F. Do not willfully install the sprinkler system as shown on the drawings when it is obvious in the field that unknown obstructions, grade differences or differences in the area dimensions exist that might not have been considered in the engineering. Such obstructions or differences should immediately be brought to the attention of the owner's authorized representative. In the event this notification is not performed, the irrigation contractor shall assume full responsibility for any revisions necessary.

G. Tree locations take priority over irrigation piping. Stake tree locations prior to trenching for pipe. Obtain approval from owner's representative for all pipe routing and valve box locations prior to initiating any work.

3.2 PREPARATION

A. Locations of the irrigation components need to be staked and approved prior to initiating any work. Consult with all trades and individuals to gain approval of positioning of the irrigation components including Owner's Representative, landscape architect, controller representative, and engineers to ensure that all components are placed in locations where they will operate most efficiently and not be in the way of utilities, plant material and other site components. Any items which are installed and later found to need re-installation because approval was not granted by the knowledgeable party, will be done at the irrigation contractor's expense.

B. Set stakes to identify locations of proposed piping and valve boxes. Obtain Owner's Representatives approval before excavation.

C. Obtain latest manufacturer's recommended installation requirements for components. Any deviation between these specifications and plans and those recommendations are to be brought to the attention of the Owner's Representative.

3.3 EXCAVATION AND BACKFILLING

A. Excavating shall be considered unclassified and shall include all materials encountered, except materials that cannot be excavated by normal mechanical means. Excavate trenches of sufficient depth and width to permit proper handling and installation of pipe and fittings. Excavate to depths required to provide two-inch (2") depth of earth fill or sand bedding for piping when rock or other unsuitable bearing material is encountered.

B. Fill to match adjacent grade elevation with approved earth fill material. Place and compact fill in layers not greater than eight-inch (8") depth.

C. Provide approved fine-grained earth fill or sand to a point four inches (4") above the top of pipe, as detailed on the irrigation detail sheet.

D. Fill to within six inches (6") of final grade with approved excavated or borrow fill materials free of lumps or rocks larger than 2" in any dimension.

E. The top six inches (6") of backfill shall be topsoil, free of rocks, subsoil or trash. Any special soil mixture shall be replaced to the original condition it was prior to irrigation installation.

F. Mechanically compact backfill in 6-inch lifts to a minimum of 95 percent (maximum density) under pavement and 90 percent in unpaved areas.
G. Compacted backfill shall match surrounding grades. Repair of trench settlement and affected landscape shall be at Contractor's expense.

H. All mainline pipe is to be installed using open trenches. Lateral pipe may be installed using vibratory plow if suitable soil conditions exist.

I. All trenches opened during any particular working day are to be backfilled the same day. Open or partially backfilled trenches left overnight or unsupervised shall be barricaded.

J. Mechanically compact backfill in 6-inch lifts to a minimum of 95 percent (maximum density) under pavement and 90 percent in unpaved areas.

K. Compacted backfill shall match surrounding grades. Repair of trench settlement and affected landscape shall be at the irrigation contractor's expense.

3.4 PIPING INSTALLATION

A. Install plastic pipe in accordance with manufacturer's installation instructions and ASTM D2274, particularly as it applies to thermal expansion and contraction.

B. Store pipe such that it is protected from oil and grease and from prolonged exposure to sunlight and excessive heat.

C. Solvent welding shall be in strict accordance with manufacturer's recommendations and ASTM Standards D2564 and D2855, especially as they apply to ambient temperature.

D. Maintain interior free of dirt and debris. Close open ends of pipe by capping, taping or other acceptable method when pipe installation is not in progress, including overnight, to prevent entrance of foreign matter.

E. Pipe and fittings shall be handled in a manner to ensure delivery to the trench in sound, undamaged condition. If the coating of any pipe or fitting is damaged or if materials are in poor condition, it shall be repaired or replaced.

F. Allow glued joints to set at least twenty-four hours before pressure is applied to the system.

G. All mainline and contiguously pressurized pipe is to be installed using open trench and backfill.

H. Minimum depth of cover over lateral pipe shall be twelve inches (12") and over mainline pipe shall be eighteen to twenty-four inches (18"-24").

I. Install piping in sleeves under parking lots, roadways, and sidewalks prior to paving. Minimum depth to be 18"-24" beneath subgrade.

J. Where sleeves need to be installed beneath paving, coordinate work with paving contractor to set sleeves prior to the paving process.

K. Where more than one sleeve is to pass beneath paving, install sleeves 6" apart, as measured from the outside wall of the sleeves, in an even lateral layout. Do not install sleeves stacked on top of each other or rubbing against each other.

L. Install sleeves made of SDR 21, 200 PSI, PVC pipe and socket fittings, and solvent-cemented joints.
3.5 PIPE JOINT CONSTRUCTION

A. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.

B. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.

C. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

D. Copper-Tubing Soldered Joints: Apply ASTM B 813 water-flushable flux to tube end unless otherwise indicated. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy (0.20 percent maximum lead content) complying with ASTM B 32.

E. PVC Piping Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. Join schedule number, ASTM D 1785, PVC pipe and PVC socket fittings according to ASTM D 2672. Join other-than-schedule-number PVC pipe and socket fittings according to ASTM D 2855.

3.6 VALVE INSTALLATION

A. Electric valve installation shall be as indicated on the drawings. All electrical, quick coupler, and manual valves shall be enclosed in a valve box. Add valve box manufactured extensions as required to prevent soil settlement around the valve. Set box flush with finish grade and aligned with adjacent boxes and/or adjoining sitework.

B. Install valve access boxes on a suitable base of gravel to provide a level foundation at proper grade and to provide drainage of the access box.

C. Support box with bricks to protect pipe under box and box settlement. For rectangular boxes, support with four bricks, one at each corner. For round valve boxes, support with two bricks on opposing sides.

D. Refer to details on irrigation detail sheet.

3.7 CONTROLLER AND ELECTRICAL INSTALLATION

A. Make final connection of 110-volt service to timer. 110-volt service to timer location to be coordinated with electrical trades.

B. Install surge protection and grounding equipment as recommended by controller manufacturer.
C. Install control cable/wire in same trench as irrigation piping and beside piping. Provide conductors of size not smaller than recommended by controller manufacturer. Install electrical control wire in the pipe trenches wherever possible.

D. Install cable/wire with 24” of slack so as to provide for expansion and contraction. Expansion joints in wire may be provided at two hundred-foot (200’) intervals by making 5-6 turns of the wire around a piece of half inch (1/2”) pipe. Where necessary to run wire in a separate trench, provide a minimum cover of twenty-four inches (24”).

E. Provide minimum twenty-four-inch (24”) slack at remote control valves to allow raising the valve bonnet or splice to the surface, without disconnecting the wire, for repair.

F. Provide minimum of 5'-0” of slack at all wire splices and spare wire locations. Neatly tape wire together using duct tape and coil it in a neat bundle within the valve box.

G. Connect each remote-control valve to one station of a controller except as otherwise indicated. Where there is to be more than one valve per station. Make required splice at the control timer.

H. Make splices only at valve, unless otherwise unavoidable. Locate all field splices on the as-built drawing. See detail on irrigation detail sheet for approved wire splice method.

I. All wire to be spliced using 3M scotch-lok or DBY/R-6 connectors as detailed on the irrigation detail sheet.

J. Install decoders per manufacturer’s recommendations.

K. Ground controller, cable, and decoders per manufacturer’s recommendations.

L. Obtain assistance from landscape contractor to set zone watering days and run time durations.

3.8 SPRINKLERS

A. Install sprinklers as detailed on the irrigation detail sheet.

B. Install nozzles as noted in the irrigation legend. All nozzles shall be by the sprinkler manufacturer.

3.9 MASTER VALVE / FLOW METER

A. Install master valve/flow meter as noted in the irrigation detail sheet. Obtain assistance from controller representative to ensure proper installation.

3.10 FLUSHING AND TESTING

A. After all new irrigation piping is in place and connected for a given section and all necessary division work has been completed, all control valves shall be opened and a full head of water used to flush out the system.

B. The sprinkler main shall be tested under normal water pressure (60 PSI) for a period of twelve hours. If leaks occur, repair and repeat the test. Give Owner's Representative twenty-four hours’ notice prior to testing.
C. Any necessary repairs shall be made, at the Contractor's expense, to put the system in good working order before final payment by the Owner.

3.11 FIELD QUALITY CONTROL

A. Control timer: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Tests and Inspections:
   1. Leak Test: After installation, charge system and test for leaks. Repair leaks and retest until no leaks exist.
   2. Operational Test: After electrical circuitry has been energized, operate controllers and automatic control valves to confirm proper system operation.
   3. Central control and controller: After master valve, flow sensor and controller has been installed and connected via hardwire to each other and by communication to the internet, test system for complete and accurate operation.
   4. Provide one day to assist authorized manufacturer in downloading data and zone operation times for all zones on controller. Irrigation system will not be considered complete until control system is in complete working order.
   5. Test and adjust controls, pressure regulators and safeties. Replace damaged and malfunctioning controls and equipment.

C. Any irrigation product will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports for both controller systems.

E. Provide certificate of compliance from plumber licensed to perform certification on backflow preventers showing that the backflow preventer meets all local and State health codes. Certification must be on licensed plumber's letterhead and include signature of inspector and applicable licensed number(s).

F. Obtain assistance from landscape contractor to set zone operation times.

END OF SECTION 32 84 00
SECTION 32 91 13
SOIL PREPARATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section includes planting soils specified by composition of the mixes.

1.3 DEFINITIONS

B. Backfill: The earth used to replace or the act of replacing earth in an excavation. This can be amended or unamended soil as indicated.

C. CEC: Cation exchange capacity.

D. Compost: The product resulting from the controlled biological decomposition of organic material that has been sanitized through the generation of heat and stabilized to the point that it is beneficial to plant growth.

E. Duff Layer: A surface layer of soil, typical of forested areas, that is composed of mostly decayed leaves, twigs, and detritus.

F. Manufactured Soil: Soil produced by blending soils, sand, stabilized organic soil amendments, and other materials to produce planting soil.

G. NAPT: North American Proficiency Testing Program. An SSSA program to assist soil-, plant-, and water-testing laboratories through interlaboratory sample exchanges and statistical evaluation of analytical data.

H. Organic Matter: The total of organic materials in soil exclusive of undecayed plant and animal tissues, their partial decomposition products, and the soil biomass; also called "humus" or "soil organic matter."

I. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified as specified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth.

L. Subgrade: Surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

M. Subsoil: Soil beneath the level of subgrade; soil beneath the topsoil layers of a naturally occurring soil profile, typified by less than 1 percent organic matter and few soil organisms.

N. Surface Soil: Soil that is present at the top layer of the existing soil profile. In undisturbed areas, surface soil is typically called "topsoil"; but in disturbed areas such as urban environments, the surface soil can be subsoil.

1.4 SUBMITTALS

A. Submittals to be made in accordance with Section 013300 “Submittal Procedures”.

B. Product Data: For each type of product.

1. Include recommendations for application and use.
2. Include test data substantiating that products comply with requirements.
3. Include sieve analyses for aggregate materials.
4. Material Certificates: For each type of soil amendment and fertilizer before delivery to the site, according to the following:
   a. Manufacturer's qualified testing agency's certified analysis of standard products.
   b. Analysis of fertilizers, by a qualified testing agency, made according to AAPFCO methods for testing and labeling and according to AAPFCO's SUIP #25.
   c. Analysis of nonstandard materials, by a qualified testing agency, made according to SSSA methods, where applicable.

C. Qualification Data: For each testing agency.

D. Preconstruction Test Reports: For preconstruction soil analyses specified in "Preconstruction Testing" Article.

1.5 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent or state-operated or university-operated laboratory; experienced in soil science, soil testing, and plant nutrition; with the experience and capability to conduct the testing indicated; and that specializes in types of tests to be performed.

1. Laboratories: Subject to compliance with requirements, provide testing by the following:
   a. Environmental/Hazardous Metals Testing:
      1) University Laboratories, 22530 Heslip Drive, Novi, MI 4837, 248-615-8000 (support@universitylaboratories.com)
      2) Or Approved Equal.
   b. Soil Physical Testing:
1) Turf and Soil Diagnostics, 35 King Street, Trumansburg, NY 14886, 855-769-4231 (lab@turfdiag.com)
2) Or Approved Equal

c. Soil Fertility Testing
1) CLC Labs, 325 Venture Drive, Lewis Center, OH 43035, 614-888-1663 (clclabs@aol.com)

1.6 PRECONSTRUCTION TESTING

A. Preconstruction Testing Service: Engage a qualified testing agency to perform preconstruction soil analyses on existing, on-site soil.

1. Notify Architect seven days in advance of the dates and times when laboratory samples will be taken.

B. Preconstruction Soil Analyses: For each unamended soil type, perform testing on soil samples and furnish soil analysis and a written report containing soil-amendment and fertilizer recommendations by a qualified testing agency performing the testing according to "Soil-Sampling Requirements" and "Testing Requirements" articles.

1. Have testing agency identify and label samples and test reports according to sample collection and labeling requirements.

1.7 SOIL-SAMPLING REQUIREMENTS

A. General: Extract soil samples according to requirements in this article.

B. Sample Collection and Labeling: Have samples taken and labeled by Contractor in presence of Architect under the direction of the testing agency.

1. Number and Location of Samples: Minimum of eight representative soil samples from varied locations for each soil to be used or amended for landscaping purposes.
2. Procedures and Depth of Samples: According to USDA-NRCS's "Field Book for Describing and Sampling Soils."
3. Division of Samples: Split each sample into two, equal parts. Send half to the testing agency and half to Owner for its records.
4. Labeling: Label each sample with the date, location keyed to a site plan or other location system, visible soil condition, and sampling depth.

1.8 TESTING REQUIREMENTS

A. General: Perform tests on soil samples according to requirements in this article.

B. Physical Testing:

1. Soil Texture: Soil-particle, size-distribution analysis by the following methods according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods."

2. Total Porosity: Calculate using particle density and bulk density according to SSSA's "Methods of Soil Analysis - Part 1-Physical and Mineralogical Methods."

C. Chemical Testing:

1. Metals Hazardous to the Environment: Test for presence and quantities of RCRA metals including, arsenic, barium, cadmium, chromium, lead, and mercury. If RCRA metals are present, include recommendations for corrective action.

2. Metals Hazardous to Human Health: Test for the presence and quantities of the USEPA 503 metals, including arsenic, cadmium, copper, lead, mercury, nickel, selenium, and zinc. Reports levels found in comparison to allowable levels according to Table 3 of 503.13.

D. Fertility Testing: Soil-fertility analysis according to standard laboratory protocol of SSSA NAPT NCR-13, including the following:

1. Percentage of organic matter (LOI at 360°C or 440°C).

2. CEC, calcium percent of CEC, and magnesium percent of CEC.

3. Soil reaction (acidity/alkalinity pH value).

4. Buffered acidity or alkalinity.

6. Phosphorous ppm.

7. Potassium ppm.

8. Calcium ppm.

10. Iron ppm.

11. Manganese ppm.

12. Zinc ppm.

13. Copper ppm.

15. Boron ppm.

E. Recommendations: Based on the test results, state recommendations for soil treatments and soil amendments to be incorporated to produce satisfactory planting soil suitable for healthy, viable tree, shrub, and perennial planting indicated. Include, at a minimum, recommendations for nitrogen, phosphorous, and potassium fertilization, and for micronutrients.

1. Fertilizers and Soil Amendment Rates: State recommendations in weight per 1000 sq. ft. (100 sq. m) for 6-inch (150-mm) depth of soil.

2. Soil Reaction: State the recommended liming rates for raising pH or sulfur for lowering pH according to the buffered acidity or buffered alkalinity in weight per 1000 sq. ft. (100 sq. m) for 6-inch (150-mm) depth of soil.
1.9 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and compliance with state and Federal laws if applicable.

B. Bulk Materials:
   1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.
   2. Provide erosion-control measures to prevent erosion or displacement of bulk materials, discharge of soil-bearing water runoff, and airborne dust reaching adjacent properties, water conveyance systems, or walkways.
   3. Do not move or handle materials when they are wet or frozen.
   4. Accompany each delivery of bulk fertilizers and soil amendments with appropriate certificates.

PART 2 - PRODUCTS

2.1 PLANTING SOILS SPECIFIED BY COMPOSITION

A. General: Soil amendments, fertilizers, and rates of application specified in this article are guidelines that may need revision based on testing laboratory's recommendations after preconstruction soil analyses are performed.

B. Existing Soil: On-site surface soil, with the duff layer, if any, retained; and stockpiled on-site; modified to produce viable planting soil. Blend existing, on-site surface soil with soil amendments, fertilizers, and lime in quantities as recommended based on Testing reports.

2.2 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C 602, agricultural liming material containing a minimum of 80 percent calcium carbonate equivalent and as follows:
   1. Class: O, with a minimum of 95 percent passing through a No. 8 (2.36-mm) sieve and a minimum of 55 percent passing through a No. 60 (0.25-mm) sieve.
   2. Form: Provide lime in form of ground calcitic limestone.

B. Sulfur: Granular, biodegradable, and containing a minimum of 90 percent elemental sulfur, with a minimum of 99 percent passing through a No. 6 (3.35-mm) sieve and a maximum of 10 percent passing through a No. 40 (0.425-mm) sieve.

C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.

D. Perlite: Horticultural perlite, soil amendment grade.

E. Agricultural Gypsum: Minimum 90 percent calcium sulfate, finely ground with 90 percent passing through a No. 50 (0.30-mm) sieve.
F. Sand: Clean, washed, natural or manufactured, free of toxic materials, and according to ASTM C 33/C 33M.

2.3 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter produced by composting feedstock, and bearing USCC's "Seal of Testing Assurance," and as follows:
   1. Reaction: pH of 5.5 to 8.
   2. Soluble-Salt Concentration: Less than 4 dS/m.
   3. Moisture Content: 35 to 55 percent by weight.
   5. Particle Size: Minimum of 98 percent passing through a 1-inch (25-mm) sieve.

2.4 FERTILIZERS

A. Superphosphate: Commercial, phosphate mixture, soluble; a minimum of 33 percent available phosphoric acid.

B. Commercial Fertilizer: Commercial-grade complete fertilizer of neutral character, consisting of fast- and slow-release nitrogen, 50 percent derived from natural organic sources of urea formaldehyde, phosphorous, and potassium in the following composition:
   1. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified testing agency.

C. Slow-Release Fertilizer: Granular or pelleted fertilizer consisting of 50 percent water-insoluble nitrogen, phosphorus, and potassium in the following composition:
   1. Composition: Nitrogen, phosphorous, and potassium in amounts recommended in soil reports from a qualified testing agency.

D. Chelated Iron: Commercial-grade FeEDDHA for dicots and woody plants, and commercial-grade FeDTPA for ornamental grasses and monocots.

PART 3 - EXECUTION

3.1 GENERAL

A. Place planting soil and fertilizers according to requirements in other Specification Sections.

B. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in planting soil.

C. Proceed with placement only after unsatisfactory conditions have been corrected.
3.2 PREPARATION OF UNAMENDED, ON-SITE SOIL BEFORE AMENDING

A. Excavation: Excavate soil from designated area(s) to a depth of 6 inches (150 mm) and stockpile until amended.

B. Unacceptable Materials: Clean soil of concrete slurry, concrete layers or chunks, cement, plaster, building debris, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, acid, and other extraneous materials that are harmful to plant growth.

C. Unsuitable Materials: Clean soil to contain a maximum of 8 percent by dry weight of stones, roots, plants, sod, clay lumps, and pockets of coarse sand.

3.3 PLACING AND MIXING PLANTING SOIL OVER EXPOSED SUBGRADE

A. General: Apply and mix unamended soil with amendments on-site to produce required planting soil. Do not apply materials or till if existing soil or subgrade is frozen, muddy, or excessively wet.

B. Subgrade Preparation: Till subgrade to a minimum depth of 6 inches (150 mm). Remove stones larger than 2 inches (50 mm) in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.

1. Apply, add soil amendments, and mix approximately half the thickness of unamended soil over prepared, loosened subgrade according to "Mixing" Paragraph below. Mix thoroughly into top 4 inches (100 mm) of subgrade. Spread remainder of planting soil.

C. Mixing: Spread unamended soil to total depth of 6 inches (150 mm), but not less than required to meet finish grades after mixing with amendments and natural settlement. Do not spread if soil or subgrade is frozen, muddy, or excessively wet.

1. Amendments: Apply soil amendments and fertilizer, if required, evenly on surface, and thoroughly blend them with unamended soil to produce planting soil.
   a. Mix lime and sulfur with dry soil before mixing fertilizer.
   b. Mix fertilizer with planting soil no more than seven days before planting.

2. Lifts: Apply and mix unamended soil and amendments in lifts not exceeding 8 inches (200 mm) in loose depth for material compacted by compaction equipment, and not more than 6 inches (150 mm) in loose depth for material compacted by hand-operated tampers.

D. Compaction: Compact each blended lift of planting soil to 75 to 82 percent of maximum Standard Proctor density according to ASTM D 698 and tested in-place.

E. Finish Grading: Grade planting soil to a smooth, uniform surface plane with loose, uniformly fine texture. Roll and rake, remove ridges, and fill depressions to meet finish grades.

3.4 PROTECTION

A. Protection Zone: Identify protection zones according to Section 015639 "Temporary Tree and Plant Protection."
B. Protect areas of in-place soil from additional compaction, disturbance, and contamination. Prohibit the following practices within these areas except as required to perform planting operations:

1. Storage of construction materials, debris, or excavated material.
2. Parking vehicles or equipment.
3. Vehicle traffic.
4. Foot traffic.
5. Erection of sheds or structures.
6. Impoundment of water.
7. Excavation or other digging unless otherwise indicated.

C. If planting soil or subgrade is overcompacted, disturbed, or contaminated by foreign or deleterious materials or liquids, remove the planting soil and contamination; restore the subgrade as directed by Architect and replace contaminated planting soil with new planting soil.

3.5 CLEANING

A. Protect areas adjacent to planting-soil preparation and placement areas from contamination. Keep adjacent paving and construction clean and work area in an orderly condition.

B. Remove surplus soil and waste material including excess subsoil, unsuitable materials, trash, and debris and legally dispose of them off Owner's property unless otherwise indicated.

END OF SECTION 32 91 13
TURF AND GRASSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Seeding.
   2. Turf Renovation.

B. Related Sections:
   1. Division 31 Section "Site Clearing" for topsoil stripping and stockpiling.
   2. Division 31 Section "Earth Moving" for excavation, filling and backfilling, and rough grading.
   3. Division 32 Section "Fine Grading" for final grades for planting.

1.3 DEFINITIONS

A. Finish Grade: Elevation of finished surface of planting soil.

B. Manufactured Soil: Soil produced off-site by homogeneously blending mineral soils or sand with stabilized organic soil amendments to produce topsoil or planting soil.

C. Planting Soil: Native or imported topsoil, manufactured topsoil, or surface soil modified to become topsoil; mixed with soil amendments.

D. Subgrade: Surface or elevation of subsoil remaining after completing excavation, or top surface of a fill or backfill immediately beneath planting soil.

1.4 SUBMITTALS

A. Product Data: For each type of product indicated.

B. Certification of Grass Seed: From seed vendor for each grass-seed monostand or mixture stating the botanical and common name and percentage by weight of each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.

C. Certification of Bio-Retention Area Seed: From seed vendor for each bio-retention-seed monostand or mixture stating the botanical and common name and percentage by weight of...
each species and variety, and percentage of purity, germination, and weed seed. Include the year of production and date of packaging.

D. Product Certificates: For fertilizers, signed by product manufacturer.

E. Qualification Data: For landscape Installer.

F. Material Test Reports: For imported topsoil.

G. Planting Schedule: Indicating anticipated planting dates for each type of planting.

H. Maintenance Instructions: Recommended procedures to be established by Contractor for the Owner for maintenance of lawns during a calendar year. Submit before expiration of required maintenance periods.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful lawn establishment.

1. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when planting is in progress.

B. Soil-Testing Laboratory Qualifications: An independent laboratory, recognized by the State Department of Agriculture, with the experience and capability to conduct the testing indicated and that specializes in types of tests to be performed.

C. Topsoil Analysis: Furnish soil analysis by a qualified soil-testing laboratory stating percentages of organic matter; gradation of sand, silt, and clay content; location exchange capacity; sodium absorption ratio; deleterious material; pH; and mineral and plant-nutrient content of topsoil.

1. Report suitability of topsoil for lawn growth. State recommended quantities of nitrogen, phosphorus, and potash nutrients and soil amendments to be added to produce a satisfactory topsoil.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Seed: Deliver seed in original sealed, labeled, and undamaged containers.

B. Sod: Harvest, deliver, store, and handle sod according to requirements in TPI's “Specifications for Turfgrass Sod Materials” and “Specifications for Turfgrass Sod Transplanting and Installation” in its “Guideline Specifications to Turfgrass Sodding.”

1.7 SCHEDULING

A. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion.

1. Spring Planting: April 1st and June 1st.
2. Fall Planting: September 15th and October 15th.
B. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit.

1.8 LAWN MAINTENANCE

A. Begin maintenance immediately after each area is planted and continue until acceptable lawn is established, but for not less than the following periods:

1. Seeded Lawns: 60 days from date of Substantial Completion.

   a. When full maintenance period has not elapsed before end of planting season, or if lawn is not fully established, continue maintenance during next planting season.

   b. A minimum of two (2) lawn cuttings (MANICURED LAWN ZONES ONLY) will be completed before the owner takes over maintenance.

B. Maintain and establish lawn by watering, fertilizing, weeding, mowing, trimming, replanting, and other operations. Roll, regrade, and replant bare or eroded areas and remulch to produce a uniformly smooth lawn.

   1. In areas where mulch has been disturbed by wind or maintenance operations, add new mulch. Anchor as required to prevent displacement.

C. Watering: Provide and maintain temporary piping, hoses, and lawn-watering equipment to convey water from sources and to keep lawn uniformly moist to a depth of 4 inches.

   1. Schedule watering to prevent wilting, puddling, erosion, and displacement of seed or mulch. Lay out temporary watering system to avoid walking over muddy or newly planted areas.

   2. Water lawn at a minimum rate of 1 inch per week.

D. Mow lawn as soon as top growth is tall enough to cut. Repeat mowing to maintain specified height without cutting more than 40 percent of grass height. Remove no more than 40 percent of grass-leaf growth in initial or subsequent mowings. Do not delay mowing until grass blades bend over and become matted. Do not mow when grass is wet. Schedule initial and subsequent mowings to maintain the following grass height:

   1. Mow grass to 2 inches height.

E. Lawn Postfertilization: Apply fertilizer after initial mowing and when grass is dry.

   1. Apply Type B fertilizer to lawns approximately 30 days after seeding at a rate equal to 1.0 lb. of actual nitrogen per 1,000 sq. ft. (140 lbs./acre). Apply with a mechanical rotary or drop type distributor. Thoroughly water into soil. (Provide 3 applications)

F. Weed Control: If an infestation of weeds or crab grass develops prior to acceptance of the lawn, the Contractor shall treat the infestation by hand weeding or chemical control. The chemical control shall be furnished and installed by the contractor as recommended by the manufacturer and approved by the Landscape Architect. At least two weeks shall elapse af-
G. Apply fungicides and insecticides as required to control diseases and insects.

H. Coordinate with Section 02940 Landscape Maintenance and Warranty Standards.

PART 2 - PRODUCTS

2.1 SEED

A. Grass Seed: Fresh, clean, dry, new-crop seed complying with AOSA’s “Journal of Seed Technology; Rules for Testing Seeds” for purity and germination tolerances.

B. Seed shall be provided from one of the following suppliers
   1. Lesco (248) 689-5005
   2. Rhino Seed & Supply (800) 482-3130
   3. Michigan State Seed Solutions (800) 647-8873

C. Seed Species: Seed of grass species as follows, with not less than 95 percent germination, not less than 85 percent pure seed, and not more than 0.5 percent weed seed:
   1. General Seeded Lawn Areas (for lawn restoration areas only):
      a. 50 percent Kentucky Bluegrass, a minimum of (3) three cultivars
      b. 50 percent Perennial Ryegrass, a minimum of (2 or 3) two or three cultivars.

2.2 TURFGRASS SOD

A. Turfgrass Sod: Certified Number 1 Quality/Premium, including limitations on thatch, weeds, diseases, nematodes, and insects, complying with TPI’s “Specifications for Turfgrass Sod Materials” in its “Guideline Specifications to Turfgrass Sodding.” Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.

B. Turfgrass Species: Sod of grass species as follows, with not less than 95 percent germination, not less than 85 percent pure seed, and not more than 0.5 percent weed seed:
   1. Full Sun: Kentucky bluegrass (Poa pratensis), a minimum of three cultivars

2.3 TOPSOIL

A. Topsoil: ASTM D 5268, pH range of 5.5 to 7, a minimum of 4 percent organic material content; free of stones 1 inch or larger in any dimension and other extraneous materials harmful to plant growth.

   1. Topsoil Source: Import topsoil or manufactured topsoil from off-site sources. Obtain topsoil displaced from naturally well-drained construction or mining sites where topsoil occurs at least 4 inches deep; do not obtain from agricultural land, bogs or marshes.
2.4 INORGANIC SOIL AMENDMENTS

A. Lime: ASTM C 602, agricultural limestone containing a minimum 80 percent calcium carbonate equivalent and as follows:
   1. Class: Class T, with a minimum 99 percent passing through No. 8 sieve and a minimum 75 percent passing through No. 60 sieve.

B. Sulfur: Granular, biodegradable, containing a minimum of 90 percent sulfur, with a minimum 99 percent passing through No. 6 sieve and a maximum 10 percent passing through No. 40 sieve.

C. Iron Sulfate: Granulated ferrous sulfate containing a minimum of 20 percent iron and 10 percent sulfur.

D. Aluminum Sulfate: Commercial grade, unadulterated.

E. Perlite: Horticultural perlite, soil amendment grade.

F. Agricultural Gypsum: Finely ground, containing a minimum of 90 percent calcium sulfate.

G. Sand: Clean, washed, natural or manufactured, free of toxic materials.

2.5 ORGANIC SOIL AMENDMENTS

A. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1/2-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:
   1. Organic Matter Content: 60 percent of dry weight.
   2. Feedstock: Agricultural, food, or industrial residuals; biosolids; yard trimmings; or source-separated or compostable mixed solid waste.

B. Peat: Finely divided or granular texture, with a pH range of 6 to 7.5, containing partially decomposed moss peat, native peat, or reed-sedge peat and having a water-absorbing capacity of 1100 to 2000 percent.

C. Manure: Well-rotted, unleached, stable or cattle manure containing not more than 25 percent by volume of straw, sawdust, or other bedding materials; free of toxic substances, stones, sticks, soil, weed seed, and material harmful to plant growth.

2.6 PLANTING ACCESSORIES

A. Selective Herbicides: EPA registered and approved, of type recommended by manufacturer for application.

2.7 FERTILIZER

A. Granular, non-burning product composed of not less than 50% organic slow acting, guaranteed analysis professional fertilizer.
1. Type A: Starter fertilizer containing 11% nitrogen, 23% phosphoric acid, and 10% potash by weight or similar approved composition.

2. Type B: Top dressing fertilizer containing 31% nitrogen, 3% phosphoric acid, and 10% potash by weight or similar approved composition.

   a. Apply Type A fertilizer at initial sowing of seed and a Type B fertilizer application 4 weeks after initial germination.

   b. (Provide a min. one (1) Type A fertilizer application and three (3) Type B fertilizer applications)

2.8 MULCHES

A. Straw Mulch: Provide air-dry, clean, mildew- and seed-free, salt hay or threshed straw of wheat, rye, oats, or barley.

B. Fiber Mulch: Biodegradable, dyed-wood, cellulose-fiber mulch; nontoxic; free of plant-growth or germination inhibitors; with maximum moisture content of 15 percent and a pH range of 4.5 to 6.5.

C. Nonasphaltic Tackifier: Colloidal tackifier recommended by fiber-mulch manufacturer for slurry application; nontoxic and free of plant-growth or germination inhibitors.

D. Asphalt Emulsion: ASTM D 977, Grade SS-1; nontoxic and free of plant-growth or germination inhibitors.

2.9 EROSION-CONTROL MATERIALS

A. Erosion-Control Blankets: Biodegradable wood excelsior, straw, or coconut-fiber mat enclosed in a photodegradable plastic mesh. Include manufacturer's recommended steel wire staples, 6 inches long.

B. Erosion-Control Fiber Mesh: Biodegradable twisted jute or spun-coir mesh, a minimum of 0.92 lb/sq. yd., with 50 to 65 percent open area. Include manufacturer's recommended steel wire staples, 6 inches long.

2.10 PLANTING SOIL MIX

A. Planting Soil Mix: Mix topsoil with the following soil amendments in the following quantities:

   PLANTING BEDS:
   1. Three parts well-drained screened organic imported topsoil to one part clean imported sand to one part Canadian sphagnum peat moss, to one part natural compost (weed-free).
   
   LAWNs:
   2. Manicured Lawns shall use screened stock-piled topsoil from specified on-site location.
2.11 SEEDING
A. General: Provide grasses for seeding.

2.12 MATERIALS
A. Topsoil for Seeding Lawn Areas.
B. Seed: Fresh, clean and new crop seed mixture. Mixed by approved methods.
C. Composed of the following varieties, mixed to the specified proportions by weight and tested to minimum percentages of purity and germination.
D. Seed Mixture: Proportioned by weight as indicated below:

1. Type 1: All Sports Mix

<table>
<thead>
<tr>
<th>Seed Variety</th>

</tbody>
</table>

a. Sow seed at 5 lbs/1000 sf
b. No noxious weed seeds permitted.

E. Fertilizer: 13-25-12. Granular, non-burning product composed of not less than 50% organic slow acting, guaranteed analysis, professional fertilizer.

F. Ground Limestone: Used if required by soil test report. Containing not less than 85% of total carbonates and ground to such fineness that 50% will pass through a 100 mesh sieve and 90% will pass through a 20% mesh sieve.

G. Granulated sulfur 0-0-0-90 to lower pH. Use if determined by soil tests to be necessary. Apply per soil test recommendations at specified rate.

H. Straw Mulch: Used in crimping process only. Clean oat or wheat straw well seasoned before bailing, free from mature seed-bearing stalks or roots of prohibited or noxious weeds.

I. Water: Free of substance harmful to seed growth. Hoses or other methods of transportation furnished by Contractor. Test for excess Alkalinity, if necessary.

J. Wood Cellulose Fiber Mulch: Degradable green dyed wood cellulose fiber or 100% recycled long fiber pulp, free from weeds or other foreign matter toxic to seed germination and suitable to hydra-mulching.

1. AVAILABLE MANUFACTURER AND TYPE:
2. CONWED HYDROMULCH: CONWED CORP., ST. PAUL, MN
3. CELLIN HYDROMULCH: CELLIN MFG. INC., LORTON, VA

K. Paper Mulch: Degradable paper mulch, free of foreign debris. Do not use on slopes over 30%. Available manufacturer and type NU Wool Hydro Mulch, Jennison, MI.

L. Tackifier: Liquid concentrate diluted with water forming a transparent 3-dimensional film like crust permeable to water and air and containing no agents toxic to seed germination.

1. AVAILABLE MANUFACTURER AND TYPE:
2. FINN HYDROSTIK, FAIRFIELD, OH

3. POLYING DLR: CELITE INC., CLEVELAND, OH

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive lawns and grass for compliance with requirements and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities, trees, shrubs, and plantings from damage caused by planting operations.

1. Protect adjacent and adjoining areas from hydro-seeding overspray.

B. Provide erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

3.3 LAWN PREPARATION

A. Limit lawn subgrade preparation to areas to be planted.

B. Newly Graded Subgrades: Loosen subgrade to a minimum depth of 4 inches. Remove stones larger than 1 inch in any dimension and sticks, roots, rubbish, and other extraneous matter and legally dispose of them off Owner's property.

1. Thoroughly blend planting soil mix off-site before spreading or spread topsoil, apply soil amendments and fertilizer on surface, and thoroughly blend planting soil mix.

   a. Delay mixing fertilizer with planting soil if planting will not proceed within a few days.
   b. Mix lime with dry soil before mixing fertilizer.

2. Spread lawn planting soil mix to a depth of 3 inches but not less than required to meet finish grades after light rolling and natural settlement. Do not spread if planting soil or subgrade is frozen, muddy, or excessively wet.

C. Unchanged Subgrades: If lawns are to be planted in areas unaltered or undisturbed by excavating, grading, or surface soil stripping operations, prepare surface soil as follows:

1. Remove existing grass, vegetation, and turf. Do not mix into surface soil.
2. Loosen surface soil to a depth of at least of 6 inches.
3. Remove stones larger than 1 inch in any dimension and sticks, roots, trash, and other extraneous matter.
4. Legally dispose of waste material, including grass, vegetation, and turf, off Owner's property.
D. Finish Grading: Grade planting areas to a smooth, uniform surface plane with loose, uniformly fine texture. Grade to within plus or minus 1/4 inch of finish elevation. Roll and rake, remove ridges, and fill depressions to meet finish grades. Limit fine grading to areas that can be planted in the immediate future.

E. Moisten prepared lawn areas before planting if soil is dry. Water thoroughly and allow surface to dry before planting. Do not create muddy soil.

F. Restore areas if eroded or otherwise disturbed after finish grading and before planting.

3.4 SODDING

A. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.

B. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.

   1. Lay sod across angle of slopes exceeding 1:3.
   2. Anchor sod on slopes exceeding 1:6 with wood pegs or steel staples spaced as recommended by sod manufacturer but not less than 2 anchors per sod strip to prevent slippage.

C. Saturate sod with fine water spray within two hours of planting. During first week, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.5 SEEDING

A. Sow seed with spreader or seeding machine. Do not broadcast or drop seed when wind velocity exceeds 5 mph. Evenly distribute seed by sowing equal quantities in two directions at right angles to each other.

   1. Do not use wet seed or seed that is moldy or otherwise damaged.

B. Sow seed at the rate of 4-5 lb/1000 sq. ft. as indicated per specified seed mix.

C. Rake seed lightly into top 1/8 inch of topsoil, roll lightly, and water with fine spray.

D. Protect seeded areas with slopes exceeding 1:6 with erosion-control fiber mesh and 1:4 with erosion-control blankets installed and stapled according to manufacturer's written instructions.

E. Protect seeded areas with slopes not exceeding 1:6 by spreading straw mulch. Spread uniformly at a minimum rate of 2 tons/acre to form a continuous blanket 1-1/2 inches in loose depth over seeded areas. Spread by hand, blower, or other suitable equipment.

   1. Anchor straw mulch by crimping into topsoil with suitable mechanical equipment.
3.6 TURF RENOVATION

A. Renovate existing lawn.

B. Renovate existing lawn damaged by Contractor's operations, such as storage of materials or equipment and movement of vehicles.
   1. Reestablish lawn where settlement or washouts occur or where minor regrading is required.

C. Remove sod and vegetation from diseased or unsatisfactory lawn areas; do not bury in soil.

D. Remove topsoil containing foreign materials resulting from Contractor's operations, including oil drippings, fuel spills, stone, gravel, and other construction materials, and replace with new topsoil.

E. Mow, dethatch, core aerate, and rake existing lawn.

F. Remove weeds before seeding. Where weeds are extensive, apply selective herbicides as required. Do not use pre-emergence herbicides.

G. Remove waste and foreign materials, including weeds, soil cores, grass, vegetation, and turf, and legally dispose of them off Owner's property.

H. Till stripped, bare, and compacted areas thoroughly to a soil depth of 6 inches.

I. Apply soil amendments and initial fertilizers required for establishing new lawns and mix thoroughly into top 4 inches of existing soil. Provide new planting soil to fill low spots and meet finish grades.

J. Apply seed and protect with straw mulch as required for new lawns.

K. Water newly planted areas and keep moist until new lawn is established.

3.7 MULCHING

A. Place straw mulch on seeded areas within twenty-four (24) hours after seeding.

B. Place straw mulch uniformly in a continuous blanket at a rate of 2-1/2 tons per acre or two (2) 50 lb. bales per 1,000 sq. ft. of area. A mechanical blower may be used for straw mulch application when acceptable to the Architect.

C. Crimp straw into soil by use of a “crimper.” Two (2) passes in opposite direction required.

3.8 SLIT SEEDING (OPTIONAL METHOD)

A. Lawn to be professionally slit seeded by using equipment designed for this purpose. Recommended brands: Brilliant, Jacobsen or Olathe.
3.9 HYDROSEEDING (OPTIONAL METHOD)

A. Use a hydromulcher (sprayer) and apply mixture(s) at the following rate. Mix in accordance with manufacturer’s recommendations.

B. Apply hydroseed slurry to indicated areas. Use tackifier only on erosion prone areas. Apply fertilizer with hydro mix.

<table>
<thead>

</tr>
</tbody>
</table>

C. Care must be taken not to get hydroseed materials on buildings, walks, roadways, plant beds, etc.

3.9 SATISFACTORY LAWNS

A. Satisfactory Seeded Lawn: At end of maintenance period, a healthy, uniform, close stand of grass has been established, free of weeds and surface irregularities, with coverage exceeding 90 percent over any 10 sq. ft. (0.92 sq. m) and bare spots not exceeding 4 by 4 inches.

3.10 CLEANUP AND PROTECTION

A. Promptly remove soil and debris created by lawn work from paved areas. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Erect barricades and warning signs as required to protect newly planted areas from traffic. Maintain barricades throughout maintenance period and remove after lawn is established.

C. Remove erosion-control measures after grass establishment period.

END OF SECTION 329200
TOPSOIL (LANDSCAPING)

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Extent of Topsoil Work is shown on drawings and by provisions of this section.

B. Topsoil for lawn work shall be as stripped from site or provided by contractor from off-site sources free of herbicides.

C. Related work specified elsewhere:
   1. Division 32 8400 Section “Planting Irrigation.”
   2. Division 32 9210 Section “Lawns and Grasses.”
   3. Division 32 9215 Section “Trees, Shrubs, Plants and Ground Covers.”

1.3 QUALITY ASSURANCE

A. Testing and Inspection: For supplied or stockpiled topsoil. Performed by a qualified independent testing laboratory, under the supervision of a registered professional engineer, specializing in soils engineering. Obtain samples from interior of stockpiled topsoil.

B. Soil originating from corn fields shall not be used unless the fields have not grown corn for a minimum of two (2) years. Soil testing must verify the levels of dangerous elements in the soil. Soil testing results shall be reviewed by the Landscape Architect prior to topsoil being delivered to the site.

C. Provide and pay for testing and inspection during topsoil operations. Laboratory, inspection services and Soils Engineer shall be acceptable to the Landscape Architect.

   1. Recommended testing laboratory:
      A & L Agricultural Laboratories, Inc.
      3505 Conestoga Drive
      Fort Wayne, IN  46808
      (219) 483-4759

D. Test representative material samples for proposed use.

E. Topsoil: (Supplied and Stockpiled – See Materials 2.1)

   1. pH factor
   2. Lime requirement
   3. Mechanical analysis (P.K. Ca. mg) and cation ratios
   4. Percentage of organic content and loss of ignition
   5. Soil series classification
   6. Clay content
7. Herbicide residue

F. Recommendations on type and quantity of additives required to establish satisfactory pH factor and supply of nutrients to bring nutrients to satisfactory level for planting.

G. Submit test reports.

1.4 PROJECT CONDITIONS

A. Known underground and surface utility lines are indicated on the drawings.

B. Protect existing trees, plants, lawns and other features designated to remain as part of the landscaping work.

C. Promptly repair damage to adjacent facilities caused by topsoil operations.

D. Promptly notify the Landscape Architect of unexpected sub-surface conditions.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Topsoil: Supplied or stockpiled topsoil proposed for use must meet testing criteria results specified and conform to adjustments as recommended by soil test and Landscape Architect.

B. Existing Topsoil: Existing topsoil from on-site stockpile shall be utilized. All processing, screening, cleaning and preparation of this stored topsoil to render it acceptable for use is the responsibility of the Contractor.

C. Provide additional topsoil as required to complete job. Topsoil must meet testing criteria results specified. All processing, cleaning and preparation of this stored topsoil to render it acceptable for use is the responsibility of this Contractor.

D. Supplied or stockpiled topsoil shall be fertile, friable and representative of local productive soil, capable of sustaining vigorous plant growth and screened free of clay lumps, subsoil, noxious weeds or other foreign matter such as stones greater than 1” in diameter in any dimension, roots, sticks and other extraneous materials not frozen or muddy. pH of existing or supplied soil to range between 5.0 and 7.5. Adjusted to not more than 7.0 by additives as required by soil test. Topsoil shall contain not less than 3% and not greater than 10% organic matter. Clay content as determined by Bouyoucous Hydrometer Test shall range between 5 and 15 percent. Mechanical analysis as follows:

<table>

</tbody>
</table>

32 9220 - 2 TOPSOIL (LANDSCAPING)
PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine rough grades and installation conditions. Do not start topsoil work until unsatisfactory conditions are corrected.

3.2 FINISH GRADING

A. Perform topsoiling within contract limits, including adjacent transition areas, to new elevations, levels, profiles, and contours indicated. Provide uniform levels and slopes between new elevations and existing grades.

B. Grade surfaces to assure areas drain away from building structures and to prevent ponding and pockets of surface drainage.

C. Lawn Areas: Supply and spread topsoil to a minimum uniform depth of 4” or as noted. Incorporate into existing subsoil by disc, rototill or other approved method to a minimum 6” depth. No layering of soils is to exist after tilling. Remove clumps larger than 1” in diameter.

D. Grade lawn areas to a smooth, free draining even surface with a loose, moderately coarse texture ready to accept seed or sod.

E. For trees, shrubs, ground cover beds and backfill for beds see Trees, Plants and Ground Cover Section.

F. Provide earth crowning where indicated on drawings.

G. Crowning/mounding to be free flowing in shape and design, as indicated, and to blend into existing grades gradually so that toe of slope is not readily visible. Landscape Architect to verify final contouring before planting.

H. Regardless of finish grading elevations indicated, it is intended that grading be such that proper drainage of surface water will occur and that no low areas are created to allow ponding. Contractor to consult with Owner or Landscape Architect regarding minor variations in grade elevations before rough grading is completed.

3.3 LAWN ESTABLISHMENT

A. Establish dense lawn of permanent grasses, free from lumps and depressions. Any area failing to show uniform germination to be reseeded; continue until dense lawn established. Damage to seeded area resulting from erosion to be repaired by Contractor. Scattered bare spots over 5 percent now allowed.

B. In event contractor does not establish dense lawn during germination period, return to project to refertilize and reseed to establish dense lawn.

C. Should the seeded lawn become largely weeds after germination, Contractor is responsible to kill the weeds and reseed the proposed lawn areas to produce a dense turf, as specified.

3.4 CLEANING

A. Upon completion of topsoiling operations, clean areas within contract limits, remove tools and equipment. Site shall be clear, clean, free of debris and suitable for site work operations.
 Gateway Theater Complex – Utilities
 HAA Project No. 2016034.00
 WSU Project No. 189-178578

 END OF SECTION  329220
SECTION 32 93 00

PLANTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Plants.
2. Tree stabilization.

1.3 DEFINITIONS

A. Backfill: The earth used to replace or the act of replacing earth in an excavation.

B. Balled and Burlapped Stock: Plants dug with firm, natural balls of earth in which they were grown, with a ball size not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required; wrapped with burlap, tied, rigidly supported, and drum laced with twine with the root flare visible at the surface of the ball as recommended by ANSI Z60.1.

C. Balled and Potted Stock: Plants dug with firm, natural balls of earth in which they are grown and placed, unbroken, in a container. Ball size is not less than diameter and depth recommended by ANSI Z60.1 for type and size of plant required.

D. Container-Grown Stock: Healthy, vigorous, well-rooted plants grown in a container, with a well-established root system reaching sides of container and maintaining a firm ball when removed from container. Container shall be rigid enough to hold ball shape and protect root mass during shipping and be sized according to ANSI Z60.1 for type and size of plant required.

E. Finish Grade: Elevation of finished surface of planting soil.

F. Pesticide: A substance or mixture intended for preventing, destroying, repelling, or mitigating a pest. Pesticides include insecticides, miticides, herbicides, fungicides, rodenticides, and molluscsicides. They also include substances or mixtures intended for use as a plant regulator, defoliant, or desiccant. Some sources classify herbicides separately from pesticides.

G. Pests: Living organisms that occur where they are not desired or that cause damage to plants, animals, or people. Pests include insects, mites, grubs, mollusks (snails and slugs), rodents (gophers, moles, and mice), unwanted plants (weeds), fungi, bacteria, and viruses.

H. Planting Area: Areas to be planted.
I. Planting Soil: Existing, on-site soil; imported soil; or manufactured soil that has been modified with soil amendments and perhaps fertilizers to produce a soil mixture best for plant growth. See Section 329113 "Soil Preparation" for drawing designations for planting soils.

J. Plant; Plants; Plant Material: These terms refer to vegetation in general, including trees, shrubs, vines, ground covers, ornamental grasses, bulbs, corms, tubers, or herbaceous vegetation.

K. Root Flare: Also called "trunk flare." The area at the base of the plant's stem or trunk where the stem or trunk broadens to form roots; the area of transition between the root system and the stem or trunk.

L. Stem Girdling Roots: Roots that encircle the stems (trunks) of trees below the soil surface.

M. Subgrade: The surface or elevation of subsoil remaining after excavation is complete, or the top surface of a fill or backfill before planting soil is placed.

1.4 COORDINATION

A. Coordination with Turf Areas (Lawns): Plant trees, shrubs, and other plants after finish grades are established and before planting turf areas unless otherwise indicated.

1. When planting trees, shrubs, and other plants after planting turf areas, protect turf areas, and promptly repair damage caused by planting operations.

1.5 PREINSTALLATION MEETINGS

A. Preinstallation Conference: For each phase of landscape installation, Conduct conference at Project site.

1.6 ACTION SUBMITTALS

A. Product Data: For each type of product.

2. Plant Photographs: Include color photographs in digital format of each required species and size of plant material as it will be furnished to Project. Take photographs from an angle depicting true size and condition of the typical plant to be furnished. Include a scale rod or other measuring device in each photograph. For species where more than 20 plants are required, include a minimum of three photographs showing the average plant, the best quality plant, and the worst quality plant to be furnished. Identify each photograph with the full scientific name of the plant, plant size, and name of the growing nursery.

B. Samples for Verification: For each of the following:

1. Trees and Shrubs: Three samples of each variety and size delivered to site for review. Maintain approved Samples on-site as a standard for comparison.
2. Organic Mulch: 1-pint volume of each organic mulch required; in sealed plastic bags labeled with composition of materials by percentage of weight and source of mulch. Each Sample shall be typical of the lot of material to be furnished; provide an accurate representation of color, texture, and organic makeup.
3. Mineral Mulch: 1-pint of each mineral mulch required, in sealed plastic bags labeled with source of mulch. Sample shall be typical of the lot of material to be delivered and installed on-site; provide an accurate indication of color, texture, and makeup of the material.
4. Root Barrier: Width of panel by 12 inches (300 mm).

1.7 INFORMATIONAL SUBMITTALS

A. Qualification Data: For landscape Installer. Include list of similar projects completed by Installer demonstrating Installer's capabilities and experience. Include project names, addresses, and year completed, and include names and addresses of owners' contact persons.

B. Product Certificates: For each type of manufactured product, from manufacturer, and complying with the following:
   1. Manufacturer's certified analysis of standard products.
   2. Analysis of other materials by a recognized laboratory made according to methods established by the Association of Official Analytical Chemists, where applicable.

C. Pesticides and Herbicides: Product label and manufacturer's application instructions specific to Project.

D. Sample Warranty: For special warranty.

1.8 CLOSEOUT SUBMITTALS

A. Maintenance Data: Recommended procedures to be established by Owner for maintenance of plants during a calendar year. Submit before expiration of required maintenance periods.

1.9 QUALITY ASSURANCE

A. Installer Qualifications: A qualified landscape installer whose work has resulted in successful establishment of plants.
   1. Professional Membership: Installer shall be a member in good standing of either the Professional Landcare Network or the American Nursery and Landscape Association.
   2. Experience: Five years’ experience in landscape installation in addition to requirements in Section 014000 "Quality Requirements."
   3. Installer's Field Supervision: Require Installer to maintain an experienced full-time supervisor on Project site when work is in progress.
   4. Personnel Certifications: Installer's field supervisor shall have certification in one of the following categories from the Professional Landcare Network:
      a. Landscape Industry Certified Technician - Exterior.
      b. Landscape Industry Certified Interior.
      c. Landscape Industry Certified Horticultural Technician.
   5. Pesticide Applicator: State licensed, commercial.

B. Provide quality, size, genus, species, and variety of plants indicated, complying with applicable requirements in ANSI Z60.1.
1. Selection of plants purchased under allowances is made by Architect, who tags plants at their place of growth before they are prepared for transplanting.

C. Measurements: Measure according to ANSI Z60.1. Do not prune to obtain required sizes.

1. Trees and Shrubs: Measure with branches and trunks or canes in their normal position. Take height measurements from or near the top of the root flare for field-grown stock and container-grown stock. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip to tip. Take caliper measurements 6 inches (150 mm) above the root flare for trees up to 4-inch (100-mm) caliper size, and 12 inches (300 mm) above the root flare for larger sizes.

2. Other Plants: Measure with stems, petioles, and foliage in their normal position.

D. Plant Material Observation: Architect may observe plant material either at place of growth or at site before planting for compliance with requirements for genus, species, variety, cultivar, size, and quality. Architect may also observe trees and shrubs further for size and condition of balls and root systems, pests, disease symptoms, injuries, and latent defects and may reject unsatisfactory or defective material at any time during progress of work. Remove rejected trees or shrubs immediately from Project site.

1. Notify Architect of sources of planting materials two weeks in advance of delivery to site.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Packaged Materials: Deliver packaged materials in original, unopened containers showing weight, certified analysis, name and address of manufacturer, and indication of compliance with state and Federal laws if applicable.

B. Bulk Materials:

1. Do not dump or store bulk materials near structures, utilities, walkways and pavements, or on existing turf areas or plants.

2. Provide erosion-control measures to prevent erosion or displacement of bulk materials; discharge of soil-bearing water runoff; and airborne dust reaching adjacent properties, water conveyance systems, or walkways.

3. Accompany each delivery of bulk materials with appropriate certificates.

C. Do not prune trees and shrubs before delivery. Protect bark, branches, and root systems from sun scald, drying, wind burn, sweating, whipping, and other handling and tying damage. Do not bend or bind-tie trees or shrubs in such a manner as to destroy their natural shape. Provide protective covering of plants during shipping and delivery. Do not drop plants during delivery and handling.

D. Handle planting stock by root ball.

E. Apply antidesiccant to trees and shrubs using power spray to provide an adequate film over trunks (before wrapping), branches, stems, twigs, and foliage to protect during digging, handling, and transportation.

1. If deciduous trees or shrubs are moved in full leaf, spray with antidesiccant at nursery before moving and again two weeks after planting.
F. Wrap trees and shrubs with burlap fabric over trunks, branches, stems, twigs, and foliage to protect from wind and other damage during digging, handling, and transportation.

G. Deliver plants after preparations for planting have been completed, and install immediately. If planting is delayed more than six hours after delivery, set plants and trees in their appropriate aspect (sun, filtered sun, or shade), protect from weather and mechanical damage, and keep roots moist.

1. Heel-in bare-root stock. Soak roots that are in less than moist condition in water for two hours. Reject plants with dry roots.
2. Set balled stock on ground and cover ball with soil, peat moss, sawdust, or other acceptable material.
3. Do not remove container-grown stock from containers before time of planting.
4. Water root systems of plants stored on-site deeply and thoroughly with a fine-mist spray. Water as often as necessary to maintain root systems in a moist, but not overly wet condition.

1.11 FIELD CONDITIONS

A. Field Measurements: Verify actual grade elevations, service and utility locations, irrigation system components, and dimensions of plantings and construction contiguous with new plantings by field measurements before proceeding with planting work.

B. Planting Restrictions: Plant during one of the following periods. Coordinate planting periods with maintenance periods to provide required maintenance from date of Substantial Completion.

2. Fall Planting: October 15.

C. Weather Limitations: Proceed with planting only when existing and forecasted weather conditions permit planting to be performed when beneficial and optimum results may be obtained. Apply products during favorable weather conditions according to manufacturer's written instructions and warranty requirements.

1.12 WARRANTY

A. Special Warranty: Installer agrees to repair or replace plantings and accessories that fail in materials, workmanship, or growth within specified warranty period.

1. Failures include, but are not limited to, the following:
   a. Death and unsatisfactory growth, except for defects resulting from abuse, lack of adequate maintenance, or neglect by Owner.
   b. Structural failures including plantings falling or blowing over.

2. Warranty Periods: From date of planting completion.
   a. Trees, Shrubs, Vines, and Ornamental Grasses: 12 months.
   b. Ground Covers, Biennials, Perennials, and Other Plants: 12 months.

3. Include the following remedial actions as a minimum:
a. Immediately remove dead plants and replace unless required to plant in the succeeding planting season.
b. Replace plants that are more than 25 percent dead or in an unhealthy condition at end of warranty period.
c. A limit of one replacement of each plant is required except for losses or replacements due to failure to comply with requirements.
d. Provide extended warranty for period equal to original warranty period, for replaced plant material.

PART 2 - PRODUCTS

2.1 PLANT MATERIAL

A. General: Furnish nursery-grown plants true to genus, species, variety, cultivar, stem form, shearing, and other features indicated in Plant List, Plant Schedule, or Plant Legend indicated on Drawings and complying with ANSI Z60.1; and with healthy root systems developed by transplanting or root pruning. Provide well-shaped, fully branched, healthy, vigorous stock, densely foliated when in leaf and free of disease, pests, eggs, larvae, and defects such as knots, sun scald, injuries, abrasions, and disfigurement.

1. Trees with damaged, crooked, or multiple leaders; tight vertical branches where bark is squeezed between two branches or between branch and trunk ("included bark"); crossing trunks; cut-off limbs more than 3/4 inch in diameter; or with stem girdling roots are unacceptable.

2. Collected Stock: Do not use plants harvested from the wild, from native stands, from an established landscape planting, or not grown in a nursery unless otherwise indicated.

B. Provide plants of sizes, grades, and ball or container sizes complying with ANSI Z60.1 for types and form of plants required. Plants of a larger size may be used if acceptable to Architect, with a proportionate increase in size of roots or balls.

C. Root-Ball Depth: Furnish trees and shrubs with root balls measured from top of root ball, which begins at root flare according to ANSI Z60.1. Root flare shall be visible before planting.

D. Labeling: Label at least one plant of each variety, size, and caliper with a securely attached, waterproof tag bearing legible designation of common name and full scientific name, including genus and species. Include nomenclature for hybrid, variety, or cultivar, if applicable for the plant.

E. If formal arrangements or consecutive order of plants is indicated on Drawings, select stock for uniform height and spread, and number the labels to assure symmetry in planting.

2.2 MULCHES

A. Organic Mulch: Free from deleterious materials and suitable as a top dressing of trees and shrubs, consisting of one of the following:

1. Type: Shredded hardwood.
2. Size Range: 3 inches (76 mm) maximum, 1/2 inch (13 mm) minimum.
2.3 PESTICIDES

A. General: Pesticide registered and approved by the EPA, acceptable to authorities having jurisdiction, and of type recommended by manufacturer for each specific problem and as required for Project conditions and application. Do not use restricted pesticides unless authorized in writing by authorities having jurisdiction.

B. Pre-Emergent Herbicide (Selective and Nonselective): Effective for controlling the germination or growth of weeds within planted areas at the soil level directly below the mulch layer.

C. Post-Emergent Herbicide (Selective and Nonselective): Effective for controlling weed growth that has already germinated.

2.4 TREE-STABILIZATION MATERIALS

A. Trunk-Stabilization Materials:

1. Upright and Stakes: Rough-sawn, sound, new hardwood, free of knots, holes, cross grain, and other defects. Dimensions as indicated on Drawings.

2.5 MISCELLANEOUS PRODUCTS

A. Antidesiccant: Water-insoluble emulsion, permeable moisture retarder, film forming, for trees and shrubs. Deliver in original, sealed, and fully labeled containers and mix according to manufacturer's written instructions.

B. Planter Drainage Gravel: Washed, sound crushed stone or gravel complying with ASTM D 448 for Size No. 8.

C. Planter Filter Fabric: Nonwoven geotextile manufactured for separation applications and made of polypropylene, polyolefin, or polyester fibers or combination of them.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas to receive plants, with Installer present, for compliance with requirements and conditions affecting installation and performance of the Work.

1. Verify that no foreign or deleterious material or liquid such as paint, paint washout, concrete slurry, concrete layers or chunks, cement, plaster, oils, gasoline, diesel fuel, paint thinner, turpentine, tar, roofing compound, or acid has been deposited in soil within a planting area.

2. Verify that plants and vehicles loaded with plants can travel to planting locations with adequate overhead clearance.

3. Suspend planting operations during periods of excessive soil moisture until the moisture content reaches acceptable levels to attain the required results.

4. Uniformly moisten excessively dry soil that is not workable or which is dusty.
B. If contamination by foreign or deleterious material or liquid is present in soil within a planting area, remove the soil and contamination as directed by Architect and replace with new planting soil.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities and turf areas and existing plants from damage caused by planting operations.

B. Install erosion-control measures to prevent erosion or displacement of soils and discharge of soil-bearing water runoff or airborne dust to adjacent properties and walkways.

C. Lay out individual tree and shrub locations and areas for multiple plantings. Stake locations, outline areas, adjust locations when requested, and obtain Architect's acceptance of layout before excavating or planting. Make minor adjustments as required.

D. Lay out plants at locations directed by Architect. Stake locations of individual trees and shrubs and outline areas for multiple plantings.

3.3 PLANTING AREA ESTABLISHMENT

A. General: Prepare planting area for soil placement and mix planting soil according to Section 329113 "Soil Preparation."

B. Placing Planting Soil: Place manufactured planting soil over exposed subgrade.

C. Before planting, obtain Architect's acceptance of finish grading; restore planting areas if eroded or otherwise disturbed after finish grading.

3.4 EXCAVATION FOR TREES AND SHRUBS

A. Planting Pits and Trenches: Excavate circular planting pits.

1. Excavate planting pits with sides sloping inward at a 45-degree angle. Excavations with vertical sides are unacceptable. Trim perimeter of bottom leaving center area of bottom raised slightly to support root ball and assist in drainage away from center. Do not further disturb base. Ensure that root ball will sit on undisturbed base soil to prevent settling. Scarify sides of planting pit.

2. Excavate approximately three times as wide as root ball diameter.

3. Excavate at least 12 inches (300 mm) wider than root spread and deep enough to accommodate vertical roots for bare-root stock.

4. Do not excavate deeper than depth of the root ball, measured from the root flare to the bottom of the root ball.

5. If area under the plant was initially dug too deep, add soil to raise it to the correct level and thoroughly tamp the added soil to prevent settling.

6. Maintain angles of repose of adjacent materials to ensure stability. Do not excavate subgrades of adjacent paving, structures, hardscapes, or other new or existing improvements.

7. Maintain supervision of excavations during working hours.
8. Keep excavations covered or otherwise protected after working hours.
9. If drain tile is indicated on Drawings or required under planting areas, excavate to top of porous backfill over tile.

B. Backfill Soil: Subsoil and topsoil removed from excavations may not be used as backfill soil unless otherwise indicated.

C. Obstructions: Notify Architect if unexpected rock or obstructions detrimental to trees or shrubs are encountered in excavations.
   1. Hardpan Layer: Drill 6-inch-diameter holes, 24 inches apart, into free-draining strata or to a depth of 10 feet, whichever is less, and backfill with free-draining material.

D. Drainage: Notify Architect if subsoil conditions evidence unexpected water seepage or retention in tree or shrub planting pits.

E. Fill excavations with water and allow to percolate away before positioning trees and shrubs.

3.5 TREE, SHRUB, AND VINE PLANTING

A. Inspection: At time of planting, verify that root flare is visible at top of root ball according to ANSI Z60.1. If root flare is not visible, remove soil in a level manner from the root ball to where the top-most root emerges from the trunk. After soil removal to expose the root flare, verify that root ball still meets size requirements.

B. Roots: Remove stem girdling roots and kinked roots. Remove injured roots by cutting cleanly; do not break.

C. Balled and Burlapped Stock: Set each plant plumb and in center of planting pit or trench with root flare 2 inches above adjacent finish grades.
   2. After placing some backfill around root ball to stabilize plant, carefully cut and remove burlap, rope, and wire baskets from tops of root balls and from sides, but do not remove from under root balls. Remove pallets, if any, before setting. Do not use planting stock if root ball is cracked or broken before or during planting operation.
   3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.

D. Container-Grown Stock: Set each plant plumb and in center of planting pit or trench with root flare 2 inches above adjacent finish grades.
   2. Carefully remove root ball from container without damaging root ball or plant.
   3. Backfill around root ball in layers, tamping to settle soil and eliminate voids and air pockets. When planting pit is approximately one-half filled, water thoroughly before placing remainder of backfill. Repeat watering until no more water is absorbed.
PLANTS 32 93 00 - 10

E. Slopes: When planting on slopes, set the plant so the root flare on the uphill side is flush with the surrounding soil on the slope; the edge of the root ball on the downhill side will be above the surrounding soil. Apply enough soil to cover the downhill side of the root ball.

3.6 MECHANIZED TREE-SPADE PLANTING

A. Trees may be planted with an approved mechanized tree spade at on grade locations. Do not use tree spade to move trees larger than the maximum size allowed for a similar field-grown, balled-and-burlapped root-ball diameter according to ANSI Z60.1, or larger than manufacturer's maximum size recommendation for the tree spade being used, whichever is smaller.

B. Use the same tree spade to excavate the planting hole as will be used to extract and transport the tree.

C. When extracting the tree, center the trunk within the tree spade and move tree with a solid ball of earth.

D. Cut exposed roots cleanly during transplanting operations.

E. Plant trees following procedures in "Tree, Shrub, and Vine Planting" Article.

F. Where possible, orient the tree in the same direction as in its original location.

3.7 TREE, SHRUB, AND VINE PRUNING

A. Remove only dead, dying, or broken branches. Do not prune for shape.

B. Prune, thin, and shape trees, shrubs, and vines as directed by Architect.

C. Prune, thin, and shape trees, shrubs, and vines according to standard professional horticultural and arboricultural practices. Unless otherwise indicated by Architect, do not cut tree leaders; remove only injured, dying, or dead branches from trees and shrubs; and prune to retain natural character.

D. Do not apply pruning paint to wounds.

3.8 TREE STABILIZATION

A. Trunk Stabilization by Upright Staking and Tying: as indicated on Drawings.

3.9 GROUND COVER AND PLANT PLANTING

A. Set out and space ground cover and plants other than trees, shrubs, and vines as indicated on Drawings.

B. Use Planting Soil for backfill.

C. Dig holes large enough to allow spreading of roots.
D. For rooted cutting plants supplied in flats, plant each in a manner that minimally disturbs the root system but to a depth not less than two nodes.

E. Work soil around roots to eliminate air pockets and leave a slight saucer indentation around plants to hold water.

F. Water thoroughly after planting, taking care not to cover plant crowns with wet soil.

G. Protect plants from hot sun and wind; remove protection if plants show evidence of recovery from transplanting shock.

3.10 PLANTING AREA MULCHING

A. Mulch backfilled surfaces of planting areas and other areas indicated.

1. Organic Mulch in Planting Areas: Apply 3-inch over whole surface of planting area and finish level with adjacent finish grades. Do not place mulch within 3 inches of trunks or stems.

3.11 PLANT MAINTENANCE

A. Maintain plantings by pruning, cultivating, watering, weeding, fertilizing, mulching, restoring planting saucers, adjusting and repairing tree-stabilization devices, resetting to proper grades or vertical position, and performing other operations as required to establish healthy, viable plantings.

B. Fill in, as necessary, soil subsidence that may occur because of settling or other processes. Replace mulch materials damaged or lost in areas of subsidence.

C. Apply treatments as required to keep plant materials, planted areas, and soils free of pests and pathogens or disease. Use integrated pest management practices when possible to minimize use of pesticides and reduce hazards. Treatments include physical controls such as hosing off foliage, mechanical controls such as traps, and biological control agents.

3.12 PESTICIDE APPLICATION

A. Apply pesticides and other chemical products and biological control agents according to authorities having jurisdiction and manufacturer's written recommendations. Coordinate applications with Owner's operations and others in proximity to the Work. Notify Owner before each application is performed.

B. Pre-Emergent Herbicides (Selective and Nonselective): Apply to tree, shrub, and ground-cover areas according to manufacturer's written recommendations. Do not apply to seeded areas.

C. Post-Emergent Herbicides (Selective and Nonselective): Apply only as necessary to treat already-germinated weeds and according to manufacturer's written recommendations.

3.13 REPAIR AND REPLACEMENT

A. General: Repair or replace existing or new trees and other plants that are damaged by construction operations, in a manner approved by Architect.
1. Submit details of proposed pruning and repairs.
2. Perform repairs of damaged trunks, branches, and roots within 24 hours, if approved.
3. Replace trees and other plants that cannot be repaired and restored to full-growth status, as determined by Architect.

B. Remove and replace trees that are more than 25 percent dead or in an unhealthy condition before the end of the corrections period or are damaged during construction operations that Architect determines are incapable of restoring to normal growth pattern.

1. Provide new trees of same size and species as those being replaced.

3.14 CLEANING AND PROTECTION

A. During planting, keep adjacent paving and construction clean and work area in an orderly condition. Clean wheels of vehicles before leaving site to avoid tracking soil onto roads, walks, or other paved areas.

B. Remove surplus soil and waste material including excess subsoil, unsuitable soil, trash, and debris and legally dispose of them off Owner's property.

C. Protect plants from damage due to landscape operations and operations of other contractors and trades. Maintain protection during installation and maintenance periods. Treat, repair, or replace damaged plantings.

D. After installation and before Substantial Completion, remove nursery tags, nursery stakes, tie tape, labels, wire, burlap, and other debris from plant material, planting areas, and Project site.

E. At time of Substantial Completion, verify that tree-watering devices are in good working order and leave them in place. Replace improperly functioning devices.

3.15 MAINTENANCE SERVICE

A. Maintenance Service for Trees and Shrubs: Provide maintenance by skilled employees of landscape Installer. Maintain as required in "Plant Maintenance" Article. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established, but for not less than maintenance period below:

1. Maintenance Period: 12 months from date of Substantial Completion.

B. Maintenance Service for Ground Cover and Other Plants: Provide maintenance by skilled employees of landscape Installer. Maintain as required in "Plant Maintenance" Article. Begin maintenance immediately after plants are installed and continue until plantings are acceptably healthy and well established, but for not less than maintenance period below:

1. Maintenance Period: Six months from date of Substantial Completion.

END OF SECTION 32 93 00
LANDSCAPE MAINTENANCE AND WARRANTY STANDARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. The requirements of this section include a one (1) year warranty period from date of acceptance of installation.

B. Related work specified elsewhere:
   1. Division 32 9210 Section "Lawns and Grasses."

1.3 ACCEPTANCE OF INSTALLATION

A. At the completion of all landscape installation, or pre-approved portions thereof, the Landscape Contractor shall request in writing an inspection for acceptance of installation in which the Landscape Contractor, Landscape Architect and Owner’s Representative shall be present. After this inspection a “Punch List” will be issued by the Landscape Architect and/or Owner’s Representative. The Landscape Architect and/or Owner’s Representative shall re-inspect the project and issue a written statement of acceptance of installation and establish the beginning of the project warranty period.

B. It is the responsibility of the Landscape Contractor to make the above written request for inspection of installation in a timely fashion. If there is plant material loss prior to the Landscape Contractor’s written request for inspection of installation, the Landscape Contractor shall make all replacements of this dead material at no additional cost. These replacements are not considered to be the required one (1) replacement of dead plant material by the Landscape Contractor during the one (1) year project warranty period, as outlined below.

C. Landscape work may be inspected for acceptance in parts agreeable to Owner’s Representative and Landscape Architect provided work offered for inspection is complete, including maintenance as required.

D. For work to be inspected for partial acceptance, Contractor shall provide a drawing outlining work completed, and supply a written statement requesting acceptance of this work completed to date.

1.4 PROJECT WARRANTY

A. The project warranty period begins upon written acceptance of the project installation by Landscape Architect and Owner’s Representative.
B. The Landscape Contractor shall guarantee trees, shrubs, ground cover bed, and seeded or sodded areas through construction and for a period of one (1) year after date of acceptance of installation against defects including death and unsatisfactory growth, except for defects resulting from neglect by Owner, abuse or damage by others, or unusual phenomena or incidents which are beyond Landscape Contractor’s control.

C. The cost of replacements is at the Contractor’s expense. Warranty all replacement plants for one (1) year after installation acceptance. Every plant that is replaced under warranty shall again be guaranteed for one (1) full year from date of Owner’s acceptance.

D. Warranty: One (1) year from date of Owner’s acceptance.

1.5 MAINTENANCE

A. Arrange with the Owner’s Representative to walk the site monthly during the warranty period to review the maintenance standards. Written minutes of this meeting shall be furnished to the Owner and the Landscape Architect.

B. To insure guarantee standards, the following maintenance procedures shall be executed during construction and for the full project warranty period.

C. Maintenance of Trees, Shrubs, and Ground Covers:

1. Landscape Contractor shall be responsible for replacement of any plant materials that are dead or in the opinion of the Landscape Architect are in an unhealthy or unsightly condition, or having lost natural shape, resulting from dieback, excessive pruning or inadequate or improper maintenance as part of the guarantee. Prior to any replacements Landscape Contractor shall review individual plants in question with Landscape Architect and determine the reason for plant demise. The replacement shall be guaranteed for 1 year (same as initial plantings). A plant shall be replaced as many times as necessary until it lives for a minimum of one (1) year.

2. Replacements must meet specifications i.e. quality, species of plant material and planting procedures to receive approval of replacement materials by Landscape Architect.

3. Costs for replacements are assumed part of bid quotations and therefore will not result in an additional cost to Owner or Landscape Architect.

4. Areas damaged as result of replacement operations are to be restored by Contractor at no cost to the Owner or Landscape Architect.

5. The contractor shall be responsible for watering all plantings through the warranty period and shall keep guy wires taut, raise tree balls which settle, furnish and apply sprays as necessary to keep the plantings free of disease and insects until the end of the warranty period. All evergreens shall be watered thoroughly in the fall to insure they do not go into the winter dry. Arrange with Owner’s Representative to walk the site monthly during warranty period to review maintenance standards. Remove and replace trees, shrubs, or other plants and materials promptly. Make replacements during following normal planting schedule. Replace trees and shrubs which are in doubt, unless, in opinion of Owner’s Representative and Landscape Architect it is advisable to extend warranty period for a full-growing season. Remove all stakes, guy wires, tree wrap paper, dead twigs and branches from tree and plant materials at the end of this warranty period. Keep planting beds free of weeds during guarantee period.

D. Maintenance of Sodded Lawn Areas:

1. Water sod thoroughly as required to establish proper rooting.
2. The Contractor shall establish a dense lawn of permanent grasses free from lumps and depressions. Repair, rework and resod all areas that have washed out or are eroded. Replace undesirable or dead areas with new sod.

3. Mow lawn areas as soon as lawn top growth reaches a 3” height. Cut back to 2” height. Repeat mowing as required to maintain specified height. Not more than 40% of grass leaf shall be removed at any single mowing.

4. The Contractor shall provide a minimum of two cuttings of the lawn or more as necessary until the inspection and acceptance of installation by the Owner's Representative and Landscape Architect. When the lawn reaches 3 inches in height it shall be cut to 2 inches in height. Contractor shall notify the Owner’s Representative and Landscape Architect in writing one (1) week in advance of the final lawn cutting to allow the Owner and the Landscape Architect to inspect the lawns and schedule Owner's maintenance work.

5. The Owner assumes cutting responsibility following the acceptance of installation by the Owner's Representative and the Landscape Architect.

6. After acceptance of installation, and for the duration of the project warranty period, the Landscape Contractor shall continue all other maintenance procedures including fertilizing and weeding, and other operations such as rolling, regrading, replanting, and applying herbicides, fungicides, insecticides as required to establish a smooth, acceptable lawn free of eroded or bare areas.

7. Apply three (3) applications of Type “B” fertilizer once in every seven to eight (7-8) week intervals. These applications shall be in addition to fertilizer applied for the soil preparation. The first application shall be applied on or about thirty (30) days after seeding. Contractor to time the applications in conjunction with anticipated rain. If initial seeding takes place in late fall, begin fertilizing applications very early at onset of the following spring season.

8. At conclusion of project warranty period and after reviewing written final acceptance by Owner’s Representative and Landscape Architect, the Owner shall assume all lawn maintenance responsibilities.

E. Maintenance of Seeded Lawn Areas:

1. The Contractor shall establish a dense lawn of permanent grasses, free from lumps and depressions or any bare spots, none of which is larger than one foot of area up to a maximum of 3% of the total seeded lawn area. Any part of the seeded lawn that fails to show a uniform growth and/or germination shall be reseeded until a dense cover is established.

2. If seeded in fall or if not considered acceptable at that time, continue maintenance the following spring until acceptable lawn is established.

3. The Contractor shall provide a minimum of two (2) cuttings of the lawn or more as necessary until the inspection and acceptance of installation by the Owner’s Representative and Landscape Architect. When the lawn reaches 3 inches in height, it shall be cut to 2 inches in height.

4. The Owner assumes cutting responsibilities following the acceptance of installation by the Owner’s Representative and the Landscape Architect.

5. After acceptance of installation, and for the duration of the project warranty period the Landscape Contractor shall continue all other maintenance procedures including fertilizing and weeding, and other operations such as rolling, regrading, replanting, and applying herbicides, fungicides, insecticides as required to establish a smooth, acceptable lawn free of eroded or bare areas.

6. Repair, rework, and re-seed all areas that have washed out, and eroded, or do not substantially germinate.

7. At conclusion of project warranty period and after receiving written final acceptance by Owner’s Representative and Landscape Architect, the Owner shall assume all seeded lawn maintenance responsibilities.
1.6 FINAL ACCEPTANCE

A. At the conclusion of the project warranty period, the Landscape Contractor shall request a project inspection for final acceptance in which the Landscape Contractor, Landscape Architect and Owner’s Representative shall be present. After this inspection a “Punch List” will be issued by the Landscape Architect. Upon completion of all punch list items, the Landscape Architect and Owner’s Representative shall reinspect the project and issue a written statement of final acceptance. Upon final acceptance the Owner assumes all maintenance responsibilities for the landscape of the project.

END OF SECTION 32 9400
SECTION 331100 - WATER MAIN

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section. Where these specifications differ from the standard details or specifications of the governing agency, the agency standards shall apply.

B. Materials and installation requirements are generally indicated on the plans. Materials indicated in these specifications only apply if indicated on the plans and allowed by the regulating authority. Contractor is responsible for confirming allowable materials and installation requirements with the regulating authority and including these requirements in their bid.

C. CAD files will be made available for use in construction staking. Contact the engineer regarding applicable fee and requirements for signing of the CAD File Transfer Agreement.

1.2 SUMMARY

A. This Section includes water-distribution piping and related components outside the building for the water supply system (for both fire protection and domestic water systems).

B. Water meters may be provided by the regulating authority. Contractor shall confirm with the regulating authority and pay the required fees for the meter.

1.3 DEFINITIONS

A. EPDM: Ethylene propylene diene terpolymer rubber.

B. HDPE: High density polyethylene plastic

C. PVC: Polyvinyl chloride plastic.

D. DI – Ductile Iron.

1.4 SUBMITTALS

A. Product Data and shop drawing submittals are not required. Contractor shall confirm that the materials provided meet the requirements of the regulating authority, and provide material certification to the engineer. Material certification shall state that the products meet or exceed the requirements indicated on the plans and the requirements of the regulating authority.

1.5 QUALITY ASSURANCE

A. Regulatory Requirements:
1. Comply with requirements of utility company supplying water, including materials, installation, tapping of water mains, testing, and disinfection.

   B. Piping materials shall bear label, stamp, or other markings of specified testing agency.

1.6 DELIVERY, STORAGE, AND HANDLING

   A. Preparation for Transport: Prepare valves, including fire hydrants, according to the following:

      1. Ensure that valves are dry and internally protected against rust and corrosion.
      2. Protect valves against damage to threaded ends and flange faces.
      3. Set valves in best position for handling. Set valves closed to prevent rattling.

   B. During Storage: Use precautions for valves, including fire hydrants, according to the following:

      1. Do not remove end protectors unless necessary for inspection; then reinstall for storage.
      2. Protect from weather. Store indoors and maintain temperature higher than ambient dew-point temperature. Support off the ground or pavement in watertight enclosures when outdoor storage is necessary.

   C. Handling: Use sling to handle valves and fire hydrants if size requires handling by crane or lift. Rig valves to avoid damage to exposed parts. Do not use handwheels or stems as lifting or rigging points.

   D. Deliver piping with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe-end damage and to prevent entrance of dirt, debris, and moisture.

   E. Protect stored piping from moisture and dirt. Elevate above grade. Do not exceed structural capacity of floor when storing inside.

   F. Protect flanges, fittings, and specialties from moisture and dirt.

   G. Store plastic piping protected from direct sunlight. Support to prevent sagging and bending.

1.7 PROJECT CONDITIONS

   A. Interruption of Existing Water-Distribution Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary water-distribution service according to requirements indicated:

      1. Notify construction manager (or architect if there is no construction manager) no fewer than three days in advance of proposed interruption of service.
      2. Do not proceed with interruption of water-distribution service without construction manager’s or architect’s written permission.

1.8 COORDINATION

   A. Coordinate connection to water main with utility company and make connection per their requirements.
PART 2 - PRODUCTS

2.1 COPPER TUBE AND FITTINGS

A. Soft Copper Tube: ASTM B 88, Type K, water tube, annealed temper.
   2. Copper, Pressure-Seal Fittings:
      a. NPS 2 (DN 50) and Smaller: Wrought-copper fitting with EPDM O-ring seal in each end.
      b. NPS 2-1/2 (DN 65) Bronze fitting with stainless-steel grip ring and EPDM O-ring seal in each end.

B. Hard Copper Tube: ASTM B 88, Type K, water tube, drawn temper.
      a. NPS 2 (DN 50) and Smaller: Wrought-copper fitting with EPDM O-ring seal in each end.
      b. NPS 2-1/2 (DN 65): Bronze fitting with stainless-steel grip ring and EPDM O-ring seal in each end.

C. Bronze Flanges: ASME B16.24, Class 150, with solder-joint end. Furnish Class 300 flanges if required to match piping.

D. Copper Unions: MSS SP-123, cast-copper-alloy, hexagonal-stock body with ball-and-socket, metal-to-metal seating surfaces, and solder-joint or threaded ends.

2.2 GATE VALVES

A. AWWA, Gate Valves:
   1. Available Manufacturers: Subject to compliance with requirements of the regulating authority.
   2. Stem (rising or non-rising), and Gate Valve seating (metal seated or resilient seated) to meet requirements of the regulating authority and/or as shown on the standard detail sheets included with the plan:

2.3 GATE VALVE ACCESSORIES AND SPECIALTIES

A. Tapping-Sleeve Assemblies:
   1. Available Manufacturers: Subject to compliance with requirements of the regulating authority.
   2. Description: Sleeve and valve compatible with drilling machine.
a. Standard: MSS SP-60.
b. Tapping Sleeve: Cast- or ductile-iron or stainless-steel, two-piece bolted sleeve with flanged outlet for new branch connection. Include sleeve matching size and type of pipe material being tapped and with recessed flange for branch valve.
c. Valve: per requirements of regulating authority.

B. Valve Boxes: If requirements are not indicated on the plans or standard detail sheets, comply with AWWA M44 for cast-iron valve boxes. Include top section, adjustable extension of length required for depth of burial of valve, plug with lettering “WATER,” and bottom section with base that fits over valve and with a barrel approximately 5 inches (125 mm) in diameter.

1. Operating Wrenches: Steel, tee-handle with one pointed end, stem of length to operate deepest buried valve, and socket matching valve operating nut.

C. Indicator Posts (only if indicated on the plan or required by the regulating authority): UL 789, FMG-approved, vertical-type, cast-iron body with operating wrench, extension rod, and adjustable cast-iron barrel of length required for depth of burial of valve.

2.4 WATER METERS

A. Water meters will be furnished by utility company.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Refer to Division 31 Section "Earth Moving“ for excavating, trenching, and backfilling.

3.2 PIPING APPLICATIONS

A. General: Use pipe, fittings, and joining methods for piping systems according to the following applications and in accordance with the regulating authority. Where these specifications differ from the requirements of the regulating authority, those requirements shall govern.

B. Transition couplings and special fittings with pressure ratings at least equal to piping pressure rating may be used, unless otherwise indicated.

C. Do not use flanges or unions for underground piping.

D. Flanges, unions, grooved-end-pipe couplings, and special fittings may be used, instead of joints indicated, on aboveground piping and piping in vaults.

E. Underground water-service piping [NPS 3/4 to NPS 2 1/2] shall be the following:

1. Soft copper tube, ASTM B 88, Type K; wrought-copper, solder-joint fittings.

F. Underground watermain piping [NPS 4 to NPS 16] shall be as indicated in the plans and standard detail sheets, and as allowed by the regulating authority:
3.3 VALVE APPLICATIONS

A. General Application: As indicated in the plans and standard detail sheets, and as allowed by the regulating authority.

3.4 PIPING INSTALLATION

A. Water-Main Connection: Tap water main according to requirements of water utility company and of size and in location indicated. Include valve in box per City requirements. Coordinate with the water utility company to provide necessary inspection of watermain installation.

B. Bury piping with depth of cover over top at least 60 inches but not less than the minimum required by the regulating authority.

C. Install piping by tunneling or jacking, or combination of both, under streets and other obstructions that cannot be disturbed. These locations will be indicated on the plans, however, the contractor can propose this installation method in areas where it would be beneficial to minimize disturbance to existing conditions.

D. Extend water-service piping to within 5' of the building wall. Coordinate with the interior plumbing plans and the construction manager, owner, or general contractor to confirm the location.

1. Terminate piping with caps, plugs, or flanges as required for piping material. Connections to building-water-piping systems will be done by the interior plumbing contractor.

E. Install underground piping with restrained joints and/or thrust blocks at horizontal and vertical changes in direction (as indicated on the standard detail sheets or as required by the regulating authority). Use restrained-joint piping, thrust blocks, anchors, tie-rods and clamps, and other supports.

3.5 JOINT CONSTRUCTION

A. Make pipe joints according to the following:

2. Dissimilar Materials Piping Joints: Use adapters compatible with both piping materials, with OD, and with system working pressure.

3.6 ANCHORAGE INSTALLATION

A. Anchorage, General: Install water-distribution piping with restrained joints. Anchorages and restrained-joint types that may be used include the following (as long as the regulating authority approves of their use):

1. Concrete thrust blocks.
2. Locking mechanical joints.
4. Bolted flanged joints.
5. Pipe clamps and tie rods.
B. Install anchorages for tees, plugs and caps, bends, crosses, valves, and hydrant branches. Include anchorages for all piping systems:

C. Apply full coat of asphalt or other acceptable corrosion-resistant material to surfaces of installed ferrous anchorage devices.

3.7 VALVE INSTALLATION

A. AWWA Gate Valves: Comply with AWWA C600 and AWWA M44. Install each underground valve with stem pointing up and with valve box unless gate well is indicated on the plan.

B. AWWA Valves Other Than Gate Valves: Comply with AWWA C600 and AWWA M44.

C. UL/FMG, Gate Valves: Comply with NFPA 24. Install each underground valve and valves in vaults with stem pointing up and with vertical cast-iron indicator post.

D. UL/FMG, Valves Other Than Gate Valves: Comply with NFPA 24.

3.8 CONNECTIONS

A. Connect water-distribution piping to existing water main. Use connection method indicated on the plan and as dictated by the regulating authority.

3.9 FIELD QUALITY CONTROL

A. Piping Tests: Conduct piping tests according to requirements of the regulating authority. If testing methods are not dictated by the regulating authority, test as follows: Conduct tests before joints are covered and after concrete thrust blocks have hardened sufficiently. Fill pipeline 24 hours before testing and apply test pressure to stabilize system. Use only potable water.

B. Hydrostatic Tests: Test at not less than one-and-one-half times working pressure for two hours.

1. Increase pressure in 50-psig (350-kPa) increments and inspect each joint between increments. Hold at test pressure for 1 hour; decrease to 0 psig (0 kPa). Slowly increase again to test pressure and hold for 1 more hour. Maximum allowable leakage is 2 quarts (1.89 L) per hour per 100 joints. Remake leaking joints with new materials and repeat test until leakage is within allowed limits.

C. Prepare reports of testing activities.

3.10 IDENTIFICATION

A. If required by the regulating authority, install continuous underground detectable warning tape during backfilling of trench for underground water-distribution piping. Locate below finished grade, directly over piping. Underground warning tapes are specified in Division 31 Section "Earth Moving."
3.11 CLEANING

A. Clean and disinfect water-distribution piping in accordance with the requirements of the regulating authority. When requirements are not given, clean and disinfect as follows:

1. Purge new water-distribution piping systems and parts of existing systems that have been altered, extended, or repaired before use.
2. Use purging and disinfecting procedure prescribed by authorities having jurisdiction or, if method is not prescribed by authorities having jurisdiction, use procedure described in AWWA C651 or do as follows:
   a. Fill system or part of system with water/chlorine solution containing at least 50 ppm of chlorine; isolate and allow to stand for 24 hours.
   b. Drain system or part of system of previous solution and refill with water/chlorine solution containing at least 200 ppm of chlorine; isolate and allow to stand for 3 hours.
   c. After standing time, flush system with clean, potable water until no chlorine remains in water coming from system.
   d. Submit water samples in sterile bottles to authorities having jurisdiction. Repeat procedure if biological examination shows evidence of contamination.

B. Prepare reports of purging and disinfecting activities.

END OF SECTION 331100
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section. Where these specifications differ from the standard details or specifications of the governing agency, the agency standards shall apply.

B. Materials and installation requirements are generally indicated on the plans. Materials indicated in these specifications only apply if indicated on the plans and allowed by the regulating authority. Contractor is responsible for confirming allowable materials and installation requirements with the regulating authority and including these requirements in their bid.

C. Contractor shall follow all standards and details as directed by the City of Detroit Water and Sewerage Department.

D. CAD files will be made available for use in construction staking. Contact the engineer regarding applicable fee and requirements for signing of the CAD File Transfer Agreement.

1.2 SUMMARY

A. This Section includes gravity-flow, nonpressure sanitary sewerage outside the building, with the following components:
   1. Cleanouts.
   2. Precast concrete manholes.

1.3 DEFINITIONS

A. PVC: Polyvinyl chloride plastic.

1.4 SUBMITTALS

A. Product Data and shop drawing submittals are not required. Contractor shall confirm that the materials provided meet the requirements of the regulating authority, and provide material certification to the engineer. Material certification shall state that the products meet or exceed the requirements indicated on the plans and the requirements of the regulating authority.

B. Field quality-control test reports.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Do not store plastic manholes, pipe, and fittings in direct sunlight.

B. Protect pipe, pipe fittings, and seals from dirt and damage.
C. Handle manholes according to manufacturer’s written rigging instructions.

1.6 PROJECT CONDITIONS

A. Interruption of Existing Sanitary Sewerage Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:

1. Notify Architect, Construction Manager, and Owner no fewer than two days in advance of proposed interruption of service.
2. Do not proceed with interruption of service without written permission.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Available Manufacturers: Subject to compliance with requirements of the regulating authority.

2.2 PIPING MATERIALS

A. Refer to Part 3 "Piping Applications" Article for applications of pipe, fitting, and joining materials.

B. Materials are generally indicated on the plans. Materials indicated in these specifications only apply if indicated on the plans and allowed by the regulating authority. Contractor is responsible for confirming allowable materials and installation requirements with the regulating authority and including these requirements in their bid.

2.3 PVC PIPE AND FITTINGS

A. PVC Sewer Pipe and Fittings, NPS 8 and Smaller: ASTM D 3034, SDR 26, with bell-and-spigot ends for gasketed joints with ASTM F 477, elastomeric seals.

B. PVC Profile Gravity Sewer Pipe and Fittings: ASTM F 794 pipe, with bell-and-spigot ends; ASTM D 3034 fittings, with bell ends; and ASTM F 477, elastomeric seals.

2.4 CONCRETE PIPE AND FITTINGS

A. Reinforced-Concrete Sewer Pipe and Fittings: ASTM C 76 (ASTM C 76M), Class IV, with groove and tongue ends for gasketed joints with ASTM C 443 (ASTM C 443M), rubber gaskets
2.5 MANHOLEs

A. Standard Precast Concrete Manholes: ASTM C 478, precast, reinforced concrete, of depth indicated, with provision for sealant joints. Refer to plans for standard detail.

2.6 CONCRETE

A. General: Cast-in-place concrete according to ACI 318/318R, ACI 350R, and the following:

1. Cement: ASTM C 150, Type II.

B. Portland Cement Design Mix: 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio.

2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60, deformed steel.

C. Manhole Channels and Benches: Factory or field formed from concrete. Portland cement design mix, 4000 psi minimum, with 0.45 maximum water/cementitious materials ratio. Include channels and benches in manholes.

1. Channels: Concrete invert, formed to same width as connected piping, with height of vertical sides to three-fourths of pipe diameter. Form curved channels with smooth, uniform radius and slope.
   a. Invert Slope: 1 percent through manhole.

2. Benches: Concrete, sloped to drain into channel.
   a. Slope: 8 percent.

D. Ballast and Pipe Supports: Portland cement design mix, 3000 psi minimum, with 0.58 maximum water/cementitious materials ratio.

2. Reinforcement Bars: ASTM A 615/A 615M, Grade 60, deformed steel.

2.7 CLEANOUTS

A. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

PART 3 - EXECUTION

3.1 EARTHWORK

A. Excavating, trenching, and backfilling are specified in Division 31 Section "Earth Moving."
3.2 PIPING APPLICATIONS

A. Gravity-Flow, Nonpressure Sewer Piping: Pipe material is indicated on the plans. Use only pipe materials indicated on the plans and acceptable to the regulating authority.

3.3 PIPING INSTALLATION

A. General Locations and Arrangements: Drawing plans and details indicate general location and arrangement of underground sanitary sewerage piping. Location and arrangement of piping layout take design considerations into account. Install piping as indicated, to extent practical. Where specific installation is not indicated, follow piping manufacturer's written instructions.

B. Install piping beginning at low point, true to grades and alignment indicated with unbroken continuity of invert. Place bell ends of piping facing upstream. Install gaskets, seals, sleeves, and couplings according to manufacturer's written instructions for using lubricants, cements, and other installation requirements.

C. Install manholes for changes in direction, unless fittings are indicated. Use fittings for branch connections, unless direct tap into existing sewer is indicated.

D. Install proper size increasers, reducers, and couplings where different sizes or materials of pipes and fittings are connected. Reducing size of piping in direction of flow is prohibited.

E. Tunneling: Install pipe under streets or other obstructions that cannot be disturbed by tunneling, jacking, or combination of both.

F. Install gravity-flow, nonpressure, sewer piping according to the following:

1. Install piping pitched down in direction of flow, at minimum slope of 1 percent, unless otherwise indicated on the drawings.
2. Install piping at depths indicated on the plans.
3. Install piping below frost line.
4. Install PVC sewer piping according to ASTM D 2321 and ASTM F 1668.
5. Install reinforced-concrete sewer piping according to ASTM C 1479 and ACPA's "Concrete Pipe Installation Manual".

3.4 PIPE JOINT CONSTRUCTION

A. Basic piping joint construction is specified in Division 22 Section "Common Work Results for Plumbing" Where specific joint construction is not indicated, follow piping manufacturer's written instructions.

B. Join gravity-flow, nonpressure, piping according to the following:

1. Join PVC sewer piping according to ASTM D 2321 and ASTM D 3034 for elastomeric-seal joints or ASTM D 3034 for elastomeric-gasket joints.
2. Join reinforced-concrete sewer piping according to ACPA's "Concrete Pipe Installation Manual" for rubber-gasket joints
3. Join dissimilar pipe materials with nonpressure-type, flexible couplings.
3.5 MANHOLE INSTALLATION

A. General: Install manholes complete with appurtenances and accessories indicated.
B. Install precast concrete manhole sections with sealants according to ASTM C 891.
C. Form continuous concrete channels and benches between inlets and outlet.
D. Set tops of frames and covers flush with finished surface of manholes that occur in pavements. Set tops of manholes in lawn areas to the rim elevations indicated on the plan.

3.6 CONCRETE PLACEMENT

A. Place cast-in-place concrete according to ACI 318/318R.

3.7 CLEANOUT INSTALLATION

A. Install cleanouts and riser extensions from sewer pipes to cleanouts at grade.
   1. Use light-duty, top-loading classification cleanouts in earth areas.
   2. Use heavy-duty, top-loading classification cleanouts in paved areas.
B. Set with tops one inch above surrounding grade in nonpaved areas.
C. Set cleanout frames and covers in concrete pavement with tops flush with pavement surface.

3.8 CONNECTIONS

A. Extend sewer piping to within 5’ of building. Connection to building piping will be made by the plumbing contractor.
B. Make connections to existing piping and underground manholes.
   1. Use commercially manufactured wye fittings for piping branch connections. Remove section of existing pipe; install wye fitting into existing piping; and encase entire wye fitting, plus 6-inch overlap, with not less than 6 inches of concrete with 28-day compressive strength of 3000 psi.
   2. Make branch connections from side into existing piping, NPS 21 or larger, or to underground manholes by cutting opening into existing unit large enough to allow 3 inches of concrete to be packed around entering connection. Cut end of connection pipe passing through pipe or structure wall to conform to shape of and be flush with inside wall, unless otherwise indicated. On outside of pipe or manhole wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support of collar from connection to undisturbed ground.
      a. Use concrete that will attain minimum 28-day compressive strength of 3000 psi, unless otherwise indicated.
      b. Use epoxy-bonding compound as interface between new and existing concrete and piping materials.
3. Protect existing piping and manholes to prevent concrete or debris from entering while making tap connections. Remove debris or other extraneous material that may accumulate.

3.9 FIELD QUALITY CONTROL

A. Test new piping system according to requirements of regulating authority and provide test reports as required. If a testing method is not specified, test as follows:

B. Inspect interior of piping to determine whether line displacement or other damage has occurred. Inspect after approximately 24 inches of backfill is in place, and again at completion of Project.

1. Submit separate report for each system inspection.
2. Defects requiring correction include the following:
   a. Alignment: Less than full diameter of inside of pipe is visible between structures.
   b. Deflection: Flexible piping with deflection that prevents passage of ball or cylinder of size not less than 92.5 percent of piping diameter.
   c. Crushed, broken, cracked, or otherwise damaged piping.
   d. Infiltration: Water leakage into piping.
   e. Exfiltration: Water leakage from or around piping.

3. Replace defective piping using new materials, and repeat inspections until defects are within allowances specified.
4. Reinspect and repeat procedure until results are satisfactory.

C. Test new piping systems, and parts of existing systems that have been altered, extended, or repaired, for leaks and defects.

1. Do not enclose, cover, or put into service before inspection and approval.
2. Test completed piping systems according to requirements of authorities having jurisdiction.
3. Schedule tests and inspections by authorities having jurisdiction with at least 24 hours' advance notice.
4. Submit separate report for each test.
5. Hydrostatic Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction and the following:
   a. Allowable leakage is maximum of 50 gal./inch of nominal pipe size per mile of pipe, during 24-hour period.
   b. Close openings in system and fill with water.
   c. Purge air and refill with water.
   d. Disconnect water supply.
   e. Test and inspect joints for leaks.
   f. Option: Test ductile-iron piping according to AWWA C600, "Hydrostatic Testing" Section. Use test pressure of at least 10 psig.

6. Air Tests: Test sanitary sewerage according to requirements of authorities having jurisdiction, UNI-B-6, and the following:
   a. Option: Test plastic gravity sewer piping according to ASTM F 1417.
   b. Option: Test concrete gravity sewer piping according to ASTM C 924.

D. Leaks and loss in test pressure constitute defects that must be repaired.
3.10 CLEANING

A. Clean interior of piping of dirt and superfluous material. Flush with potable water.

END OF SECTION 333100
SECTION 334100 - STORM SEWERS, UNDERDRAINS AND DRAINAGE STRUCTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of Contract, including General and Supplementary Conditions and Division 01 Specification sections, apply to work of this section.

1.2 SUMMARY

A. The work under this Section includes, but is not necessarily limited to, the furnishing and installation of all storm sewers, underdrains and drainage structures and leads and connections as indicated on the Drawings, herein specified and as necessary for the proper and complete performance of this Work.

1. Storm Sewer Pipe
2. Castings
3. Manhole Sections and Steps
4. Catch Basin
5. Brick and Concrete Block Masonry

B. Related Sections may include, but not be limited to, the following:

1. Division 31 2000 Section “Earth Moving” for excavation and backfill.

1.3 QUALITY ASSURANCE

A. Use only personnel completely trained and experienced in installation of the materials.

B. Compliance to City/Township Codes and all other agencies having jurisdiction shall govern material and installation procedures.

1.4 SUBMITTALS

A. Shop Drawings: Submit product data for storm sewer materials. Contractor is expected to conform to the plans, specifications, and details for this work. Submit material certificates in lieu of shop drawings. Material certificates shall be signed by manufacturer and contractor certifying that each material item complies with or exceeds requirements.

B. Submittals and Resubmittals: Engineer will review each of Contractor’s shop drawings and/or submittal data the initial time and, should resubmittal be required, one additional time to verify that reasons for resubmittal have been addressed by Contractor and corrections made. Resubmittal changes/revisions/corrections shall be circled. Engineer will review only circled items and will not be responsible for non-circled changes/revisions/corrections and additions. Should additional resubmittals be required, Contractor shall reimburse Owner for all costs incurred, including the cost of Engineer’s services made necessary to review such additional resubmittals. Owner will in turn reimburse Engineer.

C. Requests for Information

1. Engineer reserves the right to reject any Request for Information (RFI) that the Engineer, at its sole discretion, deems frivolous.
2. Engineer reserves the right to reject any RFI that the Engineer, at its sole discretion, deems already answered in the Contract Documents.
3. RFI process shall not be used for requesting substitutions. Procedures for substitutions are clearly specified elsewhere in the Contract Documents.

1.5 PRODUCT HANDLING

A. Protection: Use all means necessary to protect the materials before, during and after installation.
B. Replacements: In the event of damage, immediately make all necessary repairs and replacements acceptable to the Engineer and at no additional cost to the Owner.

PART 2 - PRODUCTS

2.1 STORM SEWER PIPE

A. General: Storm sewer pipe material shall be as indicated on the plans. If indicated on the plans, pipe materials shall conform to the following requirements.
B. Reinforced Concrete Pipe
   1. Reinforced concrete pipe shall conform to ASTM C-76.72A, Type III & Type IV.
   2. Joints shall be premium rubber joint as acceptable to the Engineer unless otherwise specified on the drawings.
C. Corrugated Polyethelene Tubing (CPT)
   1. Corrugated Polyethylene Tubing (CPT) shall conform to ASTM F405 and shall be perforated with sock where indicated on the plans.
   2. Joints shall be secured with a factory made snap-on or screen-on coupler for 4” and 6” diameter. Joints for 8” diameter and larger shall be a factory made coupler ties, bolts or screws on.
D. PVC Sewer Pipe and Fittings, NPS 10 (DN 375) and Smaller: ASTM D 3034, SDR 26 for 8” and smaller, SDR 35 for 10” and larger, with bell-and-spigot ends for gasketed joints with ASTM F 477, elastomeric seals.

2.2 CASTINGS

A. General: All castings shall be of cast iron, conforming to ASTM A 48 unless otherwise indicated. Conform to details and notes indicated on the plans. Where details or notes are not indicated, conform with the following requirements.
B. Manhole frames and covers: Material shall be MDOT Type A with perforated covers.
C. Catch basins and inlet castings: Catch basin and inlet castings shall be MDOT Type K when located in curbs and gutter, MDOT Type E in non-paved locations, and MDOT Type A when located in paved areas.

2.3 MANHOLE SECTIONS
A. Manhole walls
   1. Standard manhole walls shall be Precast concrete units conforming to ASTM C 478, or be concrete block masonry.

B. Manhole bases: Manhole bases shall be precast concrete units of the dimensions indicated on the Drawings.

2.7 MANHOLE STEPS

A. Manhole steps shall be of cast iron conforming to ASTM A 48 or equal, and shall meet pertinent safety rules and regulations.

2.8 CATCH BASINS

A. Construct catch basins of brick, block, masonry, or Precast units. Precast concrete catch basin units, if used, shall have reinforcing steel conforming to ASTM C 76 II, Wall B.

2.9 INLETS

A. Construct inlets of brick, block, masonry, or Precast units. Precast inlet units, if used, shall have reinforcing steel conforming to ASTM C 76 II, Wall B.

2.10 CLEANOUTS

A. PVC Cleanouts: PVC body with PVC threaded plug. Include PVC sewer pipe fitting and riser to cleanout of same material as sewer piping.

2.11 MORTAR

A. Mortar for brick masonry or plastering manholes shall be made of one part Portland cement to two parts sand, and materials and mixing shall correspond, in general, to Division 04 2000 Section “Unit Masonry.”

2.12 BRICK

A. Brick Work shall meet the requirements of Medium Brick of ASTM C 13.

2.13 CONCRETE BLOCK MASONRY

A. Concrete block masonry shall conform to ASTM C 139.

2.14 OTHER MATERIALS

A. All other materials not specifically described but required for a complete and proper installation of the work of this Section, shall be new, first quality of their respective kinds, and as selected by the Contractor subject to review by the Engineer.

PART 3 - EXECUTION

3.1 SURFACE CONDITIONS
A. Inspection

1. Verify that all work under this Section may be installed in accordance with all pertinent codes and regulations, the original design and the reference standards.
2. All materials shall be inspected immediately before installation, and if found defective, immediately removed from the site.

B. Discrepancies

1. In the event of discrepancy, immediately notify the Engineer.
2. Do not proceed with installation in areas of discrepancy until all such discrepancies have been fully resolved.

3.2 EARTHWORK

A. All earthwork required for the performance of the work of this Section shall be installed in accordance with Division 31 2000 Section “Earth Moving.”

3.3 INSTALLATION

A. General: Install all pipe and fittings in strict accordance with the manufacturer's recommendations as acceptable to the Engineer and other authorities having jurisdiction.

B. Handling

1. Distribute pipe and materials at the site as required, care to prevent damage to the pipe and materials.
2. Use proper tools and implements for safely handling and installing the pipe and other materials.
3. Protect the pipe and other materials from falling to the ground or into the trench.
4. Protect distributed pipe and materials from the public and passing vehicles.

C. Laying pipe

1. Lay all pipe true to line and grade with pipe ends abutting each other and the bell end facing the direction of laying.
2. Use laser alignment equipment to establish and maintain proper line and grade, unless otherwise directed.
3. Correct any deviation from line and grade at no additional cost to the Owner.
4. Protect workers at all times from cave-in and other hazardous conditions.

D. Joints: Inspect each joint immediately after being completed and, if defective, shall be corrected before any more pipe is laid.

E. Manholes

1. Construct manholes as indicated on the Drawings and Specifications.
2. Take special care in forming the channels in the concrete bottom and use wooden templates or half sewer pipe for this work.
3. Plaster masonry work and castings as indicated on the Drawings.
4. In precast concrete manholes, the bottom section shall have cast openings of sufficient size
to receive the sewer pipe. If such openings are not provided, the bottom portion may be constructed of masonry work from the concrete base to at least 6” above the top of the largest pipe entering the manhole and Precast sections placed from the masonry to the desired top elevation.

5. All the annular space between the sewer pipe and the opening in the manhole section shall be filled with brick and/or masonry to provide a waterproof seal.

6. Place the manhole casting on a minimum of 3 courses of masonry brick and a maximum of 5 courses of manhole brick. Install bricks radially. Precast concrete adjusting rings may be used in place of brick.

7. Mortar joints have to be smooth tooled joints.

F. Catch basins and inlets

1. Construct catch basins and inlets as indicated on the Drawings and Specifications.

2. Place catch basin and inlet castings on a minimum of 3 courses of manhole brick and a maximum of 5 courses of manhole brick. Install brick radially. Precast concrete adjusting rings may be used in place of brick.

G. Trench bracing: Install trench bracing in accordance with safety and other pertinent rules and regulations, and Division 31 Section “Earth Moving.”

H. Erosion control and sedimentation: Contractor to provide erosion control to minimize introduction of sedimentation into the system.

3.4 CLEANING

A. Prior to acceptance of storm sewers, underdrains, manholes and drainage structures, thoroughly clean those structures and remove all dirt and debris of whatever nature from inside sewer pipes, manholes and the like, and leave the site in a neat and clean condition.

END OF SECTION 334100
