PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Balancing Air Systems:
      a. Constant-volume air systems.
      b. Variable-air-volume systems.
   2. Balancing Hydronic Piping Systems:
      a. Constant-flow hydronic systems.
      b. Variable-flow hydronic systems.
      c. Primary-secondary hydronic systems.
   3. HVAC equipment quantitative-performance settings.
   4. Exhaust hood airflow balancing.
   5. Space pressurization testing and adjusting.
   6. Verifying that automatic control devices are functioning properly.
   7. Existing systems TAB.
   8. Reporting results of activities and procedures specified in this Section.

1.3 DEFINITIONS

A. Adjust: To regulate fluid flow rate and air patterns at the terminal equipment, such as to reduce fan speed or adjust a damper.

B. Balance: To proportion flows within the distribution system, including sub mains, branches, and terminals, according to indicated quantities.

C. Barrier or Boundary: Construction, either vertical or horizontal, such as walls, floors, and ceilings that are designed and constructed to restrict the movement of airflow, smoke, odors, and other pollutants.

D. Draft: A current of air, when referring to localized effect caused by one or more factors of high air velocity, low ambient temperature, or direction of airflow, whereby more heat is withdrawn from a person's skin than is normally dissipated.

E. NC: Noise criteria.

F. Procedure: An approach to and execution of a sequence of work operations to yield repeatable results.

G. RC: Room criteria.

H. Report Forms: Test data sheets for recording test data in logical order.

I. Static Head: The pressure due to the weight of the fluid above the point of measurement. In a closed system, static head is equal on both sides of the pump.

J. Suction Head: The height of fluid surface above the centerline of the pump on the suction side.

K. System Effect: A phenomenon that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
L. System Effect Factors: Allowances used to calculate a reduction of the performance ratings of a fan when installed under conditions different from those presented when the fan was performance tested.

M. TAB: Testing, adjusting, and balancing.

N. Terminal: A point where the controlled medium, such as fluid or energy, enters or leaves the distribution system.

O. Test: A procedure to determine quantitative performance of systems or equipment.

P. Testing, Adjusting, and Balancing (TAB) Firm: The entity responsible for performing and reporting TAB procedures.

S. TAB: Testing, adjusting, and balancing.

U. TAB Specialist: An entity engaged to perform TAB Work.

1.4 SUBMITTALS

C. Certified TAB Reports: Submit two copies of reports prepared, as specified in this Section, on approved forms certified by TAB firm.

D. Sample Report Forms: Submit two sets of sample TAB report forms.

1.5 QUALITY ASSURANCE

A. TAB Contractor Qualifications: Engage a TAB entity certified by either AABC or NEBB.
   1. TAB Technician: Employee of the TAB contractor and who is certified by AABC, NEBB, or TABB as a TAB technician.

B. TAB Conference: Meet with Architect and Owners representatives and Commissioning Authority on approval of the TAB strategies and procedures plan to develop a mutual understanding of the details. Require the participation of the TAB field supervisor and technicians. Provide seven days’ advance notice of scheduled meeting time and location.
   1. Agenda Items:
      b. The TAB plan.
      c. Coordination and cooperation of trades and subcontractors.

C. Coordination of documentation and communication flow. Certification of TAB Reports: Certify TAB field data reports. This certification includes the following:
   1. Review field data reports to validate accuracy of data and to prepare certified TAB reports.
   2. Certify that TAB team complied with approved TAB plan and the procedures specified and referenced in this Specification.

E. Instrumentation Type, Quantity, and Accuracy: As described in AABC’s "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems or NEBB’s " Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems, "Section II, " Required Instrumentation for NEBB Certification."

F. Instrumentation Calibration: Calibrate instruments at least every six months or more frequently if required by instrument manufacturer.
1. Keep an updated record of instrument calibration that indicates date of calibration and the name of party performing instrument calibration.

G. ASHRAE Compliance: Applicable requirements in ASHRAE 62.1, Section 7.2.2 - "Air Balancing."

H. ASHRAE/IESNA Compliance: Applicable requirements in ASHRAE/IESNA 90.1, Section 6.7.2.3 - "System Balancing."

1.6 PROJECT CONDITIONS
A. Partial Owner Occupancy: Owner may occupy completed areas of building before Substantial Completion. Cooperate with Owner during TAB operations to minimize conflicts with Owner’s operations.

1.7 COORDINATION
A. Coordinate the efforts of factory-authorized service representatives for systems and equipment, HVAC controls installers, and other mechanics to operate HVAC systems and equipment to support and assist TAB activities.

B. Notice: Provide seven days' advance notice for each test. Include scheduled test dates and times.

C. Perform TAB after leakage and pressure tests on air and water distribution systems have been satisfactorily completed.

1.8 WARRANTY
A. National Project Performance Guarantee: Provide a guarantee on AABC's "National Standards for Testing and Balancing Heating, Ventilating, and Air Conditioning Systems" forms stating that AABC will assist in completing requirements of the Contract Documents if TAB firm fails to comply with the Contract Documents. Guarantee includes the following provisions:
1. The certified TAB firm has tested and balanced systems according to the Contract Documents.
2. Systems are balanced to optimum performance capabilities within design and installation limits.

B. Special Guarantee: Provide a guarantee on NEBB forms stating that NEBB will assist in completing requirements of the Contract Documents if TAB firm fails to comply with the Contract Documents. Guarantee shall include the following provisions:
1. The certified TAB firm has tested and balanced systems according to the Contract Documents.
2. Systems are balanced to optimum performance capabilities within design and installation limits.

PART 2 PRODUCTS (Not Applicable)

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine the Contract Documents to become familiar with Project requirements and to discover conditions in systems' designs that may preclude proper TAB of systems and equipment.

B. Examine systems for installed balancing devices, such as test ports, gage cocks, thermometer wells, flow-control devices, balancing valves and fittings, and manual volume dampers. Verify that locations of these balancing devices are accessible.
C. Examine the approved submittals for HVAC systems and equipment.

D. Examine design data including HVAC system descriptions, statements of design assumptions for environmental conditions and systems' output, and statements of philosophies and assumptions about HVAC system and equipment controls.

E. Examine ceiling plenums and under floor air plenums used for supply, return, or relief air to verify that they meet the leakage class of connected ducts as specified in Division 23 "Metal Ducts" division 23 "Nonmetal Ducts" and are properly separated from adjacent areas. Verify that penetrations in plenum walls are sealed and fire-stopped if required.

F. Examine equipment performance data including fan and pump curves.
   1. Relate performance data to Project conditions and requirements, including system effects that can create undesired or unpredicted conditions that cause reduced capacities in all or part of a system.
   2. Calculate system-effect factors to reduce performance ratings of HVAC equipment when installed under conditions different from the conditions used to rate equipment performance. To calculate system effects for air systems, use tables and charts found in AMCA 201, "Fans and Systems," or in SMACNA’s "HVAC Systems - Duct Design." Compare results with the design data and installed conditions.

G. Examine system and equipment installations and verify that field quality-control testing, cleaning, and adjusting specified in individual Sections have been performed.

H. Examine test reports specified in individual system and equipment Sections.

I. Examine HVAC equipment and filters and verify that bearings are greased, belts are aligned and tight, and equipment with functioning controls is ready for operation.

J. Examine terminal units; such as variable-air-volume boxes, and verify that they are accessible and their controls are connected and functioning.

K. Examine strainers. Verify that startup screens are replaced by permanent screens with indicated perforations.

L. Examine three-way valves for proper installation for their intended function of diverting or mixing fluid flows.

M. Examine heat-transfer coils for correct piping connections and for clean and straight fins.

N. Examine system pumps to ensure absence of entrained air in the suction piping.

O. Examine operating safety interlocks and controls on HVAC equipment.

P. Report deficiencies discovered before and during performance of TAB procedures. Observe and record system reactions to changes in conditions. Record default set points if different from indicated values.

3.2 PREPARATION

A. Prepare a TAB plan that includes strategies and step-by-step procedures.

B. Complete system-readiness checks and prepare reports. Verify the following: 7
   1. Permanent electrical-power wiring is complete.
   2. Hydronic systems are filled, clean, and free of air.
   3. Automatic temperature-control systems are operational.
   4. Equipment and duct access doors are securely closed.
   5. Balance, smoke, and fire dampers are open.
   6. Isolating and balancing valves are open and control valves are operational.
   7. Ceilings are installed in critical areas where air-pattern adjustments are required and access to balancing devices is provided.
   8. Windows and doors can be closed so indicated conditions for system operations can be met.
3.3 GENERAL PROCEDURES FOR TESTING AND BALANCING

A. Perform testing and balancing procedures on each system according to the procedures contained in AABC's "National Standards for Total System Balance", ASHRAE 111, NEBB's "Procedural Standards for Testing, Adjusting, and Balancing of Environmental Systems", SMACNA's "HVAC Systems - Testing, Adjusting, and Balancing" and in this Section.
   1. Comply with requirements in ASHRAE 62.1, Section 7.2.2 - "Air Balancing."

B. Cut insulation, ducts, pipes, and equipment cabinets for installation of test probes to the minimum extent necessary for TAB procedures.
   1. After testing and balancing, install test ports and duct access doors that comply with requirements in Division 23 "Air Duct Accessories."
   2. Install and join new insulation that matches removed materials. Restore insulation, coverings, vapor barrier, and finish according to Division 23 "Duct Insulation," Division 23 "HVAC Equipment Insulation," and Division 23 "HVAC Piping Insulation."

C. Mark equipment and balancing devices, including damper-control positions, valve position indicators, fan-speed-control levers, and similar controls and devices, with paint or other suitable, permanent identification material to show final settings.

D. Take and report testing and balancing measurements in inch-pound (IP) units.

3.4 GENERAL PROCEDURES FOR BALANCING AIR SYSTEMS

A. Prepare test reports for both fans and outlets. Obtain manufacturer's outlet factors and recommended testing procedures. Crosscheck the summation of required outlet volumes with required fan volumes.

B. Prepare schematic diagrams of systems' "as-built" duct layouts.

C. For variable-air-volume systems, develop a plan to simulate diversity.

D. Determine the best locations in main and branch ducts for accurate duct-airflow measurements.

E. Check airflow patterns from the outdoor-air louvers and dampers and the return- and exhaust-air dampers through the supply-fan discharge and mixing dampers.

F. Locate start-stop and disconnect switches, electrical interlocks, and motor starters.

G. Verify that motor starters are equipped with properly sized thermal protection.

H. Check dampers for proper position to achieve desired airflow path.

I. Check for airflow blockages.

J. Check condensate drains for proper connections and functioning.

K. Check for proper sealing of air-handling-unit components.

L. Verify that air duct system is sealed as specified in Division 23 "Metal Ducts."

3.5 PROCEDURES FOR CONSTANT-VOLUME AIR SYSTEMS

A. Adjust fans to deliver total indicated airflows within the maximum allowable fan speed listed by fan manufacturer.
   1. Measure total airflow.
      a. Where sufficient space in ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow.
   2. Measure fan static pressures as follows to determine actual static pressure:
      a. Measure outlet static pressure as far downstream from the fan as practical and upstream from restrictions in ducts such as elbows and transitions.
      b. Measure static pressure directly at the fan outlet or through the flexible connection.
c. Measure inlet static pressure of single-inlet fans in the inlet duct as near the fan as possible, upstream from the flexible connection, and downstream from duct restrictions.

d. Measure inlet static pressure of double-inlet fans through the wall of the plenum that houses the fan.

3. Measure static pressure across each component that makes up an air-handling unit, rooftop unit, and other air-handling and -treating equipment.
   a. Report the cleanliness status of filters and the time static pressures are measured.

4. Obtain approval from Architect for adjustment of fan speed higher or lower than indicated speed. Comply with requirements in HVAC Sections for air-handling units for adjustment of fans, belts, and pulley sizes to achieve indicated air-handling-unit performance.

5. Measure static pressures entering and leaving other devices, such as sound traps, heat-recovery equipment, and air washers, under final balanced conditions.

6. Do not make fan-speed adjustments that result in motor overload. Consult equipment manufacturers about fan-speed safety factors. Modulate dampers and measure fan-motor amperage to ensure that no overload will occur. Measure amperage in full-cooling, full-heating, economizer, and any other operating mode to determine the maximum required brake horsepower.

B. Adjust volume dampers for main duct, submain ducts, and major branch ducts to indicated airflows within specified tolerances.

1. Measure airflow of submain and branch ducts.
   a. Where sufficient space in submain and branch ducts is unavailable for Pitot-tube traverse measurements, measure airflow at terminal outlets and inlets and calculate the total airflow for that zone.

2. Measure static pressure at a point downstream from the balancing damper, and adjust volume dampers until the proper static pressure is achieved.

3. Remeasure each submain and branch duct after all have been adjusted. Continue to adjust submain and branch ducts to indicated airflows within specified tolerances.

C. Measure air outlets and inlets without making adjustments.

1. Measure terminal outlets using a direct-reading hood or outlet manufacturer's written instructions and calculating factors.

D. Adjust air outlets and inlets for each space to indicated airflows within specified tolerances of indicated values. Make adjustments using branch volume dampers rather than extractors and the dampers at air terminals.

1. Adjust each outlet in same room or space to within specified tolerances of indicated quantities without generating noise levels above the limitations prescribed by the Contract Documents.

2. Adjust patterns of adjustable outlets for proper distribution without drafts.

3.6 PROCEDURES FOR VARIABLE-AIR-VOLUME SYSTEMS

A. Compensating for Diversity: When the total airflow of all terminal units is more than the indicated airflow of the fan, place a selected number of terminal units at minimum set-point airflow with the remainder at maximum-airflow condition until the total airflow of the terminal units equals the indicated airflow of the fan. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.

B. Pressure-Independent, Variable-Air-Volume Systems: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:

1. Set outdoor-air dampers at minimum, and set return- and exhaust-air dampers at a position that simulates full-cooling load.

2. Select the terminal unit that is most critical to the supply-fan airflow and static pressure. Measure static pressure. Adjust system static pressure so the entering static pressure for the critical terminal unit is not less than the sum of the terminal-unit manufacturer's recommended minimum inlet static pressure plus the static pressure needed to overcome terminal-unit discharge system losses.

3. Measure total system airflow. Adjust to within indicated airflow.
4. Set terminal units at maximum airflow and adjust controller or regulator to deliver the designed maximum airflow. Use terminal-unit manufacturer's written instructions to make this adjustment. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.

5. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
   a. If air outlets are out of balance at minimum airflow, report the condition but leave outlets balanced for maximum airflow.

6. Remeasure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
   a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.

7. Measure static pressure at the most critical terminal unit and adjust the static-pressure controller at the main supply-air sensing station to ensure that adequate static pressure is maintained at the most critical unit.

8. Record final fan-performance data.

C. Pressure-Dependent, Variable-Air-Volume Systems without Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
   1. Balance variable-air-volume systems the same as described for constant-volume air systems.
   2. Set terminal units and supply fan at full-airflow condition.
   3. Adjust inlet dampers of each terminal unit to indicated airflow and verify operation of the static-pressure controller. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
   4. Readjust fan airflow for final maximum readings.
   5. Measure operating static pressure at the sensor that controls the supply fan if one is installed, and verify operation of the static-pressure controller.
   6. Set supply fan at minimum airflow if minimum airflow is indicated. Measure static pressure to verify that it is being maintained by the controller.
   7. Set terminal units at minimum airflow and adjust controller or regulator to deliver the designed minimum airflow. Check air outlets for a proportional reduction in airflow the same as described for constant-volume air systems.
      a. If air outlets are out of balance at minimum airflow, report the condition but leave the outlets balanced for maximum airflow.
   8. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow.
      a. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.

D. Pressure-Dependent, Variable-Air-Volume Systems with Diversity: After the fan systems have been adjusted, adjust the variable-air-volume systems as follows:
   1. Set system at maximum indicated airflow by setting the required number of terminal units at minimum airflow. Select the reduced-airflow terminal units so they are distributed evenly among the branch ducts.
   2. Adjust supply fan to maximum indicated airflow with the variable-airflow controller set at maximum airflow.
   3. Set terminal units at full-airflow condition.
   4. Adjust terminal units starting at the supply-fan end of the system and continuing progressively to the end of the system. Adjust inlet dampers of each terminal unit to indicated airflow. When total airflow is correct, balance the air outlets downstream from terminal units the same as described for constant-volume air systems.
   5. Adjust terminal units for minimum airflow.
   6. Measure static pressure at the sensor.
7. Measure the return airflow to the fan while operating at maximum return airflow and minimum outdoor airflow. Adjust the fan and balance the return-air ducts and inlets the same as described for constant-volume air systems.

3.7 GENERAL PROCEDURES FOR HYDRONIC SYSTEMS

A. Prepare test reports with pertinent design data, and number in sequence starting at pump to end of system. Check the sum of branch-circuit flows against the approved pump flow rate. Correct variations that exceed plus or minus 5 percent.

B. Prepare hydronic systems for testing and balancing according to the following, in addition to the general preparation procedures specified above:

1. Open all manual valves for maximum flow.
2. Check liquid level in expansion tank.
3. Check makeup water-station pressure gage for adequate pressure for highest vent.
4. Check flow-control valves for specified sequence of operation, and set at indicated flow.
5. Set differential-pressure control valves at the specified differential pressure. Do not set at fully closed position when pump is positive-displacement type unless several terminal valves are kept open.
6. Set system controls so automatic valves are wide open to heat exchangers.
7. Check pump-motor load. If motor is overloaded, throttle main flow-balancing device so motor nameplate rating is not exceeded.
8. Check air vents for a forceful liquid flow exiting from vents when manually operated.

3.8 PROCEDURES FOR CONSTANT-FLOW HYDRONIC SYSTEMS

A. Measure water flow at pumps. Use the following procedures except for positive-displacement pumps:

1. Verify impeller size by operating the pump with the discharge valve closed. Read pressure differential across the pump. Convert pressure to head and correct for differences in gage heights. Note the point on manufacturer's pump curve at zero flow and verify that the pump has the intended impeller size.
   a. If impeller sizes must be adjusted to achieve pump performance, obtain approval from Owner, Commissioning Authority and/or Engineer and comply with requirements in Section 232123 "Hydronic Pumps."
2. Check system resistance. With all valves open, read pressure differential across the pump and mark pump manufacturer's head-capacity curve. Adjust pump discharge valve until indicated water flow is achieved.
   a. Monitor motor performance during procedures and do not operate motors in overload conditions.
3. Verify pump-motor brake horsepower. Calculate the intended brake horsepower for the system based on pump manufacturer's performance data. Compare calculated brake horsepower with nameplate data on the pump motor. Report conditions where actual amperage exceeds motor nameplate amperage.
4. Report flow rates that are not within plus or minus 10 percent of design.

B. Measure flow at all automatic flow control valves to verify that valves are functioning as designed.

C. Measure flow at all pressure-independent characterized control valves, with valves in fully open position, to verify that valves are functioning as designed.

D. Set calibrated balancing valves, if installed, at calculated pre-settings.

E. Measure flow at all stations and adjust, where necessary, to obtain first balance.

1. System components that have Cv rating or an accurately cataloged flow-pressure-drop relationship may be used as a flow-indicating device.

F. Measure flow at main balancing station and set main balancing device to achieve flow that is 5 percent greater than indicated flow.
G. Adjust balancing stations to within specified tolerances of indicated flow rate as follows:
   1. Determine the balancing station with the highest percentage over indicated flow.
   2. Adjust each station in turn, beginning with the station with the highest percentage over indicated flow and proceeding to the station with the lowest percentage over indicated flow.
   3. Record settings and mark balancing devices.

H. Measure pump flow rate and make final measurements of pump amperage, voltage, rpm, pump heads, and systems' pressures and temperatures including outdoor-air temperature.

I. Measure the differential-pressure-control-valve settings existing at the conclusion of balancing.

J. Check settings and operation of each safety valve. Record settings.

3.9 PROCEDURES FOR VARIABLE-FLOW HYDRONIC SYSTEMS

A. Balance systems with automatic two- and three-way control valves by setting systems at maximum flow through heat-exchange terminals and proceed as specified above for hydronic systems.

3.10 PROCEDURES FOR PRIMARY-SECONDARY HYDRONIC SYSTEMS

A. Balance the primary circuit flow first and then balance the secondary circuits.

3.11 PROCEDURES FOR MOTORS

A. Motors, 1/2 HP and Larger: Test at final balanced conditions and record the following data:
   1. Manufacturer's name, model number, and serial number.
   4. Efficiency rating.
   5. Nameplate and measured voltage, each phase.
   6. Nameplate and measured amperage, each phase.
   7. Starter thermal-protection-element rating.

B. Motors Driven by Variable-Frequency Controllers: Test for proper operation at speeds varying from minimum to maximum. Test the manual bypass of the controller to prove proper operation. Record observations including name of controller manufacturer, model number, serial number, and nameplate data.

3.12 PROCEDURES FOR BOILERS

A. Measure entering- and leaving-water temperatures and water flow.

3.13 PROCEDURES FOR HEAT-TRANSFER COILS

A. Measure, adjust, and record the following data for each water coil:
   1. Entering- and leaving-water temperature.
   2. Water flow rate.
   3. Water pressure drop.
   4. Dry-bulb temperature of entering and leaving air.
   5. Wet-bulb temperature of entering and leaving air for cooling coils.
   6. Airflow.
   7. Air pressure drop.

B. Measure, adjust, and record the following data for each electric heating coil:
   1. Nameplate data.
   2. Airflow.
   3. Entering- and leaving-air temperature at full load.
   4. Voltage and amperage input of each phase at full load and at each incremental stage.
   5. Calculated kilowatt at full load.
   6. Fuse or circuit-breaker rating for overload protection.
C. Measure, adjust, and record the following data for each steam coil:
   1. Dry-bulb temperature of entering and leaving air.
   2. Airflow.
   3. Air pressure drop.
   4. Inlet steam pressure.

D. Measure, adjust, and record the following data for each refrigerant coil:
   1. Dry-bulb temperature of entering and leaving air.
   2. Wet-bulb temperature of entering and leaving air.
   3. Airflow.
   4. Air pressure drop.
   5. Refrigerant suction pressure and temperature.

3.14 PROCEDURES FOR TEMPERATURE MEASUREMENTS

A. During TAB, report the need for adjustment in temperature regulation within the automatic temperature-control system.

B. Measure indoor wet- and dry-bulb temperatures every other hour for a period of two successive eight-hour days, in each separately controlled zone, to prove correctness of final temperature settings. Measure when the building or zone is occupied.

C. Measure outside-air, wet- and dry-bulb temperatures.

3.15 PROCEDURES FOR EXHAUST HOODS

A. Measure, adjust, and record the airflow of each exhaust hood. Measure airflow by duct Pitot-tube traverse. If a duct Pitot-tube traverse is not possible, explain why, in the report, and explain the test method used.

B. After balancing is complete, do the following:
   1. Measure and record the static pressure at the hood exhaust-duct connection.
   2. Check the hood for capture and containment of smoke using a smoke emitting device. Observe the smoke pattern. Make adjustments to achieve optimum results.

3.16 TEMPERATURE-CONTROL VERIFICATION

A. Verify that controllers are calibrated and commissioned.

B. Check transmitter and controller locations and note conditions that would adversely affect control functions.

C. Record controller settings and note variances between set points and actual measurements.

D. Check the operation of limiting controllers (i.e., high- and low-temperature controllers).

E. Check free travel and proper operation of control devices such as damper and valve operators.

F. Check the sequence of operation of control devices. Note air pressures and device positions and correlate with airflow and water flow measurements. Note the speed of response to input changes.

G. Check the interaction of electrically operated switch transducers.

H. Check the interaction of interlock and lockout systems.

I. Check main control supply-air pressure and observe compressor and dryer operations.

J. Record voltages of power supply and controller output. Determine whether the system operates on a grounded or non-grounded power supply.

K. Note operation of electric actuators using spring return for proper fail-safe operations.
3.17 PROCEDURES FOR TESTING, ADJUSTING, AND BALANCING EXISTING SYSTEMS

A. Perform a preconstruction inspection of existing equipment that is to be reused.
   1. Measure and record the operating speed, airflow, and static pressure of each air terminal device impacted by demolition, relocation and new work.
   2. Measure and record water flow and pressure of each air terminal device on pipe loops impacted by demolition, relocation and new work.
   3. Measure and record water flow and pressure of existing chiller.
   4. Measure and record water flow of each pump impacted by demolition, relocation and new work.
   5. Measure motor voltage and amperage. Compare the values to motor nameplate information.
   6. Check the condition of filters.
   7. Check the condition of coils.
   8. Check the operation of the drain pan and condensate drain trap.
   9. Check bearings and other lubricated parts for proper lubrication.
  10. Report on the operating condition of the equipment and the results of the measurements taken.
      Report deficiencies.

B. Before performing testing and balancing of existing systems, inspect existing equipment that is to remain and be reused to verify that existing equipment has been cleaned and refurbished.
   1. New filters are installed.
   2. Coils are clean and fins combed.
   3. Drain pans are clean.
   4. Fans are clean.
   5. Bearings and other parts are properly lubricated.
   6. Deficiencies noted in the preconstruction report are corrected.

C. Perform testing and balancing of existing systems to the extent that existing systems are affected by the renovation work.
   1. Compare the indicated airflow of the renovated work to the measured fan airflows and determine the new fan, speed, filter, and coil face velocity.
   2. Compare the indicated water flow of impacted work to the measured water flows and balance systems to meet flow rates of existing systems.
   3. Verify that the indicated airflows of the renovated work result in filter and coil face velocities and fan speeds that are within the acceptable limits defined by equipment manufacturer.
   4. If calculations increase or decrease the airflow and water flow rates by more than 5 percent, make equipment adjustments to achieve the calculated airflow and water flow rates. If 5 percent or less, equipment adjustments are not required.
   5. Air balance each air outlet.

3.18 TOLERANCES

A. Set HVAC system's air flow rates and water flow rates within the following tolerances:
   1. Supply, Return, and Exhaust Fans and Equipment with Fans: Plus 5 to plus 10 percent.
   2. Air Outlets and Inlets: minus 5 to plus 10 percent.
   3. Heating-Water Flow Rate: 0 to minus 10 percent.
   4. Cooling-Water Flow Rate: 0 to minus 5 percent.

3.19 REPORTING

A. Initial Construction-Phase Report: Based on examination of the Contract Documents as specified in “Examination” Article, prepare a report on the adequacy of design for systems' balancing devices. Recommend changes and additions to systems' balancing devices to facilitate proper performance measuring and balancing. Recommend changes and additions to HVAC systems and general construction to allow access for performance measuring and balancing devices.
B. Status Reports: As work progress prepare progress reports to describe completed procedures, procedures in progress, and scheduled procedures. Include a list of deficiencies and problems found in systems being tested and balanced. Prepare a separate report for each system and each building floor for systems serving multiple floors.

3.20 FINAL REPORT

A. General: Prepare a certified written report; tabulate and divide the report into separate sections for tested systems and balanced systems.
   1. Include a certification sheet at the front of the report’s binder, signed and sealed by the certified testing and balancing engineer.
   2. Include a list of instruments used for procedures, along with proof of calibration.

B. Final Report Contents: In addition to certified field-report data, include the following:
   1. Pump curves.
   2. Fan curves.
   3. Manufacturers' test data.
   4. Field test reports prepared by system and equipment installers.
   5. Other information relative to equipment performance; do not include Shop Drawings and product data.

C. General Report Data: In addition to form titles and entries, include the following data:
   1. Title page.
   2. Name and address of the TAB contractor.
   3. Project name.
   4. Project location.
   5. Architect's name and address.
   6. Engineer's name and address.
   7. Contractor's name and address.
   9. Signature of TAB supervisor who certifies the report.
   10. Table of Contents with the total number of pages defined for each section of the report. Number each page in the report.
   11. Summary of contents including the following:
       a. Indicated versus final performance.
       b. Notable characteristics of systems.
       c. Description of system operation sequence if it varies from the Contract Documents.
   12. Nomenclature sheets for each item of equipment.
   13. Data for terminal units, including manufacturer's name, type, size, and fittings.
   14. Notes to explain why certain final data in the body of reports vary from indicated values.
   15. Test conditions for fans and pump performance forms including the following:
       a. Settings for outdoor-, return-, and exhaust-air dampers.
       b. Conditions of filters.
       c. Cooling coil, wet- and dry-bulb conditions.
       d. Face and bypass damper settings at coils.
       e. Fan drive settings including settings and percentage of maximum pitch diameter.
       f. Inlet vane settings for variable-air-volume systems.
       g. Settings for supply-air, static-pressure controller.
       h. Other system operating conditions that affect performance.

D. System Diagrams: Include schematic layouts of air and hydronic distribution systems. Present each system with single-line diagram and include the following:
   1. Quantities of outdoor, supply, return, and exhaust airflows.
   2. Water and steam flow rates.
   3. Duct, outlet, and inlet sizes.
   4. Pipe and valve sizes and locations.
   5. Terminal units.

E. Air-Handling Unit Test Reports: For air-handling units with coils, include the following:

1. Unit Data: Include the following:
   a. Unit identification.
   b. Location.
   c. Make and type.
   d. Model number and unit size.
   e. Manufacturer's serial number.
   f. Unit arrangement and class.
   g. Discharge arrangement.
   h. Sheave make, size in inches (mm), and bore.
   i. Sheave dimensions, center-to-center, and amount of adjustments in inches (mm).
   j. Number of belts, make, and size.
   k. Number of filters, type, and size.

2. Motor Data:
   a. Make and frame type and size.
   b. Horsepower and rpm.
   c. Volts, phase, and hertz.
   d. Full-load amperage and service factor.
   e. Sheave make, size in inches (mm), and bore.
   f. Sheave dimensions, center-to-center, and amount of adjustments in inches (mm).

3. Test Data (Indicated and Actual Values):
   a. Total airflow rate in cfm.
   b. Total system static pressure in inches wg.
   c. Fan rpm.
   d. Discharge static pressure in inches w.g.
   e. Filter static-pressure differential in inches w.g.
   f. Preheat coil static-pressure differential in inches w.g.
   g. Cooling coil static-pressure differential in inches w.g.
   h. Heating coil static-pressure differential in inches w.g.
   i. Outside airflow in cfm.
   j. Return airflow in cfm.
   k. Outside-air damper position.
   l. Return-air damper position.
   m. Vortex damper position.

F. Apparatus-Coil Test Reports:

1. Coil Data:
   a. System identification.
   b. Location.
   c. Coil type.
   d. Number of rows.
   e. Fin spacing in fins per inch o.c.
   f. Make and model number.
   g. Face area in sq. ft.
   h. Tube size in NPS.
   i. Tube and fin materials.
   j. Circuiting arrangement.

2. Test Data (Indicated and Actual Values):
   a. Airflow rate in cfm.
   b. Average face velocity in fpm.
   c. Air pressure drop in inches w.g.
   d. Outside-air, wet- and dry-bulb temperatures in degrees F.
   e. Return-air, wet- and dry-bulb temperatures in degrees F.
f. Entering-air, wet- and dry-bulb temperatures in degrees F.
g. Leaving-air, wet- and dry-bulb temperatures in degrees F.
h. Water flow rate in gpm.
i. Water pressure differential in feet of head or psig.
j. Entering-water temperature in degrees F.
k. Leaving-water temperature in degrees F.
l. Refrigerant expansion valve and refrigerant types.
m. Refrigerant suction pressure in psig.
n. Refrigerant suction temperature in degrees F.
o. Inlet steam pressure in psig.

G. Electric-Coil Test Reports: For electric furnaces, duct coils, and electric coils installed in central-station air-handling units, include the following:

1. Unit Data:
   a. System identification.
   b. Location.
   c. Coil identification.
   d. Capacity in Btuh.
   e. Number of stages.
   f. Connected volts, phase, and hertz.
   g. Rated amperage.
   h. Airflow rate in cfm.
   i. Face area in sq. ft.
   j. Minimum face velocity in fpm.

2. Test Data (Indicated and Actual Values):
   a. Heat output in Btuh.
   b. Airflow rate in cfm.
   c. Air velocity in fpm.
   d. Entering-air temperature in degrees F.
   e. Leaving-air temperature in degrees F.
   f. Voltage at each connection.
   g. Amperage for each phase.

H. Fan Test Reports: For supply, return, and exhaust fans, include the following:

1. Fan Data:
   a. System identification.
   b. Location.
   c. Make and type.
   d. Model number and size.
   e. Manufacturer's serial number.
   f. Arrangement and class.
   g. Sheave make, size in inches, and bore.
   h. Sheave dimensions, center-to-center, and amount of adjustments in inches.

2. Motor Data:
   a. Make and frame type and size.
   b. Horsepower and rpm.
   c. Volts, phase, and hertz.
   d. Full-load amperage and service factor.
   e. Sheave make, size in inches, and bore.
   f. Sheave dimensions, center-to-center, and amount of adjustments in inches.
   g. Number of belts, make, and size.

3. Test Data (Indicated and Actual Values):
   a. Total airflow rate in cfm.
   b. Total system static pressure in inches w.g.
   c. Fan rpm.
   d. Discharge static pressure in inches w.g.
e. Suction static pressure in inches w.g.

I. Round, Flat-Oval, and Rectangular Duct Traverse Reports: Include a diagram with a grid representing the duct cross-section and record the following:

1. Report Data:
   a. System and air-handling unit number.
   b. Location and zone.
   c. Traverse air temperature in degrees F.
   d. Duct static pressure in inches w.g.
   e. Duct size in inches.
   f. Duct area in sq. ft.
   g. Indicated airflow rate in cfm.
   h. Indicated velocity in fpm.
   i. Actual airflow rate in cfm.
   j. Actual average velocity in fpm.
   k. Barometric pressure in psig.

J. Air-Terminal-Device Reports:

1. Unit Data:
   a. System and air-handling unit identification.
   b. Location and zone.
   c. Test apparatus used.
   d. Area served.
   e. Air-terminal-device make.
   f. Air-terminal-device number from system diagram.
   g. Air-terminal-device type and model number.
   h. Air-terminal-device size.
   i. Air-terminal-device effective area in sq. ft.

2. Test Data (Indicated and Actual Values):
   a. Airflow rate in cfm.
   b. Air velocity in fpm.
   c. Preliminary airflow rate as needed in cfm.
   d. Preliminary velocity as needed in fpm.
   e. Final airflow rate in cfm.
   f. Final velocity in fpm.
   g. Space temperature in degrees F.

K. System-Coil Reports: For reheat coils and water coils of terminal units, include the following:

1. Unit Data:
   a. System and air-handling unit identification.
   b. Location and zone.
   c. Room or riser served.
   d. Coil make and size.
   e. Flowmeter type.

2. Test Data (Indicated and Actual Values):
   a. Airflow rate in cfm.
   b. Entering-water temperature in degrees F.
   c. Leaving-water temperature in degrees F.
   d. Water pressure drop in feet of head or psig.
   e. Entering-air temperature in degrees F.
   f. Leaving-air temperature in degrees F.

L. Pump Test Reports: Calculate impeller size by plotting the shutoff head on pump curves and include the following:

1. Unit Data:
   a. Unit identification.
   b. Location.
c. Service.
d. Make and size.
e. Model and serial numbers.
f. Water flow rate in gpm.
g. Water pressure differential in feet of head or psig.
h. Required net positive suction head in feet of head or psig.
i. Pump rpm.
j. Impeller diameter in inches.
k. Motor make and frame size.
l. Motor horsepower and rpm.
m. Voltage at each connection.
n. Amperage for each phase.
o. Full-load amperage and service factor.
p. Seal type.

2. Test Data (Indicated and Actual Values):
   a. Static head in feet of head or psig.
   b. Pump shutoff pressure in feet of head or psig.
   c. Actual impeller size in inches (mm).
   d. Full-open flow rate in gpm.
   e. Full-open pressure in feet of head or psig.
   f. Final discharge pressure in feet of head or psig.
   g. Final suction pressure in feet of head or psig.
   h. Final total pressure in feet of head or psig.
   i. Final water flow rate in gpm.
   j. Voltage at each connection.
   k. Amperage for each phase.

M. Instrument Calibration Reports:
   1. Report Data:
      a. Instrument type and make.
      b. Serial number.
      c. Application.
      d. Dates of use.
      e. Dates of calibration.

3.21 INSPECTIONS

A. Initial Inspection:
   1. After testing and balancing are complete, operate each system and randomly check measurements to verify that the system is operating according to the final test and balance readings documented in the final report.
   2. Check the following for each system:
      a. Measure airflow of at least 10 percent of air outlets.
      b. Measure water flow of at least 5 percent of terminals.
      c. Measure room temperature at each thermostat/temperature sensor. Compare the reading to the set point.
      d. Verify that balancing devices are marked with final balance position.
      e. Note deviations from the Contract Documents in the final report.

B. Final Inspection:
   1. Final test and balance report requires sign off by Owner.
   2. Architect, Owner, Engineer, or Commissioning Authority shall randomly select measurements, documented in the final report, to be rechecked. Rechecking shall be limited to either 20 percent of the total measurements recorded or the extent of measurements that can be accomplished in a normal 8-hour business day.
   3. If rechecks yield measurements that differ from the measurements documented in the final report by more than the tolerances allowed, the measurements shall be noted as "FAILED."
4. If the number of "FAILED" measurements is greater than 10 percent of the total measurements checked during the final inspection, the testing and balancing shall be considered incomplete and shall be rejected.

5. TAB firm shall recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes and resubmit the final report.

6. Request a second final inspection. If the second final inspection also fails, Owner shall contract the services of another TAB firm to complete the testing and balancing in accordance with the Contract Documents and deduct the cost of the services from the final payment.

C. TAB Work will be considered defective if it does not pass final inspections. If TAB Work fails, proceed as follows:
   1. Recheck all measurements and make adjustments. Revise the final report and balancing device settings to include all changes; resubmit the final report and request a second final inspection.
   2. If the second final inspection also fails, Owner may contract the services of another TAB contractor to complete TAB Work according to the Contract Documents and deduct the cost of the services from the original TAB contractor's final payment.

D. Prepare test and inspection reports.

E. Within 90 days of completing TAB, perform additional TAB to verify that balanced conditions are being maintained throughout and to correct unusual conditions.

F. Seasonal Periods: If initial TAB procedures were not performed during near-peak summer and winter conditions, perform additional TAB during near-peak summer and winter conditions.

LIST OF ALTERNATES

Alternate #1 - Full parking lot

Alternate #2 - Shop Loading Dock Scissor Lift (Lift-5) to be located in Loading 1340

Alternate #3 – Add camera in café

Alternate #4 - Multi-Connector for catwalk

Alternate #5 - Add 7400 SF of 2" fiberglass insulation distributed on walls and/or ceiling in the shop space.

Alternate #6 - Remove scissor lift (Lift-5) at Valade Loading dock (Loading 1219).

Alternate #7 - Remove Valade WD FAB-8 flush panels and provide painted gypsum board finish.

Alternate #8 - Deduct alternate for a portion of the new theatrical lighting control system in the Valade - 116163. Refer to TL Documents.

Alternate #9 - Deduct alternate for motorized lineset #4 in the Valade – 116133.

Alternate #10 - Replace WD FAB-4 at Theater with RPG Flutterfree-T, 1-1/32” deep, size per drawing

Alternate #11 – Add acoustic panels to Valade 2nd floor Dressing Room 2123, Lounge 2124 and Dressing Room 2122. BOD – Kinetics SportsBoard Conform, color: to be selected by architect by manufactures standard colors.

Alternate #12 – Add Truss and Chain Motor at Proscenium

Alternate #14 – Owner provided second direct view LED screen. Provide infrastructure in base bid.

THIS ENTIRE SET OF CONSTRUCTION DRAWINGS WAS ORIGINALLY PUBLISHED IN COLOR. IF THIS TEXT IS NOT DISPLAYED AS GREEN, YOU MAY BE MISSING IMPORTANT DETAILS.
PROJECT DESCRIPTION AND SYSTEM TYPE

THE SCOPE OF WORK IN THIS SECTION INCLUDES PROVIDING ALL WORK, MATERIALS, LABOR, EQUIPMENT AND SUPERVISION NECESSARY TO COMPLETE AN ACTIVE SUB-SLAB DEPRESSURIZATION (SSD) SYSTEM FOR THE ENTIRE FOOTPRINT OF THE BUILDING.

GENERAL REQUIREMENTS

1. THE SSD SYSTEM SHALL BE INSTALLED IN GENERAL ACCORDANCE WITH THE DESIGN AND INSTALLATION STANDARD.
2. MATERIALS AND EQUIPMENT SHALL BE PROVIDED AS PER THE DRAWINGS AND SPECIFICATIONS.
3. MATERIALS AND EQUIPMENT SHALL NOT BE STORED OR USED IN SUCH A MANNER AS TO CREATE UNSAFE CONDITIONS AND SHALL MEET ALL APPLICABLE CODES.
4. WORK WILL BE CONDUCTED IN CLOSE PROXIMITY TO OTHER TRADES, SAFETY CONCERNS ARE A PRIORITY.
5. ATTEMPTS SHOULD BE MADE TO MINIMIZE DUST, NOISE, AND OTHER INCONVENIENCES.
6. ALL SLAB PENETRATIONS SHALL BE SEALED TO REDUCE DRAWING AIR FROM THE INTERIOR OF THE BUILDING. COORDINATE SEALING WITH OTHER TRADES.
7. AS MINIMUM REQUIREMENTS, THE CONTRACTOR SHALL OBSERVE AND FOLLOW ALL APPROPRIATE AND RELEVANT OR APPLICABLE PROCEDURES IDENTIFIED IN APPLICABLE FEDERAL, STATE, AND LOCAL RULES AND REGULATIONS IN CONDUCTING THE WORK.
8. OTHER APPLICABLE REGULATIONS NOT EXPLICITLY INCLUDED IN THESE SPECIFICATIONS SHALL BE ADHERED TO IN CONDUCTING THE WORK.
9. THE CONTRACTOR SHALL BE RESPONSIBLE FOR OBTAINING NECESSARY PERMITS AND APPROVALS FOR HIS PROJECT RELATED WORK AND FACILITIES.

PROJECT BENCHMARK

THE FINISHED SYSTEM SHALL DEMONSTRATE A MINIMUM DIFFERENTIAL PRESSURE BETWEEN THE SUB SLAB AND INDOOR AIR OF -0.020"WC AT THE LEAST RESPONSIVE MONITORING POINT.

INSTALLATION MATERIALS

SEE SHEET V0-02 FOR A LIST OF SPECIFIED MATERIALS AND AN ESTIMATED NECESSARY QUANTITY TO COMPLETE THE PROJECT.

MATERIAL SUBSTITUTIONS

NO SUBSTITUTIONS ARE ALLOWED WITHOUT THE PRIOR WRITTEN AUTHORIZATION OF THE SYSTEM DESIGN PROFESSIONAL.

CONTRACTOR QUALIFICATIONS

THE PERSON RESPONSIBLE FOR DIAGNOSTIC TESTING, DESIGN, CONSTRUCTION AND ON-SITE SUPERVISION, AS REQUIRED BY THE SPECIFICATIONS, SHALL HAVE SUCCESSFULLY COMPLETED THE REQUIREMENTS OF THE SPECIFICATIONS AND SHALL BE MAINTAINING A CURRENT CERTIFICATION IN THE NATIONAL RADON PROFICIENCY PROGRAM (NRPP) AS A MITIGATION SPECIALIST.

CONTRACTOR EXPERIENCE

CONTRACTOR WILL BE REQUIRED TO SUBMIT EVIDENCE DEMONSTRATING THAT THE CONTRACTOR HAS SUCCESSFULLY DESIGNED AND INSTALLED AT LEAST 5 SSD SYSTEMS OF THE SAME OR SIMILAR TYPE REQUIRED.

ON SITE SUPERVISION

NO WORK AT THE SITE WILL BE PERMITTED WITHOUT THE PRESENCE OF A PERSON POSSESSING A CURRENT VALID MITIGATION SPECIALIST CERTIFICATION WITH THE NRPP.

DESIGN AND INSTALLATION STANDARD

THIS SYSTEM WAS DESIGNED TO MEET OR EXCEED THE 2018 EDITION OF ANSI/AARST CC-1000: SOIL GAS CONTROL SYSTEMS IN NEW CONSTRUCTION BUILDINGS STANDARD. THE FOLLOWING SECTIONS SHALL APPLY TO THIS PROJECT:

1.0 Scope
1.1 General
1.2 Significance of Use
1.3 Applicability
2.0 TERMS AND DEFINITIONS
3.0 REQUIREMENT SUMMARY
3.1 General
3.2 SOIL GAS VENT SYSTEMS REQUIRED
3.4 MATERIALS AND SPECIFICATIONS
4.0 SOIL GAS COLLECTION PLENUMS
4.1 General
4.2 PLENUM SIZE CALCULATIONS
4.3 SOIL GAS VENT SYSTEMS PER PLENUM SIZE
4.4 COLLECTIVE EXPANSES AND PLENUM SIZE
4.5 JOINED PLENUMS
4.6 JOINED SOIL GAS VENT SYSTEMS
4.7 LIMITING PLENUM AND VENT SYSTEM SIZE
5.0 PLENUM CONSTRUCTION
5.1 CLOSE THE BOTTOM OF THE PLENUMS
5.2 CLOSE THE SIDES OF THE PLENUMS
5.3 FOUNDATION DRAIN SYSTEMS
5.4 FOOTINGS AND JOINED PLENUMS
5.5 GAS PERMEABLE LAYERS
5.6 DUCT SIZES
5.7 SOIL GAS INFILTRATION AND AIRFLOW CAPACITY
5.8 TEST PORTS
5.9 PRIOR TO CONCRETE OR SOIL GAS RETARDERS
6.0 CLOSE THE TOP OF THE PLENUM
6.1 GENERAL
6.2 CLOSURE OF CONCRETE FLOORS
6.4 SOIL GAS RETARDER MATERIALS/INSTALLATION
6.5 INSPECTION PRIOR TO INDOOR FINISHINGS
7.0 PRESSURE FIELD EVALUATION
7.1 GENERAL
7.2 TEST PORT LOCATIONS
7.3 TEST PORT DESIGN
7.4 PFE EVALUATION
8.0 SOIL GAS EXHAUST VENT PIPE
8.1 GENERAL
8.2 SLOPE
8.3 AIR AND WATER LEAKAGE
8.4 PIPE ROUTING AND THERMAL INSULATION
8.5 PIPE SUPPORTS
8.6 EXHAUST VENT PIPE EQUIVALENT LENGTH
8.7 PIPING MATERIALS
8.8 JOINTS
8.9 PROVISIONS FOR SSD FANS
8.10 LABELS REQUIRED FOR EXHAUST PIPING
9.0 EXHAUST LOCATIONS
9.1 GENERAL
9.2 OUTDOORS
9.3 DIRECTIONAL SPREAD
9.4 STRAIGHT LINE TRAJECTORY
9.5 ELEVATION ABOVE GRADE
9.6 ROOF
9.7 SEPARATION FROM OPENINGS AND PEOPLE
9.8 PROTECTION FROM DEBRIS
9.9 INCREASE DISTANCES - LARGE SYSTEMS
9.10 INSPECT THE EXHAUST VENT PIPE
10.0 COMPLETION OF SYSTEMS
10.1 LABELING OR MARKING REQUIRED
10.3 ACTIVATION FOR SSD
12.0 DOCUMENTATION
12.1 OPERATION AND MAINTENANCE PLAN - STAFF
12.2 O&M MANUAL
12.3 CONSIDERATIONS: CHEMICAL VAPOR
ANNEX A: INSPECTIONS FOR COMPLIANCE

CC-1000 STANDARD SPECIFIC REQUIREMENTS

THE FOLLOWING ITEMS LIMIT THE POTENTIAL INSTALLATION CHOICES IN THE STANDARD TO THE REQUIREMENTS OF THE DESIGN PROFESSIONAL.

4.3 SOIL GAS VENT SYSTEMS PER PLENUM SIZE

ALL SOIL GAS COLLECTION PLENUMS IN THIS BUILDING SHALL MEET THE REQUIREMENTS OF TABLE 4.3.3: CREDIT ALLOWANCE FOR AIRTIGHT APPLICATIONS. THE MAXIMUM PLENUM SIZE ALLOWED FOR A 4" RISER PIPE SHALL BE 7,100 FT².

5.1.1 SUB GRADE SURFACE CLOSURE

EXISTING OR CONSTRUCTED MATERIALS THAT SURROUND THE EXTERIOR AND SIDEWALKS OF GAS PERMEABLE LAYERS AND PERMEABLE COMPONENTS OF FOUNDATION DRAIN SYSTEMS SHALL BE EARTHEN MATERIALS THAT CONTAIN MORE THAN 35% SAND, ROCK FRAGMENT FINES, CLAY AND SILT TO RESTRICT PERMEABILITY.

5.2.2 GAS PERMEABLE LAYER CONFIGURATIONS

A MINIMUM 4" LAYER OF MDOT 6AA WHICH CONTAINS NO WASTE PRODUCTS SHALL BE INSTALLED DIRECTLY ABOVE THE SUB GRADE AND BENEATH THE VAPOR BARRIER TO SATISFY THE REQUIREMENTS OF THIS SECTION.

5.6 DUCT SIZING

ALL CONVEYANCE PIPING FOR THE SSD SYSTEM ABOVE AND BELOW GRADE SHALL BE 4" SCH40 PVC.

6.4.1 MATERIALS UNDER CONCRETE SLABS

A 20ML EVOH SHEET APPLIED VAPOR BARRIER WITH AIRTIGHT SEAMS SHALL BE USED ON THIS BUILDING.

6.5 INSPECT FOR CLOSURE PRIOR TO FINISHING

IMMEDIATELY AFTER INSTALLATION, ARTIFICIAL SMOKE SHALL BE PUMPED BENEATH THE BARRIER TO VERIFY THE INTEGRITY OF THE SEAL. ANY LEAKS IN BARRIER SHALL BE REPAIRED AND THE AREA RETESTED UNTIL NO LEAKS ARE FOUND. THE CLIENT AND ENGINEER OF RECORD SHALL BE PRESENT DURING THIS ACTIVITY TO DOCUMENT THE SUCCESSFUL INSTALLATION OF THE BARRIER.

9.0 EXHAUST LOCATIONS

ALL DISCHARGE LOCATIONS SHALL MEET THE REQUIREMENTS FOR VERTICAL DISCHARGE IN THIS SECTION.
### Soil Gas Exhaust Fan

**System:**
- **Make:**
- **Model:**
- **Amps:**
- **Volts:**
- **Frequency:**
- **Flow:**
- **Pressure:**

**Installation:**
- **Panel #:**
- **Circuit #:**
- **System Installed & Maintained By:** A-Z Solutions, Inc.
- **Phone:** 330-915-2650
- **Website:** www.VaporRemoval.com

### Soil Gas Exhaust System Monitoring Panel

**System:** _____________

**Pressure Sensor Component:**

**Electrical Service Disconnect:**

### Soil Gas Control Extraction Point Record

### System Identification

**Typical Requirements**

**Conveyance Pipe Label:**
- **Material:** Weatherproof Vinyl
- **Use:** Identify SSD System Conveyance Piping.

**Extraction Point Label:**
- **Material:** Weatherproof Vinyl
- **Use:** Records Sub Slab and Initial Operating Conditions at Startup for Future Reference.

**Fan Assembly Label:**
- **Material:** Weatherproof Vinyl
- **Use:** Records Fan Details, Electrical Info and System Operating Conditions at Startup for Future Reference.

**Service Disconnect Label:**
- **Material:** Weatherproof Vinyl
- **Use:** Identifies Electrical Service Disconnect Switch for Each Fan.

**Monitoring Panel Label:**
- **Material:** Weatherproof Vinyl
- **Use:** Identifies Monitoring System Components and Advises Occupant How to Respond to an Alarm.

**Pressure Sensor Label:**
- **Material:** Weatherproof Vinyl
- **Use:** Identifies Pressure Sensor Component.

### TYPICAL REQUIREMENTS

**System Identification**

**Scale:** 6" = 1'

**Label Name:**
- **Conveyance Pipe Label:**
- **Extraction Point Label:**
- **Fan Assembly Label:**
- **Service Disconnect Label:**
- **Monitoring Panel Label:**
- **Pressure Sensor Label:**

**Size:**
- **Conveyance Pipe Label:** 2" X 4"
- **Extraction Point Label:** 3" X 4"
- **Fan Assembly Label:** 4" X 6"
- **Service Disconnect Label:** ½" X 2"
- **Monitoring Panel Label:** 2" X 4"
- **Pressure Sensor Label:** ¾" X 2"

**Material:**
- WEATHERPROOF VINYL

**Quantity:**
- Place one label per 20' of piping. At least one label on exposed piping in any room.
- Place one label at every extraction point below balancing valve.
- Place one label at every fan assembly.
- Place one label on each electric disconnect housing.
- Place one label on the front panel of each monitoring panel.
- Place one label on the front panel of each pressure sensor.

### Notes

- May contain volatile hazardous substances. Do not alter or disconnect. Not a plumbing line. Piping for vapor mitigation system.
- Do not alter or disconnect. Not a plumbing line for vapor mitigation system.
- If alarm sounds, please call (company name) at (installer phone) for deactivation code and to schedule service.

### MONITORING SYSTEM AND ACCESSORIES

- CENTRAL MONITORING STATION CONTROL PANEL: NETWORK MONITORING STATION
- SLAB MONITORING POINT: BRASS VAPOR PIN
- SLAB MONITORING POINT CONCRETE SEAL: VAPOR PIN SILICONE SLEEVE
- SLAB MONITORING POINT BARB CAP: VAPOR PIN CAP
- SUB SLAB ENCLOSURE MOUNT: 12" x 12" x 2" CONCRETE PAVER
- SUB SLAB MONITORING POINT ENCLOSURE: 6" x 6" x 4" PVC JUNCTION BOX
- PRESSURE RELAY TUBING: 3/8" PVC TUBING
- RELAY TUBING PROTECTION: 1" PVC CONDUIT
- RELAY TUBING PROTECTION: 2" PVC CONDUIT
- SYSTEM OPERATING PRESSURE GAGE: 0-3" MINIHELIC
- MONITORING POINT BARB ENDS FOR ENCLOSURE: 1/4" BARB X FIP

### UNDERGROUNDS

- VAPOR COLLECTION MATING: 15" X 8" VAPORMAT
- VAPOR BARRIER: 20 MIL EVOH VAPOR BARRIER
- VAPOR BARRIER BOTTOM SEAM TAPE: BUTYL SEAM TAPE
- VAPOR BARRIER MIDDLE SEAM: RTV SILICONE
- VAPOR BARRIER TOP SEAM TAPE: VAPOR BOND TAPE
- PENETRATION FLASHING TAPE: VAPOR BOOT TAPE
- SECURE VAPOR BARRIER TO WALLS/PIERS: TERMINATION BAR
- FASTEN TERMINATION BAR TO WALLS/PIERS: HEX HEAD CONCRETE SCREW
- GENERAL SEALING: WHITE LATEX CAULKING
- SEAL CHANNEL DRAIN TOP AT CONCRETE: RTV SILICONE

SECTION 014339
MOCKUPS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: General requirements for mockups specified in other technical Sections.
B. Related Sections:
   1. Section 013300 - Submittal Procedures: Sample submittals.
   2. Section 014500 - Quality Control.
   3. Section 014533 - Structural Testing and Special Inspections.

1.2 DEFINITIONS
A. Mockups: Full-size physical assemblies that are constructed on-site. Mockups are constructed to verify selections made under Sample submittals; to demonstrate aesthetic effects and, where indicated, qualities of materials and execution; to review coordination, testing, or operation; to show interface between dissimilar materials; and to demonstrate compliance with specified installation tolerances. Mockups are not Samples. Unless otherwise indicated, approved mockups establish the standard by which the Work will be judged.
   1. Integrated Exterior Mockups: Mockups of the exterior envelope erected separately from the building but on Project site, consisting of multiple products, assemblies, and subassemblies.
   2. Integrated Interior Mockups: Mockups of architectural elements and finishes with common adjacencies, with lighting conditions identical to actual finished construction.
   3. Room Mockups: As described in Part 3.

1.3 ACTION SUBMITTALS
A. Mockup Shop Drawings: For integrated exterior wall mockups and integrated mockups of interior assemblies and finishes.
   1. Provide plans, sections, and elevations, indicating materials and size of mockup construction.
   2. Indicate manufacturer and model number of individual components.
   3. Provide axonometric drawings for conditions difficult to illustrate in two dimensions.

1.4 MOCKUPS
A. Mockup Pre-Installation Conference: Before beginning mock-up construction and installation, conduct conference with manufacturer’s representatives, fabricators, installers, Architect, Owner and other interested parties to review procedures, schedules, and coordination of curtain wall installation with other elements of Work.
B. Mockups: Before installing portions of the Work requiring mockups, build mockups for each form of construction and finish required to comply with the following requirements, using materials indicated for the completed Work:
   1. Build mockups in location and of size indicated or, if not indicated, as directed by Architect.
   2. Notify Architect seven days in advance of dates and times when mockups will be constructed.
   3. Employ supervisory personnel who will oversee mockup construction. Employ workers that will be employed during the construction at Project.
   4. Demonstrate the proposed range of aesthetic effects and workmanship.
   5. Obtain Architect's approval of mockups before starting work, fabrication, or construction.
      a. Allow seven days for initial review and each re-review of each mockup.
6. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.

C. Obtain Architect's approval of mockups before starting work, fabrication, or construction.
   1. Notify Architect 7 days in advance of dates and times when mockups will be constructed.
   2. Allow 10 days for initial review and each re-review of each mockup.
   3. Do not start production run for final job site erection until acceptance has been obtained of tested mock-ups.

D. Approved Mockups: Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work. Mockup shall remain on site and shall not be removed, disassembled, or disposed of until so directed by Architect.
   1. Approved in-place mockups may remain as part of final Work.
   2. Maintain stand-alone mockups on site. Do not remove, disassembled, or disposed of until so directed by Architect.

1.5 MOCKUP TESTING

A. Preconstruction Testing: Where testing agency is indicated to perform preconstruction testing for compliance with specified requirements, comply with requirements specified in individual technical Sections and with the following:
   1. Provide sizes and configurations of test assemblies, mockups, and laboratory mockups to adequately demonstrate capability of products to comply with performance requirements.
   2. Build site-assembled test assemblies and mockups using installers who will perform same tasks for Project.
   3. Build laboratory mockups at testing facility using personnel, products, and methods of construction indicated for the completed Work.
   4. When testing is complete, remove test specimens, assemblies, and mockups; do not reuse products on Project.
   5. Provide test specimens representative of proposed products and construction.
   6. Submit specimens in a timely manner with sufficient time for testing and analyzing results to prevent delaying the Work.
   7. Provide sizes and configurations of test assemblies, mockups, and laboratory mockups to adequately demonstrate capability of products to comply with performance requirements.
   8. Build site-assembled test assemblies and mockups using installers who will perform same tasks for Project.
   9. Build laboratory mockups at testing facility using personnel, products, and methods of construction indicated for the completed Work.
  10. When testing is complete, remove test specimens, assemblies, and mockups; do not reuse products on Project.

B. Testing Agency Responsibilities: Submit a certified written report of each test, inspection, and similar quality-assurance service to Architect, through Construction Manager, with copy to Contractor. Interpret tests and inspections and state in each report whether tested and inspected work complies with or deviates from the Contract Documents.

C. Representatives of Architect's office and representatives of Owner's office will be present to observe preparation for testing and testing procedures.
   1. Notify Architect in advance of testing.

D. Testing of Mockups: Conduct tests in accordance with test procedures specified in individual specification Sections.
PART 2 PRODUCTS
Not Used.

PART 3 MOCKUP SCHEDULE

3.1 INTEGRATED EXTERIOR WALL MOCKUP
A. General: Construct integrated exterior mockup according to approved Mockup Shop Drawings. Coordinate installation of exterior envelope materials and products for which mockups are required in individual Specification Sections, along with other supporting materials.
B. Mockup Shop Drawings and Mockup Pre-Installation Conference: As specified herein.
C. Size: As indicated on approved Mockup Shop Drawings, and as follows:
   1. Width: 8'-0" wide, minimum.
   2. Height: Minimum truncated height required to include all elements of full-height wall.
D. Scope: Construct integrated mockup of partial exterior wall as indicated on Detail ______. Include the following wall assembly elements:
   E. Components to Include:
      1. 03 45 00 Architectural Precast
      2. 07 27 00 Air Barrier
      3. 07 42 00 Metal Panels
      4. 07 62 00 Sheet Metal & Flashing
      5. 07 92 00 Joint Sealant
      6. 08 44 00 Curtain Walls, Storefronts & Entrances: Provide mockup of curtain wall system to be field-tested for air and water infiltration
      7. 08 80 00 Glazing: For each glass product indicated, in combination with curtain wall mockup

3.2 INTEGRATED INTERIOR MOCKUP
A. Mockup Shop Drawings and Mockup Pre-Installation Conference: As specified herein.
B. Integrated Interior Mockups: Mockups of architectural elements and finishes with common adjacencies, with lighting conditions identical to actual finished construction.
   1. Refer to Section 064000 - Architectural Woodwork.
   2. Provide all accessories required for sound & vibration control.
   3. Mockup adjacent construction for the purpose of assessing fit and alignment of moveable assembly, and to establish tolerances for final installed Work.
C. (WD FAB-4), (WD FAB-6), (WD FAB-7) and (WD FAB-8) Wood Wall Assemblies:
   2. Scope: As indicated in approved mockup shop drawings.
   3. If system is panelized, include at least 1 vertical and 1 horizontal panel-to-panel joint in mockup.
      a. Type L100 (1) 4ft sample, including fixture and mounting accessories. Purpose of the mock-up is to review the lighting effect, and the appearance of the donor wall signage. Results of mockup may effect fixture location, accessories and/or fixture specification.
      b. Type L151 (1) sample, including fixture and mounting accessories. Purpose of the mock-up is to review the aesthetic integration of the fixture housing with the vertical wood rods at the perimeter walls of the Valade theatre. Results of mockup may effect fixture location, accessories and/or fixture specification.
c. Type L150 (1) sample, including fixture and mounting accessories. Purpose of the mock-up is to review the appearance of the fixture housing with the uneven wall treatment in the perimeter walls of the proscenium theatre. Results of mockup may effect fixture location, accessories and/or fixture specification.

3.3 SPECIFIC MOCKUPS

A. General: Refer to individual specification Sections for specific mockup requirements.

B. 03 30 00 Cast-in Place Concrete
   1. CONC FIN-

C. 05 50 00 Metal Fabrications
   1. MET FAB-14: Catwalk assembly
   2. MET FAB-15: Lighting support rail

D. 05 70 00 Ornamental Metal
   1. ORN MET-4: Metal Ceiling

E. 05 72 00 Ornamental Railings
   1. ORN RAIL-3
   2. ORN RAIL-4
   3. ORN RAIL-6
   4. ORN RAIL-7
   5. ORN RAIL-8

F. 06 40 00 Architectural Woodwork
   1. WD FAB-1
   2. WD FAB-3
   3. WD FAB-4
   4. WD FAB-6
   5. WD FAB-8

G. 09 29 00 Gypsum Board: For level 5 finish.

H. 09 64 00 Wood Flooring: Mockup of wood flooring.

I. 09 67 23 Resinous Flooring: Mockup of Resinous flooring.

J. 09 80 00 Acoustic Treatments: Before installing acoustical wall and ceiling panels, build mockups for each form of construction and finish required to verify selections made.

K. 09 90 00 Painting: For PT-13, demonstrating 2 different paint options for final selection. Mockup shall include mockup of lighting conditions.

L. 10 11 00 Visual Display Boards: To verify selections made.

M. 10 14 14 Custom Illuminated Signage: Mockup for each sign type.

N. 10 14 19 Dimensional Letter Signage: Mockup for each sign type.

O. 12 61 00 Fixed Audience Seating: For each type of audience seat, fabric, finishes and accessories – double seat mockup with 1 light.

P. 27 41 00 Performance AV Systems: Mockup of all system graphical user interface screens and all source code/configuration files.
3.4 OTHER MOCKUPS
   A. In addition to previous items, construct field (project site) mock-ups and samples for review where indicated in individual Specifications Sections.

3.5 INSTALLATION
   A. Installation: Construct mock-ups for Architect's visual examination, for quality control, and performance of required testing. Use materials, fabrication and installation methods identical with those indicated for Work. Simulate surrounding conditions as closely as possible.
      1. Construct mockups for Architect's visual examination, for quality control and quality of installation.
         a. Demonstrate the proposed range of aesthetic effects and workmanship.
         b. Build mockups of size indicated in Drawings.
         c. Use materials, fabrication and installation methods identical with those indicated for Work.
         d. Simulate surrounding conditions as closely as possible.
      2. Employ supervisory personnel who will oversee mockup construction. Employ workers that will be employed during the construction at Project.
      3. Install mockups under manufacturer's direct supervision employing workmen who will be used during actual erection at job site.

END OF SECTION
SECTION 017329
CUTTING & PATCHING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Cutting, demolition, removal, patching and restoration of work as necessary to accomplish and complete all work under the Contract, including general construction, mechanical and electrical work; except where work is indicated within designated historic areas.

B. Related Sections:
   1. Refer to Sections 011100 and 015100 for special requirements, protection, constraints, timing of work, scheduling of work, enclosures and similar requirements relating to this Section.
   3. Section 024119 - Selective Demolition.

1.2 INFORMATIONAL SUBMITTALS
A. Schedule: Submit schedule indicating proposed sequence of operations for demolition work to Owner's Representative for review prior to start of work. Include coordination for shutoff, capping, and continuation of utility services as required, together with details for dust and noise control protection.

   1. Provide detailed sequence of demolition and removal work to ensure uninterrupted progress of Owner's on-site operations. Coordinate with Work of other related Sections.

1.3 QUALITY ASSURANCE
A. Skilled Mechanics: Accomplish all work of cutting, removal, demolition, relocation, patching and other restoration by using only mechanics skilled in the trade. If necessary, sublet the work to skilled contractors or subcontractors.

1.4 COORDINATION
A. Coordinate all work of this Section with all subcontractors so the work will progress without interruption and minimum delays.

B. Coordinate and schedule work of this Section with the Owner where possible disturbance may occur and where relocations or other potential disruptions of the Owner's functions and services may occur. All work affecting the Owner's functions and services shall be performed at times acceptable to the Owner.

C. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during installation or cutting and patching operations, by methods and with materials so as not to void existing warranties.

PART 2 DISPOSITION OF MATERIALS

2.1 UNSALVABLE MATERIALS
A. Remove unsalvable materials in a manner that will avoid damage to materials or equipment which will remain. Completely remove and legally dispose of away from the site.
2.2 SALVABLE MATERIALS TO BE RE-USED IN WORK
   A. Salvable materials and items designated for reuse or relocation, such as brick, millwork, or equipment shall be removed by the applicable trades and relocated to the new location or stored and protected from damage until incorporated into the new work.
   B. Carefully remove, salvage, clean and preserve materials, equipment and other items indicated to be reused, or which will be needed for reuse to match existing work.
   C. Exercise extreme care in removals to prevent damage or to make materials unsuitable to reuse.
   D. For materials shown or called for to be reused and which are damaged, replace with equivalent and matching work.

PART 3 EXECUTION

3.1 DESCRIPTION OF WORK
   A. Drawings generally indicate the extent of demolition, removals, relocations and cutting. The drawings shall not be construed as indicating all required work, nor indicating all conditions or details which might be encountered to accomplish the work of this Contract. The Contractor and subcontractors must examine the spaces themselves to determine the actual conditions and requirements.

3.2 TEMPORARY PROTECTION
   A. Provide temporary bracing, shoring, needling and support during demolition, cutting, remodeling and related new construction as necessary for the execution of the Work and the protection of persons and property. Perform all work with appropriate supports, protection and methods to prevent collapse, settling or damage to property or persons. Provide adequate supports for the loads to be carried, with loads properly distributed, including to lower levels and sound bearing, if necessary.
   B. Protection: Protect in-place construction during cutting and patching to prevent damage.
      1. Provide protective coverings and enclosures necessary to prevent damage to existing spaces and materials to remain.
      2. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.
      3. Provide dustproof temporary enclosures separating areas under demolition and remodeling from the remainder of the building as well as temporary HEPA filters at ductwork.
      4. Provide temporary hinged doors in temporary enclosures where necessary. Temporary and permanent doors shall be completely sealed with tape or other suitable material during demolition work and shall remain sealed until dust has settled.
   C. Limit dust, dirt and noise dispersal to the lowest practical level. Comply with governing regulations regarding environmental hazards and general dust control. Notify the Owner’s representative of possible exposure to harmful dusts and vapors, flammable or explosive materials, and other potential hazards.

3.3 CUTTING AND REMOVING
   A. Perform cutting, demolition, removal work, patching and restoration of work as necessary to accomplish and complete all work under the Contract, including any relocation or reuse of existing materials, equipment, systems, or other work, as well as the disposition of salvaged materials or debris.
1. Inspect existing conditions, including elements subject to damage or movement during cutting and patching.
2. Beginning of cutting or patching means acceptance of existing conditions.
3. Provide protective coverings and enclosures necessary to prevent damage to existing spaces and materials to remain.
4. Demolish and remove existing construction as shown, indicated or required to be removed to accomplish the Work.
5. Execute work with care. Existing construction that is to remain which is loosened, cracked, or otherwise damaged or defaced as a result of the Work and is unsuitable for use intended shall be removed and replaced at no additional cost to the Owner.
6. In general, use hand or small power tools designed for sawing and grinding, not hammering and chopping. Cut holes and slots neatly to minimum size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.
7. Cutting: Cut in-place construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. If possible, review proposed procedures with original Installer; comply with original Installer's written recommendations.
8. Transport debris and rubbish in such a manner as to prevent the spread of dust.
9. Clean demolition areas and remove debris, waste and rubbish from the building at the conclusion of each day's work.
   a. Transport debris and rubbish in such a manner so as to prevent spread of dust.
   b. Do not store or permit debris storage at site.
   c. Do not burn debris, rubbish or waste at the site.
   d. Keep adjacent areas unencumbered and clean.
   e. Keep walks and similar areas broom clean.

3.4 PATCHING AND RESTORING

A. Patch or otherwise restore disturbed existing construction as indicated on the drawings and schedules, or as otherwise required to restore the work and surfaces. Patching or restoration shall be carried to natural breaks (i.e., corners) wherever possible. Where existing construction is removed, cut or otherwise disturbed by Work of the Project, patch defective and incomplete surfaces. Repair any damage to existing construction which is to remain.
   1. Patching work shall be done by skilled mechanics experienced in the particular type of work involved. Patching work shall conform to the standards of the Specifications where applicable and where not specified, work shall conform to the highest standards of the trade.
   2. Patch existing construction to match existing work (unless otherwise called for) except provide new materials and accomplish as for new work. Examine existing surfaces to be patched before proceeding with the work. Report all conditions where existing materials, colors and finishes cannot be matched to the Architect and Owner, and do not proceed until instructions have been given.
   3. Existing construction that has been damaged as a result of the Work shall be repaired to an extent and as required to match adjacent existing undamaged construction.
   4. Painting: Painting, including preparation, materials, workmanship and number of coats shall comply with Section 099000 - Painting. Painting of surfaces patched shall extend to natural breaks, such as corners, as approved by the Architect and Owner.
      a. It is the intent that the mechanical and electrical subcontractors are responsible to paint or repaint surfaces at locations where demolition, cutting and patching has been accomplished only for their work.

B. Thoroughly clean and prepare all surfaces to receive new finish or covering. Completely remove dirt, dust, grease, oil, paint, loose materials and soil. Clean, etch where necessary, and place surfaces in most suitable condition for the finish.
3.5 CLEANING

A. Perform periodic and final cleaning.
B. Clean Owner-occupied areas daily.
C. Clean spillage, overspray, and heavy collection of dust in Owner-occupied areas immediately.
D. At completion of work of each trade, clean area and make surfaces ready for work of successive trades.
E. At completion of alteration work in each area, provide final cleaning and return space to a condition suitable for use by Owner.

END OF SECTION
SECTION 017900
DEMONSTRATION AND TRAINING

PART 1 GENERAL

1.1 SUMMARY
A. Section includes administrative and procedural requirements for instructing Owner’s personnel, including the following:
   1. Demonstration of operation of systems, subsystems, and equipment.
   2. Training in operation and maintenance of systems, subsystems, and equipment.
   3. Demonstration and training video recordings.

1.2 APPLICATION OF SPECIFICATION SECTION
A. Specification section applies to Divisions 21, 22, 23, 26 and 28—respectively Fire Protection, Plumbing, Mechanical and Electrical. The specific sections where this applies per division is below:
   1. Division 21
      a. 211313 Wet-Pipe Sprinkler Systems
   2. Division 22
      a. 221429 Sump Pumps
      b. 223400 Fuel-Fired, Domestic-Water Heaters
   3. Division 23
      a. 230514 Variable-Frequency Motor Controllers
      b. 230900 Building Automation Systems
      c. 230993 Sequence of Operation for HVAC Controls
      d. 235216 Condensing Boilers
      e. 236423 Screw Water Chillers
      f. 237316 Air-Handling Units
      g. 238123 Computer-Room-Air-Conditioning Units
      h. 238126 Split-System Air-Conditioning Units
      i. 238413 Humidifiers
   4. Division 26
      a. 260913 Electrical Power Monitoring and Control
      b. 260923 Lighting Control Devices
      c. 260943 Distributed Digital Lighting Controls
      d. 262713 Electricity Metering
      e. 263213.16 Gaseous Emergency Engine Generators
      f. 265119 LED Interior Lighting
   5. Division 28
      a. 283111 Digital, Addressable Fire-Alarm System

B. These demonstration and training requirements are in addition to those listed elsewhere in the project.

1.3 INFORMATIONAL SUBMITTALS
A. Instruction Program: Submit outline of instructional program for demonstration and training, including a list of training modules and a schedule of proposed dates, times, length of instruction time, and instructors’ names for each training module. Include learning objective and outline for each training module.
1. Indicate proposed training modules using manufacturer-produced demonstration and training video recordings for systems, equipment, and products in lieu of video recording of live instructional module.

B. Attendance Record: For each training module, submit list of participants and length of instruction time.

C. Evaluations: For each participant and for each training module, submit results and documentation of performance-based test.

1.4 CLOSEOUT SUBMITTALS

A. Demonstration and Training Video Recordings: Submit two copies within seven days of end of each training module.
   1. Identification: On each copy, provide an applied label with the following information:
      a. Name of Project.
      b. Name and address of videographer.
      c. Name of Architect.
      d. Name of Construction Manager.
      e. Name of Contractor.
      f. Date of video recording.
   2. Transcript: Prepared in PDF electronic format. Include a cover sheet with same label information as the corresponding video recording and a table of contents with links to corresponding training components. Include name of Project and date of video recording on each page.
   3. At completion of training, submit complete training manual(s) for Owner's use prepared and bound in format matching operation and maintenance manuals and in PDF electronic file format.

1.5 QUALITY ASSURANCE

A. Facilitator Qualifications: A firm or individual experienced in training or educating maintenance personnel in a training program similar in content and extent to that indicated for this Project, and whose work has resulted in training or education with a record of successful learning performance.

B. Instructor Qualifications: A factory-authorized service representative experienced in operation and maintenance procedures and training.

C. Videographer Qualifications: A professional videographer who is experienced photographing demonstration and training events similar to those required.

D. Preinstruction Conference: Conduct conference at Project site. Review methods and procedures related to demonstration and training including, but not limited to, the following:
   1. Inspect and discuss locations and other facilities required for instruction.
   2. Review and finalize instruction schedule and verify availability of educational materials, instructors' personnel, audiovisual equipment, and facilities needed to avoid delays.
   3. Review required content of instruction.
   4. For instruction that must occur outside, review weather and forecasted weather conditions and procedures to follow if conditions are unfavorable.

1.6 COORDINATION

A. Coordinate instruction schedule with Owner's operations. Adjust schedule as required to minimize disrupting Owner's operations and to ensure availability of Owner's personnel.

B. Coordinate instructors, including providing notification of dates, times, length of instruction time, and course content.
C. Coordinate content of training modules with content of approved emergency, operation, and maintenance manuals. Do not submit instruction program until operation and maintenance data has been reviewed and approved by Architect.

PART 2 PRODUCTS

2.1 INSTRUCTION PROGRAM

A. Program Structure: Develop an instruction program that includes individual training modules for each system and for equipment not part of a system.

B. Training Modules: Develop a learning objective and teaching outline for each module. Include a description of specific skills and knowledge that participant is expected to master. For each module, include instruction for the following as applicable to the system, equipment, or component:

1. Basis of System Design, Operational Requirements, and Criteria: Include the following:
   a. System, subsystem, and equipment descriptions.
   b. Performance and design criteria if Contractor is delegated design responsibility.
   c. Operating standards.
   d. Regulatory requirements.
   e. Equipment function.
   f. Operating characteristics.
   g. Limiting conditions.
   h. Performance curves.

2. Documentation: Review the following items in detail:
   a. Emergency manuals.
   b. Operations manuals.
   c. Maintenance manuals.
   d. Project record documents.
   e. Identification systems.
   f. Warranties and bonds.
   g. Maintenance service agreements and similar continuing commitments.

3. Emergencies: Include the following, as applicable:
   a. Instructions on meaning of warnings, trouble indications, and error messages.
   b. Instructions on stopping.
   c. Shutdown instructions for each type of emergency.
   d. Operating instructions for conditions outside of normal operating limits.
   e. Sequences for electric or electronic systems.
   f. Special operating instructions and procedures.

4. Operations: Include the following, as applicable:
   a. Startup procedures.
   b. Equipment or system break-in procedures.
   c. Routine and normal operating instructions.
   d. Regulation and control procedures.
   e. Control sequences.
   f. Safety procedures.
   g. Instructions on stopping.
   h. Normal shutdown instructions.
   i. Operating procedures for emergencies.
   j. Operating procedures for system, subsystem, or equipment failure.
   k. Seasonal and weekend operating instructions.
   l. Required sequences for electric or electronic systems.
   m. Procedures and recordings for operating equipment above Wood Ceilings and all ceilings besides 2’x2’ ACT ceilings.
n. Special operating instructions and procedures.
5. Adjustments: Include the following:
   a. Alignments.
   b. Checking adjustments.
   c. Noise and vibration adjustments.
   d. Economy and efficiency adjustments.
6. Troubleshooting: Include the following:
   a. Diagnostic instructions.
   b. Test and inspection procedures.
7. Maintenance: Include the following:
   a. Inspection procedures.
   b. Types of cleaning agents to be used and methods of cleaning.
   c. List of cleaning agents and methods of cleaning detrimental to product.
   d. Procedures for routine cleaning
   e. Procedures for preventive maintenance.
   f. Procedures for routine maintenance.
   g. Procedures and recordings for accessing equipment above Wood Ceilings and all ceilings besides 2’x2’ ACT ceilings.
   h. Instruction on use of special tools.
8. Repairs: Include the following:
   a. Diagnosis instructions.
   b. Repair instructions.
   c. Disassembly; component removal, repair, and replacement; and reassembly instructions.
   d. Instructions for identifying parts and components.
   e. Review of spare parts needed for operation and maintenance.

PART 3 EXECUTION

3.1 PREPARATION
A. Assemble educational materials necessary for instruction, including documentation and training module. Assemble training modules into a training manual organized in coordination with operation and maintenance data.
B. Set up instructional equipment at instruction location.

3.2 INSTRUCTION
A. Facilitator: Engage a qualified facilitator to prepare instruction program and training modules, to coordinate instructors, and to coordinate between Contractor and Owner for number of participants, instruction times, and location.
B. Engage qualified instructors to instruct Owner’s personnel to adjust, operate, and maintain systems, subsystems, and equipment not part of a system.
   1. Owner will furnish Contractor with names and positions of participants.
C. Scheduling: Provide instruction at mutually agreed on times. For equipment that requires seasonal operation, provide similar instruction at start of each season.
   1. Schedule training with Owner, with at least ten business days' advance notice.
D. Training Location and Reference Material: Conduct training on-site in the completed and fully operational facility using the actual equipment in-place. Conduct training using final operation and maintenance data submittals.
E. Cleanup: Collect used and leftover educational materials and give to Owner. Remove instructional equipment. Restore systems and equipment to condition existing before initial training use.

3.3 DEMONSTRATION AND TRAINING VIDEO RECORDINGS

A. General: Engage a qualified commercial videographer to record demonstration and training video recordings. Record each training module separately. Include classroom instructions and demonstrations, board diagrams, and other visual aids, but not student practice.
   1. At beginning of each training module, record each chart containing learning objective and lesson outline.

B. Video: Provide minimum 640 x 480 video resolution converted to format file type acceptable to Owner, on electronic media.
   1. Electronic Media: Read-only format acceptable to Owner, with commercial-grade graphic label.
   2. File Hierarchy: Organize folder structure and file locations according to project manual table of contents. Provide complete screen-based menu.
   3. File Names: Utilize file names based upon name of equipment generally described in video segment, as identified in Project specifications.
   4. Contractor and Installer Contact File: Using appropriate software, create a file for inclusion on the Equipment Demonstration and Training Video that describes the following for each Contractor involved on the Project, arranged according to Project table of contents:
      a. Name of Contractor/Installer.
      b. Business address.
      c. Business phone number.
      d. Point of contact.
      e. E-mail address.

C. Recording: Mount camera on tripod before starting recording, unless otherwise necessary to adequately cover area of demonstration and training. Display continuous running time.
   1. Film training session(s) in segments not to exceed 30 minutes.
      a. Produce segments to present a single significant piece of equipment per segment.
      b. Organize segments with multiple pieces of equipment to follow order of Project Manual table of contents.
      c. Where a training session on a particular piece of equipment exceeds 30 minutes, stop filming and pause training session. Begin training session again upon commencement of new filming segment.

END OF SECTION
SECTION 01 81 23
ACOUSTIC ISOLATION REQUIREMENTS

PART 1 - GENERAL

1.1 SUMMARY

A. This section specifies common requirements for acoustic isolation construction throughout the project.

B. The construction enclosing a significant proportion of the building spaces on the project is designed to achieve high degrees of acoustic isolation that are critical to the successful functioning of the completed project. The acoustic isolation construction encompasses multiple disciplines, trades, and contractors. Careful coordination among the entities involved, vigilant adherence to specialized details, and a high level of installation precision are required for proper implementation of the acoustic isolation construction.

C. The acoustic isolation requirements specified in this section are applicable to the following spaces:

1. Trap Room 0240
2. Orchestra Pit 0235
3. Valade Jazz Center 1110
4. Green Room 1113
5. AV Rack Room 1116
6. Audience Chamber 1230
7. Stagehouse 1240
8. Studio Theater 1227
9. Dressing Room 2123
10. Dressing Room 2122
11. Control Room 2223
12. Audio Rack Room 2231
13. Dimmer Room 2230
14. Followspot 3200
15. Mechanical and Electrical Equipment Spaces
16. Sound and Light Locks (SLL)

1.2 RELATED SECTIONS

A. Related sections include:

1. 03 3000 Cast-in-Place Concrete
2. 04 2200 Concrete Unit Masonry
3. 05 4000 Cold-Formed Metal Framing
4. 07 2100 Thermal Insulation
5. 07 8413 Penetration Firestopping
6. 07 8446 Fire-Resistive Joint Firestopping
7. 07 9200 Joint Sealants
8. 08 1113 Hollow Metal Doors and Frames
9. 08 5673 Sound Control Window Assemblies
10. 09 2900 Gypsum Board Assemblies
PART 2 - PRODUCTS (refer to Related Sections for product specifications)

PART 3 - EXECUTION

3.1 PRE-INSTALLATION CONFERENCE

A. A pre-installation conference shall be convened prior to installation of any interior acoustic isolation construction. Attendees shall include the contractor, architect, acoustic consultant, and subcontractors, fabricators, and installers of work in the spaces covered by this specification. At a minimum, trades represented shall include masonry, carpentry, specialty interior finishes, doors, mechanical, electrical, and plumbing. Contractor representatives shall include on-site superintendents.

B. The agenda for the pre-installation conference shall include review of the acoustic isolation requirements specified in this section and elsewhere in the contract documents; comprehension of the contract documents and design intent; specific construction details and assemblies; means and methods; sequencing, tolerances, and required clearances; coordination of the work by multiple entities; and possible conflicts and incompatibilities.

3.2 REQUIREMENTS FOR AIRTIGHT ACOUSTIC ISOLATION CONSTRUCTION

A. The physical envelopes of all spaces covered by this section of the specifications shall be constructed "airtight", i.e. leak-proof for the purposes of acoustic isolation.

B. Airtightness shall be maintained at all walls, ceilings, floors, doors, and windows, and their intersection with adjacent construction; construction joints; penetrations by structural elements, mechanical ducts, pipes, electrical conduits, and other infrastructure items; and at electrical boxes and fixtures, cabinets, access panels, windows, frames, and supports.

C. All electrical, lighting, or other recessed boxes 4"x4" and smaller, installed within spaces covered by this section of the specifications, shall be caulked at their interface with gypsum board finish, and shall be covered on the back sides with putty pads. All electrical, lighting, or other recessed boxes larger than 4"x4" shall be caulked at their interface with gypsum board finish and provided with one (1) layer of 5/8" gypsum board on the back sides, with all joints sealed.

D. Every precaution shall be taken to maintain airtight construction around the physical envelopes of all spaces covered by this section of the specifications, whether explicitly indicated in the contract documents or not. Provide additional framing, blocking, escutcheons, grouting, gaskets, packing, caulking, putties, taping, filling, and / or other elements as required to achieve airtight construction.

3.3 INSPECTION OF WORK

A. The architect and acoustic consultant will make periodic visits to the site to inspect progress of the work. Contractor shall notify the architect and acoustic consultant in advance of when the following check points have been made in spaces covered by this specification, and that the conditions are available for inspection:

1. Completion of wall and ceiling framing; plumbing, mechanical, and electrical systems; prior to installation of insulation or gypsum board.

ACOUSTIC ISOLATION REQUIREMENTS 01 81 23 - 2
B. If work to be inspected is covered up prior to architect and acoustic consultant’s approval of the above checkpoints, the materials shall be removed so such inspections can occur.

C. Any work deemed unacceptable shall be remedied but not covered up until re-inspected.

END OF SECTION
SECTION 018198
FACILITY ACOUSTIC PERFORMANCE REQUIREMENTS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Special acoustical performance requirements of Project.
   1. Definition and identification of acoustically-critical spaces.
   2. Qualifications requirements.
   3. Preconstruction conference.
   5. Repair of work not in compliance with specified requirements.
B. Related Work: Coordinate with Work of other specification sections related to Work of this Section and acoustically-critical spaces and construction.
   1. Specific test and inspection requirements are not specified in this Section.
C. Related Sections:
   1. Section 033000 - Cast-in-Place Concrete: Isolated concrete deck and isolation pads and coordination of underlayment installation.
   2. Section 054000 - Cold-Formed Metal Framing, Section 092200 - Non-Structural Metal Framing and Section 092900 - Gypsum Board: Stud-framed gypsum board assemblies incorporating resilient hangers and isolators.
   3. Section 057000 - Ornamental Metal: Metal panels and screens within performance space.
   5. Section 077236 - Smoke Vents: STC-rated smoke vents.
   7. Section 083100 - Access Panels: STC-rated access panels.
   8. Section 083473 - Sound Control Door Assemblies.
   9. Section 085673 - Sound Control Window Units.
   10. Section 087100 - Door Hardware: Sound gasketing.
   11. Section 088000 - Glazing: STC-rated glass units.
   13. Section 095100 - Acoustic Ceiling Tile.
   14. Section 098400 - Acoustic Surface Treatments: Sound-absorbing, [reflecting] [and] [diffusing] panels, assemblies and surface treatments for walls and ceilings.
   15. Section 134833 - Sound and Vibration Control: Manufactured sound and vibration control products.
   16. Section 220548 - Vibration and Seismic Controls for Plumbing Piping and Equipment
   17. Section 230548 - Vibration Controls for HVAC

1.2 REFERENCES
A. Acoustician's Report.

1.3 DEFINITIONS
A. Acoustically-Critical Spaces: The following spaces are acoustically-critical spaces, requiring special provisions and restrictions to meet the target background noise levels, achieve proper sound isolating performance of demising constructions, and achieve the design intent for interior acoustic performance:
   1. Proscenium Theater
2. Valade Theater  
3. Audience Chamber  
4. Stagehouse  
5. Studio Theater  
6. Sound & Light Locks  
7. Trap Room  
8. Control Booths  
9. Projection Booth  
10. Dimmer Room  
11. Audio Rack Room, Sound, Communications, and AV Equipment Rooms  
12. Mechanical and Electrical Rooms  

1.4 INFORMATIONAL SUBMITTALS  
A. Qualification Data: For qualified fabricators, installers, and testing agencies.  
B. Certificates: Manufacturer’s certificates for products and equipment.  
C. Test and Inspection Reports: Prepare and submit certified written reports as specified in other Sections.  
D. Schedule of Tests and Inspections: Prepare a schedule of tests, inspections, and similar quality-control services required by the Contract Documents. Coordinate and submit concurrently with Contractor’s construction schedule. Update as the Work progresses.  

1.5 QUALITY ASSURANCE  
A. Fabricator and Manufacturer Qualifications: A firm experienced in producing products similar to those indicated for this Project and with a record of successful in-service acoustical performance. Qualified firm will provide authorized technical representatives to observe and inspect installation of products, equipment and assemblies.  
B. Subcontractors and Installers Qualifications: A firm or individual experienced in installing, erecting, or assembling work similar in material, design, and extent to that indicated for this Project, being familiar with special acoustical requirements indicated, and whose work has resulted in construction with a record of successful acoustical performance.  
   1. Engage specialists who satisfy qualification requirements indicated in specifications.  
C. Acoustical Testing Agency Qualifications: An NRTL, an NVLAP, or an independent agency with the experience and capability to conduct testing and inspecting indicated, as documented according to ASTM E 329; and with additional qualifications specified in individual Sections; and, where required by authorities having jurisdiction, that is acceptable to authorities.  
   1. NRTL: A nationally recognized testing laboratory according to 29 CFR 1910.7.  
   2. NVLAP: A testing agency accredited according to NIST’s National Voluntary Laboratory Accreditation Program.  

1.6 PRECONSTRUCTION CONFERENCE  
A. Preconstruction Conference: Prior to start of Work, conduct a conference to ensure understanding of Construction Documents and special acoustical requirements of acoustically-critical spaces and construction.  
   1. Attendees: Contractor, Architect, acoustic consultant, theater consultant, audio/visual consultant, subcontractors, fabricators and installers of Work in acoustically-critical spaces. At minimum, sub-contractors represented shall include but is not limited to; carpentry, masonry, specialty interior finish, door, mechanical, electrical and plumbing.  
   2. Agenda: Include the following agenda items:
a. Acoustical performance requirements of completed project.
b. Comprehension of Contract Documents and design intent.
c. Construction details and assemblies.
d. Review qualifications of personnel assigned to the work.
e. Review installation, sequencing, tolerances and required clearances.
f. Coordination of work by multiple subcontractors.
g. Possible conflicts and compatibility issues. Possible performance issues.
h. Possible bridging of vibration isolation joints or flanking of airborne sound.
i. Building services equipment and installation methods.
j. Applicable field conditions, field dimensions, means and methods, general guidelines and practices.
k. Other discussion topics and considerations related to acoustically-critical spaces and construction.
l. Coordinate sleeving and sealing of penetrations through partitions and slabs at acoustically-critical spaces and at mechanical and electrical rooms.

PART 2 PRODUCTS

2.1 PRODUCTS

A. Refer to specifications for product requirements.

B. Provide products identical to those tested by an acoustical testing agency.

PART 3 EXECUTION

3.1 EXECUTION OF ACOUSTICALLY-CRITICAL WORK

A. Refer to applicable specification sections for specific requirements.

B. Do not enclose or obscure items requiring testing and inspection services after placement until after testing and inspection services are performed.

C. Coordinate and provide sleeving and sealing of penetrations through partitions and slabs at acoustically-critical spaces and at mechanical and electrical rooms.
   1. Duct, pipe and conduit penetrations at acoustically-critical spaces shall be sleeved, packed and sealed airtight with flexible non-hardening sealant.
   2. Provide 1-inch flexible joint around penetrating elements, unless otherwise indicated in the Construction Documents.

D. Joints: Make joints of uniform width. Where joint locations in exposed work are not indicated, arrange joints for the best visual effect. Fit exposed connections together to form hairline joints.

E. Not Permitted in Installed Work: Vibration harmonics; noises caused by movement of components; vibration transmitted to other building elements; loosening, weakening, or fracturing of attachments or components of system.

3.2 TESTING AND INSPECTING

A. Acoustical Testing and Related Inspections: Engage qualified testing agency as indicated in individual Specification Sections, and perform additional inspections required to verify that the Work complies with requirements, whether specified or not.
   1. Provide advanced notice of at least five (5) working days to Owner, Architect and acoustic consultant to schedule field-testing and site inspections.
2. Interpret tests and inspections and stating in each report whether tested and inspected work complies with or deviates from the Contract Documents.
3. Notify Architect promptly of irregularities and deficiencies observed in the Work during performance of its services.
4. Retest and re-inspect corrected work.
5. Submit a final report of acoustical tests and inspections at Substantial Completion. Include descriptions of unresolved deficiencies.

B. Scheduling and Coordination: Inspection of installation and workmanship may occur prior to or during completion of the Work, including:
   1. After completion of all partition framing, the first course of masonry work, ceiling framing, rough door framing, window framing, resilient ceiling hangers and sway braces, but before installation of the drywall, plaster or any other interior finish for all acoustically-critical Spaces.
   2. After installation of acoustic underlayment or slab isolation, but prior to finish flooring installation.
   3. After all partitions, doors, windows, ceilings and floors, ductwork, conduit, sprinklers, have been installed and completed, including acoustic sealing of partition, ceiling and floor penetrations, but prior to installation of interior wall, ceiling or floor finishes in acoustically-critical spaces.
   4. Acoustical inspection of all other construction shall occur as appropriate to the phase and level of completion of each part of the work.

C. Preparation for Inspections:
   1. Confirm the air distribution system is fully balanced and operating normally.
   2. Identify construction and equipment within acoustically-critical spaces

D. Prior to final commissioning by Acoustic Consultant, inspect and perform acoustical testing to determine compliance with requirements, including:
   1. Overall separation of acoustically-critical spaces, acoustic sealant joints, vibration and airborne sound control.
   2. Installation and adjustment of acoustically-rated doors, door sets, gasketing and hardware.
   3. Installation and adjustment of sound-control door and frame assemblies.
   4. Installation and operation of sound-control window units.
   5. Sealing of service penetrations into and out of acoustically-critical spaces.
   6. Installation and operation of fixed and adjustable acoustic surface treatments and room tuning products and assemblies.
   7. Installation of sound and vibration components, vibration isolation joints and resilient equipment mounting and attachment.

3.3 REPORT
A. Acoustic inspector will prepare a punchlist to itemize observed conditions that are not in compliance with specified requirements or intent of the Construction Documents.
B. Do not proceed until the Architect and Acoustic Consultant have reviewed and approved these constructions in the field with the appropriate Contractor representative.

3.4 CORRECTION OF WORK
A. Perform corrective measures in a timely manner acceptable to the Owner and prior to proceeding with subsequent work related Work.
B. Examination and Acceptance of Conditions: Before proceeding with each component of the Work, examine substrates, areas, and conditions, with Installer or Applicator present where indicated, for compliance with requirements for installation tolerances and other conditions affecting performance. Record observations.
1. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the Work indicates acceptance of surfaces and conditions.

END OF SECTION
SECTION 01 91 13
COMMISSIONING REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the contract, including General and Supplementary
      Conditions and other Division 01 specification sections, apply to this section.
   B. Owner’s Project Requirements and Basis of Design documents are included by reference for
      information only.
   C. Related Sections include the following:
      Division 01 Section “Coordination.”
      Division 01 Section “Construction Progress Documentation.”
      Division 01 Section “Submittal Procedures.”
      Division 01 Section “LEED Requirements.”
      Division 01 Section “Closeout Procedures” for Project Records, Operation and Maintenance
      Manuals.

1.2 SUMMARY
   A. This section includes general requirements that apply to the implementation of the
      commissioning process without regard to specific systems, assemblies, and components.

1.3 DEFINITIONS
   A. Acceptance: A formal action, taken by a person with appropriate provider (which may or may
      not be contractually defined) to declare that some aspect of the project meets defined
      requirements, thus permitting subsequent activities to proceed.
   B. Approval: Acceptance that a piece of equipment or system has been properly installed and is
      functioning in the tested modes according to the Contract Documents.
   C. Basis of Design (BoD): A document that records the concepts, calculations, decisions, and
      product selections used to meet the Owner’s project requirements and to satisfy applicable
      regulatory requirements, standards, and guidelines. The document includes both narrative
      descriptions and lists of individual items that support the design process.
   D. Checklists: Verification checklists that are developed and used during all phases of the
      commissioning process to verify that the Owner’s project requirements are being achieved. This
      includes checklists for general verification, plus testing, training, and other specific
      requirements.
   E. Commissioning Authority (CxA): The entity identified by the Owner who leads, plans,
      schedules, and coordinates the commissioning team to implement the commissioning process.
   F. Commissioning Plan: An overall plan developed by the commissioning agent that provides the
      structure, schedule and coordination planning for the commissioning process.
G. Commissioning Process: A quality-focused process for enhancing the delivery of a project. The process focuses upon verifying and documenting that the facility and all of its systems and assemblies are planned, designed, installed, tested, operated, and maintained to meet the Owner’s project requirements.

H. Commissioning Process Activities: Components of the commissioning process.

I. Commissioning Process Progress Report: A written document that details activities completed as part of the commissioning process and significant findings from those activities that is continuously updated during the course of a project. Usually it is incorporated into the commissioning plan as an ongoing appendix.

J. Commissioning Team: The individuals who through coordinated actions are responsible for implementing the commissioning process.

K. Construction Checklist: A form used by the Contractor to verify that appropriate components are on-site, ready for installation, correctly installed, and functional. Also refer to Checklists.

L. Construction Documents: This includes a wide range of documents, which will vary from project to project, with the Owner’s needs and with regulations, laws, and countries. Construction documents usually include the Project Manual ( specifications), plans (Drawings) and general terms and conditions of the Contract.

M. Continuous Commissioning Process: A continuation of the commissioning process well into the occupancy and operations phase to verify that a project continues to meet current and evolving Owner’s project requirements. Continuous commissioning process activities are on-going for the life of the facility. Also refer to On-Going Commissioning Process.

N. Contract Documents: This includes a wide range of documents, which will vary from project to project, with the Owner’s needs and with regulations, laws, and countries. Contract Documents frequently include price agreements, construction management process, sub-contractor agreements or requirements, requirements and procedures for submittals, changes, and other construction requirements, timeline for completion, and the construction documents.

O. Coordination Drawings: Drawings showing the work of all trades to illustrate that equipment can be installed in the space allocated without compromising equipment function or access for maintenance and replacement. These drawings graphically illustrate and dimension manufacturers’ recommended maintenance clearances.

P. Control System: A component of environmental, HVAC, security, and fire systems for reporting/monitoring and issuing of commands to/from field devices.

Q. Data Logging: The monitoring and recording of flows, currents, status, pressures, etc., of equipment using stand-alone data recorders separate from the control system or the trending capabilities of control systems.

R. Deferred Performance Tests (DPTs): Performance tests that are performed, at the discretion of the CxA, after substantial completion, due to partial occupancy, equipment, seasonal requirements, design, or other site conditions that disallow the test from being performed.

S. Deficiency: A condition in the installation or function of a component, piece of equipment, or system that is not in compliance with the Contract Documents.

T. Field Quality Control: Testing of equipment on-site, by factory personnel, or by the Contractor with or without the assistance of factory personnel, and with or without an Owner’s representative present.
**U. Issues Log:** A formal and ongoing record of problems or concerns, and their resolutions, which have been raised by members of the commissioning team during the course of the commissioning process.

**V. Non-Compliance:** See Deficiency.

**W. Non-Conformance:** See Deficiency.

**X. Owner’s Project Requirements (OPR):** A written document that details the functional requirements of a project and the expectations of how it will be used and operated. This includes project goals, measurable performance criteria, cost considerations, benchmarks, success criteria, and supporting information. (The term “Project Intent” is used by some Owners for their commissioning process Owner’s project requirements or design.)

**Y. Over-ridden Value:** Riding over a sensor value in the equipment’s controls to observe the response of the equipment’s operation. Also see **Simulated Signal**.

**Z. Phased Commissioning:** Commissioning that is completed in phases as required by the phasing plan for the project and other scheduling issues.

**AA. Quality Based Sampling:** A process for evaluating a sub-set (sample) of the total population. The sample is based upon a known or estimated probability distribution of expected values; an assumed statistical distribution based upon data from a similar product, assembly, or system; or a random sampling that has scientific statistical basis.

**BB. Re-Commissioning:** An application of the commissioning process requirements to a project that has been delivered using the commissioning process. This may be a scheduled re-commissioning developed as part of an ongoing commissioning process, or it may be triggered by use change, operations problems, or other needs.

**CC. Retro-Commissioning:** The commissioning process applied to an existing facility that was not previously commissioned. This guideline does not specifically address retro-commissioning. However, the same basic process needs to be followed from pre-design through occupancy and operations to optimize the benefits of implementing the commissioning process philosophy and practice.

**DD. Seasonal Performance Tests:** Performance tests that are deferred until the system(s) will experience conditions closer to their design conditions based on weather conditions.

**EE. Simulated Condition:** Condition that is created for the purpose of testing the response of a system (e.g., raising/lowering the setpoint of a thermostat to see the response in a VAV box).

**FF. Simulated Signal:** Disconnecting a sensor and using a signal generator to simulate a sensor value for the purpose of testing a full range of conditions.

**GG. Source Quality Control:** Testing of equipment at the factory, by factory personnel, with or without an Owner’s representative present.

**HH. Startup:** The initial starting or activating of dynamic equipment, including completing construction checklists.

**II. Systems Manual:** A system-focused composite document that includes the operation manual, maintenance manual, and additional information of use to the Owner during the occupancy and operations phase.
JJ. Test Procedure: A written protocol that defines methods, personnel, and expectations for tests conducted on components, equipment, assemblies, systems, and interfaces among systems. The test procedures are specified in the Technical Specifications sections of the Contract Documents. Performance testing covers the dynamic functions and operations of equipment and systems using manual or monitoring methods. Performance testing is the dynamic testing of systems under full operation. Systems are tested under various modes, such as during low cooling loads, high loads, component failures, unoccupied, varying outside air temperatures, fire alarm, power failure, etc. The systems are run through all the control system’s sequences of operation and components are verified to respond as the sequences state.

KK. Training Plan: A written document that details the expectations, schedule, budget, and deliverables of commissioning process activities related to training of project operating and maintenance personnel, users, and occupants.

LL. Verification: The process by which specific documents, components, equipment, assemblies, systems, and interfaces among systems are confirmed to comply with the criteria described in the Owner’s Project Requirements.

MM. Trending: The monitoring, by a building automation system (BAS) or other electronic data gathering equipment and analyzing of the data gathered over a period of time.

NN. Vendor: Supplier of equipment.

OO. Warranty Period: Refer to the Conditions of the Contract and individual Specification Sections.

1.4 DESCRIPTION

A. Commissioning: Commissioning is a quality-oriented process for achieving, verifying, and documenting that the performance of facilities, systems, and assemblies meet defined objectives and criteria. The Commissioning process begins at project inception (during the pre-design phase) and continues through the life of the facility. The commissioning process includes specific tasks to be conducted during each phase in order to verify that design, construction, and training meets the Owner's project requirements.

B. Commissioning Team: The members of the commissioning team consist of the contracted commissioning authority (CxA), Building Enclosure Commissioning Authority (BECxA), the Owner’s Representative/Construction Manager (CM), the General Contractor (GC), the Architect and Engineers (A/E), the mechanical subcontractor (MC), the electrical subcontractor (EC), the testing and balancing (TAB) subcontractor, the control subcontractor (CC), the facility operating staff, and any other installing subcontractors or suppliers of equipment. The CxA is hired by the Owner directly. The CxA directs and coordinates the project commissioning activities and the reports to the Owner. All team members work together to fulfill their contracted responsibilities and meet the objectives of the Contract Documents.

C. Commissioning shall:

Verify that applicable equipment and systems are installed according to the Contract Documents, manufacturer’s recommendations, and industry accepted minimum standards and that they receive adequate operational checkout by installing Contractors.

Verify that the building cladding, fenestration, and roofing systems are designed and installed to perform according to the design intent and Owner’s project requirements.

Verify the proper installation of building enclosure components and assemblies.

Verify and document proper operation of equipment and systems.
Verify that O&M documentation left on site is complete.
Verify that the Owner’s operating personnel are adequately trained.

D. The commissioning process does not take away from or reduce the responsibility of the system designers or installing Contractors to provide a finished and fully functioning product.

1.5 SUBMITTALS

A. The CxA will provide appropriate Contractors with a specific request for the type of submittal documentation the CxA requires facilitating the commissioning work. These requests will be integrated into the normal submittal process and protocol of the construction team. At minimum, the request will include the manufacturer and model number, the manufacturer’s printed installation and detailed startup procedures, full sequences of operation, O&M data, performance data, any performance test procedures, control drawings and details of Owner contracted tests. In addition, the installation and checkout materials that are actually shipped inside the equipment and the actual field checkout sheet forms to be used by the factory or field technicians shall be submitted to the CxA. All documentation requested by the CxA will be included by the subcontractors in their O&M manual contributions.

B. The CxA will review submittals related to the commissioned equipment and specific building enclosure components for conformance to the Contract Documents as it relates to the commissioning process, to the performance of the equipment and adequacy for developing test procedures. This review is intended primarily to aid in the development of performance procedures and only secondarily to verify compliance with equipment specifications. The commissioning authority will notify the Owner/CM, PM or A/E as requested, of items missing or areas that are not in conformance with Contract Documents and may require resubmission.

C. The CxA may request additional design narrative from the A/E and controls subcontractor, depending on the completeness of the OPR documentation and sequences provided with the Specifications.

D. These submittals to the CxA do not constitute compliance for O&M manual documentation. The O&M manuals are the responsibility of the Contractor, though the CxA will review them.

1.6 REFERENCED STANDARDS

A. ASHRAE Guideline 0 “The Commissioning Process”

C. ASTM E2813 “Standard Practice for Building Enclosure Commissioning”

1.7 QUALITY ASSURANCE

A. ASHRAE: Follow Guidelines:

B. InterNational Electrical Testing Association: NETA Acceptance Testing Specifications (ATS) - 1996
C. Instructor Qualifications: Factory-authorized service representatives, experienced in training, operation, and maintenance procedures for installed systems, subsystems, and equipment.

D. Test Equipment Calibration: Comply with test equipment manufacturer's calibration procedures and intervals. Recalibrate test instruments immediately whenever instruments have been repaired following damage or dropping. Affix calibration tags to test instruments or have certificates readily available. Instruments shall have been calibrated within six months prior to use.

1.8 COORDINATION

A. Project Commissioning Team: The members of the project commissioning team will consist of the commissioning authority and any support personnel, the Construction Manager, the Owner's facility staff (FS) or designee, the General Contractor, subcontractors and/or vendors as required, and the Architect/Engineer (A/E).

B. Management: The CxA coordinates the commissioning activities through the Construction Manager. All members shall work together to fulfill their contracted responsibilities and meet the objectives of the Contract Documents. Refer to Article "Commissioning Plan" for additional management details.

C. Scheduling: The CxA, through the Owner or CM, will provide sufficient notice to the Contractor for scheduling commissioning activities with respect to the Owner's participation. The Contractor will integrate all commissioning activities into the overall project schedule. All parties will address scheduling problems and make necessary notifications in a timely manner in order to expedite the commissioning process.

D. Manufacturers' Field Services: CxA shall coordinate through the CM the services of manufacturers' field representatives to demonstrate the operation of packaged controlled equipment.

1.9 COMMISSIONING PLAN

A. The CxA will develop the commissioning plan which shall be included in the project schedule after review by the Owner or CM. The following narrative provides a brief overview of the typical commissioning tasks during construction and the general order in which they occur.

Commissioning during construction begins with an initial commissioning meeting conducted by the CxA where the commissioning process is reviewed with the project commissioning team members.

Additional meetings will be required throughout construction, scheduled by the CxA, through the Owner or CM, with necessary parties attending to plan, scope, coordinate, schedule future activities and resolve problems.

Equipment documentation is submitted to the CxA, through the Owner or CM, during normal submittals, including detailed startup procedures.

The construction checklists are to be completed by the Contractor (or subcontractors), before and during the startup process.

Construction checklists, TAB and startup must be completed before performance testing.

Items of non-compliance in material, installation, or setup shall be corrected at no expense to the Owner.
The Contractor ensures that the subcontractors’ construction checklists are executed and documented, and that startup and initial checkout are performed. The CxA verifies that the TAB, construction checklists and startup were completed according to the plans. This includes the CxA reviewing TAB, checklists and startup plans. This may also include the witnessing of startup of selected equipment. Any testing failure is to be corrected at no additional cost to the Owner, and a re-test is to be performed, observed, and documented.

The CxA develops and implements equipment, system, and building components performance test procedures. The forms and procedures are reviewed by the Owner, CM and A/E.

The performance tests are executed by the Contractor under the direction of the CxA with the assistance of the facility staff, or third-party testing agency. All documentation is by the CxA.

The CxA reviews the O&M documentation for completeness and provides the commissioning record for the O&M manuals.

Commissioning should be completed before substantial completion.

The CxA reviews the Contractors training plan and ensures that training of the Owner’s Facility personnel is provided by the Contractor.

Deferred testing is conducted as specified or required.

1.10 COMMISSIONING TEAM

A. Members appointed by Contractor(s): Individuals, each having authority to act on behalf of the entity they represent, explicitly organized to implement the commissioning process through coordinated actions. The commissioning team shall consist of, but not be limited to, representatives of each Contractor, including project superintendent and subcontractors, installers, suppliers, and specialists deemed appropriate by the CxA.

B. Members appointed by Owner:

CxA - An entity identified by the Owner who leads, plans, schedules, and coordinates the commissioning team to implement the commissioning process. Owner will engage the CxA under a separate contract.

Representatives of the facility user and operation and maintenance personnel.

Architect and engineering design professionals.

1.11 RESPONSIBILITIES

A. The general responsibilities of various parties in the commissioning process are provided in this Article. The specific responsibilities are in the Technical Specifications.

B. All Parties:

Follow the commissioning plan.

Attend initial commissioning meeting and additional meetings as necessary.

C. Architect (of A/E):

Construction Phase:
Prepare BoD documents for review and distribution by the Owner.

Attend the commissioning scoping meeting and selected commissioning team meetings.

Perform normal submittal review, construction observation, as-built drawing preparation, project punch list preparation, etc., as contracted.

Provide any design narrative documentation requested by the CxA.

Coordinate resolution of system deficiencies identified during commissioning, according to the Contract Documents.

Prepare and submit final as-built design intent documentation for inclusion in the O&M manuals. Review the O&M manuals.

D. Mechanical and Electrical Designers/Engineers (of the A/E):

Construction Phase:

Perform normal submittal review, construction observation, as-built drawing preparation, project punch list preparation, etc., as contracted. One site observation should be completed just prior to system startup.

Provide any design narrative and sequences documentation requested by the CxA. The designers shall assist (along with the Contractors) in clarifying the operation and control of commissioned equipment in areas where the specifications, control drawings or equipment documentation is not sufficient for writing detailed testing procedures.

Attend commissioning scoping meetings and other selected commissioning team meetings.

Participate in the resolution of system deficiencies identified during commissioning, according to the Contract Documents.

Prepare and submit the final as-built design intent and operating parameters documentation for inclusion in the O&M manuals. Review the O&M manuals.

Occupancy and Operations Phase:

Participate in the resolution of non-compliance, non-conformance and design deficiencies identified during commissioning.

E. Commissioning Authority (CxA):

The Contractors will provide all tools or the use of tools to start, check-out and test equipment and systems, except for specified testing with portable data-loggers, which shall be supplied and installed by the CxA when necessary.

The CxA will verify the execution of commissioning process activities using random sampling as coordinated with the Owner. The sampling rate may vary from 1 to 100 percent. Verification will include, but is not limited to, equipment submittals, construction checklists, training, operating and maintenance data, tests, and test reports to verify compliance with the OPR. When a random sample does not meet the requirement, CxA will report the failure in the "Issues Log."

Construction Phase:
Coordinates and directs the commissioning activities in a logical, sequential and efficient manner using consistent protocols and forms, centralized documentation, clear and regular communications and consultations with all necessary parties, frequently updated timelines and schedules and technical expertise.

Coordinate the commissioning work and, with the Owner/CM, help integrate commissioning activities into the master schedule.

Revise the Construction Phase Commissioning Plan as necessary.

Plan and conduct a commissioning scoping meeting and other commissioning meetings.

Request and review additional information required to perform commissioning tasks, including O&M materials, Contractor startup and checkout procedures.

Before startup, gather and review the current control sequences and interlocks and work with Contractors and design engineers until sufficient clarity has been obtained, in writing, to be able to write detailed testing procedures.

Review normal Contractor submittals applicable to systems being commissioned for compliance with commissioning needs.

Write and distribute construction checklists. Prepare and maintain completed construction checklist log.

Perform site visits, as necessary, to observe component and system installations. Attend selected planning and job-site meetings to obtain information on construction progress. Review construction meeting minutes for revisions/substitutions relating to the commissioning process. Assist in resolving any discrepancies.

Review construction checklist completion by selected site observation and spot checking.

Recommend approval of systems startup by reviewing startup reports and by selected site observation.

Analyze any performance trend logs and monitoring data to verify performance when necessary.

Coordinate and witness manual performance tests performed by installing Contractors.

Maintain a master Issues Log and a separate testing record. Provide the Owner/CM with written progress reports and test results.

Witness performance testing of smoke control systems by Authority Having Jurisdiction and all other Owner contracted tests or tests by manufacturer's personnel over which the CxA may not have direct control. Document these tests and include this documentation in Commissioning Record.

Witness part of the building enclosure systems installation. Document observations, notify Owner/CM of any deficiencies in procedures.

Witness performance testing of window assemblies, and installation testing of wall and roof components.

Ensure the training of the Owner’s operating personnel.
Compile and maintain a commissioning record, Cloud-Based database or hard copy book(s).

Review the O&M manuals for compliance with the Contract requirements.

Provide a final commissioning report (as described in this Section).

Occupancy and Operations Phase:

Coordinate and supervise required seasonal or deferred testing and deficiency corrections if needed.

F. Owner or Owner’s Representative (CM):

Establish Contracts:

Owner and Architect: Agreement for design.

Owner and Contractor: Contract for construction.

Owner and Commissioning Authority: Agreement for observation and review of the commissioning process.

Construction and Acceptance Phase:

Facilitate the coordination of the commissioning work by the CxA, and, with the GC and CxA, ensure that commissioning activities are being scheduled into the master schedule.

Provide utility services required for the commissioning process.

Review the final "Commissioning Plan - Construction Phase."

Attend a commissioning scoping meeting and other commissioning team meetings.

Perform the normal review of Contractor submittals.

Furnish a copy of all construction documents, addenda, change orders and reviewed submittals and shop drawings related to commissioned equipment to the CxA.

Review the performance test procedures submitted by the CxA, prior to testing.

When necessary, observe and witness startup and performance testing of selected equipment.

Review commissioning progress and deficiency reports.

Coordinate the resolution of non-compliance and design deficiencies identified in all phases of commissioning.

Assist in coordinating the training of Owner personnel.

Provide the OPR documentation to the CxA and each Contractor for information and use.

Provide the BoD documents, prepared by Architect and reviewed by Owner, to the CxA and each Contractor for use in developing the commissioning plan, systems manual, and operation and maintenance training plan.

Assign operation and maintenance personnel and schedule them to participate in commissioning team activities.
Occupancy and Operations Phase:

Assist the CxA as necessary in the seasonal or deferred testing and deficiency corrections required by the Specifications.

G. Owner’s Project Manager (PM):

Construction Phase:

Manage the Contract of the A/E and of the GC.

Arrange for facility operating and maintenance personnel to attend various field commissioning activities and field training sessions.

Occupancy and Operations Phase:

Ensure that any seasonal or deferred testing and any deficiency issues are addressed.

H. Contractor: Each Contractor and their subcontractors and vendors shall assign representatives with expertise and authority to act on their behalf and schedule them to participate in and perform commissioning process activities including, but not limited to, the following:

Construction Phase:

Facilitate the coordination of the commissioning and incorporate commissioning activities (the Commissioning Plan) into the Overall Project Schedule (OPS).

Integrate and coordinate commissioning process activities with the OPS.

Provide detailed startup procedures.

Provide utility services required for the commissioning process.

Include the cost of commissioning in the total Contract price.

Ensure that all subcontractors and vendors execute their commissioning responsibilities according to the Contract Documents and the OPS.

Provide copies of all submittals as required in Division 01 Section "Submittals" including all changes thereto. Attend and participate in commissioning team meetings.

No later than 60 days prior to startup of the first piece of major equipment, meet with the CxA, CM, A/E, and PM and Owner to finalize the detailed commissioning procedures/ schedule.

Provide the training of Owner personnel.

Review construction checklists provided by the commissioning authority.

Complete construction checklists as work is completed and provide to the CxA.

Accomplish commissioning process test procedures.

Evaluate performance deficiencies identified in test reports and, in collaboration with entity responsible for system and equipment installation, recommend corrective action.

Cooperate with the CxA for resolution of issues recorded in the “Issues Log”.

Permit Set

29 June 2020
Prepare O&M manuals, according to the Contract Documents, including clarifying and updating the original sequences of operation to as-built/as-tested conditions.

Occupancy and Operations Phase:

Ensure that subcontractors provide assistance for seasonal or deferred performance testing, performed by the CxA, according to the Specifications.

Ensure that subcontractors correct deficiencies and make necessary adjustments to O&M manuals and as-built drawings for applicable issues identified in any seasonal testing.

Perform all guarantee work for materials furnished under the contract for the time specified in the Contract, including all warranties and curing all latent defects within the time period provided in the Contract.

I. Vendors/Subcontractors:

Provide all requested submittal data, including detailed startup procedures and specific responsibilities of the Owner to keep warranties in force.

Assist in equipment testing per agreements with subcontractors and/or Contractor.

Include cost of all special tools and instruments (only available from vendor, specific to a piece of equipment) required for testing, operating, and maintaining equipment according to these Contract Documents in the base bid price to the Contractor.

Analyze specified products and verify that the A/E has specified the newest, most current equipment reasonable for this project’s scope and budget.

Provide requested information regarding equipment sequence of operation and testing procedures.

Review construction checklists and test procedures for equipment installed by factory representatives.

1.12 EQUIPMENT/SYSTEMS TO BE COMMISSIONED

A. The following equipment/systems will be commissioned in this project:

Mechanical Systems:

a. Heating systems.
   1) Heating Hot Water System
   2) Associated pumps and controls
   3) Humidification Systems.

b. Cooling systems.
   1) Air Cooled Chilled Water System.
   2) Associated pumps, heat exchanger and controls.

c. Air handling systems.
   1) Blower Coil units.
2) Air Handling Systems.

d. Terminal systems.
   1) Air Terminal Units.
   2) Terminal Heating Devices (Unit heaters, Cabinet Unit Heaters & Radiant Heaters)

e. Exhaust and stand-alone systems.
   1) Ductless split systems Air Conditioning Systems.
   2) Exhaust and Ventilation Fans.
   3) Lab Exhaust, Dust Collector and Welding Exhaust Fans.

f. Plumbing systems:
   1) Domestic Water Heaters and circulation pump.
   2) Compressed Air System.
   3) Sump Pumps.

Electrical systems:

  g. Lighting Systems.
     1) Interior Lighting Controls
     2) Site Lighting.

Building Envelope:

  h. Building Envelope Systems and Assemblies
     1) Building Roof.
     2) Building Walls.
     3) Building Windows.

Any other systems as required to comply with LEED Version 4 Rating System, Energy and Atmosphere Prerequisite 1, Fundamental Building Systems Commissioning.

PART 2 - PRODUCTS

2.1 TEST EQUIPMENT

A. All standard testing equipment required to perform startup and initial checkout and required performance testing shall be provided by the Contractor for the equipment being tested. This includes, but is not limited to, two-way radios, meters, and data recorders. Data recorders may be provided by the CxA at the option of the CxA.

B. Special equipment, tools, and instruments required for testing equipment according to these Contract Documents shall be included in the Contractor’s base bid price and shall be turned over to the Owner at Project close-out.
C. All testing equipment shall be of sufficient quality and accuracy to test and/or measure system performance within the tolerances specified in the specifications. If not otherwise noted, the following minimum requirements apply: Temperature sensors and digital thermometers shall have a certified calibration to NIST traceable standards to an accuracy of 0.5 deg F and a resolution of plus or minus 0.1 deg F. Pressure sensors shall have an accuracy of plus or minus 2.0 percent of the value range being measured (not full range of meter).

2.2 EQUIPMENT FOR ACCESS

A. Provide means for the CxA and their subconsultants to access, observe, touch, and visually observe installation of components. These means shall be in compliance with all OSHA and job-site safety regulations.
PART 3 - EXECUTION

3.1 MEETINGS

A. Initial Meeting: The CxA, through the Owner/CM, will schedule, plan and conduct an initial commissioning meeting. The Contractor and Contractor’s responsible parties are required to attend.

B. Miscellaneous Meetings: Other meetings will be planned and conducted by the CxA as construction progresses. These meetings will cover coordination, deficiency resolution, and planning issues. These meetings will be held at least monthly, until the final 2 months of construction, when they may be held as frequently as one per week.

3.2 STARTUP, CONSTRUCTION CHECKLISTS, AND INITIAL CHECKOUT

A. The following procedures apply to all equipment/systems to be commissioned, according to Article “Equipment/Systems to be Commissioned.”

B. General: Construction checklists are important to verify that the equipment and systems are fully connected and operational. It ensures that performance testing (in-depth system checkout) may proceed without unnecessary delays. The construction checklists for a given system must be successfully completed and approved prior to startup and formal performance testing of equipment or subsystems of the given system.

C. Startup and Checkout: The CxA may assist the project commissioning team members responsible for startup of any equipment. The primary role of the CxA in this process is to ensure that there is written documentation that each of the manufacturer-recommended procedures has been completed. The CxA shall provide construction checklists and startup shall be identified in the commissioning scoping meeting and on the checklist forms.

The construction checklists are provided in with the Cx Manual. These checklists indicate required procedures to be executed as part of startup and initial checkout of the systems and the party responsible for their execution.

The Contractor shall determine which trade is responsible for executing and documenting each of the line item tasks and transmit the checklists to the responsible subcontractors. Each form may have more than one trade responsible for its execution.

The Contractor/subcontractor with assistance from the CxA responsible for the purchase of the equipment shall develop the full startup plan by combining the manufacturer’s detailed startup and checkout procedures and the construction checklists.

The Contractor/subcontractor shall submit the full startup plan to the CxA for review and approval.

The Contractor will transmit the full startup plan to the subcontractors for their review and use.

D. Sensor and Actuator Calibration: All field-installed temperature, relative humidity, CO, CO2, refrigerant, O2, and/or pressure sensors and gages, and all actuators (dampers and valves) on all equipment shall be calibrated. Verify that all locations are appropriate and away from causes of erratic operation. Submit to the CxA through the CM the calibration methods and results

E. Execution of Construction Checklists and Startup:

Four weeks prior to the scheduled startup, the Contractor shall coordinate startup and checkout with the CM, A/E, and CxA. The execution and approval of the construction checklists, startup, and checkout shall be directed and performed by the Contractor, subcontractor or vendor.

The Owner/CM, and A/E as necessary, shall observe, at minimum, the procedures for each piece of primary equipment.

The subcontractors and vendors shall execute startup and provide the CxA and A/E, through the Owner/CM, with a signed and dated copy of the completed startup and construction checklists.

Only individuals of the Contractor (technicians, engineers, tradesmen, vendors, etc.) who have direct knowledge and witnessed that a line item task on the construction checklist was actually performed shall check off that item. It is not acceptable for witnessing supervisors to fill out these forms.

F. Deficiencies, Non-Conformance, and Approval in Checklists and Startup (Master Issues Log):

The Contractor shall ensure that the subcontractors clearly list any outstanding items of the initial startup and construction checklist procedures that were not completed successfully, on an attached sheet. The form and any outstanding deficiencies shall be provided, through the Owner/CM, to the CxA within two days of test completion.

The CxA will review the report and issue either a non-compliance report or an approval form, through the CM, to the Contractor. The installing subcontractors or vendors shall correct all areas that are deficient or incomplete in the checklists and tests in a timely manner, shall notify the Owner/CM as soon as outstanding items have been corrected, and resubmit an updated startup report with a Statement of Correction on the original non-compliance report.
Items left incomplete, which later cause deficiencies or delays during performance testing may result in backcharges to the Contractor. Refer to Article "Performance Testing" for details.

3.3 PHASED COMMISSIONING (IF REQUIRED)

A. The project requires TAB, startup and performance testing to be executed in phases. Phasing shall be coordinated with the Owner/CM, CxA, and A/E and be reflected in the overall project schedule and commissioning schedule by the Contractor. Final performance testing of all systems will be as required by the phasing plan. The performance testing of the “systems as a whole” will be performed before final turnover of the entire project.

3.4 PERFORMANCE TESTING

A. Requirements: The performance testing shall demonstrate that each system is operating according to the documented design intent and Contract Documents. Performance testing facilitates bringing the systems from a state of individual substantial completion to full dynamic operation. Additionally, during the testing process, areas of deficient performance are identified and corrected, improving the operation and functioning of the systems.

B. Coordination and Scheduling: The Contractor shall provide sufficient notice, regarding their completion schedule for the construction checklists and startup of all equipment and systems to allow the performance testing to be scheduled. The commissioning team shall oversee, witness, and document the performance of all equipment and systems. The CxA in association with the Contractor/subcontractors and facility staff shall execute the tests. Performance testing shall be conducted after the construction checklists, and startup has been satisfactorily completed. The control system shall be sufficiently tested prior to use, to verify performance of other components or systems. The air balancing and water balancing shall be completed before performance testing of air or water related equipment or systems. Testing proceeds from components to sub-systems to systems. When the proper performance of all interacting individual systems has been achieved, the interface or coordinated responses between systems shall be checked.

C. Development of Test Procedures: Before test procedures are finalized, the Contractor shall provide to the A/E and the CxA all requested documentation and a current list of changes affecting equipment or systems, including an updated points list, program code, control sequences, and testing parameters. Using the testing parameters and requirements in the technical Specifications, the CxA shall update/develop specific test procedures and forms to verify and document proper operation of each piece of equipment and system. Each Contractor/subcontractor or vendor, as appropriate, shall provide assistance to the CxA in developing the final procedures. Prior to finalization, the A/E shall review and concur with the test procedure.

D. Test Methods:

1. Equipment/Systems

Performance testing and verification may be achieved by manual testing or by monitoring the performance and analyzing the results using the control system’s trend log capabilities or by stand-alone data loggers. The CxA may substitute specified methods or require an additional method to be executed other than what was specified, with the approval of the A/E and Owner/CM. The CxA will determine which method is most appropriate for tests that do not have a specified method.
Simulated Conditions: Simulating conditions shall be allowed, though timing the testing to experience actual conditions is encouraged wherever practical.

Overridden Values: Overriding sensor values to simulate a condition, such as overriding the outside air temperature reading in a control system to be something other than it really is, is acceptable.

Simulated Signals: Using a signal generator which creates a simulated signal to test and calibrate transducers and DDC constants is generally recommended over using the sensor to act as the signal generator via simulated conditions or overridden values.

Altering Setpoints: Rather than overriding sensor values, and when simulating conditions is difficult, altering setpoints to test a sequence is acceptable.

Indirect Indicators: Relying on indirect indicators for responses or performance shall be allowed only after visually and directly verifying and documenting, over the range of the test parameters, that the indirect readings through the control system represent actual conditions and responses.

Setup: Each performance test shall be performed under conditions that simulate actual conditions as closely as is practically possible. The Contractor/subcontractor(s) assisting the CxA in executing the test shall provide all necessary materials, system modifications, etc., to produce the necessary flows, pressures, temperatures, etc., necessary to execute the test according to the specified conditions. At completion of the test, the Contractor/subcontractor(s) shall return all affected equipment and systems to their normal operating settings.

2. Building Enclosure Components:

For tests specified in trade sections provide technicians and tools to perform test.

For tests specified to be performed by the Owner’s Testing Agency or the CxA schedule tests in cooperation with the tester and coordinate site access and the Work of related trades to facilitate the testing work.

When material or systems manufacturer provides testing, review their procedures and deliver copies to the CxA. Deliver test result reports to the CxA.

The following building enclosure tests are recommended:

ASTM E783 “Standard Test Method for Field Measurement of Air Leakage Through Installed Exterior Windows and Doors”

ASTM E1105 “Standard Test method for Field Determination of Water Penetration of Installed Exterior Windows, Skylights, Doors, and Curtain Walls, by Uniform or Cyclic Static Air Pressure Difference”

AAMA 501.2 “Quality Assurance and Diagnostic Water Leakage Field Check of Installed Storefronts, Curtain Walls, and Sloped Glazing Systems”
E. Test Equipment: Refer to Part 2 for test equipment requirements.

F. Problem Solving: The burden of responsibility to solve, correct, and retest malfunctions/failures is with the Contractor, with A/E approval as required.

3.5 DOCUMENTATION, NON-CONFORMANCE, AND APPROVAL OF TESTS

A. Documentation: The CxA shall witness and verify the documentation of the results of all performance tests. The CxA shall complete all documentation for performance testing.

B. Non-Conformance:

Corrections of minor deficiencies identified may be made during the tests at the discretion of the CxA. In such cases the deficiency and resolution will be documented on the procedure form or on an attached sheet.

As tests progress and a deficiency is identified, the CxA shall discuss the issue with the commissioning team, and the Contractor.

When there is no dispute concerning the deficiency and the Contractor accepts responsibility to correct it:

1) The CxA will document the deficiency and the Contractor’s responsible to correct the deficiency.

2) If the correction can be fixed in the field, once complete, CxA will re-test.

3) If the correction cannot be completed during the scheduled commissioning time, the Contractor shall reschedule the test; and the test repeated.

If there is a dispute about a deficiency, regarding whether or not it is a deficiency:

4) The dispute shall be documented on the non-compliance form with the Contractor’s response.

5) Resolutions are made at the lowest management level possible. Other parties are brought into the discussions as needed. Final interpretive authority is with the A/E. Final acceptance authority is with the Construction Manager.

6) The CxA documents the resolution.

7) The test plan is modified, or the Contractor corrects the deficiency and re-testing is scheduled.

Cost of repeating a performance test is the Contractor’s.

The Contractor shall submit in writing to the CM at least as often as commissioning meetings are being scheduled, the status of each outstanding discrepancy identified during commissioning. Discussion shall cover explanations of any disagreement and proposals for their resolutions.

The CxA retains the original non-conformance forms until the end of the project.

Retesting shall not be considered a justified reason for a claim of delay or for a time extension by the Contractor.
3.6 DEFERRED TESTING

A. Unforeseen Deferred Tests: If any check or test cannot be completed due to the project completion level, required occupancy condition or other deficiency, execution of checklists and performance testing may be delayed upon approval of the CxA and CM. These tests will be conducted in the same manner as the seasonal tests as soon as possible. Services of necessary parties will be negotiated.

B. Seasonal Testing: During the warranty period, seasonal testing (tests delayed until weather conditions are closer to the system's design) shall be completed as part of this contract. The CxA shall coordinate this activity through the Owner/CM. Tests will be executed, documented by the CxA and deficiencies should be corrected by the appropriate Contractor/subcontractors with the CxA witnessing. Any final adjustments to the O&M manuals and as-builds due to the testing shall be made by the Contractor.

3.7 TRAINING OF OWNER PERSONNEL

A. The Contractor shall provide training coordination, scheduling of subcontractors, and ensure that training is completed. All training shall be coordinated, through the CM, with the CxA.

B. The Contractor shall ensure that each subcontractor and vendor (mechanical, plumbing, fire, electrical, specialty, etc.) shall have the following responsibilities:

Provide, to the CxA through the CM, a training plan before the planned training covering the following elements:

- Equipment.
- Intended audience.
- Location of training.
- Objectives.
- Subjects covered (description, duration of discussion, special methods, etc.).
- Duration of training on each subject.
- Instructor for each subject.
- Methods (classroom lecture, manufacturer’s quality video, site walk-through, actual operational demonstrations, written handouts, etc.).

Provide designated Owner personnel with comprehensive orientation and training in the understanding of the systems and the operation and maintenance of each piece of equipment that makes up the system.

Training shall normally start with classroom sessions followed by hands-on demonstration/training on each piece of equipment.

The appropriate trade or manufacturer’s representative shall provide the instructions on each major piece of equipment. Practical building operating expertise as well as in-depth knowledge of all modes of operation of the specific piece of equipment are required. More than one party may be required to execute the training.
The controls subcontractor shall attend sessions other than the controls training, as specified, to discuss the interaction of the controls system as it relates to the equipment being discussed.

The training sessions shall follow the outline in the table of contents of the operation and maintenance manual and illustrate whenever possible the use of the O&M manuals for reference.

Training shall include:

- Use of the printed installation, operation and maintenance instruction material included in the O&M manuals.
- A review of the written O&M instructions emphasizing safe and proper operating requirements, preventative maintenance, special tools needed and spare parts inventory suggestions. The training shall include startup, operation in all modes possible, shutdown, seasonal changeover and any emergency procedures.
- Discussion of relevant health and safety issues and concerns.
- Discussion of warranties and guarantees.
- Common troubleshooting problems and solutions.
- Explanatory information included in the O&M manuals.
- Discussion of any peculiarities of equipment installation or operation.
- Classroom sessions shall include the use of overhead projections, slides, video/audio-taped material as might be appropriate.
- Hands-on training shall include startup, operation in all modes possible, including manual, shut-down, alarms, power failure and any emergency procedures, and preventative maintenance for all pieces of equipment.

The Contractor shall fully explain and demonstrate the operation, function and overrides of any local packaged controls not controlled by the central control system.

3.8 OPERATIONS AND MAINTENANCE MANUALS/DATA

A. The commissioning process requires detailed O&M documentation as identified in this Section and technical Specifications.

B. Contractor shall submit draft copies (Electronic Files) of the complete operating and maintenance manual to the CM for review by the Architect/Engineer and CxA as specified in Division 1.

C. The Contractor shall compile O&M manuals for every piece of equipment and building operating or electrical system being commissioned as directed by the specification and CM.

END OF SECTION 01 9113
SECTION 024119
SELECTIVE DEMOLITION

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Demolition and removal of selected portions of building or structure.
   2. Salvage of existing items to be reused or recycled.

1.2 DEFINITIONS

A. Remove: Detach items from existing construction and dispose of them off-site unless indicated to be salvaged or reinstalled.

B. Remove and Salvage: Detach items from existing construction, in a manner to prevent damage, and deliver to Owner ready for reuse or store as directed.

C. Remove and Reinstall: Detach items from existing construction, in a manner to prevent damage, prepare for reuse, and reinstall where indicated.

D. Existing to Remain: Leave existing items that are not to be removed and that are not otherwise indicated to be salvaged or reinstalled.

E. Dismantle: To remove by disassembling or detaching an item from a surface, using gentle methods and equipment to prevent damage to the item and surfaces; disposing of items unless indicated to be salvaged or reinstalled.

1.3 MATERIALS OWNERSHIP

A. Unless otherwise indicated, demolition waste becomes property of Contractor.

B. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to Owner that may be uncovered during demolition remain the property of Owner.
   1. Carefully salvage in a manner to prevent damage and promptly return to Owner.

1.4 PREINSTALLATION MEETINGS

A. Predemolition Conference: Conduct conference at Project site.
   1. Inspect and discuss condition of construction to be selectively demolished.
   2. Review structural load limitations of existing structure.
   3. Review and finalize selective demolition schedule and verify availability of materials, demolition personnel, equipment, and facilities needed to make progress and avoid delays.
   4. Review requirements of work performed by other trades that rely on substrates exposed by selective demolition operations.
   5. Review areas where existing construction is to remain and requires protection.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For refrigerant recovery technician.
B. Proposed Protection Measures: Submit report, including Drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and for noise control. Indicate proposed locations and construction of barriers.

C. Schedule of Selective Demolition Activities: Indicate the following:
   1. Detailed sequence of selective demolition and removal work, with starting and ending dates for each activity. Ensure Owner's on-site operations are uninterrupted, if planned to be occupied.
   2. Interruption of utility services. Indicate how long utility services will be interrupted.
   3. Coordination for shutoff, capping, and continuation of utility services.
   4. Use of elevator and stairs.
   5. Coordination of Owner's continuing occupancy of portions of existing building and of Owner's partial occupancy of completed Work.

D. Predemolition Photographs or Video: Show existing conditions of adjoining construction, including finish surfaces, that might be misconstrued as damage caused by demolition operations. Comply with Section 013233 "Photographic Documentation." Submit before Work begins.

E. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

F. Warranties: Documentation indicating that existing warranties are still in effect after completion of selective demolition.

1.6 CLOSEOUT SUBMITTALS
   A. Inventory: Submit a list of items that have been removed and salvaged.

1.7 QUALITY ASSURANCE
   A. Refrigerant Recovery Technician Qualifications: Certified by an EPA-approved certification program.

1.8 FIELD CONDITIONS
   A. Notify Architect of discrepancies between existing conditions and Drawings before proceeding with selective demolition.
   B. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.
      1. Hazardous materials will be removed by Owner before start of the Work.
      2. If suspected hazardous materials are encountered, do not disturb; immediately notify Architect and Owner. Hazardous materials will be removed by Owner under a separate contract.
   C. Storage or sale of removed items or materials on-site is not permitted.
   D. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.
      1. Maintain fire-protection facilities in service during selective demolition operations.
PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.

B. Standards: Comply with ASSE A10.6 and NFPA 241.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verify that utilities have been disconnected and capped before starting selective demolition operations.

B. Review Project Record Documents of existing construction or other existing condition and hazardous material information provided by Owner. Owner does not guarantee that existing conditions are same as those indicated in Project Record Documents.

C. Perform an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during selective building demolition operations.
   1. Perform surveys as the Work progresses to detect hazards resulting from selective demolition activities.

D. Verify that hazardous materials have been remediated before proceeding with building demolition operations.

E. Survey of Existing Conditions:
   1. Inventory and record the condition of items to be removed and salvaged. Provide photographs or video of conditions that might be misconstrued as damage caused by salvage operations.
   2. Before selective demolition or removal of existing building elements that will be reproduced or duplicated in final Work, make permanent record of measurements, materials, and construction details required to make exact reproduction.

3.2 PREPARATION

A. Refrigerant: Before starting demolition, remove refrigerant from mechanical equipment according to 40 CFR 82 and regulations of authorities having jurisdiction.

3.3 UTILITY SERVICES AND MECHANICAL/ELECTRICAL SYSTEMS

A. Existing Services/Systems to Remain: Maintain services/systems indicated to remain and protect them against damage.

B. Existing Services/Systems to Be Removed, Relocated, or Abandoned: Locate, identify, disconnect, and seal or cap off utility services and mechanical/electrical systems serving areas to be selectively demolished.
   1. Owner will arrange to shut off indicated services/systems when requested by Contractor.
   2. Arrange to shut off utilities with utility companies.
3. If services/systems are required to be removed, relocated, or abandoned, provide temporary services/systems that bypass area of selective demolition and that maintain continuity of services/systems to other parts of building.

4. Disconnect, demolish, and remove fire-suppression systems, plumbing, and HVAC systems, equipment, and components indicated on Drawings to be removed.
   a. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
   b. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material and leave in place.
   c. Equipment to Be Removed: Disconnect and cap services and remove equipment.
   d. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
   e. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.
   f. Ducts to Be Removed: Remove portion of ducts indicated to be removed and plug remaining ducts with same or compatible ductwork material.
   g. Ducts to Be Abandoned in Place: Cap or plug ducts with same or compatible ductwork material and leave in place.

3.4 PROTECTION

A. Temporary Protection: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
   1. Provide protection to ensure safe passage of people around selective demolition area and to and from occupied portions of building.
   2. Provide temporary weather protection, during interval between selective demolition of existing construction on exterior surfaces and new construction, to prevent water leakage and damage to structure and interior areas.
   3. Protect walls, ceilings, floors, and other existing finish work that are to remain or that are exposed during selective demolition operations.
   4. Cover and protect furniture, furnishings, and equipment that have not been removed.
   5. Comply with requirements for temporary enclosures, dust control, heating, and cooling specified in Section 015000 "Temporary Facilities and Controls."

B. Temporary Shoring: Design, provide, and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.
   1. Strengthen or add new supports when required during progress of selective demolition.

C. Remove temporary barricades and protections where hazards no longer exist.

3.5 SELECTIVE DEMOLITION, GENERAL

A. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:
   1. Proceed with selective demolition systematically, from higher to lower level. Complete selective demolition operations above each floor or tier before disturbing supporting members on the next lower level.
2. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping. Temporarily cover openings to remain.

3. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.

4. Do not use cutting torches until work area is cleared of flammable materials. At concealed spaces, such as duct and pipe interiors, verify condition and contents of hidden space before starting flame-cutting operations. Maintain portable fire-suppression devices during flame-cutting operations.

5. Maintain fire watch during and for at least <Insert number> hours after flame-cutting operations.

7. Remove decayed, vermin-infested, or otherwise dangerous or unsuitable materials and promptly dispose of off-site.

8. Remove structural framing members and lower to ground by method suitable to avoid free fall and to prevent ground impact or dust generation.

9. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.

10. Dispose of demolished items and materials promptly. [Comply with requirements in Section 017419 "Construction Waste Management and Disposal."]

B. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.

C. Work in Historic Areas: Selective demolition may be performed only in areas of Project that are not designated as historic. In historic spaces, areas, and rooms, or on historic surfaces, the terms "demolish" or "remove" shall mean historic "removal" or "dismantling" as specified in Section 024296 "Historic Removal and Dismantling."

D. Removed and Salvaged Items:
   1. Clean salvaged items.
   2. Pack or crate items after cleaning. Identify contents of containers.
   3. Store items in a secure area until delivery to Owner.
   4. Transport items to Owner's storage area [on-site] [off-site] [designated by Owner] [indicated on Drawings].
   5. Protect items from damage during transport and storage.

E. Removed and Reinstalled Items:
   1. Clean and repair items to functional condition adequate for intended reuse.
   2. Pack or crate items after cleaning and repairing. Identify contents of containers.
   3. Protect items from damage during transport and storage.
   4. Reinstall items in locations indicated. Comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make item functional for use indicated.

F. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by Architect, items may be removed to a suitable, protected storage location during selective demolition [and cleaned] and reinstalled in their original locations after selective demolition operations are complete.
3.6 SELECTIVE DEMOLITION PROCEDURES FOR SPECIFIC MATERIALS

A. Concrete: Demolish in sections. Cut concrete full depth at junctures with construction to remain and at regular intervals using power-driven saw, and then remove concrete between saw cuts.

B. Masonry: Demolish in small sections. Cut masonry at junctures with construction to remain, using power-driven saw, and then remove masonry between saw cuts.

C. Concrete Slabs-on-Grade: Saw-cut perimeter of area to be demolished, and then break up and remove.

D. Resilient Floor Coverings: Remove floor coverings and adhesive according to recommendations in RFCI's "Recommended Work Practices for the Removal of Resilient Floor Coverings. Do not use methods requiring solvent-based adhesive strippers.

E. Roofing: Remove no more existing roofing than what can be covered in one day by new roofing and so that building interior remains watertight and weathertight.
   1. Remove existing roof membrane, flashings, coping, and roof accessories.
   2. Remove existing roofing system down to substrate.

3.7 DISPOSAL OF DEMOLISHED MATERIALS

A. Remove demolition waste materials from Project site [and dispose of them in an EPA-approved construction and demolition waste landfill acceptable to authorities having jurisdiction.] [and recycle or dispose of them according to Section 017419 "Construction Waste Management and Disposal."]
   1. Do not allow demolished materials to accumulate on-site.
   2. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
   3. Remove debris from elevated portions of building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.
   4. Comply with requirements specified in Section 017419 "Construction Waste Management and Disposal."

B. Burning: Do not burn demolished materials.

3.8 CLEANING

A. Clean adjacent structures and improvements of dust, dirt, and debris caused by selective demolition operations. Return adjacent areas to condition existing before selective demolition operations began.

END OF SECTION
SECTION 03 30 00
CAST-IN-PLACE CONCRETE

PART 1 GENERAL

1.01 RELATED DOCUMENTS

A. Division 00 - Procurement and Contracting Requirements, and Division 01 - General Requirements, are hereby made part of this Section.

1.02 SECTION INCLUDES

A. Interior slabs on grade.
B. Foundations, piers and walls.
C. Underslab vapor retarder.

1.03 REFERENCES

1.04 SUBMITTALS

A. See Section 01 3323 - Shop Drawings, Product Data, and Samples, for submittal procedures.
B. Product Data: Submit data for proprietary materials and items, including reinforcement and forming accessories, admixtures, patching compounds, joint systems, and others as requested by Architect.
   1. Submit data for form liners, form ties, and accessories for architectural concrete.
C. Shop Drawings: Reinforcement: Submit shop drawing prepared by a registered Professional Engineer for fabrication, bending, and placement of concrete reinforcement.
   1. Comply with ACI 315 "Manual of Standard Practice for Detailing Reinforced Concrete Structures" showing bar schedules, stirrup spacing, diagrams of bent bars, arrangement of concrete reinforcement. Include special reinforcement required and openings through concrete structures.
D. Laboratory Test Reports: Submit laboratory test reports for concrete materials and mix design test as specified.
   1. Submit proposed design mix for each type of concrete required. Per ACI 301, supplier is responsible for compatibility of admixtures.
   2. Integral Waterproofing Admixture:
      a. Permeability: Test reports indicating treated samples pressure tested to a 350 foot head of water (150 psi) showing no measurable leakage per COE CRD-C48-70 "Standard Test Method for Water Permeability of Concrete".
      b. Photographs: Evidencing use of admixture taken with a Scanning Electron Microscope (SEM) showing crystalline formations within concrete.

1.05 QUALITY ASSURANCE

A. Workmanship: Contractor is responsible for correction of concrete work which does not conform to specified requirements, including strength, tolerances and finishes. Correct deficient concrete as directed by Architect.
B. Concrete Testing Service: Employ, at Contractor's expense, a testing laboratory acceptable to the Architect to perform material evaluation tests and to design concrete mixes.
   1. Materials and installed work may require testing and retesting, as directed by Architect, at anytime during progress of work. Allow free access to material stockpiles and facilities. Tests, not specifically indicated to be done at Owner's expense, including retesting or rejected materials and installed work, shall be done at Contractor's expense.
   2. General Contractor will employ a testing laboratory for field quality control.

C. Testing Agency Personnel: Certified per ACI CP-1, as ACI Concrete Field Testing Technician, Grade 1.

D. Tests for Concrete Materials:
   1. For normal weight concrete, test aggregates per ASTM C 33.
   2. For portland cement, sample cement and determine chemical and physical properties per ASTM C 150.
   3. Submit written reports to Architect for each material sampled, and tested prior to start of work.
      a. Provide the project identification name and number, date of report, name of Contractor, name of concrete testing service, source of concrete aggregates, material manufacturer and brand name for manufacturing materials, values specified in the referenced specification for each material and test results.
      b. Indicate whether or not material is acceptable for intended use.
   4. Certificates of material properties and compliance with specified requirements may be submitted in lieu of testing, when acceptable to Architect. Certificates of compliance must be signed by materials producer and Contractor.

1.06 PRE-INSTALLATION CONFERENCE

A. Schedule a pre-installation conference at Cass Ave, Detroit MI-48201, minimum two weeks prior to start of concrete work containing waterproofing admixture, with the following parties in attendance.
   1. Owner's Representative.
   3. Contractor.
   4. Concrete Supplier.
   5. Concrete Contractor.
   6. Waterproofing admixture supplier.
   7. Waterproofing admixture manufacturer's representative.
   8. Other interested parties.

B. Review methods and procedures related to use of waterproofing admixture in cast-in-place concrete including, but not limited to, the following:
   1. Inspect and discuss condition of subgrade and preparatory work performed by other trades.
   2. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
   3. Review required inspecting, testing, and certifying procedures.
   4. Review weather and forecasted weather conditions and procedures for coping with unfavorable conditions.

C. Contractor shall record discussion, including agreement or disagreement on significant matters. Furnish copies of report to all parties present within 5 days after meeting date.
   1. If substantial disagreements exist at conclusion of meeting, determine how disagreements will be resolved, and set date and time to reconvene meeting.
1.07 MOCK-UPS

A. General: Prior to installing cast-in-place concrete, construct mockups for selection of each finish required to demonstrate aesthetic effects as well as qualities of materials and execution.
   1. Construct mock-ups minimum 30 days prior to start of Work using same personnel, materials, and techniques to be used for Project work.
   2. Construct mock-ups to demonstrate levels of the following finishes:
      a. Light Abrasive Blast finish for exposed exterior vertical surfaces.

B. Build mock-ups to comply with the following requirements, using materials indicated for Work.
   1. Locate mockups on-site in location indicated or, if not indicated, as directed by Architect.
   2. Size of mock-ups shall be minimum 5 feet by 5 feet.
   3. Construct 4 mock-ups for each finish required to demonstrate range available. Provide additional mock-ups, if requested by Architect.
   4. Notify Architect 7 days in advance of the dates and times when mock-ups will be constructed.
   5. Obtain Architect's approval of mock-ups and final selection of finish level before start of Work.
   6. Retain and maintain selected mock-ups during construction in an undisturbed condition as a standard for judging the completed Work.
      a. When directed, demolish and remove mockups from Project site.

PART 2 PRODUCTS

2.01 REINFORCING MATERIALS

A. Reinforcing Bars: ASTM A 615, Grade 60, deformed.
   1. Unfinished.
C. Supports for Reinforcement: Bolsters, chairs, spacers, and other devices for spacing, supporting and fastening reinforcing bars and welded wire fabric in place. Use wire bar type supports complying with CRSI specifications.
   1. For slabs-on-grade, use supports with sand plates or horizontal runners where base material will not support chair legs.
D. Fiber Reinforcement: ASTM C 1116, Type III, engineered polypropylene fibers designed for secondary reinforcement of concrete fill at metal pan stairs.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Forta Corp.; Forta CR.
      b. Fibermesh, Inc.; Fibermesh.
      c. Degussa Admixtures, Inc.; Grace Fibers.

2.02 CONCRETE MATERIALS

A. Portland Cement: ASTM C 150, Type I.
   1. Type III may be used for high early strength concrete.
   2. Use one brand of cement throughout the project, unless otherwise acceptable to Architect.
B. Normal Weight Aggregates: ASTM C 33.
   1. Fine Aggregates: Clean, sharp, natural sand free from loam, clay, lumps or other deleterious substances.
      a. Dune sand, bank run sand and manufactured sand are not acceptable.
2. Coarse Aggregate: Clean, uncoated, processed aggregate containing no clay, mud, loam, or foreign matter, as follows:
   a. Crushed stone, processed from natural rock or stone.
   b. Washed gravel, either natural or crushed. Use of pit or bank run gravel not permitted.
   c. Maximum Aggregate Size: Not larger than one-fifth of narrowest dimension between sides of forms, one-third of depth of slabs, nor three-fourths of minimum clear spacing between individual reinforcing bars or bundles of bars.

D. Fly Ash: ASTM C 618, Type F.
F. Water: Potable.
G. Colored Concrete Stain: Refer to Section 03 35 19 - Color Concrete Finishes.

2.03 ADMIXTURES

A. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
B. Water-Reducing Admixture: ASTM C 494, Type A, and contain not more than 0.1% ions.
C. High-Range Water-Reducing Admixture (Super Plasticizer): ASTM C 494, Type F or Type G and contain not more than 0.1% chloride ions.
D. Water-Reducing, Non-Chloride Accelerator Admixture: ASTM C 494, Type E, and containing not more than 0.1% chloride ions.
F. Water-Reducing, Retarding Admixture: ASTM C 494, Type D, and contain not more than 0.1% chloride ions.
G. Certification: Provide admixture manufacturer’s written certification that chloride ion content complies with specified requirements.
H. Prohibited Admixtures: Calcium chloride thyocyanates or admixtures containing more than 0.1% chloride ions are not permitted.

2.04 WATERSTOPS

A. Waterstops: Provide flat, dumbbell type or centerbulb type waterstops at construction joints and other joints as indicated on Drawings. Size to suit joints.
   1. Rubber Waterstops: Corps of Engineers CRD-C 513.
   3. Bentonite/Butyl Waterstops: CETCO; Waterstop RX.

2.05 CURING MATERIALS

A. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, approximately 9 oz. per square yard.
B. Moisture-Retaining Cover: ASTM C 171, as follows:
   1. Waterproof paper.
   2. Polyethylene film.
   3. Polyethylene-coated burlap.
2.06 JOINT MATERIALS

A. Preformed Expansion Joint Fillers: ASTM D 1751 and AASHTO M 213, resilient and non-extruding type pre-molded bituminous impregnated fiberboard units.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Knight-Celotex; Conflex Expansion Joint Filler
      b. W.R. Meadows, Inc.; Fiber Expansion Joint Filler
   2. Expansion Joint Filler Caps: Provide removable caps for all preformed expansion joint fillers. Provide caps by the following:
      a. Bometals, Inc.; Expansion Board Caps
      b. W. R. Meadows; Sealight Snap-Cap

B. Epoxy Control Joint Filler: Two component, 100 percent solids compound, with minimum Shore D Hardness of 50.
   1. Subject to compliance with requirements, provide products by the following:
      a. Dayton Superior Corp.; Poxy-Fil (J-52)
      b. L & M Construction Chemicals, Inc.; Epoflex SL

2.07 UNDERSLAB VAPOR RETARDER

A. Vapor Barrier: Provide vapor barrier cover over prepared base material. Use polyethylene/polyolefin sheet per ASTM E 1745, Class A.
   1. Thickness: Not less than 10 mils per ACI 302.1R
   2. Water Vapor Transmission Rate: Maximum 0.01 perms tested per ASTM E154, Section 7 (based on ASTM E 96) or Test Method F1249. Refer to ASTM E1745 paragraph 7.
   3. Products: Subject to compliance with requirements, provide one of the following:
      a. Stego Industries; Stego Wrap Vapor Barrier.
      b. Raven Industries; Vapor Block 10.
      c. W. R. Meadows; Perminator 10 Mil.
      d. Inteplast; Barrier-Bac VB-250 (11 mil)
   4. Substitutions: See Section 01 25 00 - Substitution Procedures.

B. Accessories: Provide manufacturer's recommended accessories as required to provide a complete vapor barrier, including but not limited to seam tape and vapor-proof mastic/sealant.

C. Granular Base Course: Clean manufactured or natural sand; per ASTM D 448, Size 10, with 10 to 30 percent passing a No. 4 sieve and 10 to 30 percent passing a No. 100 sieve.

2.08 RELATED MATERIALS

A. Dovetail Anchor Slots: Hot-dip galvanized sheet steel, not less than 0.366 inch thick (22 gage) with bent tab anchors. Fill slot with temporary filler or cover face opening to prevent intrusion of concrete or debris.

B. Bonding Compound: ASTM C 1059, Type II, styrene Butadiene or acrylic base, rewetable type.
   1. Products: Subject to compliance with requirements, provide one of the following:
      a. Dayton Superior Corp.; Day-Chem Ad Bond (J-40)
      b. Grace Construction Products; Daraweld C
      c. L & M Construction Chemicals; Everbond
      d. W. R. Meadows; Intralok

C. Epoxy Adhesive: ASTM C 881, two component, high modulus, moisture tolerant, structural epoxy adhesive suitable for use on dry or damp surfaces. Provide material "Type", "Grade", and "Class" to suit project requirements.
1. Products: Subject to compliance with requirements, provide one of the following:
   a. Dayton Superior Corp.; Resi-Bond (J-58)
   b. W. R. Meadows; Rezi-Weld
   c. Sika Chemical Corp.; Sikadur 32 Hi-Mod

2.09 PROPORTIONING AND DESIGN OF MIXES

A. Prepare design mixes for each type and strength of concrete by either laboratory trial batch or field experience methods as specified in ACI 301 Article 3.9. If trial batch method used, use an independent testing facility acceptable to Architect for preparing and reporting proposed mix designs.

   1. Testing facility shall not be same as used for field quality control testing, unless otherwise acceptable to Architect.
   2. Limit fly ash to maximum 15 percent of cement content by weight.

B. Submit written reports to Architect of each proposed mix for each class of concrete at least 15 days prior to start of work. Do not begin concrete productions until mixes have been reviewed and approved by Architect.

C. Design mixes to provide normal weight concrete with the following properties and additives:

   1. Footings and Foundations: 4000 psi 28-day compressive strength; W/C ratio, 0.50 maximum (non-air-entrained), 0.46 maximum (air entrained).
   2. Interior Slabs: 4000 psi 28-day compressive strength; W/C ratio, 0.50 maximum (non-air-entrained).
   3. Exterior Walls and Slabs: 4000 psi 28-day compressive strength; W/C ratio 0.40 (air entrained 6% plus or minus 1%).
   4. All Other Concrete: 4,000 psi 28-day compressive strength: W/C ratio, 0.50 maximum (non-air-entrained).

D. Adjustment to Concrete Mixes: Mix design adjustments may be requested by Contractor when characteristics of materials, job conditions, weather, test results, or other circumstances warrant, at no additional cost to Owner and as accepted by Architect.

   1. Laboratory test data for revised mix design and strength results must be submitted to and accepted by Architect before using in work.

E. Water-Cement Ratio: Provide concrete with maximum water-cement (WC) ratios as specified.

F. Slump Limits: Proportion and design mixes to result in concrete slump at point of placement as follows:

   1. Ramps, slabs, and sloping surfaces: Not more than 3 inches.
   2. Reinforced Foundation Systems: Not less than 1” and not more than 3 inches.
   3. Concrete containing HRWR admixture (super plasticizer): Not more than 8 inches after addition of HRWR to site verified 2 to 3 inches slump concrete.
   4. Other concrete: Not more than 4 inches.

2.10 ADMIXTURE USE

A. Use water-reducing admixture or high range water-reducing admixture (super plasticizer) in concrete as required for placement and workability.

B. Use non-chloride accelerating admixture in concrete slabs placed at ambient temperatures below 50 degF (10 degC).
C. Use high-range water-reducing admixture in pumped concrete, architectural concrete and concrete with water/cement ratios below 0.50.

D. Use air-entraining admixture in exterior exposed concrete, unless otherwise indicated. Add air-entrained admixture at manufacturer's prescribed rate to result in concrete at point of placement having total air content with a tolerance of plus-or-minus 1% within following limits:
1. Concrete structures and slabs exposed to freezing and thawing, de-icer chemicals, or subjected to hydraulic pressure.
   a. Air Entrainment: 5.0%.
2. Other Concrete (not exposed to freezing, thawing or hydraulic pressure): 2% to 4% air.

E. Use admixtures for water-reducing and set-control in strict compliance with manufacturer's directions.

2.11 MIXES

A. Ready-Mix Concrete: Comply with ASTM C 94 and ASTM C 1116, and as herein specified.
   1. Furnish Batch Ticket information.
   2. When air temperature is between 85 degF (30 degC) and 90 degF (32 degC), reduce mixing and delivery time from 1-1/2 hours to 75 minutes, and when air temperature is above 90 degF (32 degC), reduce mixing and delivery time to 60 minutes.

PART 3 EXECUTION

3.01 GENERAL

A. Coordinate installation of joint materials and vapor retarders with placement of forms and reinforcing steel.

3.02 FORMS

A. Design, erect, support, brace and maintain formwork, per ACI 301, to support vertical and lateral, static and dynamic loads that might be applied until such loads can be supported by concrete structure.
   1. Construct formwork as required so concrete members and structures are of correct size, shape, alignment, elevation and position. Maintain formwork construction tolerances per ACI 117 and ACI 347.
   2. Provide Class A tolerances for concrete exposed to view.
   3. Provide Class C tolerances for other concrete surfaces.

B. Design formwork to be readily removable without impact, shock or damage to cast-in-place concrete surfaces and adjacent materials.

C. Construct forms to sizes, shapes, lines and dimensions shown, and to obtain accurate alignment, location, grades, level and plumb work in finished structures. Use selected materials to obtain required finishes. Solidly butt joints and provide back-up at joints to prevent leakage of cement paste.
   1. Provide for openings, offsets, sinkages, keyways, recesses, moldings, rustications, reglets, chamfers, blocking, screeds, bulkheads, anchorages and inserts, and other features required in work.
   2. Single use spiral type forms are NOT ACCEPTABLE.

D. Fabricate forms for easy removal without hammering or prying against concrete surface.
   1. Provide crush plates or wrecking plates where stripping may damage cast concrete surfaces
   2. Provide top forms for inclined surfaces where slope too steep to place concrete with bottom forms only
3. Kerf wood inserts for forming keyways, reglets, recesses, and the like, to prevent swelling and for easy removal

E. Provide temporary openings where interior area of formwork is inaccessible for cleanout, for inspection before concrete placement, and for placement of concrete. Locate temporary openings in forms at inconspicuous locations.

F. Chamfer exposed corners and edges as indicated, using wood, metal, PVC or rubber chamfer strips fabricated to produce uniform smooth lines and tight edge joints.

G. Form Ties: Use specified type, sized as required to prevent form deflection, and to prevent spalling concrete surfaces upon removal.

H. Provisions for Other Trades: Provide openings in concrete formwork to accommodate work of other trades. Determine size and location of openings, recesses and chases from trades providing such items. Accurately place and securely support work of other trades built into forms.

I. Cleaning and Tightening: Thoroughly clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt or other debris just before placing concrete. Retighten forms and bracing after concrete placement as required to eliminate mortar leaks and maintain proper alignment.

J. Edge Forms and Screed Strips for Slabs: Set edge forms of bulkheads and intermediate screed strips for slabs to obtain required elevations and contours in finished slab surface. Provide and secure units to support types of screed strips by use of strike-off templates or compacting type screeds.

3.03 PLACING REINFORCEMENT

A. Comply with CRSI's recommended practice for “Placing Reinforcing Bars”, for details and methods of reinforcement placement and supports, and as herein specified.

1. Do not cut or puncture vapor retarder. Repair damage and reseal vapor retarder prior to placing concrete.

2. Clean reinforcement of loose rust and mill scale, earth, ice and other materials which reduce or destroy bond with concrete.

B. Locate and support reinforcing by metal chairs, runners, bolsters, spacers, and hangers, as required.

C. Place reinforcement to obtain at least minimum coverage for concrete protection per ACI 318.

1. Arrange, space and securely tie bars and bar supports to hold reinforcement in position during concrete placement operations.

2. Set wire ties so ends are directed into concrete, not toward exposed concrete surfaces.

D. Install welded wire fabric in as long lengths as practicable.

1. Place on bar supports spaced to minimize sagging.

2. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset end laps in adjacent widths to prevent continuous laps in either direction.

3.04 VAPOR RETARDER INSTALLATION

A. Place granular base course on slab sub-base material to minimum 4 inch thickness, unless otherwise indicated.

1. Level and compact to tolerance of plus 0 inch, minus 3/4 inch.

B. Following leveling and compacting of granular base for slabs on grade, place vapor retarder sheet with longest dimension parallel with direction of pour.

C. Place vapor retarder directly on compacted sand cushion.

D. Place, protect, and repair vapor retarder per ASTM E 1643.
1. Lap joints 6" and seal with appropriate tape.
2. Lap vapor barrier over footings or seal to foundation walls. Use manufacturer’s approved methods for sealing to foundation and walls.
3. Seal all penetrations with boots recommended by manufacturer.
4. Place patches over damaged areas, overlapping damage minimum 6 inches. Tape complete perimeter of patches.

3.05 JOINTS

A. Construction Joints: Locate and install construction joints as indicated, if not indicated, locate so not to impair strength and appearance of structure, as acceptable to Architect.
B. Provide keyways at least 1-1/2" deep in construction joints in slabs; accepted bulkheads designed for this purpose may be used for slabs.
C. Place construction joints perpendicular to main reinforcement. Continue reinforcement across construction joints.
D. Waterstops: Provide waterstops in construction joints as indicated. Install waterstops to form continuous diaphragm in each joint. Support and protect exposed waterstops during progress of work. Field fabricate joints in waterstops in accordance with manufacturers instructions.
E. Isolation Joints in Slabs-On-Ground: Construct isolation joints in slabs-on-ground at points of contact between slabs on ground and vertical surfaces, such as column pedestals, foundation walls, grade beams and elsewhere as indicated.
F. Contraction (Control) Joints in Slabs-On-Ground: Construct contraction joints in slabs-on-ground to form panels of patterns as shown. Saw cut 1/8" to 1/4" wide x 1/4 of slab depth, unless otherwise indicated.
   1. Place sawcut joints as soon as possible, no later than 24 hours, after slab finishing is complete, and without dislodging aggregate.
   2. If joint pattern is not shown, provide joints not exceeding 15 feet in either direction and located to conform to bay spacing wherever possible (at column centerlines, half bays, third bays).

3.06 INSTALLATION OF EMBEDDED ITEMS

A. General: Set and build into work anchorage devices and other embedded items required for other work attached to, or supported by cast-in-place concrete. Use setting drawings, diagrams, instructions and direction provided by suppliers of items to be attached thereto.
B. Install dovetail anchor slots to receive masonry anchors, in concrete structures as indicated on Drawings.

3.07 PREPARATION OF FORM SURFACES

A. Clean re-used forms of concrete matrix residue, repair and patch as required to return forms to acceptable surface conditions.
B. Coat contact surfaces of forms with an approved, nonresidual, low VOC, form-coating agent before reinforcement is placed.
   1. Coat steel forms with a non-staining, rust-preventative form oil or otherwise protect against rusting. Rust-stained steel formwork is not acceptable.
C. Thin form-coating compounds only with thinning agent of type, and in amount, and under conditions of form-coating compound manufacturer’s directions.
3.08 CONCRETE PLACEMENT

A. Preplacement Inspection: Before placing concrete, inspect and complete formwork installation of reinforcing steel, and items to be embedded or cast-in. Notify other crafts to permit installation of their work; cooperate with other trades in setting such work. Moisten wood forms immediately before placing concrete where form coatings are not used.

1. Notify Architect when forms and reinforcing are in place and may be examined. Do not place concrete until authorized by Architect.

B. Comply with ACI 304 "Recommended Practice for Measuring, Mixing, Transporting, and Placing Concrete", and as herein specified.

1. Deposit concrete continuously or in layers of such thickness that no concrete will be placed against concrete which has hardened sufficiently to cause formation of seams or planes of weakness.

2. If a section cannot be placed continuously, provide construction joints as herein specified. Deposit concrete as nearly as practicable to its final location to avoid segregation.

3. Protect adjacent finish materials against spatter during concrete slab placement.

C. Placing Concrete in Forms: Deposit concrete in forms in horizontal layers not deeper than 24" and in manner to avoid inclined construction joints. Where placement consists of several layers, place each layer while preceding layer is still plastic to avoid cold joints.

1. Consolidate placed concrete by mechanical vibrating equipment supplemented by hand-spading, rodding or tamping. Use equipment and procedures for consolidation of concrete per ACI 309R.

2. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations not farther than visible effectiveness of machine. Place vibrators to rapidly penetrate placed layer and at least 6" into preceding layer.

3. Do not insert vibrators into lower layers of concrete that have begun to set. At each insertion limit duration of vibration to time necessary to consolidate concrete and complete embedment of reinforcement and other embedded items without causing segregation of mix.

D. Placing Concrete Slabs: Deposit and consolidate concrete slabs in a continuous operation, within limits of construction joints, until the placing of a panel or section is completed.

1. Consolidate concrete during placing operations so concrete is thoroughly worked around reinforcement and other embedded items and into corners.

2. Bring slab surfaces to correct level with straightedge and strike off. Use bull floats or darbies to smooth surface, free of humps or hollows. Do not disturb slab surfaces prior to start of finishing operations.

3. Maintaining reinforcing in proper position on chairs during concrete placement operations.

E. Placing Concrete Footings: Once excavation is complete, protect bearing strata from being disturbed. If soil is susceptible to disturbance due to moisture conditions, place concrete immediately.

F. Cold Weather Placing: Protect concrete work from physical damage or reduced strength which could be caused by frost, freezing actions, or low temperature, in compliance with ACI 306 and as herein specified.

1. When air temperature has fallen to or is expected to fall below 40 degF (4 degC), uniformly heat water and aggregates before mixing to obtain a concrete mixture temperature of not less than 50 degF (10 degC), and not more than 80 degF (27 degC) at point of placement.

2. Do not use frozen materials or material containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
3. Do not use calcium chloride, salt and other materials containing anti-freeze agents or chemical accelerators, unless otherwise accepted in mix designs.

G. Protections of Footings Against Freezing: Cover completed work at footing level with sufficient temporary or permanent cover, as required, to protect footings and adjacent subgrade from freezing; maintain as required.

H. Hot Weather Placing: When hot weather conditions exist that would seriously impair quality and strength of concrete, place concrete in compliance with ACI 305 and as herein specified.
   1. Cool ingredients before mixing to maintain concrete temperature at time of placement below 90 degF (32 degC). Mixing water may be chilled, or chopped ice may be used to control temperature provided water equivalent of ice is calculated to total amount of mixing water. Use of liquid nitrogen to cool concrete is Contractor's option.
   2. Cover reinforcing steel with water-soaked burlap if it becomes too hot, so that steel temperature will not exceed the ambient air temperature immediately before embedment in concrete.
   3. Fog spray forms, reinforcing steel and subgrade just before concrete is placed. Keep subgrade uniformly moist, without puddles or dry spots.
   4. Use water-reducing retarding admixture (Type D) when required by high temperatures, low humidity, or other adverse placing conditions.

3.09 FINISH OF FORMED SURFACES

A. Rough Form Finish: For formed concrete surfaces not exposed-to-view in finish work or covered by other construction, unless otherwise indicated.
   1. This is the as-cast concrete surface having texture imparted by form facing material used, with tie holes and defective areas repaired and patched and fins and other projections exceeding 1/4" in height rubbed down or chipped off.

B. Smooth Form Finish: For formed concrete surfaces exposed-to-view, or that are to be covered with a coating material, or a covering material, applied directly to concrete, such as waterproofing, painting or similar system.
   1. This is as-cast concrete surface obtained with selected form facing material, arranged orderly and symmetrically with a minimum of seams.
   2. Repair and patch defective areas with fins or other projections completely removed and smoothed.

C. Smooth Rubbed Finish: Provide smooth rubbed finish on exposed walls at areas scheduled/indicated, that have received smooth form finish treatment, not later than one day after form removal.
   1. Moisten concrete surfaces and rub with carborundum brick or other abrasive until a uniform color and texture is produced.
   2. Do not apply cement grout other than that created by the rubbing process.

D. Related Unformed Surfaces: At unformed surfaces occurring adjacent to formed surfaces, strike-off smooth and finish with a texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise indicated.

3.10 MONOLITHIC SLAB FINISHES

A. Scratch Finish: Apply scratch finish to monolithic slab surfaces to receive concrete floor topping or mortar setting beds for tile, portland cement terrazzo, and other bonded, applied cementitious finish flooring material, and where indicated.
1. After placing slabs, plane surfaces to tolerances of F(f) 15 (floor flatness) and F(l) 13 (floor levelness) measured per ASTM E 1155. Uniformly slope surfaces to drains. After leveling, roughen surface before final set, with stiff brushes, brooms, or rakes.

B. Float Finish: Apply float finish to monolithic slab surfaces to receive trowel finish and other finishes specified; slab surfaces to be covered with waterproofing, membrane roofing, or sand-bed terrazzo, and where indicated.
   1. After screeding, consolidating, and leveling concrete slabs, do not work surface until ready for floating.
   2. Begin floating when surface water has disappeared or when concrete has stiffened sufficiently to permit operation of power-driven floats, or both. Consolidate surface with power-driven floats, or by hand-floating if area is small or inaccessible to power units.
   3. Check and level surface plane to tolerance of F(f) 18 (floor flatness) and F(l) 15 (floor levelness) measured per ASTM E 1155. Cut down high spots and fill low spots. Uniformly slope surfaces to drains.
   4. Immediately after leveling, refloat surface to a uniform, smooth, granular texture.

C. Trowel Finish: Apply trowel finish to interior monolithic slab surfaces exposed to view, and slab surfaces to be covered with resilient flooring, carpet, ceramic tile, quarry tile, paint, or other thin film finish system, which have been float finish.
   1. After floating, begin first trowel finish operation using a power driven trowel.
   2. Begin final troweling when surface produces a ringing sound as trowel is moved over surface. Consolidate concrete surface by final hand-troweling operation, free of trowel marks, uniform in texture and appearance, and with surface leveled to tolerances F(f) 20 (floor flatness) and F(l) 17 (floor levelness) measured per ASTM E 1155.
   3. Grind smooth surface defects which would telegraph through applied floor covering system.

D. Trowel and Fine Broom Finish: Where ceramic tile, porcelain tile, and quarry tile are to be installed with thin set mortar, apply trowel finish as specified, then immediately follow with slightly scarifying surface with fine brooming.

E. Non-Slip Broom Finish: Apply non-slip broom finish to exterior concrete platforms, steps, ramps, and elsewhere as indicated.

3.11 MISCELLANEOUS CONCRETE ITEMS

A. Filling-In: Fill-in holes and openings left in concrete structures for passage of work by other trades, unless otherwise shown or directed after work of other trades is in place. Mix, place and cure concrete as herein specified, to blend with in-place construction. Provide other miscellaneous concrete filling shown or required to complete work.

B. Equipment Bases and Foundations: Provide machine and equipment bases and foundations, as shown on Drawings. Set anchor bolts for machines and equipment to template at correct elevations, complying with certified diagrams or templates of manufacturer furnishing machines and equipment.

C. Steel Pan Stairs: Provide fiber reinforced concrete fill for steel pan stair treads, landings, and associated items. Cast in safety inserts and accessories as shown on Drawings. Screed, tamp, and finish concrete surfaces as scheduled.

3.12 CONCRETE CURING AND PROTECTION

A. Protect freshly placed concrete from premature drying and excessive cold or hot temperatures.
   1. Start initial curing as soon as free water has disappeared from concrete surface after placing and finishing. Weather permitting; keep continuously moist for not less than 7 days.
2. Begin final curing procedures immediately following initial curing and before concrete has dried. Continue final curing for at least 7 days per ACI 301 procedures. Avoid rapid drying at end of final curing period.

B. Curing Methods: Perform curing of concrete by moist curing, by moisture-retaining cover curing, and by combination thereof, as herein specified.
1. Provide moisture curing by following methods.
   a. Keep concrete surface continuously wet by covering with water.
   b. Continuous water-fog spray.
   c. Covering concrete surface with specified absorptive cover, thoroughly saturating cover with water and keeping continuously wet. Place absorptive cover to provide coverage of concrete surfaces and edges, with 4" lap over adjacent absorptive covers.
2. Provide moisture-cover curing as follows:
   a. Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width with sides and ends lapped at least 3" and sealed by waterproof tape or adhesive. Immediately repair any holes or tears during curing period using cover material and waterproof tape.

C. Curing Formed Surfaces: Cure formed concrete surfaces by moist curing with forms in place for full curing period or until forms are removed. If forms are removed, continue curing by methods specified above, as applicable.

D. Curing Unformed Surfaces: Cure unformed surfaces and other flat surfaces by use of moisture-retaining cover, unless otherwise directed.

E. Protect all concrete slabs indicated on Room Finish Schedule to be stained/sealed/colored concrete as follows:
   1. Sweep up all grit and debris immediately. Do NOT use oil based sweeping compounds.
   2. Use cleaner approved by sealer/hardener manufacturer for removing fine dust and grime on a daily basis. Avoid harsh chemicals.
   4. Do not eat or drink on slab.
   5. Remove isolated staining with specialty cleaner approved by sealer/hardener manufacturer.
   6. Get authorization from Contractor to operate equipment on the slab. Diaper all equipment and protect slab with absorbent drop cloth when working on slab.
      a. Use non-marking tires on all equipment. Inspect tires and remove embedded debris that may scratch slab.
   7. Store and charge materials and equipment in designated areas only. Contractor shall select location to minimize soiling and damage to slab to remain exposed.
   8. Use temporary, breathable protective coverings as needed for access. Remove coverings immediately after work is complete.

3.13 REMOVAL OF FORMS

A. Formwork not supporting weight of concrete may be removed after cumulatively curing at not less than 50 degF (10 degC) for 24 hours after placing concrete, provided concrete is sufficiently hard to not be damaged by form removal operations, and provided curing and protection operations are maintained.

B. Formwork supporting weight of concrete may not be removed in less than 14 days and until concrete has attained at least 75 percent of design minimum compressive strength at 28 days. Determine potential compressive strength of in-place concrete by testing field-cured specimens representative of concrete location or members, or by use of nondestructive testing method acceptable to Architect.
C. Form facing material may be removed 4 days after placement, only if shores and other vertical supports have been arranged to permit removal of form facing material without loosening or disturbing shores and supports.

3.14 RE-USE OF FORMS

A. Clean and repair surfaces of forms to be re-used in work. Apply new form coating compound as specified for new formwork.
   1. Split, frayed, delaminated or otherwise damaged form facing material is not acceptable for exposed surfaces.

B. When forms are extended for successive concrete placement, thoroughly clean surfaces and remove fins and laitance, and tighten forms to close joints. Align and secure joint to avoid offsets. Do not use “patched” forms for exposed concrete surfaces, except as acceptable to Architect.

3.15 CONCRETE SURFACE REPAIRS

A. Patching Defective Areas: Repair and patch defective areas with cement mortar immediately after removal of forms, when acceptable to Architect.
   1. Cut out honeycomb, rock pockets, voids over 1/4” in any dimension, and holes left by tie rods and bolts, down to solid concrete but, in no case to a depth of less than 1”. Make edges of cuts perpendicular to concrete surface. Thoroughly clean, dampen with water and brush-coat area to be patched with specified bonding agent. Place patching mortar after bonding compound has dried.
   2. For exposed-to-view surfaces, blend white portland cement and standard portland cement so that, when dry, patching mortar will match surrounding color. Provide test areas at inconspicuous location to verify mixture and color match before proceeding with patching.
   3. Compact mortar in place and strike-off slightly higher than surrounding surface.

B. Repair of Formed Surfaces: Remove and replace concrete having defective surfaces if defects cannot be repaired to satisfaction of Architect.
   1. Surface defects, as such, include color and texture irregularities, cracks, spalls, air bubbles, honeycomb, rock pockets; fins and other projections on the surface; and stains and other discoloration that can not be removed by cleaning.
   2. Flush out form tie holes, fill with dry pack mortar, or precast cement cone plugs secured in place with bonding agent.
   3. Repair concealed formed surfaces, where possible, that contain defects that affect the durability of concrete. If defects cannot be repaired, remove and replace concrete.

C. Repair of Unformed Surfaces: Test unformed surfaces, such as monolithic slabs, for smoothness and verify surface plane to tolerances specified for each surface and finish. Correct low and high areas as herein specified. Test unformed surfaces sloped to drain for trueness of slope, in addition to smoothness using a template having required slope.
   1. Repair finished unformed surfaces that contain defects which affect durability of concrete. Surface defects, as such, include crazing, cracks in excess of 0.01” wide or which penetrate to reinforcement or completely through non-reinforced sections regardless of width, spalling, pop-outs, honeycomb, rock pockets and other objectionable conditions.
   2. Correct high areas in unformed surfaces by grinding, after concrete has cured at least 14 days.
   3. Correct low areas in unformed surfaces during, or immediately after completion of surface finishing operations by cutting out low areas and replacing with fresh concrete. Finish repaired areas to blend into adjacent concrete. Proprietary patching compounds may be used when acceptable to Architect.
D. Repair defective areas, except random cracks and single holes not exceeding 1" diameter, by cutting out and replacing with fresh concrete.
   1. Remove defective areas to sound concrete with clean, square cuts and expose reinforcing steel with at least 3/4" clearance all around. Dampen concrete surfaces in contact with patching concrete and apply bonding compound.
   2. Mix patching concrete of same materials to provide concrete of same type or class as original concrete.
   3. Place, compact and finish to blend with adjacent finished concrete. Cure in same manner as adjacent concrete.

E. Repair isolated random cracks and single holes not over 1" in diameter by dry-pack method.
   2. Mix dry-pack, consisting of one part portland cement to 2-1/2 parts fine aggregate passing a No. 16 mesh sieve, using only enough water as required for handling and placing.
   3. Place dry pack after bonding compound has dried. Compact dry-pack mixture in place and finish to match adjacent concrete. Keep patched area continuously moist for not less than 72 hours.
   4. Perform structural repairs with prior approval of Architect for method and procedures, using specified epoxy adhesive and mortar.

F. Repair methods not specified above may be used, subject to acceptance of Architect.

3.16 FIELD QUALITY CONTROL

A. WSU will employ a testing laboratory to perform tests and to submit test reports.

B. Sampling and testing for quality control during placement of concrete may include the following, as directed by Architect.
   1. Sampling Fresh Concrete: ASTM C 172, except modified for slump per ASTM C 94.
      a. Slump: ASTM C 143; one test at point of discharge for each day's pour of each type of concrete; additional tests when concrete consistency seems to have changed.
      b. Air Content: ASTM C 173, volumetric method or ASTM C 231 pressure method; one for each day's pour of each type of air-entering compound.
      c. Concrete Temperature: ASTM C 1064, test hourly when air temperature is 40 degF (4 degC) and below, and when 80 degF (27 degC) and above; and each time a set of compression test specimens are made.
      d. Compression Test Specimens: ASTM C 31; one set of 4 standard cylinders for each compressive strength test, unless otherwise directed. Mold and store cylinders for laboratory cured test specimens except when field-cure test specimens are required.
      e. Compressive Strength Tests: ASTM C 39; one set for each day's pour exceeding 5 cubic yards plus additional sets for each 50 cubic yards over and above the first 25 cubic yards of each concrete class placed in any one day; one specimen tested at 7 days, two specimens tested at 28 days, and one specimen retained in reserve for later testing if required.
   2. When frequency of testing will provide less than 5 strength tests for a given class of concrete, conduct testing from at least 5 randomly selected batches or from each batch if fewer than 5 are used.
   3. When total quantity of a given class of concrete is less than 50 cubic yards, strength test may be waived by Architect if, in his judgement, adequate evidence of satisfactory strength is provided.
   4. When strength of field-cured cylinders is less than 85% of companion laboratory-cured cylinders, evaluate current operations and provide corrective procedures for protecting and curing the in-place concrete.
5. Strength level of concrete will be considered satisfactory if averages of sets of three consecutive strength test results equal or exceed specified compressive strength, and no individual strength test result falls below specified compressive by more than 300 psi.

C. Report test results in writing to the Architect, Contractor, and Contractor within 24 hours after tests.  
   1. Reports of compressive strength tests shall contain the project identification name and number, date of concrete placement, name of concrete testing service, concrete type and class, location of concrete batch in structure, design compressive strength at 28 days, concrete mix proportions and materials; compressive breaking strength and type of break for both 7-day and 28-day tests.

D. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted, but shall not be used as the sole basis for acceptance or rejection.

E. Additional Tests: Testing service will make additional tests of in-place concrete when test results indicate specified concrete strengths and other characteristics have not been attained, as directed by the Architect.  
   1. Testing service may conduct tests to determine adequacy of concrete by cored cylinders per ASTM C 42, or by other methods as directed.  
   2. Contractor shall pay for such tests conducted and any other additional testing as may be required, when unacceptable concrete is verified.

F. Measure floor and slab flatness and levelness per ASTM E 1155 within 24 hours of finishing.

3.17 PROTECTION

A. Protect all concrete slabs to receive exposed concrete finishes for petroleum staining, including but not limited to sealed/hardened, polished concrete or dyed and stained concrete floors

END OF SECTION
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Precast structural concrete.
   2. Precast structural concrete with commercial architectural finish.

B. Related Requirements:
   1. Section 033000 "Cast-in-Place Concrete" for placing connection anchors in concrete.
   2. Section 051200 "Structural Steel Framing" for furnishing and installing connections attached to structural-steel framing.
   3. Section 055000 "Metal Fabrications" for kickers and other miscellaneous steel shapes.
   4. Section 071900 "Water Repellents" for water-repellent finish treatments.

1.3 DEFINITIONS

1.4 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Project site.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Design Mixtures: For each precast concrete mixture. Include compressive strength and, if required, water-absorption tests.

C. Shop Drawings:
   1. Submit a detailed shop drawings and design calculations sealed by a professional engineer registered in the state of Michigan.
   2. Include member locations, plans, elevations, dimensions, shapes and sections, openings, support conditions, and types of reinforcement, including special reinforcement.
3. Detail fabrication and installation of precast structural concrete units, including connections at member ends and to adjoining construction.

4. Indicate joints, reveals, drips, chamfers, and extent and location of each surface finish.

5. Indicate separate face and backup mixture locations and thicknesses.

6. Indicate type, size, and length of welded connections by AWS standard symbols.

7. Detail loose and cast-in hardware, lifting and erection inserts, connections, and joints.

8. Indicate locations, tolerances, and details of anchorage devices to be embedded in or attached to structure or other construction.

9. Include and locate openings larger than 10 inches (250 mm). Where additional structural support is required, include header design.

10. Indicate location of each precast structural concrete unit by same identification mark placed on panel.

11. Indicate relationship of precast structural concrete units to adjacent materials.

12. Indicate locations, dimensions, and details of thin-brick units, including corner units and special shapes, and joint treatment.

13. Indicate locations, dimensions, and details of stone facings, anchors, and joint widths.

14. Indicate shim sizes and grouting sequence.

15. If design modifications are proposed to meet performance requirements and field conditions, submit design calculations and Shop Drawings. Do not adversely affect the appearance, durability, or strength of units when modifying details or materials and maintain the general design concept.

D. Samples:

1. For each type of finish indicated on exposed surfaces of precast structural concrete units with architectural finish, in sets of three, representative of finish, color, and texture variations expected; approximately 12 by 12 by 2 inches (300 by 300 by 50 mm).
   a. Where other faces of precast concrete unit are exposed, include Samples illustrating workmanship, color, and texture of backup concrete as well as facing concrete.

E. Delegated-Design Submittal: For precast structural concrete indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1. Show precast structural concrete unit types, connections, types of reinforcement, including special reinforcement, and concrete cover on reinforcement. Indicate location, type, magnitude, and direction of loads imposed on the building structural frame from precast structural concrete.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, fabricator and testing agency.

B. Welding certificates.

C. Material Certificates: For the following:

1. Cementitious materials.
2. Reinforcing materials and prestressing tendons.
3. Admixtures.
5. Insulation.
D. Material Test Reports: For aggregates, by a qualified testing agency.

E. Preconstruction test reports.

F. Source quality-control reports.

G. Field quality-control and special inspection reports.

1.7 QUALITY ASSURANCE

A. Fabricator Qualifications: A firm that assumes responsibility for engineering precast structural concrete units to comply with performance requirements. Responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.

1. Designated as a PCI-certified plant:

B. Installer Qualifications: A precast concrete erector qualified and designated by PCI's Certificate of Compliance, to erect Category S1 – Simple and Category S2 - Complex Structural Systems.

C. Installer Qualifications: An experienced precast concrete erector who has retained a "PCI-Certified Field Auditor" to conduct a field audit of a project installed by erector in Category S1 – Simple and Category S2 - Complex Structural Systems and who can produce an Erectors' Post Audit Declaration, according to PCI MNL 127, "PCI Erector's Manual - Standards and Guidelines for the Erection of Precast Concrete Products."

D. Testing Agency Qualifications: Qualified according to ASTM C1077 and ASTM E329 for testing indicated.

E. Quality-Control Standard: For manufacturing procedures, testing requirements, and quality-control recommendations for types of units required, comply with PCI MNL 116, "Manual for Quality Control for Plants and Production of Structural Precast Concrete Products."

F. Welding Qualifications: Qualify procedures and personnel according to the following:

1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
2. AWS D1.4/D1.4M, "Structural Welding Code - Reinforcing Steel."

G. Sample Panels: After sample approval and before fabricating precast structural concrete units with architectural finish, produce a minimum of two sample panels approximately 16 sq. ft. (1.5 sq. m) in area for review by Architect. Incorporate full-scale details of architectural features, finishes, textures, and transitions in sample panels.

1. Locate panels where indicated or, if not indicated, as directed by Architect.
2. Damage part of an exposed-face surface for each finish, color, and texture, and demonstrate adequacy of repair techniques proposed for repair of surface blemishes.
3. After approval of repair technique, maintain one sample panel at fabricator's plant and one at Project site in an undisturbed condition as a standard for judging the completed Work.
4. Demolish and remove sample panels when directed.

H. Mockups: After sample panel approval but before production of precast structural concrete units with architectural finish, construct full-sized mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for materials and execution.
1. Build mockup as indicated on Drawings including sealants and precast structural concrete units with an architectural finish complete with anchors, connections, flashings, and joint fillers.

2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.

3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.8 COORDINATION

A. Furnish loose connection hardware and anchorage items to be embedded in or attached to other construction before starting that Work. Provide locations, setting diagrams, templates, instructions, and directions, as required, for installation.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Support units during shipment on nonstaining shock-absorbing material in same position as during storage.

B. Store units with adequate bracing and protect units to prevent contact with soil, to prevent staining, and to prevent cracking, distortion, warping or other physical damage.

   1. Store units with dunnage across full width of each bearing point unless otherwise indicated.
   2. Place adequate dunnage of even thickness between each unit.
   3. Place stored units so identification marks are clearly visible, and units can be inspected.

C. Handle and transport units in a manner that avoids excessive stresses that cause cracking or damage.

D. Lift and support units only at designated points indicated on Shop Drawings.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design precast structural concrete units.

B. Design Standards: Comply with ACI 318 (ACI 318M) and with design recommendations in PCI MNL 120, “PCI Design Handbook - Precast and Prestressed Concrete,” applicable to types of precast structural concrete units indicated.

C. Fire-Resistance Calculations: Where indicated, provide precast structural concrete units whose fire resistance meets prescriptive requirements of authorities having jurisdiction or has been calculated according to ACI 216.1 (ACI 216.1M) and PCI MNL 124, “Design for Fire Resistance of Precast Prestressed Concrete,” and is acceptable to authorities having jurisdiction.

D. Structural Performance: Precast structural concrete units and connections shall withstand design loads indicated within limits and under conditions indicated.
E. Structural Performance: Provide precast structural concrete units and connections capable of withstanding the following design loads within limits and under conditions indicated:

1. Dead Loads: Refer to Structural Drawings.
2. Live Loads: Refer to Structural Drawings.
3. Roof Loads: Refer to Structural Drawings.
5. Seismic Loads: Refer to Structural Drawings.
6. Wind Loads: Refer to Structural Drawings.
7. Design precast structural concrete framing system and connections to maintain clearances at openings, to allow for fabrication and construction tolerances, to accommodate live-load deflection, shrinkage and creep of primary building structure, and other building movements. Maintain precast structural concrete deflections within limits of ACI 318 (ACI 318M).
   a. Thermal Movements: Allow for in-plane thermal movements resulting from annual ambient temperature changes of minus 18 to plus 120 deg F (minus 10 to plus 67 deg C).

8. Fire-Resistance Rating: Select material and minimum thicknesses to provide indicated fire rating.

2.2 MOLD MATERIALS

A. Molds: Rigid, dimensionally stable, non-absorptive material, warp and buckle free, that provides continuous precast concrete surfaces within fabrication tolerances indicated; nonreactive with concrete and suitable for producing required finishes.

   1. Mold-Release Agent: Commercially produced form-release agent that does not bond with, stain, or adversely affect precast concrete surfaces and does not impair subsequent surface or joint treatments of precast concrete.

B. Form Liners: Units of face design, texture, arrangement, and configuration indicated or to match those used for precast concrete design reference sample. Furnish with manufacturer's recommended form-release agent that does not bond with, stain, or adversely affect precast concrete surfaces and does not impair subsequent surface or joint treatments of precast concrete.

C. Surface Retarder: Chemical set retarder, capable of temporarily delaying setting of newly placed concrete mixture to depth of reveal specified.

2.3 REINFORCING MATERIALS

A. Reinforcing Bars: ASTM A615/A615M, Grade 60 (Grade 420), deformed.

B. Low-Alloy-Steel Reinforcing Bars: ASTM A706/A706M, deformed.

C. Steel Bar Mats: ASTM A184/A184M, fabricated from ASTM A615/A615M, Grade 60 (Grade 420), deformed bars, assembled with clips.

D. Plain-Steel Welded Wire Reinforcement: ASTM A185/A185M, fabricated from as-drawn steel wire into flat sheets.
2.4 PRESTRESSING TENDONS

A. Pretensioning Strand: ASTM A416/A416M, or Grade 270 (Grade 1860), uncoated, seven-wire, low-relaxation strand.

2.5 CONCRETE MATERIALS

A. Portland Cement: ASTM C150/C150M, Type I or Type III, gray, unless otherwise indicated.
   1. For surfaces exposed to view in finished structure, use gray or white cement, of same type, brand, and mill source.

B. Supplementary Cementitious Materials:
   1. Metakaolin: ASTM C618, Class N.
   2. Ground Granulated Blast-Furnace Slag: ASTM C989, Grade 100 or 120.

C. Normal-Weight Aggregates: Except as modified by PCI MNL 116, ASTM C33/C33M, with coarse aggregates complying with Class 5S. Stockpile fine and coarse aggregates for each type of exposed finish from a single source (pit or quarry) for Project.
   1. Face-Mixture-Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining; to match selected finish sample.
      a. Gradation: Uniformly graded
   2. Face-Mixture-Fine Aggregates: Selected, natural or manufactured sand compatible with coarse aggregate to match approved finish sample.

D. Coloring Admixture: ASTM C979/C979M, synthetic or natural mineral-oxide pigments or colored water-reducing admixtures, temperature stable, and nonfading.

E. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 116.

F. Air-Entraining Admixture: ASTM C260, certified by manufacturer to be compatible with other required admixtures.

G. Chemical Admixtures: Certified by manufacturer to be compatible with other admixtures and to not contain calcium chloride, or more than 0.15 percent chloride ions or other salts by weight of admixture.
   1. Water-Reducing Admixtures: ASTM C494/C494M, Type A.
   2. Retarding Admixture: ASTM C494/C494M, Type B.
3. Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type D.
4. Water-Reducing and Accelerating Admixture: ASTM C494/C494M, Type E.
5. High-Range, Water-Reducing Admixture: ASTM C494/C494M, Type F.
6. High-Range, Water-Reducing and Retarding Admixture: ASTM C494/C494M, Type G.
7. Plasticizing Admixture: ASTM C1017/C1017M, Type I.
8. Plasticizing and Retarding Admixture: ASTM C1017/C1017M, Type II.
9. Corrosion-Inhibiting Admixture: ASTM C1582/C1582M.

2.6 STEEL CONNECTION MATERIALS

A. Carbon-Steel Shapes and Plates: ASTM A36/A36M.
B. Carbon-Steel-Headed Studs: ASTM A108, Grade 1010 through 1020, cold finished, AWS D1.1/D1.1M, Type A or B, with arc shields and with minimum mechanical properties of PCI MNL 116.
C. Carbon-Steel Plate: ASTM A283/A283M, Grade C.
D. Malleable-Iron Castings: ASTM A47/A47M, Grade 32510 or Grade 35028.
E. Carbon-Steel Castings: ASTM A27/A27M, Grade 60-30 (Grade 415-205).
F. High-Strength, Low-Alloy Structural Steel: ASTM A572/A572M.
G. Carbon-Steel Structural Tubing: ASTM A500/A500M, Grade B or Grade C.
H. Wrought Carbon-Steel Bars: ASTM A675/A675M, Grade 65 (Grade 450).
I. Deformed-Steel Wire or Bar Anchors: ASTM A496/A496M or ASTM A706/A706M.
J. Carbon-Steel Bolts and Studs: ASTM A307, Grade A (ASTM F568M, Property Class 4.6); carbon-steel, hex-head bolts and studs; carbon-steel nuts, ASTM A563 (ASTM A563M); and flat, unhardened steel washers, ASTM F844.
K. High-Strength Bolts, Nuts, and Washers: ASTM F3125/F3125M, Grade A325 (Grade A325M), Type 1, heavy-hex steel structural bolts; ASTM A563, Grade DH, (ASTM A563M, Class 10S) heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers.
   1. Finish: Plain.
L. High-Strength Bolts, Nuts, and Washers: ASTM F3125/F3125M, Grade A490 (Grade A490M), Type 1, heavy-hex steel structural bolts; ASTM A563, Grade DH, (ASTM A563M, Class 10S) heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers; all with plain finish.
M. Zinc-Coated Finish: For exterior steel items, steel in exterior walls, and items indicated for galvanizing, apply zinc coating by hot-dip process according to ASTM A123/A123M.
   1. For steel shapes, plates, and tubing to be galvanized, limit silicon content of steel to less than 0.03 percent or to between 0.15 and 0.25 percent or limit sum of silicon and 2.5 times phosphorous content to 0.09 percent.
   2. Galvanizing Repair Paint: High-zinc-dust-content paint with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD-P-21035B or SSPC-Paint 20.
N. Shop-Primed Finish: Prepare surfaces of nongalvanized-steel items, except those surfaces to be embedded in concrete, according to requirements in SSPC-SP 3, and shop apply lead-and chromate-free, rust-inhibitive primer, complying with performance requirements in MPI 79 according to SSPC-PA 1.

O. Welding Electrodes: Comply with AWS standards.

P. Precast Accessories: Provide clips, hangers, plastic or steel shims, and other accessories required to install precast structural concrete units.

2.7 BEARING PADS

A. Provide one of the following bearing pads for precast structural concrete units as recommended by precast fabricator for application:

1. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100 percent polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, 50 to 70 Shore, Type A durometer hardness, ASTM D2240; minimum tensile strength 2250 psi (15.5 MPa), ASTM D412.

2. Random-Oriented-Fiber-Reinforced Elastomeric Pads: Preformed, randomly oriented synthetic fibers set in elastomer. 70 to 90 Shore, Type A durometer hardness, ASTM D2240; capable of supporting a compressive stress of 3000 psi (20.7 MPa) with no cracking, splitting, or delaminating in the internal portions of pad. Test one specimen for every 200 pads used in Project.

3. Cotton-Duck-Fabric-Reinforced Elastomeric Pads: Preformed, horizontally layered cotton-duck fabric bonded to an elastomer; 80 to 100 Shore, Type A durometer hardness, ASTM D2240; complying with AASHTO’s “AASHTO LRFD Bridge Design Specifications,” Division II, Section 18.10.2; or with MIL-C-882E.

4. Frictionless Pads: PTFE, glass-fiber reinforced, bonded to stainless or mild-steel plate, or random-oriented-fiber-reinforced elastomeric pads; of type required for in-service stress.

2.8 ACCESSORIES

A. Reglets: Specified in Section 076200 "Sheet Metal Flashing and Trim."

B. Precast Accessories: Provide clips, hangers, high-density plastic or steel shims, and other accessories required to install structural precast concrete units.

2.9 GROUT MATERIALS

A. Nonmetallic, Nonshrink Grout: Packaged, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C1107/C1107M, Grade A for drypack and Grades B and C for flowable grout and of consistency suitable for application within a 30-minute working time. Water-soluble chloride ion content less than 0.06 percent by weight of cement when tested according to ASTM C1218/C1218M.
2.10 INSULATED FLAT-WALL PANEL ACCESSORIES

A. Extruded-Polystyrene Board Insulation: ASTM C578, Type X, 1.30 lb/cu. ft. (21 kg/cu. m).

B. Wythe Connectors: manufactured to connect wythes of precast concrete panels.

2.11 CONCRETE MIXTURES

A. Prepare design mixtures for each type of precast concrete required.

1. Limit use of fly ash to 20 percent replacement of portland cement by weight and ground granulated blast-furnace slag to 20 percent of portland cement by weight; metakaolin and silica fume to 10 percent of portland cement by weight.

B. Design mixtures may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast structural concrete fabricator's option.

C. Limit water-soluble chloride ions to maximum percentage by weight of cement permitted by ACI 318 (ACI 318M) or PCI MNL 116 when tested according to ASTM C1218/C1218M.

D. Normal-Weight Concrete Mixtures: Proportion face and backup mixtures by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:

1. Compressive Strength (28 Days): 5000 psi (34.5 MPa).
2. Maximum Water-Cementitious Materials Ratio: 0.45.

E. Water Absorption: For structural precast concrete with an architectural finish, limit water absorption to 6 percent by weight or 14 percent by volume, tested according to ASTM C642, except for boiling requirement.

F. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 116.

G. When included in design mixtures, add other admixtures to concrete mixtures according to manufacturer's written instructions.

H. Concrete Mix Adjustments: Concrete mix design adjustments may be proposed if characteristics of materials, Project conditions, weather, test results, or other circumstances warrant.

2.12 MOLD FABRICATION

A. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for prestressing and detensioning operations. Coat contact surfaces of molds with release agent before reinforcement is placed. Avoid contamination of reinforcement and prestressing tendons by release agent.

1. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during concrete placement. Coat form liner with form-release agent.
B. Maintain molds to provide completed precast structural concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.

1. Form joints are not permitted on faces of structural precast concrete with an architectural finish that is exposed to view in the finished work.
2. Edge and Corner Treatment: Uniformly chamfered or radiused.

2.13 FABRICATION

A. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.

1. Weld-headed studs and deformed bar anchors used for anchorage according to AWS D1.1/D1.1M and AWS C5.4, "Recommended Practices for Stud Welding."

B. Furnish loose hardware items including steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast structural concrete units to supporting and adjacent construction.

C. Cast-in reglets, slots, holes, and other accessories in precast structural concrete units as indicated on the Contract Drawings.

D. Cast-in openings larger than 10 inches (250 mm) in any dimension. Do not drill or cut openings or prestressing strand without Architect's approval.

E. Reinforcement: Comply with recommendations in PCI MNL 116 for fabricating, placing, and supporting reinforcement.

1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete. When damage to epoxy-coated reinforcement exceeds limits specified in ASTM A775/A775M, repair with patching material compatible with coating material and epoxy coat bar ends after cutting.
2. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
3. Place reinforcing steel and prestressing strand to maintain at least 3/4-inch (19-mm) minimum concrete cover. Increase cover requirements for reinforcing steel to 1-1/2 inches (38 mm) when units are exposed to corrosive environment or severe exposure conditions. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh spacing and wire tie laps, where required by design. Offset laps of adjoining widths to prevent continuous laps in either direction.

F. Reinforce precast structural concrete units to resist handling, transportation, and erection stresses and specified in-place loads.

G. Prestress tendons for precast structural concrete units by either pretensioning or post-tensioning methods. Comply with PCI MNL 116.
1. Delay detensioning or post-tensioning of precast, prestressed structural concrete units until concrete has reached its indicated minimum design release compressive strength as established by test cylinders cured under same conditions as concrete unit.

2. Detension pretensioned tendons either by gradually releasing tensioning jacks or by heat cutting tendons, using a sequence and pattern to prevent shock or unbalanced loading.

3. If concrete has been heat cured, detension while concrete is still warm and moist to avoid dimensional changes that may cause cracking or undesirable stresses.

4. Protect strand ends and anchorages with bituminous, zinc-rich, or epoxy paint to avoid corrosion and possible rust spots.

5. Protect strand ends and anchorages with a minimum of 1-inch- (25-mm-) thick, nonmetallic, nonshrink, grout mortar and sack rub surface. Coat or spray the inside surfaces of pocket with bonding agent before installing grout.

H. Comply with requirements in PCI MNL 116 and in this Section for measuring, mixing, transporting, and placing concrete. After concrete batching, no additional water may be added.

I. Thoroughly consolidate placed concrete by vibration without dislocating or damaging reinforcement and built-in items, and minimize pour lines, honeycombing, or entrapped air voids on surfaces. Use equipment and procedures complying with PCI MNL 116.

1. Place self-consolidating concrete without vibration according to PCI TR-6, "Interim Guidelines for the Use of Self-Consolidating Concrete in Precast/Prestressed Concrete Institute Member Plants." Ensure adequate bond between face and backup concrete, if used.

J. Comply with PCI MNL 116 procedures for hot- and cold-weather concrete placement.

K. Identify pickup points of precast structural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each precast structural concrete unit on a surface that does not show in finished structure.

L. Cure concrete, according to requirements in PCI MNL 116, by moisture retention without heat or by accelerated heat curing using live steam or radiant heat and moisture. Cure units until compressive strength is high enough to ensure that stripping does not have an effect on performance or appearance of final product.

M. Discard and replace precast structural concrete units that do not comply with requirements, including structural, manufacturing tolerance, and appearance, unless repairs meet requirements in PCI MNL 116 and meet Architect's approval.

2.14 CASTING INSULATED WALL PANELS

A. Cast, screed, and consolidate wythe supported by mold.

B. Place insulation boards abutting edges and ends of adjacent boards. Insert wythe connectors through insulation, and consolidate concrete around connectors according to connector manufacturer's written instructions.

C. Ensure bottom wythe and insulation layer are not disturbed after bottom wythe reaches initial set.

D. Cast, screed, and consolidate top wythe to meet required finish.
E. Maintain temperature below 150 deg F (65 deg C) in bottom concrete wythe.

2.15 FABRICATION TOLERANCES

A. Fabricate precast structural concrete units to shapes, lines, and dimensions indicated so each finished unit complies with PCI MNL 116 product dimension tolerances as well as position tolerances for cast-in items.

2.16 COMMERCIAL ARCHITECTURAL FINISHES

A. Manufacture member faces free of joint marks, grain, and other obvious defects with corners, including false joints, uniform and straight. Finish exposed-face surfaces of precast concrete units to match approved design reference sample, sample panels and mockups.

2.17 SOURCE QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to evaluate precast structural concrete fabricator's quality-control and testing methods.

1. Allow testing agency access to material storage areas, concrete production equipment, concrete placement, and curing facilities. Cooperate with testing agency and provide samples of materials and concrete mixtures as may be requested for additional testing and evaluation.

B. Testing: Test and inspect precast structural concrete according to PCI MNL 116 requirements and ASTM C1610/C1610M, ASTM C1611/C1611M, ASTM C1621/C1621M, and ASTM C1712/C1712M.

1. Test and inspect self-consolidating concrete according to PCI TR-6.

C. Strength of precast structural concrete units is considered deficient if units fail to comply with ACI 318 (ACI 318M) requirements for concrete strength.

D. If there is evidence that strength of precast concrete units may be deficient or may not comply with ACI 318 (ACI 318M) requirements, employ a qualified testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C42/C42M.

1. A minimum of three representative cores shall be taken from units of suspect strength, from locations directed by Architect.
2. Test cores in an air-dry condition or, if units are wet under service conditions, test cores after immersion in water in a wet condition.
3. Strength of concrete for each series of three cores is considered satisfactory if average compressive strength is equal to at least 85 percent of 28-day design compressive strength and no single core is less than 75 percent of 28-day design compressive strength.
4. Report test results in writing on same day that tests are performed, with copies to Architect, Contractor, and precast concrete fabricator. Test reports include the following:

   a. Project identification name and number.
   b. Date when tests were performed.
   c. Name of precast concrete fabricator.
d. Name of concrete testing agency.
e. Identification letter, name, and type of precast concrete unit(s) represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.

E. Patching: If core test results are satisfactory and precast structural concrete units comply with requirements, clean and dampen core holes and solidly fill with same precast concrete mixture that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.

F. Defective Units: Discard and replace precast structural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and color and texture range. Chipped, spalled, or cracked units may be repaired, subject to Architect's approval. Architect reserves the right to reject precast units that do not match approved samples, sample panels, and mockups. Replace unacceptable units with precast concrete units that comply with requirements.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine supporting structural frame or foundation and conditions for compliance with requirements for installation tolerances, bearing surface tolerances, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Do not install precast concrete units until supporting, cast-in-place concrete has attained minimum allowable design compressive strength and until supporting steel or other structure is structurally ready to receive loads from precast concrete units.

3.2 INSTALLATION

A. Install clips, hangers, bearing pads, and other accessories required for connecting precast structural concrete units to supporting members and backup materials.

B. Erect precast structural concrete level, plumb, and square within specified allowable tolerances. Provide temporary structural framing, shoring, and bracing as required to maintain position, stability, and alignment of units until permanent connections are complete.

1. Install temporary steel or plastic spacing shims or bearing pads as precast structural concrete units are being erected. Tack weld steel shims to each other to prevent shims from separating.

2. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.

3. Remove projecting lifting devices and use plastic patch caps or sand-cement grout to fill voids within recessed lifting devices flush with surface of adjacent precast surfaces when recess is exposed.

C. Connect precast structural concrete units in position by bolting, welding, grouting, or as otherwise indicated on Shop Drawings. Remove temporary shims, wedges, and spacers as soon as practical after connecting and grouting are completed.
1. Do not permit connections to disrupt continuity of roof flashing.

D. Field cutting of precast units is not permitted without approval of AOR/EOR.

E. Fasteners: Do not use drilled or powder-actuated fasteners for attaching accessory items to precast, prestressed concrete units.

F. Welding: Comply with applicable requirements in AWS D1.1/D1.1M and AWS D1.4/D1.4M for welding, welding electrodes, appearance, quality of welds, and methods used in correcting welding work.

1. Protect precast structural concrete units and bearing pads from damage by field welding or cutting operations, and provide noncombustible shields as required.
2. Clean weld-affected steel surfaces with chipping hammer followed by brushing, and apply a minimum 4.0-mil- (0.1-mm-) thick coat of galvanized repair paint to galvanized surfaces according to ASTM A780/A780M.
3. Visually inspect welds and remove, reweld, or repair incomplete and defective welds.

G. At bolted connections, use lock washers, tack welding, or other approved means to prevent loosening of nuts after final adjustment.

1. Where slotted connections are used, verify bolt position and tightness. For sliding connections, properly secure bolt but allow bolt to move within connection slot.
2. For slip-critical connections, use one of the following methods to assure proper bolt pretension:
   c. Twist-off Tension Control Bolt: ASTM F3125/F3125M, Grade 1852.
   d. Direct-Tension Control Bolt: ASTM F3125/F3125M, Grade 1852.

3. For slip-critical connections, use method and inspection procedure approved by Architect and coordinated with inspection agency.

H. Grouting or Dry-Packing Connections and Joints: Grout connections and joints and open spaces at keyways, connections, and joints where required or indicated on Shop Drawings. Retain flowable grout in place until hard enough to support itself. Alternatively, pack spaces with stiff dry-pack grout material, tamping until voids are completely filled.

1. Place grout and finish smooth, level, and plumb with adjacent concrete surfaces.
2. Fill joints completely without seepage to other surfaces.
3. Trowel top of grout joints on roofs smooth and uniform. Finish transitions between different surface levels not steeper than 1 to 12.
4. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.
5. Keep grouted joints damp for not less than 24 hours after initial set.

3.3 ERECTION TOLERANCES

A. Erect precast structural concrete units level, plumb, square, and in alignment without exceeding the noncumulative erection tolerances of PCI MNL 135.
B. Minimize variations between adjacent slab members by jacking, loading, or other method recommended by fabricator and approved by Architect.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage a qualified special inspector to perform the following special inspections:

1. Erection of precast structural concrete members.

B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

C. Visually inspect field welds and test according to ASTM E165 or to ASTM E709 and ASTM E1444. High-strength bolted connections are subject to inspections.

D. Testing agency will report test results promptly and in writing to Contractor and Architect.

E. Repair or remove and replace work where tests and inspections indicate that it does not comply with specified requirements.

F. Additional testing and inspecting, at Contractor's expense, shall be performed to determine compliance of replaced or additional work with specified requirements.

G. Prepare test and inspection reports.

3.5 REPAIRS

A. Repair precast structural concrete units if permitted by AOR/EOR.

1. Repairs may be permitted if structural adequacy, serviceability, durability, and appearance of units have not been impaired.

B. Mix patching materials and repair units so cured patches blend with color, texture, and uniformity of adjacent exposed surfaces and show no apparent line of demarcation between original and repaired work, when viewed in typical daylight illumination from a distance of 20 feet (6 m).

C. Prepare and repair damaged galvanized coatings with galvanizing repair paint according to ASTM A780/A780M.

D. Wire brush, clean, and paint damaged prime-painted components with same type of shop primer.

E. Remove and replace damaged precast structural concrete units that cannot be repaired or when repairs do not comply with requirements as determined by Architect.

3.6 CLEANING

A. Clean mortar, plaster, fireproofing, weld slag, and other deleterious material from concrete surfaces and adjacent materials immediately.

B. Clean exposed surfaces of precast concrete units after erection and completion of joint treatment to remove weld marks, other markings, dirt, and stains.
1. Perform cleaning procedures, if necessary, according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.

2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes or damage adjacent materials.

END OF SECTION 034100
SECTION 03 45 00
ARCHITECTURAL PRECAST CONCRETE

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Precast architectural concrete units (APC-1).
   2. Supports, anchors, and attachments.

1.2 COORDINATION
A. Furnish loose connection hardware and anchorage items to be embedded in or attached to other construction without delaying the Work. Provide locations, setting diagrams, templates, instructions, and directions, as required, for installation.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product indicated.
B. Design Mixes: For each precast concrete mixture. Include compressive strength and water-absorption tests.
C. Shop Drawings:
   1. Coordinated Shop Drawings: Prior to submitting shop drawings, coordinate with shop drawings for glazed curtain wall. Verify rough openings and connections and indicate confirmed dimensions and details.
   2. Indicate separate face and backup mix locations and thicknesses, if applicable.
   3. Indicate welded connections by AWS standard symbols. Detail loose and cast-in hardware, inserts, connections, and joints, including accessories.
   4. Indicate locations and details of anchorage devices to be embedded in other construction.
   5. Submit detailed shop drawings and design calculations sealed by a professional engineer registered in the state of Michigan.
D. (APC-1) Finish Sample: For each type of finish indicated on exposed surfaces of precast structural concrete units with architectural finish, in sets of 3, illustrating full range of finish, color, and texture variations expected; approximately 26.5 by 48 inches.
   1. Where other faces of precast concrete unit are exposed, include Samples illustrating workmanship, color, and texture of backup concrete as well as facing concrete.

1.4 INFORMATIONAL SUBMITTALS
A. Qualification Data: For firms and persons specified in “Quality Assurance” Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.
B. Welding certificates.
C. Source quality-control test reports.

1.5 QUALITY ASSURANCE
A. Fabricator Qualifications: A firm that complies with the following requirements and is experienced in manufacturing precast architectural concrete units similar to those indicated for this Project and with a record of successful in-service performance.
1. Assumes responsibility for engineering precast architectural concrete units to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.

2. Participates in PCI’s Plant Certification program and is designated a PCI-certified plant for Group A, Category A1--Architectural Cladding and Load Bearing Units.

B. Testing Agency Qualifications: An independent testing agency, acceptable to authorities having jurisdiction, qualified according to ASTM C 1077 and ASTM E 329 to conduct the testing indicated, as documented according to ASTM E 548.

C. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, “Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products.”

D. Installer Qualifications: An experienced installer who has completed precast architectural concrete work similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

F. Mockups: Coordinate with Section 014339 - Mockups for integrated exterior wall mockup.

1.6 DELIVERY, STORAGE AND HANDLING

A. Transport, handle, store, and protect in accordance with manufacturer’s recommendations.

B. Handle precast members to position, consistent with their shape and design. Lift and support only from support points.

1. Lifting or Handling Equipment: Capable of maintaining units during manufacture, storage, transportation, erection, and in position for fastening.

C. Protect edges of members to prevent staining, chipping, or spalling of concrete.

PART 2 PRODUCTS

2.1 ARCHITECTURAL PRECAST CONCRETE

A. Fabricators:

1. Michigan:
   a. International Precast Solutions, LLC.
   c. Mack Industries, Inc.

B. (APC-1) Architectural Precast Concrete Units: Surface finish and dark integral color matching Architect’s sample.

2.2 CONCRETE MATERIALS

A. Portland Cement: ASTM C 150, Type I or Type III, gray or white, of same type, brand, and source.

B. Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S.

1. Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining.
2.3 REINFORCING MATERIALS

A. Reinforcing Bars: ASTM A 615, Grade 60, deformed.

B. Plain-Steel Welded Wire Fabric: ASTM A 185, fabricated from galvanized steel wire into flat sheets.

C. Supports: Manufacturer's bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire fabric in place according to CRSI's "Manual of Standard Practice," PCI MNL 117, and as follows:
   1. For uncoated reinforcement, use CRSI Class 1 plastic-protected bar supports.

2.4 ANCHORS AND FASTENERS

A. Fabricate anchors from stainless steel, ASTM A 240 or ASTM A 666, Type 304; temper as required to support loads imposed without exceeding allowable design stresses. Fabricate dowels and pins for anchors from stainless steel, ASTM A 276, Type 304.

2.5 CONCRETE MIXES

A. Prepare design mixes for each type of concrete required.
   1. Limit use of fly ash and silica fume to not exceed, in aggregate, 25 percent of portland cement by weight.

B. Design mixes may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast architectural concrete fabricator's option.

C. Limit water-soluble chloride ions to the maximum percentage by weight of cement permitted by ACI 318.

D. Normal-Weight Concrete Face and Backup Mixes: Proportion mixes by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
   2. Maximum Water-Cementitious Materials Ratio: 0.45.

E. Water absorption: Not to exceed 5 percent to 6 percent by weight; except between 3 percent to 4 percent for sloping surfaces (sills), for improved weathering staining resistance, tested according to PCI MNL 117.

F. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.

G. When included in design mixes, add other admixtures to concrete mixes according to manufacturer's written instructions.
2.6 FABRICATION

A. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.

B. Furnish loose steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast architectural concrete units to supporting and adjacent construction.

C. Cast-in reglets, slots, holes, and other accessories in precast architectural concrete units to receive windows, cramps, dowels, reglets, waterstops, flashings, and other similar work as indicated.

D. Cast-in openings larger than 10 inches in any dimension.

   1. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete.
   2. Accurately position, support, and secure reinforcement against displacement during concrete placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
   3. Place reinforcement to maintain at least 3/4-inch minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
   4. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.

F. Reinforce precast architectural concrete units to resist handling, transportation, and erection stresses.

G. Mix concrete according to PCI MNL 117 and requirements in this Section. After concrete batching, no additional water may be added.

H. Place face mix to a minimum thickness of 3 inches.

I. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units. Comply with requirements in PCI MNL 117 for measuring, mixing, transporting, and placing concrete.
   1. Place backup concrete to ensure bond with face mix concrete.

J. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items. Use equipment and procedures complying with PCI MNL 117.

K. Identify pickup points of precast architectural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each precast architectural concrete unit on a surface that will not show in finished structure.

L. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture.

M. Discard precast architectural concrete units that are warped, cracked, broken, spalled, stained, or otherwise defective unless repairs are approved by Architect.
N. Fabricate precast architectural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with PCI MNL 117 product tolerances as well as position tolerances for cast-in items.

O. Engraved Precast Concrete Cornerstone: Fabricate and install custom engraved panels as shown, with all components and accessories for complete installed assembly.
   1. Surface-Engraved Graphics: Machine engrave characters and other graphic devices into panel surface indicated to produce precisely formed copy, incised to uniform depth.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examine substrates and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Do not install precast concrete units until supporting concrete has attained minimum design compressive strength.

C. Provide for erection procedures and induced loads during erection. Maintain temporary bracing in place until final support is provided.

3.2 INSTALLATION

A. Install clips, hangers, and other accessories required for connecting precast architectural concrete units to supporting members and backup materials.

B. Install precast architectural concrete according to reviewed shop drawings and manufacturer instructions. Provide temporary supports and bracing as required to maintain position, stability, and alignment as units are being permanently connected.
   1. Install bearing pads as precast concrete units are being erected.
   2. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
   3. Remove projecting hoisting devices and use sand-cement grout to fill voids within recessed hoisting devices flush with surface of concrete.

C. Anchor precast architectural concrete units in position by bolting, welding, grouting, or as otherwise indicated. Remove temporary shims, wedges, and spacers as soon as possible after anchoring and grouting are completed.

D. Welding: Perform welding in compliance with AWS D1.1 and AWS D1.4, with qualified welders.
   1. Protect precast architectural concrete units and bearing pads from damage by field welding or cutting operations and provide noncombustible shields as required.
   2. Repair damaged steel surfaces by cleaning and repriming damaged painted surfaces.

E. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.

F. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.

3.3 FIELD QUALITY CONTROL

A. Testing: Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections.
B. Field welds and connections using high-strength bolts will be subject to tests and inspections.
C. Testing agency will report test results promptly and in writing to Contractor and Architect.
D. Remove and replace work that does not comply with specified requirements.
E. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of corrected work with specified requirements.

3.4 INSTALLED WORK
A. Protection: Protect members from damage, excessive soiling at grade, run-off from roofs and other construction operations which could spray or flow on to precast panels.
   1. Provide noncombustible shields during welding operations.
B. Damaged Work:
   1. If permitted by Architect, repair exposed exterior surfaces of precast architectural concrete units to match color, texture, and uniformity of surrounding precast architectural concrete.
   2. Remove and replace damaged precast architectural concrete units if repairs are not allowed or if they do not comply with architect's requirements.
C. Cleaning: Clean exposed surfaces of precast concrete units after erection to remove weld marks, other markings, dirt, and stains.
   1. Wash and rinse according to precast concrete fabricator's written recommendations. Protect other work from staining or damage due to cleaning operations.
   2. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes.

END OF SECTION
SECTION 03 45 10
PRECAST CONCRETE SITE WALLS

PART 1 - GENERAL
1.1 SUMMARY
A. Section Includes:
1. Precast Concrete Walls
2. Precast Concrete Ledges

1.2 REFERENCES
A. American Society for Testing and Materials (ASTM)
1. ASTM C-150  ASTM C-260  ASTM C-494  ASTM C-128  ASTM C-31
B. Precast Concrete Institute (PCI)

1.3 ACTION SUBMITTALS
A. Shop Drawings: Submit fabrication drawings of all precast concrete items showing detailed sections and profile for all precast items. Details shall show all reinforcing and cast in hardware.
B. Samples: For each exposed product and for each color and texture specified.
D. Performance Requirements
1. Compressive Strength 5,000 p.s.i. minimum
2. Air Content 6-8%
3. Water-Cement Ratio .45
E. Test Results
1. Manufacturer shall furnish test results attesting that materials meet specification requirements.

1.4 CLOSEOUT SUBMITTALS
A. Maintenance data.

1.5 QUALITY ASSURANCE
A. Comply with PCI Standards.
B. Precast manufacturing plant shall be certified, category AT – Architectural Trim, at the time of bidding.
C. Qualifications: Precast Concrete Manufacturer and Trade Contractor must have a minimum of 5 years of successful experience on projects of similar magnitude and complexity to the indicated project.
D. Manufacturer and contractor to be prequalified by Architect prior to bidding and failure to do so will void bid.
1.6 DELIVERY, STORAGE, AND HANDLING

A. Packaging and Shipping: precast concrete to be palletized, shrink wrapped and marked with legible manufacturer identification, including piece number and quantities.

B. Storage and Protection precast concrete to be stored in secure area in original packaging.

C. Protect from damage by other trades.

D. Report all damage due to shipment immediately. Customer is required to sign the Bill of Lading slip detailing the damaged product. Picture proof is required.

1.7 WARRANTY

A. For a period of two (2) years from delivery of precast concrete, manufacturer warrants the precast concrete products against defects in workmanship and materials per industry standards. This warranty does not cover the above products for cracking and faulting caused by settling due to improper or faulty substrates or improper installation; nor does it cover damage caused by impact, vandalism or natural disaster.

PART 2 - PRODUCTS

2.1 MANUFACTURER

B. Or approved equal.

2.2 FINISH

A. Custom color and finish to match Architect’s sample. G38 Night.

2.3 MATERIAL REQUIREMENTS

B. Aggregates: Aggregate shall be blended to meet individual project requirements.

C. Coloring; Pigments used shall be inorganic, resistant to alkalinity and used per manufacturer's recommendations.

D. Reinforcement and Hardware:
   1. Reinforce precast with deformed rods as recommended by precast concrete manufacturer.

E. Setting Materials, Caulks & Sealants
   1. Color(s) to be selected by Architect.
   2. Sealer: Colorless, pure acrylic water repellent sealer. Sealer to maintain natural look of concrete surface with no glaze or gloss, darkening or color change. Factory applied.

2.4 MANUFACTURED UNITS

A. Sizing Tolerances
   1. All units to conform to shop drawings with a (+/-) 1/8” tolerance in dimension.

B. Precast Surfaces and Edges:
   1. All exposed edges to have minimum of 1/8" radius to prevent chipping.
2. All finished surfaces to match approved control sample.
3. All precast concrete finished surfaces to be factory sealed.

PART 3 - EXECUTION

3.1 INSPECTION

A. Examine substrates for the following:
   1. Defects or cracks in existing work or substrate.
   2. Deviations beyond allowable tolerances for the substrate.
B. Continue with installation of precast units only when all defects have been corrected.

3.2 PROJECT CONDITIONS

A. Do not install products under environmental conditions outside setting material manufacturer’s absolute limits.

3.3 INSTALLATION

A. Precast Concrete products setting or installation methods are to be reviewed by the manufacturer and setting materials supplier.
B. Concrete substrate must be within a tolerance of 1/8” in all dimensions.
C. Place or screed mortar bed over primed substrate.
   1. Setting bed must be continuous under the entire length of the wall. Setting materials utilized per manufacturer’s recommended instruction.
   2. Set walls level and plumb to meet finish elevation.
D. Joints
   1. Joints between adjacent precast should be a minimum of 1/8”-1/4”.
E. Caulking of Precast
   1. Clean all joints thoroughly, removing all debris.
   2. Wipe all joints with caulk manufacturer’s recommended cleaner prior to application.
   3. Use urethane caulk. (Color match caulk to precast per architect selection.)
   4. Clean up after caulking as per caulk manufacturer’s recommendations.
F. Final Cleaning of Precast Concrete
   1. Check all surfaces and caulking, make repairs as necessary.
   2. Clean treads with a pH balanced soap.
G. Protection:
1. Upon completion, the work shall be ready for final inspection and acceptance by owner or owner’s agent.

2. General Contractor shall protect the finished work from the time the installing contractor completes the work.

H. Finish:

1. Overall match to approved sample and per industry standards.

2. All products to be factory sealed.

END OF SECTION
SECTION 042200
CONCRETE UNIT MASONRY

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Concrete masonry units (CMU).
   2. Mortar and Masonry Grout:
      a. Testing of mortar and masonry grout.
      b. Admixtures for mortar and masonry grout.
   3. Reinforcing and Anchoring Materials:
      a. Steel reinforcing bars.
      b. Masonry-joint reinforcement.
   4. Miscellaneous masonry accessories.
B. Related Requirements:
   1. Section 033000 - Cast-In-Place Concrete: For installation of inserts that are to be embedded in concrete or masonry, flashing reglets, and similar items to be used by Installer for anchoring, supporting, and flashing.
   2. Section 051200 - Structural Steel Framing items to be built into masonry work.
   3. Section 055000 - Metal Fabrications: For installation of metal fabrications, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry.

1.2 SUBMITTALS
A. Product Data: For each type of product.
B. Shop Drawings:
   1. Masonry Units: Show sizes, profiles, coursing, locations of special shapes, pertinent dimensioning, layout, anchorages, construction details, methods of installation, adjacent construction and proposed anchoring. Show control- and expansion-joint layout.
   2. Reinforcing Steel: Detail bending, lap lengths, and placement of unit masonry reinforcing bars. Comply with ACI 318. Show elevations of reinforced walls.
C. Material Certificates: For each type and size of the following:
   1. Cementitious materials. Include name of manufacturer, brand name, and type.
   2. Mortar admixtures.
   3. Preblended, dry mortar mixes. Include description of type and proportions of ingredients.
   4. Grout mixes. Include description of type and proportions of ingredients.
   5. Reinforcing bars.
   7. Anchors, ties, and metal accessories.

1.3 QUALITY ASSURANCE
A. Testing Agency Qualifications: Qualified according to ASTM C 1093 for testing indicated.
1.4 DELIVERY, STORAGE, AND HANDLING
A. Store masonry units on elevated platforms in a dry location. If units are not stored in an enclosed location, cover tops and sides of stacks with waterproof sheeting, securely tied. If units become wet, do not install until they are dry.
B. Store cementitious materials on elevated platforms, under cover, and in a dry location. Do not use cementitious materials that have become damp.
C. Store aggregates where grading and other required characteristics can be maintained and contamination avoided.
D. Deliver preblended, dry mortar mix in moisture-resistant containers. Store preblended, dry mortar mix in delivery containers on elevated platforms in a dry location or in covered weatherproof dispensing silos.
E. Store masonry accessories, including metal items, to prevent corrosion and accumulation of dirt and oil.

1.5 FIELD CONDITIONS
A. Protection of Masonry: During construction, cover tops of walls, projections, and sills with waterproof sheeting at end of each day's work. Cover partially completed masonry when construction is not in progress.
   1. Extend cover a minimum of 48 inches down both sides and hold cover securely in place.
   2. Where one wythe of multiwythe masonry walls is completed in advance of other wythes, secure cover a minimum of 48 inches down face next to unconstructed wythe and hold cover in place.
   3. Maintain protective boards at exposed external corners which may be damaged by construction activities. Provide such protection without damaging completed work.
   4. Provide temporary bracing during erection of concrete block work. Maintain in place until building structure provides permanent bracing.
   5. Do not apply uniform floor or roof loads for at least 12 hours and concentrated loads for at least 3 days after building masonry walls or columns.
B. Cold-Weather Requirements: Do not use frozen materials or materials mixed or coated with ice or frost. Do not build on frozen substrates. Remove and replace unit masonry damaged by frost or by freezing conditions. When ambient temperature is below 40 deg F comply with cold-weather construction requirements contained in TMS 602/ACI 530.1/ASCE 6.
   1. Cold-Weather Cleaning: Use liquid cleaning methods only when air temperature is 40 deg F and higher and will remain so until masonry has dried, but not less than seven days after completing cleaning.

PART 2 PRODUCTS
2.1 CONCRETE UNIT MASONRY, GENERAL
A. Masonry Standard: Comply with TMS 602/ACI 530.1/ASCE 6, except as modified by requirements in the Contract Documents.
B. Source Limitations for Masonry Units: Obtain exposed masonry units of a uniform texture and color, or a uniform blend within the ranges accepted for these characteristics, from single source for each different product required for each continuous surface or visually related surfaces.
C. Shapes: Provide shapes indicated on Drawings and as follows, with exposed surfaces matching exposed faces of adjacent units unless otherwise indicated.

D. Fire-Resistance Ratings: Comply with requirements for fire-resistance-rated assembly designs indicated. Where required by Authorities Having Jurisdiction, units shall be listed and labeled by a qualified testing agency acceptable to Authorities Having Jurisdiction.

2.2 CONCRETE MASONRY UNITS

A. Concrete Masonry Units: ASTM C 90, load-bearing units of size as shown on Drawings.
   1. Density Classification: Normal weight, unless otherwise indicated.

B. Solid Units: ASTM C 90, medium weight units of size as shown on Drawings.

2.3 MORTAR AND GROUT MATERIALS

A. Source Limitations for Mortar Materials: Obtain mortar ingredients of a uniform quality, including color for exposed masonry, from single manufacturer for each cementitious component and from single source or producer for each aggregate.

B. Portland Cement: ASTM C 150, Type I or II, except Type III may be used for cold-weather construction.
   1. Alkali content shall not be more than 0.1 percent when tested according to ASTM C 114.
   2. Use same brand of cement, lime and aggregate throughout project to insure uniform mortar colors.

C. Hydrated Lime: ASTM C 207, Type S without air-entrainment.

D. Mortar Cement: ASTM C 1329.

E. Masonry Cement: Do not use masonry cement.

F. Portland Cement-Lime Mix: Packaged blend of portland cement and hydrated lime containing no other ingredients.

G. Aggregate for Mortar (Sand): ASTM C 144, and as follows:
   1. For joints less than 1/4 inch use aggregate graded with 100 percent passing No. 16 sieve.
   2. For mortar that is exposed to view, use washed aggregate consisting of natural sand or crushed stone.

I. Water: Potable.

2.4 REINFORCEMENT

A. Manufacturers:
   1. Dur-O-Wall.
   2. Hohmann & Barnard, Inc..
   3. Heckman Building Products.

B. Uncoated-Steel Reinforcing Bars: ASTM A 615 or ASTM A 996, Grade 60.

C. Wire Bar Type Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire reinforcement in place. Manufacture according to CRSI’s “Manual of Standard Practice”.

D. Epoxy Coated Reinforcing Bars: ASTM A 775 or ASTM A 934, epoxy coated, with less than 2 percent damaged coating in each 12-inch bar length.
1. Epoxy-Coated Supports and Tie Wire: For epoxy-coated reinforcement, use epoxy coated or other dielectric-polymer-coated wire bar supports.
2. Epoxy-Coated Steel Reinforcing Touch-up Coating: 3M Scotchkote 213PC or liquid, two-part, epoxy repair coating, compatible with epoxy coating on reinforcement and complying with ASTM A 775.

E. Reinforcing Bar Positioners: Wire units designed to fit into mortar bed joints spanning masonry unit cells and to hold reinforcing bars in center of cells. Units are formed from 0.148-inch steel wire, hot-dip galvanized after fabrication. Provide units designed for number of bars indicated.

F. Horizontal Masonry Joint Reinforcement: Continuous Wire Joint Reinforcing with 9 gage side rods and crossrods. Use hot dipped galvanized wire ASTM A 153, Class B-2 (1.5 oz. PSF) for exterior masonry walls. Use mill galvanized wire ASTM A641. Class 1 (0.40 minimum zinc coating) for interior masonry walls. Use prefabricated corners and tees at wall intersections.

2.5 MORTAR AND GROUT MIXES

A. General: Comply with referenced standards and with manufacturers' written instructions for mix proportions, mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures needed to produce mortar of uniform quality and with optimum performance characteristics.
1. Use portland cement-lime mortar, unless otherwise indicated.
2. Do not use admixtures, including pigments, air-entraining agents, accelerators, retarders, water-repellent agents, or other admixtures unless otherwise indicated.
3. Do not use anti-freeze compounds to lower freezing point of mortar.
4. Do not use calcium chloride in mortar or grout.
5. Use mortar ingredients that will not produce efflorescence.
6. Combine and thoroughly mix cementitious materials, water, and aggregates in a mechanical batch mixer unless otherwise indicated. Discard mortar when it has reached initial set.

B. Mortar for Masonry Units:
1. Mortar for Non-Load Bearing Unit Masonry: ASTM C270, type as scheduled using Proportion or Property specification.

C. Schedule of Mortar Types: Provide the following types of mortar for applications stated unless another type is indicated or needed to provide required compressive strength of masonry:
1. Interior non-load-bearing partitions: Type N.
2. Exterior solid unit at stone veneer base: Type S

D. Grout for Unit Masonry: Comply with ASTM C476. For use in filling bond beams, concrete unit masonry cells with reinforcing bars, and other cells or cavities as indicated.
1. Use grout of type indicated or, if not otherwise indicated, of type (fine or coarse) that will comply with Table 7 in TMS 602/ACI 530.1/ASCE 6 for dimensions of grout spaces and pour height.
2. Use fine aggregate size No. 2 for fine grout and course aggregate size No. 8 for coarse grout in accordance with ASTM C404.
3. Proportion grout in accordance with ASTM C476, Table 1 or paragraph 4.2.2.1 for specified 28-day compressive strength indicated, but not less than 3000 psi when tested in accordance with ASTM C1019.
4. Provide grout with a slump of 8 to 11 inches as measured according to ASTM C143.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
1. For the record, prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
2. Verify that foundations are within tolerances specified.
3. Verify that reinforcing dowels are properly placed.
4. Verify that substrates are free of substances that impair mortar bond.

B. Before installation, examine rough-in and built-in construction for piping systems to verify actual locations of piping connections.
   1. Ensure items built-in by other trades for this work are properly located and sized. Fill in solidly with masonry around and built-in items. Fill space between hollow metal frames and masonry solidly with mortar.

C. Establish lines, levels and coursing. Protect from disturbances.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 MIXING MORTAR AND GROUT

A. Mixing Masonry Mortar: Thoroughly mix in accordance with TMS 602-11 / ACI 530.1 / ASCE 6-11 in quantities needed for immediate use,
   1. Admixtures: Add in accordance with manufacturer’s recommendations. Ensure uniformity of mix and colorations.
      a. Consult with and follow manufacturer’s directions on use, mix designs and procedures, quantity and mixing of admixtures and various conditions affecting mixing and pouring. Show proposed admixtures on mix designs and do not use unless shown.
   2. Ensure that sand is uniformly damp immediately before mixing
   3. Maintain workability of mortar by remixing or re-tempering. Discard mortar which has begun to stiffen or is not used within 2-1/2 hours after initial mixing.

B. Mixing Masonry Grout: Thoroughly mix grout ingredients in quantities needed for immediate use in accordance with ASTM C476 for Fine or Course grout.
   1. Unless otherwise required, mix grout other than self-consolidating grout to a consistency that has a slump between 8 and 11 inches.
   2. Proportioning of self-consolidating grout at the project site is not permitted. Do not add water at the project site in accordance with the self-consolidating grout manufacturer’s recommendations.
   3. Add admixtures in accordance with manufacturer’s instructions. Mix thoroughly.

3.3 INSTALLATION, GENERAL

A. Thickness: Build masonry walls and other masonry construction to full thickness shown. Build single-wythe walls to actual widths of masonry units, using units of widths indicated.

B. Build chases and recesses to accommodate items specified in this and other Sections.

C. Leave openings for equipment to be installed before completing masonry. After installing equipment, complete masonry to match construction immediately adjacent to opening.

D. Use full-size units without cutting if possible. If cutting is required to provide a continuous pattern or to fit adjoining construction, cut units with motor-driven saws; provide clean, sharp, unchipped edges. Allow units to dry before laying unless wetting of units is specified. Install cut units with cut surfaces and, where possible, cut edges concealed.

E. Select and arrange units for exposed unit masonry to produce a uniform blend of colors and textures. Mix units from several pallets or cubes as they are placed.
F. Temporary Formwork and Shores: Construct formwork and shores as needed to support reinforced masonry elements during construction.
   1. Construct formwork to provide shape, line, and dimensions of completed masonry as indicated. Make forms sufficiently tight to prevent leakage of mortar and grout. Brace, tie, and support forms to maintain position and shape during construction and curing of reinforced masonry.
   2. Do not remove forms and shores until reinforced masonry members have hardened sufficiently to carry their own weight and that of other loads that may be placed on them during construction.

G. Built-In Work: As work progresses, build-in items as indicated and required, including, hollow metal frames, window frames, steel angle lintels, nailing strips, anchor bolts, plates, sleeves, hangers, supports, and other items supplied by other trades.
   1. Wherever bolts, brackets and similar anchor items are cast-in masonry, fill voids in masonry with mortar to adequately anchor and transmit loads.
   2. Build-in items plumb and true.
   3. Bed anchors of hollow metal frames in mortar joints. Fill frame voids solid with mortar. Fill masonry cores at jambs with grout for full projection at frame anchors.
   4. Do not build-in organic materials which will be subjected to rot or deterioration.

H. Stopping and Resuming Work: Stop work by stepping back units in each course from those in course below; do not tooth. When resuming work, clean masonry surfaces that are to receive mortar, remove loose masonry units and mortar, and wet brick if required before laying fresh masonry.

3.4 TOLERANCES

A. Dimensions and Locations of Elements:
   1. Dimensions in Cross Section or Elevation: Do not vary by more than plus 1/2 inch or minus 1/4 inch.
   2. Location of Elements in Plan: Do not vary from that indicated by more than plus or minus 1/2 inch.
   3. Location of Elements in Elevation: Do not vary from that indicated by more than plus or minus 1/4 inch in a story height or 1/2 inch total.

3.5 CONCRETE MASONRY UNIT INSTALLATION

A. Lay out walls in advance for accurate spacing of surface bond patterns with uniform joint thicknesses and for accurate location of openings, movement-type joints, returns, and offsets.
   1. Avoid using less-than-half-size units, particularly at corners, jambs, and, where possible, at other locations.
   2. Place masonry in accordance with lines and levels indicated on drawings. Lay from exposed side, plumb, level and true to modular dimensions.

B. Bond Pattern: Unless otherwise indicated, lay exposed masonry in running bond, lapping not less than 4 inches. Bond and interlock each course of each wythe at corners.

C. Lay CMU as follows:
   1. Bed face shells in mortar and make head joints of depth equal to bed joints.
   2. Bed webs in mortar in all courses of piers, columns, and pilasters.
   3. Bed webs in mortar in grouted masonry, including starting course on footings.
   4. Fully bed entire units, including areas under cells, at starting course on footings where cells are not grouted.
   5. Fully bed units and fill cells with mortar at anchors and ties as needed to fully embed anchors and ties in mortar.
6. Lay solid masonry units with completely filled bed and head joints; butter ends with sufficient mortar to fill head joints and shove into place. Do not deeply furrow bed joints or slush head joints.

7. Install joint reinforcing, anchors and ties in full mortar surround and where necessary fill voids in blocks to provide full bed to completely imbed items.

D. Joint Tooling: Tool exposed joints slightly concave when thumbprint hard, using a jointer larger than joint thickness unless otherwise indicated.

1. Strike joints flush where below grade and where indicated to receive waterproofing, cavity wall insulation, air or moisture barriers, unless otherwise indicated.

2. Strike joints flush for masonry walls to receive plaster or other direct-applied finishes (other than paint) unless otherwise indicated.

3. Strike flush and then tool to dense sealed surface mortar joints that will be covered by earth.

4. Joints behind ceramic tile shall be flush.

5. Rake out mortar in preparation for application of sealants, where required.

E. Reinforced Unit Masonry: Comply with requirements in TMS 602/ACI 530.1/ASCE 6 for placement of reinforcing, for cleanouts and for grout placement, including minimum grout space and maximum pour height.

F. Masonry-Cell Fill: Pour lightweight-aggregate fill into cavities to fill void spaces. Maintain inspection ports to show presence of fill at extremities of each pour area. Close the ports after filling has been confirmed. Limit the fall of fill to one story high, but not more than 20 feet.

G. Install steel lintels where indicated.

H. Interior Partitions: Carry masonry partitions up to structure above, unless otherwise noted.

1. Joint to Structure Above: Provide 3/8 inch joint between masonry and over-structure and pack solidly to form dense and effective barrier to sound transmission. Fill of voids shall permit movement and deflection.

2. Openings Through Walls: Except as otherwise indicated, where piping, conduit or similar features pass through walls, carefully fill spaces to block sound. Fill voids to permit movement and deflection. Fill solid around obstructions and voids to form effective closures.

I. Build nonload-bearing interior partitions full height of story to underside of solid floor or roof structure above unless otherwise indicated.

1. Install compressible filler in joint between top of partition and underside of structure above.

2. Secure top of non-load bearing cmu partitions to structure above as indicated in drawings.

3. At fire-rated partitions, treat joint between top of partition and underside of structure above to comply with Section 078446 - Fire-Resistive Joint Systems.

J. Isolate masonry partitions from vertical structural framing members with control joint, with mortar raked back 1/4 inch regardless of joint treatment.

K. Where piping and conduit run in masonry, work with other trades to coordinate work. Cut out center bridges in block to create voids for pipes or conduit. Where pipes or conduit exit from wall, drill neat holes to provide neat unpatched walls.

1. Review acoustic penetration details. A clear annular gap of ½” to 1” must be provided around all penetrating services (ductwork, piping, conduit, cable trays, etc.) to ensure no rigid contact.

2. No penetrating services shall be mounted to, hung from or otherwise supported by the blockwork partition.

3. review locations where isolation gap is required between blockwork walls and adjacent constructions. Assure that no mortar has fallen into gaps or otherwise compromised the acoustic separation provided by the air-gap or resilient gasket.
L. Cut and fit concrete block for chases, pipes, conduit, sleeves, and grounds. Cooperate with other sections of work to ensure correct size, shape and location. Provide not less than 8 inches of masonry between chase or recess and jamb of openings. Cut masonry units using motor-driven saws to provide clean, sharp, unchipped edges.

1. Obtain Architect's review prior to cutting or fitting any area not indicated on drawings, or which may impair appearance or strength of masonry work.

3.6 MASONRY JOINT REINFORCEMENT

A. General: Install entire length of longitudinal side rods in mortar with a minimum cover of 5/8 inch on exterior side of walls, 1/2 inch elsewhere. Lap reinforcement a minimum of 6 inches.

1. Space continuous joint reinforcement not more than 16 inches o.c vertically.
2. Provide reinforcement not more than 8 inches above and below wall openings and extending 36 inches beyond openings in addition to continuous reinforcement.
3. Place joint reinforcement at bed joint at top course of wall or partition, continuous full length of wall.

B. Refer to Structural Drawings for locations of reinforcing bars within concrete masonry wall section.

C. Interrupt joint reinforcement at control and expansion joints, unless otherwise indicated.

D. Provide continuity by using prefabricated T-shaped unit at wall intersections and prefabricated L-shaped units at corners.

3.7 CONTROL AND EXPANSION JOINTS

A. General: Install control- and expansion-joint materials in unit masonry as masonry progresses. Do not allow materials to span control and expansion joints without provision to allow for in-plane wall or partition movement.

1. Provide control joints in block work as indicated and where shown on Drawings, or if not shown, review locations with Architect prior to start of installation.
2. Form joints in brick and block work, straight and true.
3. Unless otherwise shown on Structural Drawings, end reinforcing approximately one inch either side of joints. Do not continue horizontal masonry reinforcing across joints.

B. Control Joints: Form control joints in concrete masonry as follows:

1. Provide control joints in block work as indicated and where shown on Drawings, or if not shown, locate at 40 feet maximum for horizontal run of wall.
2. Fit bond-breaker strips into hollow contour in ends of CMUs on one side of control joint. Fill resultant core with grout, and rake out joints in exposed faces for application of sealant.
3. Install preformed control-joint gaskets designed to fit standard sash block.
4. Install interlocking units designed for control joints. Install bond-breaker strips at joint. Keep head joints free and clear of mortar, or rake out joint for application of sealant.
5. Install temporary foam-plastic filler in head joints, and remove filler when unit masonry is complete for application of sealant.
6. Keyed Control Joint in Bond Beams: At continuous bond beams, provide keyed control joint at construction joints.
   a. Extend rebar beyond joint minimum of 18 inches.
   b. Use 2X wood block drilled to allow rebar to pass through wood block.
   c. Set block inside of bond beam and coat with form release agent.
   d. Secure block in place before pouring bond beam.

C. Expansion Joints: Form expansion joints in brick as follows:

1. Provide control joints in brick work as indicated and where shown on Drawings, or if not shown, locate at 30 feet maximum for horizontal run of wall.
a. Corners: Provide at 2 feet from building corners if not shown on Drawings.
2. Build flanges of metal expansion strips into masonry. Lap each joint 4 inches in direction of water flow. Seal joints below grade and at junctures with horizontal expansion joints if any.
3. Build flanges of factory-fabricated, expansion-joint units into masonry.
4. Build in compressible joint fillers where indicated.
5. Form open joint full depth of brick wythe and of width indicated, but not less than 3/8 inch for installation of sealant and backer rod specified in Section 079200 - Joint Sealants.

D. Provide horizontal, pressure-relieving joints by either leaving an airspace or inserting a compressible filler of width required for installing sealant and backer rod specified in Section 079200 "Joint Sealants," but not less than 3/8 inch.
1. Locate horizontal, pressure-relieving joints beneath shelf angles supporting masonry.

E. Joint Fillers and Deflection Material: Install fillers in accordance with manufacturer's printed instructions. Compressible fillers shall be 50 percent larger than joint size.
1. Set at proper depth or position in joint to coordinate with other work, including installation of bond breakers, backer rods and sealants.
2. Do not leave voids or gaps between ends of joint filler units.
3. Recess exposed edges or faces or compressible fillers slightly behind adjoining surfaces so that compressed units will not protrude from joint.

3.8 REPAIRING AND CLEANING
A. Remove and replace masonry units that are loose, chipped, broken, stained, or otherwise damaged or that do not match adjoining units. Install new units to match adjoining units; install in fresh mortar, pointed to eliminate evidence of replacement.

B. In-Progress Cleaning: Clean unit masonry as work progresses by dry brushing to remove mortar fins and smears before tooling joints.

C. Final Cleaning: After mortar is thoroughly set and cured, clean exposed masonry in accordance with BIA recommendations.

PROTECTION
A. Without damaging completed work, provide protective boards at exposed external corners that are subject to damage by construction activities.

B. Adequately brace all work to prevent damage of any kind. Mask, barricade or similarly protect work as required from damage during building operations. Protect installed material as necessary to prevent staining or damage from the elements.

C. Provide temporary bracing of masonry during erection. Do not remove bracing until building structure provides permanent bracing.

D. During erection, keep all walls dry by covering the top with a strong, waterproof membrane at each shutdown and the end of each day. Cover partially completed walls at all times when work is not in progress. Extend cover a minimum of 2 feet down both sides, and securely hold in place.

END OF SECTION
SECTION 051200
STRUCTURAL STEEL FRAMING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
   A. Section Includes:
      1. Structural steel.
      2. Prefabricated building columns.
      3. Field-installed shear connectors.
   B. Related Requirements:
      1. Section 051213 "Architecturally Exposed Structural Steel Framing" for additional requirements for architecturally exposed structural steel.
      2. Section 053100 "Steel Decking" for field installation of shear connectors through deck.
      3. Section 055000 "Metal Fabrications" for steel lintels and shelf angles not attached to structural-steel frame miscellaneous steel fabrications and other steel items not defined as structural steel.

1.3 DEFINITIONS
   A. Structural Steel: Elements of the structural frame indicated on Drawings and as described in AISC 303, "Code of Standard Practice for Steel Buildings and Bridges."
   B. Seismic-Load-Resisting System: Elements of structural-steel frame designated as "SLRS" or along grid lines designated as "SLRS" on Drawings, including columns, beams, and braces and their connections.
   C. Heavy Sections: Rolled and built-up sections as follows:
      1. Shapes included in ASTM A6/A6M with flanges thicker than 1-1/2 inches (38 mm).
      2. Column base plates thicker than 2 inches (50 mm).

1.4 COORDINATION
   A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.
B. Coordinate installation of anchorage items to be embedded in or attached to other construction without delaying the Work. Provide setting diagrams, sheet metal templates, instructions, and directions for installation.

1.5 PREINSTALLATION MEETINGS

A. Preinstallation Conference: Conduct conference at Cass Ave, Detroit MI-48201

1.6 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Sustainable Design Submittals:

C. Shop Drawings: Show fabrication of structural-steel components.
   1. Include details of cuts, connections, splices, camber, holes, and other pertinent data.
   2. Include embedment Drawings.
   3. Indicate welds by standard AWS symbols, distinguishing between shop and field welds, and show size, length, and type of each weld. Show backing bars that are to be removed and supplemental fillet welds where backing bars are to remain.
   4. Indicate type, size, and length of bolts, distinguishing between shop and field bolts. Identify pretensioned and slip-critical, high-strength bolted connections.

D. Welding Procedure Specifications (WPSs) and Procedure Qualification Records (PQRs): Provide according to AWS D1.1/D1.1M, "Structural Welding Code - Steel," for each welded joint whether prequalified or qualified by testing, including the following:
   1. Power source (constant current or constant voltage).
   2. Electrode manufacturer and trade name, for demand critical welds.

E. Delegated-Design Submittal: For structural-steel connections indicated to comply with design loads, include analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.7 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer and fabricator.

B. Welding certificates.

C. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers, certifying that shop primers are compatible with topcoats.

D. Mill test reports for structural steel, including chemical and physical properties.

E. Product Test Reports: For the following:
   1. Bolts, nuts, and washers including mechanical properties and chemical analysis.
   2. Direct-tension indicators.
   3. Tension-control, high-strength, bolt-nut-washer assemblies.
4. Shear stud connectors.
5. Shop primers.

F. Survey of existing conditions.
G. Source quality-control reports.
H. Field quality-control and special inspection reports.

1.8 QUALITY ASSURANCE

A. Fabricator Qualifications: A qualified fabricator that participates in the AISC Quality Certification Program and is designated an AISC-Certified Plant, Category STD.

B. Installer Qualifications: A qualified installer who participates in the AISC Quality Certification Program and is designated an AISC-Certified Erector, Category CSE.

C. Shop-Painting Applicators: Qualified according to AISC's Sophisticated Paint Endorsement P2 or to SSPC-QP 3, "Standard Procedure for Evaluating Qualifications of Shop Painting Applicators."

D. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1. Welders and welding operators performing work on bottom-flange, demand-critical welds shall pass the supplemental welder qualification testing, as required by AWS D1.8/D1.8M. FCAW-S and FCAW-G shall be considered separate processes for welding personnel qualification.

E. Comply with applicable provisions of the following specifications and documents:

1. AISC 303.
2. AISC 341 and AISC 341s1.
3. AISC 360.
4. RCSC's "Specification for Structural Joints Using ASTM A325 or A 490 Bolts."

1.9 DELIVERY, STORAGE, AND HANDLING

A. Store materials to permit easy access for inspection and identification. Keep steel members off ground and spaced by using pallets, dunnage, or other supports and spacers. Protect steel members and packaged materials from corrosion and deterioration.

1. Do not store materials on structure in a manner that might cause distortion, damage, or overload to members or supporting structures. Repair or replace damaged materials or structures as directed.

B. Store fasteners in a protected place in sealed containers with manufacturer's labels intact.

1. Fasteners may be repackaged provided Owner's testing and inspecting agency observes repackaging and seals containers.
2. Clean and relubricate bolts and nuts that become dry or rusty before use.
3. Comply with manufacturers’ written recommendations for cleaning and lubricating ASTM F3125/F3125M, Grade F1852 bolt assemblies and for retesting bolt assemblies after lubrication.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Connections: Provide details of simple shear connections required by the Contract Documents to be selected or completed by structural-steel fabricator to withstand loads indicated and comply with other information and restrictions indicated.

1. Select and complete connections using schematic details indicated and AISC 360.
2. Use Allowable Stress Design; data are given at service-load level.
3. Design composite floor beams for design 75% of the uniform load carrying capacity published in table in the AISC code or the reaction indicated on the framing plans, whichever is greater. No connection shall have a capacity less than 6000 pounds.
4. Design Roof beams for 50% of the uniform load carrying capacity published in table in the AISC code or the reaction indicated on the framing plans, whichever is greater. NO connection shall have a capacity less than 6000 pounds.

B. Moment Connections: Type FR, fully restrained.

C. Construction: Combined system of moment frame, braced frame, and shear walls.

2.2 STRUCTURAL-STEEL MATERIALS

A. Recycled Content of Steel Products: Postconsumer recycled content plus one-half of preconsumer recycled content not less than 25 percent.

B. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than the following:

1. W-Shapes: 60 percent.
2. Channels, Angles 60 percent.
3. Plate and Bar: 25 percent.
4. Cold-Formed Hollow Structural Sections: 25 percent.
5. Steel Pipe: 25 percent.
6. All Other Steel Materials: 25 percent.

C. W-Shapes: ASTM A992/A992M Or ASTM A572/A572M, Grade 50.

D. Channels, Angles: ASTM A36/A36M , Grade 36.

E. Plate and Bar: ASTM A36/A36M, Grade 36.

F. Cold-Formed Hollow Structural Sections: ASTM A500/A500M, Grade B, structural tubing.

G. Steel Pipe: ASTM A53/A53M, Type E or Type S, Grade B.
1. Weight Class: Standard.
2. Finish: Black, except where indicated to be galvanized.

H. Welding Electrodes: Comply with AWS requirements.

2.3 BOLTS, CONNECTORS, AND ANCHORS

A. High-Strength Bolts, Nuts, and Washers: ASTM A325 (Grade A325M), Type 1, heavy-hex steel structural bolts; ASTM A563, heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers; all with plain finish.

1. Direct-Tension Indicators: ASTM F959/F959M, Type 325-1, compressible-washer type with plain finish.

B. High-Strength Bolts, Nuts, and Washers: ASTM A490, Type 1, heavy-hex steel structural bolts or Grade F2280 tension-control, bolt-nut-washer assemblies with splined ends; ASTM A563, heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers; all with plain finish.

1. Direct-Tension Indicators: ASTM F959/F959M, Type 490-1, compressible-washer type with plain finish.

C. Slip Critical Bolted Connections: Tension-Control, High-Strength Bolt-Nut-Washer Assemblies: ASTM F3125/F3125M, Grade F1852, Type 1, heavy-or round head assemblies consisting of steel structural bolts with splined ends; ASTM A563, heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers.

1. Finish: Plain.

D. Shear Connectors: ASTM A108, Grades 1015 through 1020, headed-stud type, cold-finished carbon steel; AWS D1.1/D1.1M, Type B.

E. Unheaded Anchor Rods: ASTM F1554, Grade 36 or ASTM F1554, Grade 55, weldable as indicated.

1. Configuration: Hooked typically, straight as indicated.
4. Washers: ASTM F436, Type 1, hardened carbon steel.
5. Finish: Plain.

F. Headed Anchor Rods: ASTM F1554, Grade 36 or ASTM F1554, Grade 55, weldable, straight.

3. Washers: ASTM F436, Type 1, hardened carbon steel.

G. Threaded Rods: ASTM A36/A36M Typically or ASTM A572/A572M, Grade 50 as indicated.

3. Finish: Plain.

I. Eye Bolts and Nuts: Made from cold-finished carbon steel bars, ASTM A108, Grade 1030.

K. Structural Slide Bearings: Low-friction assemblies, of configuration indicated, that provide vertical transfer of loads and allow horizontal movement perpendicular to plane of expansion joint while resisting movement within plane of expansion joint.

1. Manufacturers: Subject to compliance with requirements, provide products by the following:
   a. Fluorocarbon Company Limited.

2. Mating Surfaces: PTFE and PTFE.

3. Coefficient of Friction: Not more than 0.03.

4. Design Load: Not less than 2,000 psi.

5. Total Movement Capability: 2 inches

2.4 PRIMER

A. Primer: SSPC-Paint 23, latex primer.

B. Galvanize miscellaneous framing and supports where exposed to the elements such as at the Building Exterior as well as interior locations which are humid or corrosive.

C. Preparation and Coating over Galvanized Steel:
   1. Preparation: All galvanized metal receiving additional coats shall be tested by use of a copper sulfate test. This includes using a 10% solution of copper sulfate dissolved in water and applied to the galvanized surface. The reaction time between the copper sulfate and zinc should result in turning the galvanized area black within 15 seconds or less. If the reaction takes longer than 15 seconds, further cleaning is required as follows:
      a. Preparation for TNEMEC paints: Apply Oakite CrysCoat 747 or 747 LTS as recommended by manufacturer. Allow to dry and air chuck entire prepared area removing excess materials.
      b. Preparation for Wasser paints: Apply Great Lakes Clean and Etch or Oakite 747 as recommended by manufacturer followed by a thorough rinse.
   2. Primer:
      a. TNEMEC: One (1) coat TNEMEC Series N 27 S.T. Typoxy @ 2.0 to 4.0 mil DFT.
      b. Wasser: One (1) coat of Wasser MC-CR @ 3.0-4.0 mils DFT.
   3. For warranty purposes, the Contractor shall insure that the intermediate and finish coats specified in Division 9 “Painting” and the applied primer specified above are from the same

D. Galvanizing Repair Paint: MPI#18, MPI#19, SSPC-Paint 20 or ASTM A780.

2.5 GROUT

A. Nonmetallic, Shrinkage-Resistant Grout: ASTM C1107/C1107M, factory-packaged, nonmetallic aggregate grout, noncorrosive and nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.
2.6 FABRICATION

   1. Camber structural-steel members where indicated.
   2. Fabricate beams with rolling camber up.
   3. Identify high-strength structural steel according to ASTM A6/A6M and maintain markings until structural steel has been erected.
   4. Mark and match-mark materials for field assembly.
   5. Complete structural-steel assemblies, including welding of units, before starting shop-priming operations.

B. Thermal Cutting: Perform thermal cutting by machine to greatest extent possible.
   1. Plane thermally cut edges to be welded to comply with requirements in AWS D1.1/D1.1M.

C. Bolt Holes: Cut, drill, or punch standard bolt holes perpendicular to metal surfaces.

D. Finishing: Accurately finish ends of columns and other members transmitting bearing loads.

E. Cleaning: Clean and prepare steel surfaces that are to remain unpainted according to SSPC-SP 3, "Power Tool Cleaning."

F. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.

G. Holes: Provide holes required for securing other work to structural steel and for other work to pass through steel members.
   1. Cut, drill, or punch holes perpendicular to steel surfaces. Do not thermally cut bolt holes or enlarge holes by burning.
   2. Baseplate Holes: Cut, drill, mechanically thermal cut, or punch holes perpendicular to steel surfaces.
   3. Weld threaded nuts to framing and other specialty items indicated to receive other work.

2.7 SHOP CONNECTIONS

A. High-Strength Bolts: Shop install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A325 or A 490 Bolts" for type of bolt and type of joint specified.
   1. Joint Type: Snug tightened unless noted Pretensioned or Slip critical on the drawings.

B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.
   1. Assemble and weld built-up sections by methods that maintain true alignment of axes without exceeding tolerances in AISC 303 for mill material.
2.8 SHOP PRIMING

A. Shop prime steel surfaces except the following:
   1. Surfaces embedded in concrete or mortar. Extend priming of partially embedded members to a depth of 2 inches.
   2. Surfaces to be field welded.
   4. Surfaces to receive sprayed fire-resistant materials (applied fireproofing).
   5. Galvanized surfaces.

B. Surface Preparation: Clean surfaces to be painted. Remove loose rust and mill scale and spatter, slag, or flux deposits. Prepare surfaces according to the following specifications and standards:
   1. SSPC-SP 3, "Power Tool Cleaning."

C. Priming: Immediately after surface preparation, apply primer according to manufacturer's written instructions and at rate recommended by SSPC to provide a minimum dry film thickness of 1.5 mils. Use priming methods that result in full coverage of joints, corners, edges, and exposed surfaces.
   1. Stripe paint corners, crevices, bolts, welds, and sharp edges.
   2. Apply two coats of shop paint to surfaces that are inaccessible after assembly or erection. Change color of second coat to distinguish it from first.

D. Painting: Prepare steel and apply a one-coat, nonasphaltic primer complying with SSPC-PS Guide 7.00, "Painting System Guide 7.00: Guide for Selecting One-Coat Shop Painting Systems," to provide a dry film thickness of not less than 1.5 mils

2.9 GALVANIZING

A. Hot-Dip Galvanized Finish: Apply zinc coating by the hot-dip process to structural steel according to ASTM A123/A123M.
   1. Fill vent and drain holes that are exposed in the finished Work unless they function as weep holes, by plugging with zinc solder and filing off smooth.
   2. Galvanize lintels, shelf angles and welded door frames attached to structural-steel frame and located in exterior walls.

2.10 SOURCE QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform shop tests and inspections.
   1. Provide testing agency with access to places where structural-steel work is being fabricated or produced to perform tests and inspections

B. Correct deficiencies in work that test reports and inspections indicate does not comply with the contract documents.
C. Bolted Connections: shop-bolted connections will be tested and inspected according to RCSC’s “Specification for Structural Joints Using ASTM A325 or A 490 Bolts.”

D. Welded Connections: Visually inspect shop-welded connections according to AWS D1.1/D1.1M and the following inspection procedures, at testing agency’s option:

1. Liquid Penetrant Inspection: ASTM E165.
2. Magnetic Particle Inspection: ASTM E709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration are not accepted.
4. Radiographic Inspection: ASTM E94.

E. In addition to visual inspection, test and inspect shop-welded shear connectors according to requirements in AWS D1.1/D1.1M for stud welding and as follows:

1. Perform bend tests if visual inspections reveal either a less-than-continuous 360-degree flash or welding repairs to any shear connector.
2. Conduct tests according to requirements in AWS D1.1/D1.1M on additional shear connectors if weld fracture occurs on shear connectors already tested.

F. Prepare test and inspection reports.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify, with certified steel erector present, elevations of concrete- and masonry-bearing surfaces and locations of anchor rods, bearing plates, and other embedments for compliance with requirements.

1. Prepare a certified survey of existing conditions. Include bearing surfaces, anchor rods, bearing plates, and other embedments showing dimensions, locations, angles, and elevations.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Provide temporary shores, guys, braces, and other supports during erection to keep structural steel secure, plumb, and in alignment against temporary construction loads and loads equal in intensity to design loads. Remove temporary supports when permanent structural steel, connections, and bracing are in place unless otherwise indicated.

1. Do not remove temporary shoring supporting composite deck construction until cast-in-place concrete has attained its design compressive strength.

3.3 ERECTION

A. Set structural steel accurately in locations and to elevations indicated and according to AISC 303 and AISC 360.

1. Set plates for structural members on wedges, shims, or setting nuts as required.
2. Weld plate washers to top of baseplate.
3. Pretension anchor rods after supported members have been positioned and plumbed. Do not remove wedges or shims but, if protruding, cut off flush with edge of plate before packing with grout.
4. Promptly pack grout solidly between bearing surfaces and plates so no voids remain. Neatly finish exposed surfaces; protect grout and allow to cure. Comply with manufacturer's written installation instructions for shrinkage-resistant grouts.

C. Maintain erection tolerances of structural steel within AISC 303, "Code of Standard Practice for Steel Buildings and Bridges."

D. Align and adjust various members that form part of complete frame or structure before permanently fastening. Before assembly, clean bearing surfaces and other surfaces that are in permanent contact with members. Perform necessary adjustments to compensate for discrepancies in elevations and alignment.

1. Level and plumb individual members of structure.
2. Make allowances for difference between temperature at time of erection and mean temperature when structure is completed and in service.

E. Splice members only where indicated.

F. Do not use thermal cutting during erection unless approved by Architect. Finish thermally cut sections within smoothness limits in AWS D1.1/D1.1M.

G. Do not enlarge unfair holes in members by burning or using drift pins. Ream holes that must be enlarged to admit bolts.

H. Shear Connectors: Prepare steel surfaces as recommended by manufacturer of shear connectors. Use automatic end welding of headed-stud shear connectors according to AWS D1.1/D1.1M and manufacturer's written instructions.

3.4 FIELD CONNECTIONS

A. High-Strength Bolts: Install high-strength bolts according to RCSC's "Specification for Structural Joints Using ASTM A325 or A 490 Bolts" for type of bolt and type of joint specified.

1. Joint Type: Snug tightened unless noted Pretensioned or Slip critical on the drawings.

B. Weld Connections: Comply with AWS D1.1/D1.1M for tolerances, appearances, welding procedure specifications, weld quality, and methods used in correcting welding work.

1. Comply with AISC 303 and AISC 360 for bearing, alignment, adequacy of temporary connections, and removal of paint on surfaces adjacent to field welds.
2. Remove backing bars or runoff tabs, back gouge, and grind steel smooth.
3. Verify that weld sizes, fabrication sequence, and equipment used for architecturally exposed structural steel will limit distortions to allowable tolerance.
3.5 FIELD QUALITY CONTROL

A. Special Inspections: Owner will engage qualified special inspector to perform the following special inspections:
   1. Verify structural-steel materials and inspect steel frame joint details.
   2. Verify weld materials and inspect welds.
   3. Verify connection materials and inspect high-strength bolted connections.

B. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

C. Bolted Connections: Field-bolted connections will be tested and inspected according to RCSC's "Specification for Structural Joints Using ASTM A325 or A 490 Bolts."

D. Welded Connections: Visually inspect field welds according to AWS D1.1/D1.1M.
   1. In addition to visual inspection, test and inspect field welds according to AWS D1.1/D1.1M and the following inspection procedures, at testing agency's option:
      a. Liquid Penetrant Inspection: ASTM E165.
      b. Magnetic Particle Inspection: ASTM E709; performed on root pass and on finished weld. Cracks or zones of incomplete fusion or penetration are not accepted.
      c. Ultrasonic Inspection: ASTM E164.
      d. Radiographic Inspection: ASTM E94.

E. In addition to visual inspection, test and inspect field-welded shear connectors according to requirements in AWS D1.1/D1.1M for stud welding and as follows:
   1. Perform bend tests if visual inspections reveal either a less-than-continuous 360-degree flash or welding repairs to any shear connector.
   2. Conduct tests according to requirements in AWS D1.1/D1.1M on additional shear connectors if weld fracture occurs on shear connectors already tested.

F. Correct deficiencies in work that test reports and inspections indicate does not comply with the contract documents.

G. Additional inspecting, at Contractor's expense, will be performed to determine compliance of the corrected work with specified requirements.

H. Test results and inspection reports shall be reported in writing to Architect, Contractor, and Authorities having jurisdiction within 48 hours of testing.

3.6 REPAIRS AND PROTECTION

A. Galvanized Surfaces: Clean areas where galvanizing is damaged or missing and repair galvanizing to comply with ASTM A780/A780M.

B. Touchup Painting: Immediately after erection, clean exposed areas where primer is damaged or missing and paint with the same material as used for shop painting to comply with SSPC-PA 1 for touching up shop-painted surfaces.
   1. Clean and prepare surfaces by SSPC-SP 2 hand-tool cleaning or SSPC-SP 3 power-tool cleaning.
END OF SECTION 051200

END OF SECTION
SECTION 05 21 00
STEEL JOIST FRAMING

PART 1 - GENERAL
1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   2. KCS-type K-series steel joists.
   3. Long-span steel joists LH and DLH.

B. Related Sections include the following:
   1. Division 04 Section "Unit Masonry" for installing bearing plates in unit masonry.
   2. Division 5 Section "Metal Fabrications" for furnishing steel bearing plates.

1.3 DEFINITIONS

A. SJI "Specifications": Steel Joist Institute's "Standard Specifications, Load Tables and Weight Tables for Steel Joists and Joist Girders."

B. Special Joists: Steel joists or joist girders requiring modification by manufacturer to support non-uniform, unequal, or special loading conditions that invalidate load tables in SJI's "Specifications."

1.4 PERFORMANCE REQUIREMENTS

A. Structural Performance: Provide special joists and connections capable of withstanding design loads indicated.

B. Structural Performance: Provide joists and connections capable of withstanding a net uplift force of 12 pounds per square foot.

C. Design special joists to withstand design loads with live load deflections no greater than the following:
   1. Floor Joists: Vertical deflection of 1/360 of the span.
   2. Roof Joists: Vertical deflection of 1/360 of the span.

1.5 SUBMITTALS

A. General: Submit each item in this Article according to the Conditions of the Contract and Division 01 Specification Sections.

B. Product Data: For each type of joist, accessory, and product indicated.

C. Shop Drawings: Show layout, designation, number, type, location, and spacings of joists. Include joining and anchorage details, bracing, bridging, joist accessories; splice and connection locations and details; and attachments to other construction.

   1. Indicate locations and details of bearing plates to be embedded in other construction.
2. Comprehensive engineering analysis and design of joists including diagrams, geometry, chord and web sizes and stress state of each member.
3. Comprehensive engineering analysis of special joists signed and sealed by the qualified professional engineer responsible for its preparation.

D. Welding certificates.
E. Manufacturer Certificates: Signed by manufacturers certifying that joists comply with requirements.
F. Mill Certificates: Signed by bolt manufacturers certifying that bolts comply with requirements.
G. Qualification Data: For manufacturer and professional engineer.
H. Research/Evaluation Reports: Evidence of steel joists’ compliance with building code in effect for Project, from a model code organization acceptable to authorities having jurisdiction.

1.6 QUALITY ASSURANCE

A. Manufacturer Qualifications: A manufacturer certified by SJI to manufacture joists complying with applicable standard specifications and load tables of SJI "Specifications."

1. Manufacturer must be certified by SJI to manufacture joists complying with SJI standard specifications and load tables.
2. Assumes responsibility for engineering special joists to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.
3. Professional Engineer Qualifications: A professional engineer who is legally authorized to practice in jurisdiction where Project is located and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of joists that are similar to those indicated for this Project in material, design, and extent.

B. SJI Specifications: Comply with standard specifications in SJI's "Specifications" that are applicable to types of joists indicated.

C. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

1.7 DELIVERY, STORAGE, AND HANDLING

A. Deliver, store, and handle joists as recommended in SJI's "Specifications."
B. Protect joists from corrosion, deformation, and other damage during delivery, storage, and handling.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Steel: Comply with SJI's "Specifications" for web and steel-angle chord members.
B. Carbon-Steel Bolts and Threaded Fasteners: ASTM A 307, Grade A, carbon-steel, hex-head bolts and threaded fasteners; carbon-steel nuts; and flat, unhardened steel washers.

1. Finish: Plain, uncoated.
C. High-Strength Bolts, Nuts, and Washers: ASTM A 325, Type 1, heavy hex steel structural bolts; ASTM A 563 heavy hex carbon-steel nuts; and ASTM F 436 hardened carbon-steel washers.

1. Finish: Plain.
D. Welding Electrodes: Comply with AWS standards.
2.2 PRIMERS

A. Primer: SSPC-Paint 15, or manufacturer's standard shop primer complying with performance requirements in SSPC-Paint 15.

2.3 K-SERIES STEEL JOISTS

B. Steel Joist Substitutes: Manufacture according to "Standard Specifications for Open Web Steel Joists, K-Series" in SJI's "Specifications," with steel-angle or -channel members.

C. Comply with AWS requirements and procedures for shop welding, appearance, quality of welds, and methods used in correcting welding work.

D. Provide holes in chord members for connecting and securing other construction to joists.

E. Extended Ends: Extend bearing ends of joists with SJI's Type R extended ends where indicated, complying with SJI's "Specifications."

F. Camber joists according to SJI's "Specifications."

G. Equip bearing ends of joists with manufacturer's standard beveled ends or sloped shoes if joist slope exceeds 1/4 inch per 12 inches.

2.4 LONG-SPAN STEEL JOISTS

A. Manufacture steel joists according to "Standard Specifications for Longspan Steel Joists, LH-Series and Deep Longspan Steel Joists, DLH-Series" in SJI's "Specifications," with steel-angle top- and bottom-chord members; of joist type and end and top-chord arrangements as follows:

2. End Arrangement: Underslung.

3. Top-Chord Arrangement:
   a. LH: Parallel.
   b. DLH: Parallel.

B. Comply with AWS requirements and procedures for shop welding, appearance, quality of welds, and methods used in correcting welding work.

C. Provide holes in chord members for connecting and securing other construction to joists.

D. Camber long-span steel joists according to SJI's "Specifications."

E. Equip bearing ends of joists with manufacturer's standard beveled ends or sloped shoes if joist slope exceeds 1/4 inch per 12 inches.

2.5 JOIST ACCESSORIES

A. Bridging: Provide bridging anchors and number of rows of horizontal and/or diagonal bridging of material, size, and type required by SJI's "Specifications" for type of joist, chord size, spacing, and span. Furnish additional erection bridging if required for stability.

1. Bridging, including bolted x-bridging, indicated on the plans where it would not normally be required, shall be provided to supplement continuity of the lateral bracing system to:
   a. Support perimeter conventional framing, beams, posts for roof screens, etc.
   b. Offset bridging lines at roof openings, mechanical ductwork, etc.
B. Steel bearing plates with integral anchorages are specified in Division 05 Section "Metal Fabrications."

C. Supply miscellaneous accessories, including splice plates and bolts required by joist manufacturer to complete joist installation.

2.6 CLEANING AND SHOP PAINTING

A. Clean and remove loose scale, heavy rust, and other foreign materials from fabricated joists and accessories by power-tool cleaning, SSPC-SP 3.

B. Apply 1 coat of shop primer to joists and joist accessories to be primed to provide a continuous, dry paint film not less than 1 mil thick.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine supporting substrates, embedded bearing plates, and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Do not install joists until supporting construction is in place and secured.

B. Install joists and accessories plumb, square, and true to line; securely fasten to supporting construction according to SJI's "Specifications," joist manufacturer's written recommendations, and requirements in this Section.

1. Before installation, splice joists delivered to Project site in more than one piece.
2. Space, adjust, and align joists accurately in location before permanently fastening.
3. Install temporary bracing and erection bridging, connections, and anchors to ensure that joists are stabilized during construction.
4. Do not connect bottom chord extensions to columns unless specifically indicated on the Drawings. If a connection is specified, delay rigidly connecting bottom-chord extensions to columns or supports until dead loads have been applied.

C. Field weld joists to supporting steel bearing plates and framework. Coordinate welding sequence and procedure with placement of joists. Comply with AWS requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.

E. Install and connect bridging concurrently with joist erection, before construction loads are applied. Anchor ends of bridging lines at top and bottom chords if terminating at walls or beams.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Construction Manager/Owner will engage a qualified independent testing and inspecting agency to inspect field welds and bolted connections and to perform field tests and inspections and prepare test and inspection reports.

B. Field welds will be visually inspected according to AWS D1.1/D1.1M.

C. In addition to visual inspection, field welds will be tested according to AWS D1.1/D1.1M and the following procedures, as applicable:
4. Liquid Penetrant Inspection: ASTM E 165.

D. Bolted connections will be visually inspected.

1. High-strength, field-bolted connections will be tested and verified according to procedures in RCSC's "Specification for Structural Joints Using ASTM A 325 or ASTM A 490 Bolts."

E. Correct deficiencies in Work that test and inspection reports have indicated are not in compliance with specified requirements.

F. Additional testing will be performed to determine compliance of corrected Work with specified requirements.

G. Test results and Inspection Reports shall be reported in writing to Architect, Contractor, and Authorities having jurisdiction within 48 hours of testing.

3.4 REPAIRS AND PROTECTION

A. Repair damaged galvanized coatings on galvanized items with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.

B. Touchup Painting: After installation, promptly clean, prepare, and prime or re-prime field connections, rust spots, and abraded surfaces of prime-painted joists, bearing plates, abutting structural steel, and accessories.

1. Clean and prepare surfaces by hand-tool cleaning, SSPC-SP 2, or power-tool cleaning, SSPC-SP 3.
2. Apply a compatible primer of same type as shop primer used on adjacent surfaces.

C. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and installer, to ensure joists and accessories are without damage or deterioration at time of Substantial Completion.

END OF SECTION
PART 1 - GENERAL

1.1 RELATED DOCUMENTS

   A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

   A. This Section includes the following:

      1. Roof deck.
      2. Composite floor deck.

   B. Related Sections include the following:

      1. Division 03 Section “Cast-in-Place Concrete” for concrete fill.
      2. Division 05 Section “Structural Steel Framing” for shop- and field-welded shear connectors and field installed puddle welds.
      3. Division 05 Section “Metal Fabrications” for framing deck openings with miscellaneous steel shapes.

1.3 DEFINITIONS

   A. Action Submittals: Mandatory submittals by the Sub-Contractor which require action on the part of the General Contractor, Construction Manager and Design Professional.

      2. Design Professional: Review, Stamp and Return to the General Contractor or Construction Manager.

   B. Informational Submittals: Mandatory submittals by the Sub-Contractor to the General Contractor, Construction Manager and Design Professional which are not returned but kept by each for their project record.

1.4 ACTION SUBMITTALS

   A. General: Submit each item in this Article according to the Conditions of the Contract and Division 01 Specification Sections.

   B. Shop Drawings: Show layout and types of deck panels, anchorage details, reinforcing channels, pans, cut deck openings, special jointing, accessories, and attachments to other construction.

1.5 INFORMATIONAL SUBMITTALS

   A. General: Submit each item in this Article according to the Conditions of the Contract and Division 01 Specification Sections.

   B. Product Data: For each type of deck, accessory, and product indicated.

   C. Product Certificates: For each type of steel deck, signed by product manufacturer.

   D. Welding certificates.
E. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, indicating that each of the following complies with requirements:

1. Power-actuated mechanical fasteners.

F. Research/Evaluation Reports: For steel deck.

1.6 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.3, "Structural Welding Code - Sheet Steel."

B. AISI Specifications: Comply with calculated structural characteristics of steel deck according to AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members."

1.7 DELIVERY, STORAGE, AND HANDLING

A. Protect steel deck from corrosion, deformation, and other damage during delivery, storage, and handling.

B. Delivery:

1. Steel roof deck units shall be delivered to the job site in manufacturer's original, unopened bundles, containers and/or packaging.
2. Steel roof deck bundle labels shall clearly indicate:
   a. Product description.
   b. Manufacturer.
   c. Bundle weight.
   d. Number of pieces.
   e. Length.
   f. Bundle number.
   g. SDI approved installation safety warnings.
3. Note on shipper's bill of lading any material damage or shortages, before signing for material and notify the deck supplier immediately.

C. Storage:

1. Store materials in accordance with manufacturer's instructions.
2. Protect materials from corrosion, deformation, and other damage.
3. Store deck bundles off ground, with one end elevated to provide drainage.
4. Protect bundles against condensation with ventilated waterproof covering.
5. Stack bundles to prevent tipping, sliding, rolling, shifting, or material damage.
6. Check bundles for tightness and retighten as necessary to prevent wind from loosening sheets or working bundles apart.
7. Place deck bundles near main supporting beam at column or wall on building frame.
8. Do not place bundles on unbolted frames or on unattached or un-bridged joists.
9. Ensure structural frame is properly braced to receive bundles.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Steel Deck:
2.2 MATERIALS

A. Steel: Comply with AISI and SDI's "Specifications" for deck design and fabrication.

2.3 ROOF DECK

A. Steel Roof Deck: Fabricate panels, without top-flange stiffening grooves, to comply with "SDI Specifications and Commentary for Steel Roof Deck," in SDI Publication No. 30, and with the following:

1. Galvanized Steel Sheet: ASTM A 63/A 653M, Structural Steel (SS), Grade 40, G60 zinc coating.
2. Deck Profile: Type WR, wide rib.
3. Profile Depth: 1-1/2 inches.
4. Design Uncoated-Steel Thickness: As indicated.
5. Span Condition: Triple span or more.
6. Side Laps: Overlapped or interlocking seam at Contractor's option.

2.4 COMPOSITE FLOOR DECK

A. Composite Steel Floor Deck: Fabricate panels, with integrally embossed or raised pattern ribs and interlocking side laps, to comply with "SDI Specifications and Commentary for Composite Steel Floor Deck," in SDI Publication No. 30, with the minimum section properties indicated, and with the following:

1. Galvanized Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 50, G60 zinc coating.
2. Profile Depth: 2 inches and 3 inches.
3. Design Uncoated-Steel Thickness: As indicated.
4. Span Condition: Triple span or more.

2.5 NON-COMPOSITE FORM DECK

A. Non-composite Steel Form Deck: Fabricate ribbed-steel sheet non-composite form-deck panels to comply with "SDI Specifications and Commentary for Non-composite Steel Form Deck," in SDI Publication No. 30, with the minimum section properties indicated, and with the following:

1. Galvanized Steel Sheet: ASTM A 653/A 653M, Structural Steel (SS), Grade 50, G60 zinc coating.
2. Profile Depth: 2 inches and 3 inches.
3. Design Uncoated-Steel Thickness: As indicated.
4. Span Condition:
   a. Typically: Triple span or more.
   b. At Entrance Slabs: Single span unless noted otherwise.
5. Side Laps: Overlapped or interlocking seam at Contractor's option.

2.6 ACCESSORIES

A. General: Provide manufacturer's standard accessory materials for deck that comply with requirements indicated.

B. Mechanical Fasteners: Corrosion-resistant, low-velocity, power-actuated or pneumatically driven carbon-steel fasteners; or self-drilling, self-threading screws.

C. Side-Lap Fasteners: Corrosion-resistant, hexagonal washer head; self-drilling, carbon-steel screws, No. 10 minimum diameter.

D. Flexible Closure Strips: Vulcanized, closed-cell, synthetic rubber.

E. Miscellaneous Sheet Metal Deck Accessories: Steel sheet, minimum yield strength of 33,000 psi, not less than 0.0359-inch design uncoated thickness, of same material and finish as deck; of profile indicated or required for application.

F. Pour Stops and Girder Fillers: Steel sheet, minimum yield strength of 33,000 psi, of same material and finish as deck, and of thickness and profile recommended by SDI Publication No. 30 for overhang and slab depth.

G. Column Closures, End Closures, Z-Closures, and Cover Plates: Steel sheet, of same material, finish, and thickness as deck, unless otherwise indicated.

H. Flat Sump Plate: Single-piece steel sheet, 0.0747 inch thick, of same material and finish as deck. For drains, cut holes in the field.

I. Galvanizing Repair Paint: ASTM A 780 or SSPC-Paint 20 or DOD-P-21035, with dry film containing a minimum of 94 percent zinc dust by weight.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine supporting frame and field conditions for compliance with requirements for installation tolerances and other conditions affecting performance.

3.2 INSTALLATION, GENERAL

A. Install deck panels and accessories according to applicable specifications and commentary in SDI Publication No. 30, manufacturer's written instructions, and requirements in this Section.

B. Install temporary shoring before placing deck panels, if required to meet deflection limitations.

C. Locate deck bundles to prevent overloading of supporting members.

D. Place deck panels on supporting frame and adjust to final position with ends accurately aligned and bearing on supporting frame before being permanently fastened. Do not stretch or contract side-lap interlocks.

E. Place deck panels flat and square and fasten to supporting frame without warp or deflection.

F. Cut and neatly fit deck panels and accessories around openings and other work projecting through or adjacent to deck.

G. Provide additional reinforcement and closure pieces at openings as required for strength, continuity of deck, and support of other work.

H. Comply with AWS requirements and procedures for manual shielded metal arc welding, appearance and quality of welds, and methods used for correcting welding work.
1. Use correct welding heat as required to avoid burning completely through deck and support beams or joists. Welds installed in this fashion will be rejected and repaired, including reinforcement of supporting beams or joists, at the Contractor’s expense.

I. Mechanical fasteners may be used in lieu of welding to fasten deck. Locate mechanical fasteners and install according to deck manufacturer's written instructions in order to meet or exceed diaphragm strength obtained by specified welding pattern. Submit proposed mechanical fastening pattern to the Engineer for review prior to deck installation.

3.3 ROOF-DECK INSTALLATION

A. Fasten roof-deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated or arc seam welds with an equal perimeter that is not less than 1-1/2 inches long, and as follows:

2. Weld Spacing: Weld edge and interior ribs of deck units with a minimum of two welds per deck unit at each support. Space welds as indicated, but not less than 12 inches apart in the field of roof and 6 inches apart in roof corners and perimeter, based on roof-area definitions in FMG Loss Prevention Data Sheet 1-28.

B. Side-Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals as indicated, but not exceeding the lesser of 1/3 of the span and as follows:

1. Mechanically fasten with self-drilling, No. 10 diameter or larger, carbon-steel screws.

C. End Bearing: Install deck ends over supporting frame with a minimum end bearing of 1-1/2 inches, with end joints as follows:

1. End Joints: Lapped 2 inches minimum.

D. Roof Sump Pans and Sump Plates: Install over openings provided in roof deck and weld flanges to top of deck. Space welds not more than 12 inches apart with at least one weld at each corner.

1. Install reinforcing channels or zees in ribs to span between supports and weld.

E. Miscellaneous Roof-Deck Accessories: Install ridge and valley plates, finish strips, end closures, and reinforcing channels according to deck manufacturer’s written instructions. Weld to substrate to provide a complete deck installation.

1. Weld cover plates at changes in direction of roof-deck panels, unless otherwise indicated.

3.4 FLOOR-DECK INSTALLATION

A. Fasten floor-deck panels to steel supporting members by arc spot (puddle) welds of the surface diameter indicated and as follows:

2. Weld Spacing: Weld edge ribs of panels at each support. Space additional welds an average of 12 inches apart, but not more than 18 inches apart.
3. Weld Spacing: Space and locate welds as indicated.
4. Provide powder actuated pins or nails to connect form to supporting foundation walls at entrance slabs.

B. Side-Lap and Perimeter Edge Fastening: Fasten side laps and perimeter edges of panels between supports, at intervals not exceeding the lesser of half of the span or 36 inches, and as follows:

1. Mechanically fasten with self-drilling, No. 10 diameter or larger, carbon-steel screws.
C. End Bearing: Install deck ends over supporting frame with a minimum end bearing of 2 inches, with end joints as follows:

1. End Joints: Lapped at non-composite deck.

2. End Joints: Butted at composite deck.

D. Pour Stops and Girder Fillers: Weld steel sheet pour stops and girder fillers to supporting structure according to SDI recommendations, unless otherwise indicated.

E. Floor-Deck Closures: Weld steel sheet column closures, cell closures, and Z-closures to deck, according to SDI recommendations, to provide tight-fitting closures at open ends of ribs and sides of deck.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Construction Manager/Owner will engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports.

B. Field welds will be subject to inspection.

1. Inspector is to note and reject all unsatisfactory puddle welds including those in which excessive welding heat has been used resulting in the deck and/or supporting beams or joists being burnt through.

2. Rejected welds must be repaired including reinforcement of supporting beams or joists, at the Contractor’s expense.

3. The final Inspection Report shall note compliance with the specified size, spacing and quality of all puddle welds.

C. Sidelap connections will be subject to inspection.

1. Inspector is to note and reject all sidelap spacing conditions which do not comply with the specified spacing.

2. Rejected sidelap locations shall be repaired by adding additional sidelap connectors.

3. The final Inspection Report shall note compliance with the specified spacing and quality of all sidelap connections.

D. Remove and replace work that does not comply with specified requirements.

E. Additional inspecting, at Contractor’s expense, will be performed to determine compliance of corrected work with specified requirements.

F. Test results and Inspection Reports shall be reported in writing to Architect, Contractor, and Authorities having jurisdiction within 48 hours of testing.

3.6 REPAIRS AND PROTECTION

A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on both surfaces of deck with galvanized repair paint according to ASTM A 780 and manufacturer’s written instructions.

B. Provide final protection and maintain conditions to ensure that steel deck is without damage or deterioration at time of Substantial Completion.

END OF SECTION
SECTION 054000
COLD-FORMED METAL FRAMING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Exterior structural and non-structural steel stud framing systems.
   2. Interior load-bearing framing systems.
   3. Cold-formed steel framing, including:
      a. Studs (STL STUD-1).
      b. Furring (STL FURG).
   4. Exterior wall and soffit sheathing (GYP SHTG-1).
   5. Engineering required to comply with specified performance requirements.
B. Related Sections:
   1. Section 092220 - Non-Structural Metal Framing: For interior non-load-bearing, metal-stud framing and ceiling-suspension assemblies.

1.2 ACTION SUBMITTALS
A. Product Data: For products not specifically listed in the specification, submit manufacturer’s technical datasheet indicating compliance with project requirements. For products listed in the specification, submit a list identifying products incorporated into the project. If multiple products of a given type are used, indicate portion of project for which each was used.
B. Shop Drawings: Submit in accordance with Section 013300.
   1. Shop drawings shall be signed and sealed by a qualified Professional Engineer.
   2. Show layout, spacings, sizes, thicknesses, and types of cold-formed metal framing; fabrication; and fastening and anchorage details, including mechanical fasteners. Show reinforcing channels, opening framing, supplemental framing, strapping, bracing, bridging, splices, accessories, connection details, and attachment to adjoining Work.
C. Delegated Design Submittal and Shop Drawings: Where professional design services or certifications by a qualified Professional Engineer are specifically required of the Contractor by the Contract Documents, submit shop drawings submittal package with the delegated design submittal requirements in accordance with Section 013300 - Submittal Procedures.
D. Calculations: Contractor shall submit calculations in accordance with Section 013300 – Submittal Procedures.

1.3 INFORMATIONAL SUBMITTALS
A. Product Test Reports: For each product used on Project,
   1. Mill certificates or data indicating steel sheet complies with requirements, including base-metal thickness, yield strength, tensile strength, total elongation, chemical requirements, and metallic-coating thickness.
   2. Testing to be performed by a qualified independent testing agency.
B. Research Reports: For non-standard cold-formed steel framing, from ICC-ES.
1.4 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed cold-formed metal framing similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

B. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1, "Structural Welding Code - Steel."
   2. AWS D1.3, "Structural Welding Code - Sheet Steel."

C. Inspection and Quality Control: Steel framing manufacturer shall provide qualified representative for periodic on-site review of fabrication and installation in accordance with manufacturer’s recommendations.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Protect cold-formed steel framing from corrosion, moisture staining, deformation, and other damage during delivery, storage, and handling.

PART 2 PRODUCTS

2.1 DESIGN CRITERIA AND PERFORMANCE REQUIREMENTS

A. Contractor shall engage a qualified Professional Engineer to provide delegated design services in accordance with Section 013300 – Submittal Procedures

B. Specifications and Standards: Unless more stringent requirements are indicated, comply with AISI S100 and AISI S200 Series.

C. Structural Performance: Design cold-formed metal framing and connections in accordance with applicable codes and standards, capable of withstanding project design loads, within limits and under conditions indicated, without excessive stress or deflection.
   1. Design Loads: Design and construct cold-formed metal framing, including anchorages, to withstand applied loads:
      b. Wind Loads: Provisions of ASCE 7-10 as shown on Construction Documents.
   2. Deflection Limits: Design framing systems to withstand design loads without deflections greater than the following:
      a. Lateral Deflection of Studs Under Design Loading:
         1) Masonry Veneer Backup: Deflection not over L/720 of their unsupported height.
         2) Metal Panel Veneer Backup: Deflection not over L/360 of their unsupported height.
      b. Vertical Deflection of Joists Under Design Loading:
         1) Floor Members: Live Load deflection not over L/480 or Total Load Deflection not over L/360 of their unsupported length.
         2) Ceiling Joist Framing: Vertical deflection of 1/480 of the span for live loads and 1/360 for total loads of the span.
      c. Suspended metal stud framing systems shall support system dead loads, live loads, and wind loads with adequate attachment to main structure without distortion to the anchorage assembly.
   3. Building Movement:
      a. Structural Support Movement: Design system to accommodate anticipated vertical interstory differential live load deflection of 3/4 inch minimum upward and downward, in addition to anticipated thermal movement.
b. Sidesway Movement: System to accommodate anticipated interstory differential drift of H/400 in any horizontal direction.

c. Thermal Movement: System to provide for expansion and contraction within system components caused by cycling temperature change without causing detrimental effects to system or components.
   1) Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

4. Connections: Design connections to structure to support own weight and to withstand design loads without damage, deflection, overstressing, failure or other detrimental effects on connections or assembly components.
   a. Be responsible for design loads tributary to lateral and vertical connections to structural frame in accordance with the work of registered Structural Engineer.

5. Studs and track receiving anchors for other system components such as window and/or louver attachments shall be of adequate strength and gauge to support the loads of these attachments including prying, pullout, and twisting forces caused by eccentric loading conditions.

6. Bridging: all studs and joists shall have bridging line installed at a maximum of 4'-0" and 5'-0" o.c., respectively.

D. Fire-Test-Response Characteristics: Where metal framing is part of a fire-resistance-rated assembly, provide framing identical to that of assemblies tested for fire resistance per ASTM E 119 by a testing and inspecting agency acceptable to authorities having jurisdiction.

2.2 COLD-FORMED STEEL FRAMING

A. Steel Sheet for Framing Components: ASTM A 1003, Structural Grade, Type H; with G90 protective zinc coating, and as follows:
   1. Grade: ST33H, unless indicated otherwise.

B. (STL STUD-1) Structural Steel Studs: ASTM C 955, C-shaped stud, punched, with stiffened flanges.
   1. Minimum Base-Metal Thickness: 0.0538 inch.
   2. Web Depth: As indicated, and not less than 6 inches.
   3. Flange Width: As indicated, and not less than 1-5/8 inches.

C. (STL STUD-2) Steel Studs for Interior Load-Bearing Wall: ASTM C 955, C-shaped stud, punched, with stiffened flanges.
   1. Minimum Base-Metal Thickness: 0.0538 inch.
   2. Web Depth and Flange Width: As indicated on Structural Drawings.

D. (STL JOIST-1) Structural Steel Stud Joist: ASTM C 955, C-shaped stud, punched, with stiffened flanges.
   1. Grade: ST50H.
   2. Minimum Base-Metal Thickness: 0.0538 inch.
   3. Web Depth: As indicated, and not less than 6 inches.
   4. Flange Width: As indicated, and not less than 1-5/8 inches.

   1. Minimum Base-Metal Thickness: 0.0428 inch.
   2. Depth: As shown.

   1. Minimum Base-Metal Thickness: 0.0329 inch.
   2. Depth: As shown.
G. Steel Track: ASTM C 955, U-shaped track, of web depths indicated, unpunched, with straight flanges, complying with , and as follows.
   1. Minimum Base-Metal Thickness: 0.0538 inch.
   2. Web Depth: As indicated, and not less than 6 inches.
   3. Flange Width: As indicated, and not less than 1-1/4 inches.

H. Single Deflection Track: Manufacturer's single, deep-leg, U-shaped steel track; unpunched, with unstiffened flanges, of web depth to contain studs while allowing free vertical movement, with flanges designed to support horizontal and lateral loads, and as follows.
   1. Minimum Uncoated-Steel Thickness: 0.0566 inch, unless otherwise indicated or necessary for engineering.
   2. Flange Width: Minimum of 2 inches vertical deflection of 1/2 inch. Provide greater width for greater deflections or use double deflection track. Studs and track receiving anchors for other system components such as window and louver attachments shall be of adequate strength and gauge to support the loads of these attachments including prying, pullout, and twisting forces caused by eccentric loading conditions.

I. Framing Accessories: Fabricate steel-framing accessories from steel sheet, ASTM A 1003, Structural Grade, Type H, metallic coated, of same grade and coating weight used for framing members. Provide accessories of manufacturer's standard thickness and configuration, unless otherwise indicated, as follows:
   1. Supplementary framing.
   2. Bracing, bridging, and solid blocking.
   3. Web stiffeners.
   4. Anchor clips.
   5. End clips.
   6. Foundation clips.
   7. Gusset plates.
   8. Stud kickers, knee braces, and girts.
   9. Joist hangers and end closures.
  12. Backer strap at termination bar.

2.3 ANCHORS, CLIPS, AND FASTENERS

A. Steel Shapes and Clips: ASTM A36, zinc coated by hot-dip process according to ASTM A123.

B. Anchor Bolts: ASTM F1554, Grade 36, threaded carbon-steel hex-headed, headless, hooked, bolts and carbon-steel nuts; and flat, hardened-steel washers; zinc coated by hot-dip process according to ASTM A153, Class C.

C. Expansion Anchors: Fabricated from corrosion-resistant materials, with capability to resist applied loads as determined in accordance with ACI 318 Appendix D. Expansion anchors shall have a ICC-ES report indicating compliance with the governing code.

D. Power-Actuated Anchors: Fastener system of type suitable for application indicated, fabricated from corrosion-resistant materials, with allowable load capacities calculated according to ICC-ES AC70, greater than or equal to the design load, as determined by testing per ASTM E 1190 conducted by a qualified testing agency.

E. Mechanical Fasteners: Corrosion-resistant-coated, self-drilling, self-threading steel drill screws.
   1. Head Type: Low-profile head beneath sheathing, manufacturer's standard elsewhere.

F. Welding Electrodes: Comply with AWS standards.
2.4 MISCELLANEOUS MATERIALS

A. Galvanizing Repair Paint: ASTM A780.

B. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, and plasticizing and water-reducing agents, complying with ASTM C1107, with fluid consistency and 30-minute working time.

C. Sealer Gaskets: Closed-cell neoprene foam, 1/4 inch thick, selected from manufacturer’s standard widths to match width of bottom track or rim track members.

2.5 SHEATHING AND ACCESSORIES

A. (GYP SHTG-2) Glass-Mat-Faced Sheathing: ASTM C1177, Type X, 5/8 inch thick, high-moisture resistant board with water-resistant silicone or wax treated gypsum core and fiberglass reinforced faces manufactured in accordance with ASTM C1177 specially designed for exterior substrate.

1. Manufacturers and Products:
   c. USG: Securock Glass-Mat Sheathing.
   e. Temple-Inland.

B. Silicone Emulsion Sealant for Glass-Mat Gypsum Sheathing: Product complying with ASTM C834, compatible with sheathing tape and gypsum sheathing, recommended by sheathing and tape manufacturers for use with glass-fiber sheathing tape and for covering exposed fasteners.

1. Product: Subject to compliance with requirements, provide "Elmer's Siliconized Acrylic Latex Caulk" by Borden, Inc.

C. Glass-Fiber Sheathing Tape for Glass-Mat Gypsum Sheathing: Self-adhering glass-fiber tape, minimum 2 inches wide, 10 by 10 or 10 by 20 threads per inch, of type recommended by sheathing and tape manufacturers for use with silicone emulsion sealant in sealing joints in glass-mat gypsum sheathing board and with a history of successful in-service use.

1. Products: Subject to compliance with requirements, provide one of the following:
   a. Perma-Tite Tape--PGM 207A; PermaGlas-Mesh, Inc.
   b. Quik-Tape; Quik-Tape, Inc.

D. Screws for Fastening Gypsum Sheathing to Cold-Formed Metal Framing: Steel drill screws, in length recommended by sheathing manufacturer for thickness of sheathing to be attached, with organic-polymer or other corrosion-protective coating having a salt-spray resistance of more than 800 hours according to ASTM B 117.

1. For steel framing from 0.033 to 0.112 inch thick, use screws that comply with ASTM C 954.

2.6 FABRICATION

A. Fabricate cold-formed steel framing and accessories plumb, square, and true to line, and with connections securely fastened, according to referenced AISI's specifications and standards, manufacturer's written instructions, and requirements in this Section.

1. Fabricate framing assemblies using jigs or templates.
2. Cut framing members by sawing or shearing; do not torch cut.
3. Fasten cold-formed steel framing members by welding, screw fastening, clinch fastening, pneumatic pin fastening, or riveting as standard with fabricator. Wire tying of framing members is not permitted.
   a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
   b. Locate mechanical fasteners and install according to Shop Drawings, with screw penetrating joined members by no fewer than three exposed screw threads.
4. Fasten other materials to cold-formed steel framing by welding, bolting, pneumatic pin fastening, or screw fastening, according to Shop Drawings.

B. Reinforce, stiffen, and brace framing assemblies to withstand handling, delivery, and erection stresses. Lift fabricated assemblies to prevent damage or permanent distortion.

C. Fabrication Tolerances: Fabricate assemblies level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:
   1. Spacing: Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.
   2. Squareness: Fabricate each cold-formed metal framing assembly to a maximum out-of-square tolerance of 1/8 inch.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine supporting substrates and abutting structural framing for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION
   A. Grout bearing surfaces uniform and level to ensure full contact of bearing flanges or track webs on supporting concrete or masonry construction.

3.3 INSTALLATION, GENERAL
   A. Cold-formed metal framing may be shop- or field-fabricated for installation, or it may be field assembled.
   B. Install cold-formed steel framing according to ASTM C1007 and to manufacturer's written instructions unless more stringent requirements are indicated.
   C. Install shop- or field-fabricated, cold-formed framing and securely anchor to supporting structure.
   1. Bolt or weld wall panels at horizontal and vertical junctures to produce flush, even, true-to-line joints with maximum variation in plane and true position between fabricated panels not exceeding 1/16 inch.
   D. Install cold-formed steel framing and accessories plumb, square, and true to line, and with connections securely fastened.
   1. Cut framing members by sawing or shearing; do not torch cut.
   2. Fasten cold-formed steel framing members by welding, screw fastening, clinch fastening, or riveting. Wire tying of framing members is not permitted.
      a. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
b. Locate mechanical fasteners and install according to Shop Drawings, and complying with requirements for spacing, edge distances, and screw penetration.

E. Install framing members in one-piece lengths, unless splice connections are indicated for track or tension members.

F. Install temporary bracing and supports to secure framing and support loads comparable in intensity to those for which structure was designed. Maintain braces and supports in place, undisturbed, until entire integrated supporting structure has been completed and permanent connections to framing are secured.

G. Do not bridge building expansion and control joints with cold-formed metal framing. Independently frame both sides of joints.

H. Fasten hole reinforcing plate over web penetrations that exceed size of manufacturer’s standard punched openings.

I. Erection Tolerances: Install cold-formed metal framing level, plumb, and true to line to a maximum allowable tolerance variation of 1/8 inch in 10 feet and as follows:
   1. Space individual framing members no more than plus or minus 1/8 inch from plan location. Cumulative error shall not exceed minimum fastening requirements of sheathing or other finishing materials.

3.4 FRAMING INSTALLATION

A. Isolate non-load-bearing steel framing from building structure to prevent transfer of vertical loads while providing lateral support.
   1. Install single deep-leg deflection tracks and anchor to building structure.
   2. Install vertical deflection clips to structure and to studs, one per stud at each floor and roof level.
   3. Install continuous top and bottom tracks sized to match studs.
   4. Align tracks accurately and securely anchor at corners and ends, and at spacings as follows:
   5. Anchor Spacing: As shown on Shop Drawings.

B. Squarely seat studs against webs of top and bottom tracks. Fasten both flanges of studs to top and bottom tracks. Space studs as follows:
   1. Stud Spacing: As required to meeting loading requirements but not over 16 inches on center.

C. Set studs plumb, except as needed for diagonal bracing or required for nonplumb walls or warped surfaces and similar configurations.

D. Align studs vertically where wall-framing continuity is interrupted by floor framing. Where studs cannot be aligned, continuously reinforce track to transfer loads.

E. Anchor studs abutting structural columns or walls, including masonry walls, to supporting structure as indicated.

F. Install headers over wall openings wider than stud spacing. Locate headers above openings as indicated. Fabricate headers of compound shapes indicated or required to transfer load to supporting studs, complete with clip-angle connectors, web stiffeners, or gusset plates.
   1. Frame wall openings with not less than a double stud at each jamb of frame as indicated on Shop Drawings.
   2. Install runner tracks and jack studs above and below wall openings. Anchor tracks to jamb studs with clip angles or by welding, and space jack studs same as full-height wall studs.

G. Install supplementary framing, blocking, and bracing in stud framing indicated to support fixtures, equipment, services, casework, heavy trim, furnishings, and similar work requiring attachment to framing.
1. If type of supplementary support is not indicated, comply with stud manufacturer's written recommendations and industry standards in each case, considering weight or load resulting from item supported.

H. Install horizontal bridging in stud system, spaced apart at dimension indicated on Shop Drawings. Fasten at each stud intersection.
   1. Bridging: Cold-rolled steel channel, welded or mechanically fastened to webs of punched studs with a minimum of two screws into each flange of the clip angle.

I. Install steel sheet diagonal bracing straps to both stud flanges, terminate at and fasten to reinforced top and bottom tracks. Fasten clip-angle connectors to multiple studs at ends of bracing and anchor to structure.

J. Install miscellaneous framing and connections, including supplementary framing, web stiffeners, clip angles, continuous angles, anchors, and fasteners, to provide a complete and stable wall-framing system.

3.5 JOIST INSTALLATION

A. Install perimeter joist track sized to match joists. Align and securely anchor or fasten track to supporting structure at corners, ends, and spacings indicated on Shop Drawings.

B. Install joists bearing on supporting frame, level, straight, and plumb; adjust to final position, brace, and reinforce. Fasten joists to both flanges of joist track.
   1. Install joists over supporting frame with a minimum end bearing of 1-1/2 inches.
   2. Reinforce ends and bearing points of joists with web stiffeners, end clips, joist hangers, steel clip angles, or steel-stud sections as indicated on Shop Drawings.
   3. Joist Spacing: As shown.

C. Frame openings with built-up joist headers consisting of joist and joist track, or another combination of connected joists if indicated.

D. Install joist reinforcement at interior supports with single, short length of joist section located directly over interior support, with lapped joists of equal length to joist reinforcement, or as indicated.
   1. Install web stiffeners to transfer axial loads of walls above.

E. Install bridging at intervals indicated on Shop Drawings. Fasten bridging at each joist intersection as follows:
   1. Bridging: Joist-track solid blocking of width and thickness indicated, secured to joist webs.
   2. Bridging: Combination of flat, taut, steel sheet straps of width and thickness indicated and joist-track solid blocking of width and thickness indicated. Fasten flat straps to bottom flange of joists and secure solid blocking to joist webs.

F. Secure joists to load-bearing interior walls to prevent lateral movement of bottom flange.

G. Install miscellaneous joist framing and connections, including web stiffeners, closure pieces, clip angles, continuous angles, hold-down angles, anchors, and fasteners, to provide a complete and stable joist-framing assembly.

3.6 GYPSUM SHEATHING INSTALLATION

A. General: Install gypsum sheathing to comply with GA-253 and manufacturer's written instructions.
   1. Coordinate sheathing installation with flashing and joint sealant installation so these materials are installed in the sequence and manner that prevent exterior moisture from passing through completed exterior wall assembly.
   2. Do not bridge building expansion joints with sheathing; cut and space edges to match spacing of structural support elements.
3. Cut boards at penetrations, edges, and other obstructions of the work; fit tightly against abutting construction, except provide a 3/8 inch setback where non-load-bearing construction abuts structural elements.
4. Apply fasteners so screw heads bear tightly against face of sheathing boards but do not cut into facing.

B. Horizontal Installation: Install sheathing with V-grooved edge down and tongue edge up. Interlock tongue with groove to bring long edges in contact with edges of adjacent boards without forcing. Abut ends of boards over centers of studs, and stagger end joints of adjacent boards not less than one stud spacing. Attach boards at perimeter and within field of board to each steel stud.
   1. Space fasteners approximately 8 inches o.c. and set back a minimum of 3/8 inch from edges and ends of boards.

C. Vertical Installation: Install 48 inch wide gypsum sheathing boards vertically with vertical edges centered over flanges of steel studs. Abut ends and edges of each board with those of adjacent boards. Screw-attach boards at perimeter and within field of board to each steel stud at approximately 8 inches o.c. and set back a minimum of 3/8 inch from edges and ends of boards.

D. Seal or tape sheathing joints according to sheathing manufacturer's written instructions.
   1. Apply elastomeric sealant to joints and fasteners and trowel flat. Apply sufficient amount of sealant to completely cover joints and fasteners after troweling. Seal other penetrations and openings.
   2. Apply glass-fiber sheathing tape to glass-mat gypsum sheathing joints and apply and trowel silicone emulsion sealant to embed entire face of tape in sealant. Apply sealant to exposed fasteners with a trowel so fasteners are completely covered. Seal other penetrations and openings.

3.7 FIELD QUALITY CONTROL
A. Testing and Inspection: Owner will engage qualified special inspectors in accordance with Section 014533.
   1. Qualifications: The minimum category of special inspector required to perform services outlined below are noted by qualifications in parentheses. The definitions of the categories of special inspector are included in Section 014533.

B. Cold Formed Metal Framing Welds: Visually inspect 100% of welds for specified length, size and continuity in accordance with AWS D1.3 for metal less than 1/8 inch in thickness, for work designed as a structural element. (Technical I)

C. Testing agency shall conduct and interpret tests and state in each report whether test specimens comply with requirements, and specifically state any deviations therefrom.

D. Provide access for testing agency to places where cold formed metal framing work is being fabricated or produced so that inspection and testing can be accomplished.

E. Testing agency may inspect cold formed metal framing before shipment; however, Owner's Representative reserves right at any time before final acceptance, to reject material not complying with requirements.

F. Correct deficiencies in work which inspections and test reports have indicated to be not in compliance with requirements when directed in writing by Architect or Owner.

3.8 REPAIRS AND PROTECTION
A. Galvanizing Repairs: Prepare and repair damaged galvanized coatings on fabricated and installed cold-formed steel framing with galvanized repair paint according to ASTM A 780 and manufacturer's written instructions.
B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that cold-formed steel framing is without damage or deterioration at time of Substantial Completion.

END OF SECTION
SECTION 054300
METAL SUPPORT ASSEMBLIES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Slotted metal channel framing assemblies (MSA).
   2. Support system engineering and fabrication.

1.2 ACTION SUBMITTALS
A. Product Data: For each system and component.
B. Shop Drawings:
   1. Indicate plan layout, sections, typical elevations, anchoring methods.
C. Delegated Design Submittal and Shop Drawings: Where professional design services or
certifications by a qualified Professional Engineer are specifically required of the Contractor by the
Contract Documents, submit shop drawings submittal package with the delegated design submittal
requirements in accordance with Section 013300 - Submittal Procedures.

1.3 INFORMATIONAL SUBMITTALS
A. Calculations: Upon request from the Architect/Engineer only, Contractor shall submit calculations in
accordance with Section 013300 - Submittal Procedures.

1.4 QUALITY ASSURANCE
A. Manufacturer's Qualifications: Not less than 10 years' experience in the actual production of
specified products. Upon request, manufacturer shall submit proof of continuing quality assurance
program and shall demonstrate experience with projects of similar size and scope.
B. Manufacturer Quality Assurance Program: Upon request, manufacturer to submit mill test reports
for material furnished to assure that material meets specification criteria.
   1. Specifications for Design of Cold Formed Steel Structural Members: AISI.
   3. Welding: AWS

1.5 PROJECT CONDITIONS
A. Field Measurements: Installer shall take field measurements to assure that support system can be
installed without interference with structural framing, mechanical systems, plumbing, lighting, fire
suppression systems or other obstructions.
B. Coordination: Coordinate with architectural reflected ceiling plan and mechanical and electrical
Drawings. Area directly above support shall be free and clear of obstructions to ensure the support
system does not interfere with or dislocate other items. Coordinate with other contractors as
required.
PART 2 PRODUCTS

2.1 STRUCTURAL DESIGN REQUIREMENTS

A. Contractor shall engage a qualified Professional Engineer to provide delegated design services in accordance with Section 013300 - Submittal Procedures

B. Structural Performance:
   1. Design metal framing channels, connectors, and all accessories to support loads indicated in the Construction Documents.
   2. Design connectors to transfer loads from metal support assemblies to supporting members.

2.2 PRODUCTS AND MANUFACTURERS

A. Source Limitations: Provide complete support system, including framing members, hangers, fittings and hardware from single source from single manufacturer.

B. Products and Manufacturers: Provide Basis of Design or equivalent products as approved by Architect by one of the following manufacturers:
   1. Cooper B-Line, Inc., a Division of Eaton
   2. Flex-Strut.
   5. Hilti USA.
   7. Unistrut Corporation.
   8. Wesanco, Inc..

C. Metal Support Assemblies: Shop- or field-fabricated assemblies consisting of strut type cold-formed metal box channels, continuous slotted channel framing, bolted metal framing channels and all associated fittings and hardware; in compliance with performance and material requirements of MFMA-4.

D. (MSA-1) Slotted Channel Framing: Cold-formed 12 ga. galvanized steel, ASTM A 653, structural steel, Grade 33, with G90 coating and finish coating.

E. (MSA-2 – Unistrut Grid) Back-To-Back Solid Channel Framing: Cold-formed 12 ga. galvanized steel, ASTM A 653, structural steel, Grade 33, with G90 coating and finish coating.
   3. Color: Black

F. (MSA-3) Slotted Channel Framing: Cold-formed 12 ga. galvanized steel, ASTM A 653, structural steel, Grade 33, with G90 coating and finish coating.

G. (MSA-4) Slotted Channel Framing: Cold-formed 12 ga. galvanized steel, ASTM A 653, structural steel, Grade 33, with G90 coating and finish coating.
   3. Color: Black
H. Fittings: Formed or stamped steel nuts, bolts, washers and other devices designed to fit into channel slot and prevent slipping along channel.
   3. Bolt & Nut Material: Regular hexagon-head bolts, ASTM A307 Grade A; hex nuts ASTM A563; and where indicated, flat washers.
   4. Plain Washers: Round carbon steel, ASME B 18.22.1
   5. Lock Washers: Helical, spring type, carbon steel, ASME B 18.21.1
J. Finishes:
   1. Concealed Framing Members: Electro-Deposition Acrylic Coating, ASTM B117 or Pre-galvanized per ASTM A653 G90.
   2. Concealed Fittings: Hot-dipped galvanized per ASTM A123 or A153.
   3. Exposed Framing Members: [Electro-Deposition Acrylic Coating, ASTM B117] [Special powdercoating finish as selected by Architect, black color.]
   4. Exposed Fittings: Finish to match exposed framing members.

2.3 INSTALLATION ACCESSORIES

A. Embedded Slotted-Channel Inserts: Cold-formed, hot-dip galvanized-steel box channels (struts) complying with MFMA-4, 1-5/8 by 7/8 inches by length indicated with anchor straps or studs not less than 3 inches long at not more than 8 inches o.c. Provide with temporary filler and tee-head bolts, complete with washers and nuts, all zinc-plated to comply with ASTM B 633, Class Fe/Zn 5, as needed for fastening to inserts.
B. Power-Actuated Fasteners: Threaded-steel stud, for use in hardened portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
C. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated steel anchors, for use in hardened portland cement concrete; with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
D. Expansion Anchors: Anchor bolt and sleeve assembly (carbon-steel components zinc-plated to comply with ASTM B633) with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and equal to four times the load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by a qualified independent testing agency.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Examine areas and conditions under which Work is to be performed and identify conditions detrimental to proper or timely completion.
   1. Do not proceed until unsatisfactory conditions have been corrected.
B. Field Measurements: Take field measurements; report interferences with structural framing, mechanical systems, or other obstructions to Architect/Engineer and general contractor.

3.2 INSTALLATION

A. Install equipment support system and accessories in accordance with reviewed Shop Drawings and manufacturer's printed instructions.
B. Set system accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Tighten all connections to their recommended torque values.

C. Provide anchorage devices and fasteners for securing equipment support systems to in-place construction.
   1. Attach to structure by means of imbedded concrete inserts, through bolts or by direct attachment to structural framing.

3.3 INSTALLED WORK

A. Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.

B. Trim excess length of continuous-thread hanger and support rods to not less than 1-1/2 inches.

C. Protection: Protect installed work from damage and alteration for remainder of construction.

END OF SECTION
SECTION 05 50 00
METAL FABRICATION

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B.

1.2 SUMMARY

A. This Section includes the following:

1. Steel framing and supports for ceiling-hung toilet compartments.
2. Steel framing and supports for operable partitions.
3. Steel framing and supports for countertops.
4. Steel framing and supports for mechanical and electrical equipment.
5. Steel framing and supports for applications where framing and supports are not specified in other Sections.
7. Loose bearing and leveling plates.
8. Metal ladders.
9. Bar grating

B. Products furnished, but not installed, under this Section include the following:

1. Loose steel lintels.
2. Anchor bolts, steel pipe sleeves, and wedge-type inserts indicated to be cast into concrete or built into unit masonry.

C. Related Sections include the following:

1. Division 03 Section “Cast-in-Place Concrete” for installing anchor bolts, steel pipe sleeves, wedge-type inserts and other items indicated to be cast into concrete.
2. Division 04 Section “Unit Masonry” for installing loose lintels, anchor bolts, and other items indicated to be built into unit masonry.
3. Division 05 Section “Structural Steel Framing.”
4. Division 05 Section “Metal Stairs.”
5. Division 05 Section “Pipe and Tube Railings.”
6. Division 05 Section “Decorative Metal Railings.”

1.3 DEFINITIONS

A. Action Submittals: Mandatory submittals by the Sub-Contractor which require action on the part of the General Contractor, Construction Manager and Design Professional.

2. Design Professional: Review, Stamp and Return to the General Contractor or Construction Manager.

B. Informational Submittals: Mandatory submittals by the Sub-Contractor to the General Contractor, Construction Manager and Design Professional which are not returned but kept by each for their project record.
1.4 PERFORMANCE REQUIREMENTS

A. Structural Performance of Ladders: Provide ladders capable of withstanding the effects of loads and stresses within limits and under conditions specified in ANSI A14.3.

1.5 ACTION SUBMITTALS

A. General: Submit each item in this Article according to the Conditions of the Contract and Division 01 Specification Sections.

B. Shop Drawings: Show fabrication and installation details for metal fabrications.
   1. Include plans, elevations, sections, and details of metal fabrications and their connections. Show anchorage and accessory items.
   2. Provide templates for anchors and bolts specified for installation under other Sections.

1.6 INFORMATIONAL SUBMITTALS

A. General: Submit each item in this Article according to the Conditions of the Contract and Division 01 Specification Sections.

B. Product Data: For the following:
   1. Paint products.
   2. Grout.

C. Welding certificates.

1.7 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to the following:
   1. AWS D1.1, "Structural Welding Code--Steel."
   2. AWS D1.3, "Structural Welding Code--Sheet Steel."

1.8 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication and indicate measurements on Shop Drawings.
   1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating metal fabrications without field measurements. Coordinate wall and other contiguous construction to ensure that actual dimensions correspond to established dimensions.
   2. Provide allowance for trimming and fitting at site.

1.9 COORDINATION

A. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

B. Coordinate installation of steel weld plates and angles for casting into concrete that are specified in this Section but required for work of another Section. Deliver such items to Project site in time for installation.
PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:

1. Products: Subject to compliance with requirements, provide one of the products specified.
2. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 METALS, GENERAL

A. Metal Surfaces, General: Provide materials with smooth, flat surfaces, unless otherwise indicated. For metal fabrications exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

2.3 FERROUS METALS

A. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
B. Steel Tubing: ASTM A 500, cold-formed steel tubing.
C. Steel Pipe: ASTM A 53/A 53M, standard weight (Schedule 40), unless another weight is indicated or required by structural loads.
D. Slotted Channel Framing: Cold-formed metal channels with continuous slot complying with MFMA-3.
   1. Size of Channels: 1-5/8
   2. Depth of Channels: As required by field and framing conditions.
   4. Nominal thickness: As required by field and framing conditions.

2.4 FASTENERS

A. General: Unless otherwise indicated, provide Type 304 or 316 stainless-steel fasteners for exterior use and zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 5, at exterior walls. Provide stainless-steel fasteners for fastening aluminum. Select fasteners for type, grade, and class required.
B. Steel Bolts and Nuts: Regular hexagon-head bolts, ASTM A 307, Grade A; with hex nuts, ASTM A 563; and, where indicated, flat washers.
C. Anchor Bolts: ASTM F 1554, Grade 36.
   1. Provide hot-dip or mechanically deposited, zinc-coated anchor bolts where item being fastened is indicated to be galvanized.
D. Lag Bolts: ASME B18.2.1.
E. Wood Screws: Flat head, ASME B18.6.1.
H. Undercut or Adhesive Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

2.5 MISCELLANEOUS MATERIALS

A. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
B. Universal Shop Primer: Fast-curing, lead- and chromate-free, universal modified-alkyd primer complying with MPI#79.
   1. Use primer containing pigments that make it easily distinguishable from zinc-rich primer.
D. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.
E. Non-shrink, Nonmetallic Grout: Factory-packaged, non-staining, non-corrosive, non-gaseous grout complying with ASTM C 1107. Provide grout specifically recommended by manufacturer for interior and exterior applications.

2.6 FABRICATION, GENERAL

A. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.
B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch, unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.
D. Form exposed work true to line and level with accurate angles and surfaces and straight edges.
E. Weld corners and seams continuously to comply with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.
F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) screws or bolts, unless otherwise indicated. Locate joints where least conspicuous.
G. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.
H. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.
I. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
   1. Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 1/8 by 1-1/2 inches, with a minimum 6-inch embedment and 2-
METAL FABRICATION

2.7 MISCELLANEOUS FRAMING AND SUPPORTS

A. General: Provide steel framing and supports not specified in other Sections as needed to complete the Work.

B. Fabricate units from steel shapes, plates, and bars of welded construction, unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction retained by framing and supports. Cut, drill, and tap units to receive hardware, hangers, and similar items.

1. Fabricate units from slotted channel framing where indicated.
2. Furnish inserts if units are installed after concrete is placed.

C. Fabricate supports for ceiling-hung toilet compartments from continuous steel beams or channels of sizes indicated with attached bearing plates, anchors, and braces as indicated.

D. Fabricate supports for operable partitions from continuous steel beams of sizes indicated with attached bearing plates, anchors, and braces as indicated. Drill bottom flanges of beams to receive partition track hanger rods; locate holes where indicated on operable partition Shop Drawings.

E. Galvanize miscellaneous framing and supports where exposed to the elements such as the Building Exterior as well as interior locations which are humid or corrosive.

2.8 LOOSE STEEL LINTELS

A. Fabricate loose steel lintels from steel angles and shapes of size indicated for openings and recesses in masonry walls and partitions at locations indicated. Weld adjoining members together to form a single unit where indicated.

B. Size loose lintels to provide bearing length at each side of openings equal to 1/12 of clear span but not less than 8 inches, unless otherwise indicated.

C. Galvanize loose steel lintels located in exterior walls.

2.9 SHELF ANGLES

A. Fabricate shelf angles from steel angles of sizes indicated and for attachment to concrete framing. Provide horizontally slotted holes to receive 3/4-inch bolts, spaced not more than 6 inches from ends and 24 inches o.c., unless otherwise indicated.

1. Provide mitered and welded units at corners.
2. Provide open joints in shelf angles at expansion and control joints. Make open joint approximately 2 inches larger than expansion or control joint.

B. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete.

C. Galvanize shelf angles located in exterior walls.

D. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.

2.10 LOOSE BEARING AND LEVELING PLATES

A. Provide loose bearing and leveling plates for steel items bearing on masonry or concrete construction. Drill plates to receive anchor bolts and for grouting.

B. Galvanize plates after fabrication
2.11 METAL LADDERS

A. General:
1. Comply with ANSI A14.3, unless otherwise indicated.
2. For elevator pit ladders, comply with ASME A17.1.
3. Space siderails 18 inches apart, unless otherwise indicated.
4. Support each ladder at top and bottom and not more than 60 inches o.c. with welded or bolted brackets, made from same metal as ladder.

B. Steel Ladders:
1. Siderails: Continuous, 1/2-by-2-1/2-inch steel flat bars, with eased edges.
2. Rungs: 3/4-inch diameter steel bars.
3. Fit rungs in centerline of siderails; plug-weld and grind smooth on outer rail faces.
4. Provide non-slip surfaces on top of each rung, either by coating rung with aluminum-oxide granules set in epoxy-resin adhesive or by using a type of manufactured rung filled with aluminum-oxide grout.
5. Galvanize exterior ladders and interior ladders, where indicated, including brackets and fasteners.

2.12 FINISHES, GENERAL

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Finish metal fabrications after assembly.

2.13 STEEL AND IRON FINISHES

A. Galvanizing: Hot-dip galvanize items as indicated to comply with applicable standard listed below:
1. ASTM A 123/A 123M, for galvanizing steel and iron products.
2. ASTM A 153/A 153M, for galvanizing steel and iron hardware.

B. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface preparation specifications and environmental exposure conditions of installed metal fabrications:
1. Exteriors (SSPC Zone 1B): SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
2. Interiors (SSPC Zone 1A): SSPC-SP 3, "Power Tool Cleaning."

C. Shop Priming: Apply shop primer to uncoated surfaces of metal fabrications, except those with galvanized finishes and those to be embedded in concrete, sprayed-on fireproofing, or masonry, unless otherwise indicated. Comply with SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.
1. Stripe paint corners, crevices, bolts, welds, and sharp edges.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal fabrications. Set metal fabrications accurately in location, alignment, and elevation; with edges and surfaces level, plumb, true, and free of rack; and measured from established lines and levels.

B. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do
not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

C. Field Welding: Comply with the following requirements:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

D. Fastening to In-Place Construction: Provide anchorage devices and fasteners where metal fabrications are required to be fastened to in-place construction. Provide threaded fasteners for use with concrete and masonry inserts, toggle bolts, through bolts, lag bolts, wood screws, and other connectors.

E. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

F. Corrosion Protection: Coat concealed surfaces of aluminum that will come into contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

3.2 INSTALLING MISCELLANEOUS FRAMING AND SUPPORTS

A. General: Install framing and supports to comply with requirements of items being supported, including manufacturers' written instructions and requirements indicated on Shop Drawings.

B. Anchor supports for operable partitions securely to and rigidly brace from building structure.

C. Support steel girders on solid grouted masonry, concrete, or steel pipe columns. Secure girders with anchor bolts embedded in grouted masonry or concrete or with bolts through top plates of pipe columns.
   1. Where grout space under bearing plates is indicated for girders supported on concrete or masonry, install as specified in "Installing Bearing and Leveling Plates" Article.

D. Install pipe columns on concrete footings with grouted baseplates. Position and grout column baseplates as specified in "Installing Bearing and Leveling Plates" Article.
   1. Grout baseplates of columns supporting steel girders after girders are installed and leveled.

3.3 INSTALLING BEARING AND LEVELING PLATES

B. Set bearing and leveling plates on wedges, shims, or leveling nuts. After bearing members have been positioned and plumbed, tighten anchor bolts. Do not remove wedges or shims but, if protruding, cut off flush with edge of bearing plate before packing with grout.
   1. Use non-shrink grout, either metallic or nonmetallic, in concealed locations where not exposed to moisture; use non-shrink, nonmetallic grout in exposed locations, unless otherwise indicated.
   2. Pack grout solidly between bearing surfaces and plates to ensure that no voids remain.

3.4 ADJUSTING AND CLEANING

A. Touchup Painting: Immediately after erection, clean field welds, bolted connections, and abraded areas. Paint uncoated and abraded areas with the same material as used for shop painting to
comply with SSPC-PA 1 for touching up shop-painted surfaces.

1. Apply by brush or spray to provide a minimum 2.0-mil dry film thickness.

B. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.
SECTION 055005
METAL FABRICATIONS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Miscellaneous metal, except structural steel framing as specified in Section 051200 and defined as structural steel in AISC "Code of Standard Practice":
      a. Steel framing and supports for ceiling-hung toilet compartments, partitions, overhead doors and grilles, countertops, mechanical and electrical equipment, and other applications where framing and supports are not specified in other Sections.
      b. Miscellaneous steel trim including steel angle corner guards, steel edgings, loading-dock edge angles, and support for elevator door sills.
      c. Loose bearing and leveling plates for applications where they are not specified in other Sections.
   2. Metal Fabrications:
      a. Ships’ ladder (MET FAB-1).
      b. Straight Ladders (MET FAB-2) and (MET FAB-3).
      c. Bollards (MET FAB-5).
      d. Catwalk (MET FAB-14).
      e. Lighting Support Rails (MET FAB-15).
      f. Shelf Angles.
   4. Surface preparation and priming for finishes on ferrous metal, performed in shop.
   5. Engineering required to comply with specified performance requirements.

1.2 ACTION SUBMITTALS
A. Shop Drawings: Indicate dimensions, description of materials and finishes; include plans, elevations, sections, and details of metal stairs and ladders and their connections and reactions to building structure. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections, and installation procedures, including specific requirements indicated.
   1. Construction details, sizes of metal sections, thickness of metals, profiles, attachments, dimensions and field joints, method of support from structure, and finishes.
   2. Work to be built-in or provided by other Sections.
B. Delegated Design Submittal and Shop Drawings: Where professional design services or certifications by a qualified Professional Engineer are specifically required of the Contractor by the Contract Documents, submit shop drawings submittal package with the delegated design submittal requirements in accordance with Section 013300 - Submittal Procedures.
C. Calculations: Upon request from the Architect/Engineer only, Contractor shall submit calculations in accordance with Section 013300 - Submittal Procedures.
1.3 INFORMATIONAL SUBMITTALS

A. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.4 QUALITY ASSURANCE

A. Fabricator Qualifications: Firm experienced in producing metal stairs similar to those indicated for this Project and with record of successful in-service performance, as well as sufficient production capacity to produce required units.
B. Installer Qualifications: Arrange for metal stairs specified in this Section to be fabricated and installed by same firm.
D. Mockup: Prior to commencing fabrication of final work, build mockup of (MET FAB-25) to demonstrate constructability and execution of fabrication.

1.5 HANDLING AND STORAGE

A. Load, unload, handle and store work in manner that will not bend, deform or otherwise damage metal. Store so metal and shop coats will not be subject to weather or moisture, store off ground and provide covering for metal in storage.

1.6 COORDINATION

A. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, temples, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 PRODUCTS

2.1 STRUCTURAL PERFORMANCE REQUIREMENTS

A. Contractor shall engage a qualified Professional Engineer to provide delegated design services in accordance with Section 013300 - Submittal Procedures
B. Structural Performance of Ships’ Ladders: Provide metal stairs and ship’s ladders capable of withstanding following structural loads without exceeding allowable design working stress of materials involved, including anchors and connections. Apply each load to produce maximum stress in each component of metal stairs.
   1. Treads and Platforms of Metal Stairs: Capable of withstanding uniform live load of 100 lb/sq ft or concentrated load of 300 lbs. on area of 4 sq. in., whichever produces greater stress.
   2. Stair Framing: Capable of withstanding stresses resulting from loads specified above in addition to stresses resulting from railing system loads.
   3. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less.
C. Structural Performance of Straight Ladders: Provide side rails and rungs capable of withstanding following structural loads without exceeding the allowable working stress of materials and connections.
1. Single concentrated live load of 250 lbf applied at point that will cause the maximum stress in the member being considered.
2. Distributed live load of 30 lbf per foot applied along the height of the ladder.

D. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

2.2 MATERIALS AND ACCESSORIES

A. Materials, General:
   1. Metal Surfaces: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.

B. Steel:
   1. Steel Pickets, Plates, Shapes and Bars: ASTM A36; square corners and edges.
   2. Bars: Hot-rolled, carbon steel complying with ASTM A 29, Grade 1010; square corners and edges.
   3. Steel Tubing: ASTM A500 or ASTM A 513; square corners and edges.
   4. Steel Pipe: ASTM A53, Type S, Grade A, standard weight and extra-strong as required, galvanized and plain.
   5. Galvanized Sheet Metal: ASTM A526 or A527, G-90 coating designation with both sides of metal prime painted.

C. Welding Materials: Applicable AWS D1.1, type required for materials being welded.

D. Fasteners: Provide zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 25 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required
   1. Bolts, Nuts and Washers: High strength steel hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.
   2. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, load equal to 6 times load imposed when installed in unit masonry and equal to 4 times load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by qualified independent testing agency.
   3. Cast-in-Place Anchors in Concrete: Either threaded type or wedge type unless otherwise indicated; galvanized ferrous castings, either ASTM A 47 malleable iron or ASTM A 27 cast steel. Provide bolts, washers, and shims as needed, all hot-dip galvanized per ASTM F 2329

E. Concrete Materials and Properties: Comply with requirements in Section 033000 - Cast-in-Place Concrete.

2.3 METAL FABRICATIONS AND ASSEMBLIES

A. (MET FAB-1) Ships Ladders: Fabricate steel ships ladders of open-type construction with channel or plate stringers, pipe and tube railings, and bar grating treads, unless otherwise indicated. Provide brackets and fittings for installation.
   1. Comply with ANSI A14.3, unless otherwise indicated.
   2. Angle of Inclination: 60 degree angle from floor.
   3. Treads 24 inches long and approximately 6 inches wide.
   4. Handrails: 1-1/2 inch diameter pipe or tube.
   5. Finish: Shop-applied primer.
B. (MET FAB-2) Interior Steel Ladder:
   1. Comply with ANSI A14.3, unless otherwise indicated.
   2. Height as indicated on Drawings.
   3. Siderails: Continuous, 3/8 by 2-1/2 inch steel flat bars, with eased edges. Space siderails 16 inches apart, unless otherwise indicated.
   4. Rungs: 3/4 inch diameter steel bars at 12 inches on center.
   5. Fit rungs in centerline of siderails; plug-weld and grind smooth on outer rail faces.
   6. Provide nonslip surfaces on top of each rung, either by coating rung with aluminum-oxide granules set in epoxy-resin adhesive or by using a type of manufactured rung filled with aluminum-oxide grout.
   7. Support each ladder at top and bottom, and not more than 60 inches o.c. with welded or bolted steel brackets.

C. (MET FAB-3) Exterior Steel Roof Ladder:
   1. Comply with ANSI A14.3, unless otherwise indicated.
   2. Height and profile as indicated on the Drawings.
   3. Siderails: Continuous, 3/8 by 2-1/2 inch steel flat bars, with eased edges, and curved over the top to provide support. Space siderails 16 inches apart, unless otherwise indicated.
   4. Rungs: 3/4 inch diameter steel bars at 12 inches (305 mm) on center.
   5. Fit rungs in centerline of siderails; plug-weld and grind smooth on outer rail faces.
   6. Provide nonslip surfaces on top of each rung, either by coating rung with aluminum-oxide granules set in epoxy-resin adhesive or by using a type of manufactured rung filled with aluminum-oxide grout.
   7. Support each ladder at top and bottom, and not more than 60 inches o.c. with welded or bolted steel brackets.
   8. Galvanize exterior roof ladders, including brackets and fasteners.
   10. Ladder Safety Cages: Provide safety cages for ladders over 20 feet, in accordance with OSHA requirements.
       a. Fabricate ladder safety cages to comply with ANSI A14.3. Assemble by welding or with stainless-steel fasteners.
       b. Provide primary hoops at tops and bottoms of cages and spaced not more than 20 feet o.c. Provide secondary intermediate hoops spaced not more than 48 inches o.c. between primary hoops.
       c. Fasten assembled safety cage to ladder rails and adjacent construction by welding or with stainless-steel fasteners, unless otherwise indicated.

D. (MET FAB-5) Bollards Imbedded in Concrete: Hot-dipped galvanized steel pipe, 6 inch dia., 7 feet long, concrete filled, crowned cap, prime paint finish only the exposed top 3'-6".
   1. Anchor bollards in place with concrete footings. Center and align bollards in holes 3 inches above bottom of excavation. Place concrete and vibrate or tamp for consolidation. Support and brace bollards in position until concrete has cured.
   2. Fill bollards solidly with concrete, mounding top surface to shed water.

E. (MET FAB-14) Catwalk Assemblies:
   1. Welded, Banded, Galvanized Steel Bar Grating: ASTM A 36 or steel strip, ASTM A 1011 or ASTM A 1018. Configuration as shown on structural drawings.
b. Traffic Surface: Plain.
2. Framing: Galvanized steel framing as shown on Structural Drawings.
3. Railings: Galvanized steel pipe or tube, welded construction and welded connection to platform framing, as specified in Section 055200 - Metal Railings. Configurations and dimensions as shown on Drawings.
4. Finish: Shop-prime for paint (PT-3). Coordinate with Section 099000 - Painting.

1. Finish: Shop-prime for paint (PT-3). Coordinate with Section 099000 - Painting.

G. Shelf Angles and Relief Angles: Fabricate shelf angles and relief angles from steel angles of sizes indicated and for attachment to steel and concrete framing. Provide horizontally slotted holes to receive 3/4-inch bolts, spaced not more than 6 inches from ends and 24 inches o.c., unless otherwise indicated.
1. Provide mitered and welded units at corners.
2. Provide open joints in shelf angles at expansion and control joints. Make open joint approximately 2 inches larger than expansion or control joint.
3. For cavity walls, provide vertical channel brackets to support angles from backup masonry and concrete.
4. Furnish wedge-type concrete inserts, complete with fasteners, to attach shelf angles to cast-in-place concrete.
5. Finishes:
   a. Exterior Walls, Concealed: Galvanized.
   b. Exterior Walls, Exposed: Galvanized, high-performance coating (HPC).
   c. Interior: Shop-applied primer and field-painted (PT).

2.4 FABRICATION, GENERAL
A. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Form exposed corners with accurate angles and surfaces and straight edges.

E. Weld corners and seams continuously to comply with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners or welds where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) fasteners unless otherwise indicated. Locate joints where least conspicuous.
G. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

H. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.

I. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
   1. Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 1/8 by 1-1/2 inches, with a minimum 6-inch embedment and 2-inch hook, not less than 8 inches from ends and corners of units and 24 inches o.c., unless otherwise indicated.

J. Miscellaneous Framing and Supports: Fabricate from steel shapes, plates, and bars of welded construction unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction.
   1. Fabricate units from slotted channel framing where indicated.
   2. Furnish inserts for units installed after concrete is placed.

2.5 FINISHING

A. Comply with NAAMM’S "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
   1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

B. Stainless Steel:
   1. Finish designations prefixed by AISI shall conform with the system established by the American Iron and Steel Institute for designating finishes for stainless steel sheet.
   2. Bright, Directional Polish: AISI No. 4 finish.

C. Galvanizing: Hot-dip galvanize items as indicated to comply with applicable standard listed below:
   1. Hot Dip Galvanizing for Shapes and Plates: ASTM A123, for galvanizing both fabricated and unfabricated iron and steel products made of uncoated rolled, pressed, and forged shapes, plates, bars, and strips 0.0299 inch thick and heavier.
   2. Hot Dip Galvanizing for Bolts and Similar Threaded Fasteners: ASTM A153, for galvanizing steel and iron hardware.
   3. Galvanizing Touch-Up Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.

D. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed products:
   1. Exterior (SSPC Zone 1B): SSPC SP 6/NACE No. 3, "Commercial Blast Cleaning."
   2. Interior (SSPC Zone 1A): SSPC SP 3, "Power Tool Cleaning."
   3. Do not apply primer to galvanized surfaces.

E. Shop-Applied Primer and Field-Applied High-Performance Coating (HPC): Coordinate with Section 099600 - High-Performance Coatings.

F. Shop-Applied Primer and Field-Applied Paint (PT) or Epoxy Paint (PTE): Coordinate with Section 099000 - Painting.
PART 3 EXECUTION

3.1 EXAMINATION
A. Examine areas and conditions under which miscellaneous metal items are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION
A. Provide setting drawings, diagrams, templates, instructions and directions for installation of anchorages, such as concrete inserts, anchor bolts, and miscellaneous items having integral anchors, which are to be embedded in concrete or masonry construction. Coordinate delivery of such items to project site.

B. Provide anchorage devices and fasteners where necessary for securing miscellaneous metal items to in-place construction; including threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws and other connectors as required.

C. Perform cutting, drilling and fitting required for installation of miscellaneous metal items. Set work accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items which are to be built into concrete, masonry or similar construction.

D. Fit exposed connections accurately together to form tight hairline joints. Weld connections which are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Grind joints smooth and touch up shop paint coat. Do not weld, cut or abrade surfaces of exterior units which have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.

E. Comply with AWS Code for procedures of manual shielded metal-arc welding, appearance and quality of welds made, and methods used in correcting welding work.

F. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting. Apply by brush or spray to provide minimum dry film thickness of 2 mils.

3.3 INSTALLATION OF METAL BAR GRATINGS
A. General: Install gratings to comply with recommendations of referenced metal bar grating standards that apply to grating types and bar sizes indicated, including installation clearances and standard anchoring details.

B. Attach removable units to supporting members with type and size of clips and fasteners indicated or, if not indicated, as recommended by grating manufacturer for type of installation conditions shown.

C. Attach nonremovable units to supporting members by welding where both materials are same; otherwise, fasten by bolting as indicated above.

END OF SECTION
SECTION 055100
METAL STAIRS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
1. Interior exit stair assemblies.
2. Engineering required to comply with specified performance requirements.

1.2 ACTION SUBMITTALS
A. Shop Drawings: Indicate dimensions, description of materials and finishes; include plans, elevations, sections, and details of metal stairs and ladders and their connections and reactions to building structure. Show anchorage and accessory items. Provide templates for anchors and bolts specified for installation under other Sections, and installation procedures, including specific requirements indicated.
1. Construction details, sizes of metal sections, thickness of metals, profiles, attachments, dimensions and field joints, method of support from structure, and finishes.
2. Work to be built-in or provided by other Sections.
4. Delegated Design Submittal and Shop Drawings: Where professional design services or certifications by a qualified Professional Engineer are specifically required of the Contractor by the Contract Documents, submit shop drawings submittal package with the delegated design submittal requirements in accordance with Section 013300 - Submittal Procedures.
B. Calculations: Contractor shall submit calculations in accordance with Section 013300 - Submittal Procedures.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For firms and persons specified in "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.4 QUALITY ASSURANCE
A. Fabricator Qualifications: Firm experienced in producing metal stairs similar to those indicated for this Project and with record of successful in-service performance, as well as sufficient production capacity to product required units.
B. Installer Qualifications: Arrange for metal stairs specified in this Section to be fabricated and installed by same firm.
1.5 COORDINATION

A. Coordinate installation of anchorages for metal fabrications. Furnish setting drawings, temples, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

PART 2 PRODUCTS

2.1 STRUCTURAL PERFORMANCE REQUIREMENTS

A. Contractor shall engage a qualified Professional Engineer to provide delegated design services in accordance with Section 013300 - Submittal Procedures

B. Structural Performance of Stairs: Provide metal stairs and ship’s ladders capable of withstanding following structural loads without exceeding allowable design working stress of materials involved, including anchors and connections. Apply each load to produce maximum stress in each component of metal stairs.
   1. Treads and Platforms of Metal Stairs: Capable of withstanding uniform live load of 100 lb/sq ft or concentrated load of 300 lbs. on area of 4 sq. in., whichever produces greater stress.
   2. Stair Framing: Capable of withstanding stresses resulting from loads specified above in addition to stresses resulting from railing system loads.
   3. Limit deflection of treads, platforms, and framing members to L/360 or 1/4 inch, whichever is less.

C. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

2.2 METAL STAIRS

A. Metal Stair Assemblies: Provide complete systems including stringers, framing, stair treads, platforms, decks, landings, connections and other components necessary for the support and installation of fabricated assemblies.
   1. NAAMM Stair Standard: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," Commercial Class, unless more stringent requirements are indicated.
   2. Stringers: Fabricate stringers of channels, as indicated. Provide closures for exposed ends of channel stringers.
      a. Weld stringers to headers; weld framing members to stringers and headers.
   3. Subplatforms: Construct platforms of steel plate or channel framing members as indicated on Drawings and as needed to comply with performance requirements.
   4. Steel pan treads, platforms and landings to be filled with concrete as indicated on Drawings.
   5. Fabrication of Stairs and Landings:
      a. Fabricate stairs with closed risers and treads of pan construction.
      b. Form treads and risers from sheet stock.
      c. Properly secure tread pans to stringers with clip angles welded in place.
      d. Form stringers of rolled steel channels as required to meet performance requirements. Weld fascia plates of minimum 14 gage thick sheet stock across channel toes, where applicable.
      e. Form landings of sheet stock. Reinforce underside of landings with angles, tees as required.
f. Fabricate stairs, landings and component connections to support live loads of minimum 100 lb./sq.ft. with deflection of stairs and landings not exceeding 1/360 of span when underside is to be finished with gypsum board and 1/240 of span when underside is not being finished.

2.3 METAL GRATING STAIRS

A. Metal Grating Stairs: Comply with "Recommended Voluntary Minimum Standards for Fixed Metal Stairs" in NAAMM AMP 510, "Metal Stairs Manual," Industrial Class, unless more stringent requirements are indicated. See Drawings for dimensions, configurations and details.

1. Finish: Shop-primed.
2. Stair Framing: Fabricate steel stringers as indicated on Drawings, with welded connections to headers.
3. Metal Bar-Grating Stairs: Form treads and platforms to configurations shown from metal bar grating; fabricate to comply with NAAMM MBG 531, "Metal Bar Grating Manual."
   a. Fabricate treads and platforms from welded steel grating.
   b. Finish: Galvanized.
   c. Fabricate grating platforms with nosing matching that on grating treads. Provide toeplates at open-sided edges of grating platforms. Weld grating to platform framing.

2.4 SPIRAL STAIRS

A. Center Column: Steel pipe welded to baseplate for anchorage to floor structure. Brace column at upper floors by means of landings attached to column and floor structure unless otherwise indicated. Provide cap for column if top is exposed.

1. Treads: Steel-bar grating or formed metal plate, as shown; welded to hubs or center column.
2. Railings: Uniformly bent to spiral shape.
   a. Hand Rail: Steel pipe.
   b. Top Rail: Steel pipe.
   c. Balusters: Steel pipe.
   d. Intermediate Rails: Steel pipe same size as top rail.

2.5 MATERIALS

A. Materials, General:

1. Metal Surfaces: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
2. Recycled Content of Ferrous Metals: Provide products with average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.

B. Steel:

1. Rolled-Steel Floor Plate: ASTM A 786 rolled from plate complying with ASTM A 36 or ASTM A 283, Grade C or D.
2. Sections, Plates, Sheet and Bars: Structural quality steel; ASTM A36 and ASTM A440 where high strength steel is required.
5. Steel Pipe: ASTM A53, Type S, Grade A, standard weight and extra-strong as required, galvanized and plain.
7. Galvanizing: ASTM A123, hot dip galvanizing, thickness Grade 55 unless otherwise indicated.

C. Welding Materials: Applicable AWS D1.1, type required for materials being welded.

D. Fasteners: Provide zinc-plated fasteners with coating complying with ASTM B 633, Class Fe/Zn 25 for exterior use, and Class Fe/Zn 5 where built into exterior walls. Select fasteners for type, grade, and class required

1. Bolts, Nuts and Washers: High strength steel hexagon-head bolts, ASTM A307, Grade A; with hex nuts, ASTM A563; and, where indicated, flat washers.

2. Expansion Anchors: Anchor bolt and sleeve assembly of material indicated below with capability to sustain, without failure, load equal to 6 times load imposed when installed in unit masonry and equal to 4 times load imposed when installed in concrete, as determined by testing per ASTM E488, conducted by qualified independent testing agency.

3. Cast-in-Place Anchors in Concrete: Either threaded type or wedge type unless otherwise indicated; galvanized ferrous castings, either ASTM A 47 malleable iron or ASTM A 27 cast steel. Provide bolts, washers, and shims as needed, all hot-dip galvanized per ASTM F 2329

E. Concrete Materials and Properties: Comply with requirements in Section 033000 - Cast-in-Place Concrete for normal-weight, ready-mixed concrete with minimum 28-day compressive strength of 3500 psi, unless higher strengths are indicated.

2.6 FABRICATION, GENERAL

A. Shop Assembly: Preassemble items in the shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation.

B. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

C. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

D. Form exposed work with accurate angles and surfaces and straight edges.

E. Weld corners and seams continuously to comply with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

F. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners or welds where possible. Where exposed fasteners are required, use Phillips flat-head (countersunk) fasteners unless otherwise indicated. Locate joints where least conspicuous.

G. Fabricate seams and other connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

H. Cut, reinforce, drill, and tap metal fabrications as indicated to receive finish hardware, screws, and similar items.

I. Provide for anchorage of type indicated; coordinate with supporting structure. Space anchoring devices to secure metal fabrications rigidly in place and to support indicated loads.
1. Where units are indicated to be cast into concrete or built into masonry, equip with integrally welded steel strap anchors, 1/8 by 1-1/2 inches, with a minimum 6-inch embedment and 2-inch hook, not less than 8 inches from ends and corners of units and 24 inches o.c., unless otherwise indicated.

J. Miscellaneous Framing and Supports: Fabricate from steel shapes, plates, and bars of welded construction unless otherwise indicated. Fabricate to sizes, shapes, and profiles indicated and as necessary to receive adjacent construction.
   1. Fabricate units from slotted channel framing where indicated.
   2. Furnish inserts for units installed after concrete is placed.

2.7 FINISHING

A. Comply with NAAMM'S "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
   1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

B. Stainless Steel:
   1. Finish designations prefixed by AISI shall conform with the system established by the American Iron and Steel Institute for designating finishes for stainless steel sheet.
   2. Bright, Directional Polish: AISI No. 4 finish.

C. Galvanizing: Hot-dip galvanize items as indicated to comply with applicable standard listed below:
   1. Hot Dip Galvanizing for Shapes and Plates: ASTM A123, for galvanizing both fabricated and unfabricated iron and steel products made of uncoated rolled, pressed, and forged shapes, plates, bars, and strips 0.0299 inch thick and heavier.
   2. Hot Dip Galvanizing for Bolts and Similar Threaded Fasteners: ASTM A153, for galvanizing steel and iron hardware.
   3. Galvanizing Touch-Up Paint: High-zinc-dust-content paint complying with SSPC-Paint 20 and compatible with paints specified to be used over it.
   4. At railings to be hot-dipped galvanized after fabrication: Fill vent and drain holes that will be exposed in finished Work, unless indicated to remain as weep holes, by plugging with zinc solder and filing off smooth.

D. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed products:
   1. Exterior (SSPC Zone 1B): SSPC SP 6/NACE No. 3, "Commercial Blast Cleaning."
   2. Interior (SSPC Zone 1A): SSPC SP 3, "Power Tool Cleaning."
   3. Do not apply primer to galvanized surfaces.

E. Shop-Applied Primer and Field-Applied Paint (PT) or Epoxy Paint (PTE): Coordinate with Section 099000 - Painting.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which miscellaneous metal items are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.
3.2 INSTALLATION

A. Provide setting drawings, diagrams, templates, instructions and directions for installation of anchorages, such as concrete inserts, anchor bolts, and miscellaneous items having integral anchors, which are to be embedded in concrete or masonry construction. Coordinate delivery of such items to project site.

B. Provide anchorage devices and fasteners where necessary for securing miscellaneous metal items to in-place construction; including threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws and other connectors as required.

C. Perform cutting, drilling and fitting required for installation of miscellaneous metal items. Set work accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items which are to be built into concrete, masonry or similar construction.

D. Fit exposed connections accurately together to form tight hairline joints. Weld connections which are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Grind joints smooth and touch up shop paint coat. Do not weld, cut or abrade surfaces of exterior units which have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.

E. Comply with AWS Code for procedures of manual shielded metal-arc welding, appearance and quality of welds made, and methods used in correcting welding work.

F. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting. Apply by brush or spray to provide minimum dry film thickness of 2 mils.

3.3 INSTALLING METAL PAN STAIRS

A. Fastening to In-Place Construction: Provide anchorage devices and fasteners where necessary for securing metal stairs to in-place construction. Include threaded fasteners for concrete and masonry inserts, through-bolts, lag bolts, and other connectors.

B. Cutting, Fitting, and Placement: Perform cutting, drilling, and fitting required for installing metal stairs. Set units accurately in location, alignment, and elevation, measured from established lines and levels and free of rack.

C. Install metal stairs by welding stair framing to steel structure or to weld plates cast into concrete unless otherwise indicated.

D. Provide temporary bracing or anchors in formwork for items that are to be built into concrete, masonry, or similar construction.

E. Fit exposed connections accurately together to form hairline joints. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations. Do not weld, cut, or abrade surfaces of exterior units that have been hot-dip galvanized after fabrication and are for bolted or screwed field connections.

F. Field Welding: Comply with requirements for welding in "Fabrication, General" Article.

G. Place and finish concrete fill for treads and platforms to comply with Section 033000 "Cast-in-Place Concrete."
   1. Install abrasive nosings with anchors fully embedded in concrete. Center nosings on tread width.
H. Install precast concrete treads with adhesive supplied by manufacturer.

END OF SECTION
SECTION 055200  
METAL RAILINGS

PART 1 GENERAL

1.1 SUMMARY
   A. Section Includes: Guard rails and handrails for exit stair assemblies (MET RAIL).

1.2 COORDINATION
   A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers' written recommendations to ensure that shop primers and topcoats are compatible with one another.
   B. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
   C. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not satisfy structural performance requirements.

1.3 ACTION SUBMITTALS
   A. Product Data: For the following:
      1. Manufacturer's product lines of mechanically connected railings.
      2. Railing brackets.
   B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   C. Delegated-Design Submittal: For railings, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS
   A. Welding certificates.
   B. Paint Compatibility Certificates: From manufacturers of topcoats applied over shop primers certifying that shop primers are compatible with topcoats.

1.5 QUALITY ASSURANCE
   A. Welding Qualifications: Qualify procedures and personnel according to the following:
      1. AWS D1.1, "Structural Welding Code - Steel."

1.6 DELIVERY, STORAGE, AND HANDLING
   A. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

1.7 FIELD CONDITIONS
   A. Field Measurements: Verify actual locations of walls and other construction contiguous with metal fabrications by field measurements before fabrication.
PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Structural Performance of Handrails and Railings: Provide handrails and railings capable of withstanding following structural loads without exceeding allowable design working stress of materials for handrails, railings, anchors, and connections:
   1. Top Rail of Guards: Capable of withstanding following loads applied as indicated:
      a. Concentrated load of 200 lbf applied at any point and in any direction.
      b. Linear load of 50 plf applied in any direction, not concurrent with above load.
   2. Handrails Not Serving as Top Rails: Capable of withstanding following loads applied as indicated:
      a. Concentrated load of 200 lbf applied at any point and in any direction.
      b. Linear load of 50 plf applied in any direction, not concurrent with above load.

2.2 STEEL HANDRAILS

A. Configurations: As indicated on Drawings and as follows:
   1. MET RAIL-1: Exit stair handrail, steel pipe, PT-11 finish
   2. MET RAIL-2: Exit stair guardrail, steel tube, PT-11 finish
   3. MET RAIL-3: Wall-mounted steel pipe handrail, PT-11 finish
   4. MET RAIL-6: Under-stair barrier rail; steel bar, PT-11 finish
   5. MET RAIL-7: Gate, self-closing, steel bar, PT-11 finish

B. Metal Surfaces, General: Provide materials with smooth surfaces, without seam marks, roller marks, rolled trade names, stains, discolorations, or blemishes.

C. Brackets, Flanges, and Anchors: Cast or formed metal of same type of material and finish as supported rails unless otherwise indicated.

D. Tubing: ASTM A 500 (cold formed) or ASTM A 513.

E. Pipe: ASTM A 53, Type F or Type S, Grade A, Standard Weight (Schedule 40), unless another grade and weight are required by structural loads.
   1. Provide galvanized finish for exterior installations and where indicated.

F. Plates, Shapes, and Bars: ASTM A 36.

G. Cast Iron: Either gray iron, ASTM A 48, or malleable iron, ASTM A 47, unless otherwise indicated.

2.3 AUXILLIARY MATERIALS

A. Fasteners for Ungalvanized-Steel Railings: Plated steel fasteners complying with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5 for zinc coating.

B. Fasteners for Anchoring Railings to Other Construction: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads.

C. Post-Installed Anchors: Capable of sustaining, without failure, a load equal to 6 times the load imposed when installed in unit masonry and 4 times the load imposed when installed in concrete, as determined by testing according to ASTM E 488/E 488M, conducted by a qualified independent testing agency.
   1. Material for Interior Locations: Carbon-steel components zinc-plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, unless otherwise indicated.

D. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.
E. Nonshrink, Nonmetallic Grout: Factory-packaged, nonstaining, noncorrosive, nongaseous grout complying with ASTM C 1107/C 1107M. Provide grout specifically recommended by manufacturer for interior and exterior applications.

F. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound.

2.4 FABRICATION

A. General: Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage but not less than that required to support structural loads.

B. Shop assemble railings to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.

C. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

D. Form work true to line and level with accurate angles and surfaces.

E. Fabricate connections that are exposed to weather in a manner that excludes water. Provide weep holes where water may accumulate.

F. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.

G. Connections: Fabricate railings with welded connections unless otherwise indicated.

H. Welded Connections: Cope components at connections to provide close fit, or use fittings designed for this purpose. Weld all around at connections, including at fittings.
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove flux immediately.
   4. At exposed connections, finish exposed surfaces smooth and blended so no roughness shows after finishing and welded surface matches contours of adjoining surfaces.

I. Form Changes in Direction as Follows: As detailed.

J. Close exposed ends of railing members with prefabricated end fittings.

K. Provide wall returns at ends of wall-mounted handrails unless otherwise indicated. Close ends of returns unless clearance between end of rail and wall is 1/4 inch or less.

L. Brackets, Flanges, Fittings, and Anchors: Provide wall brackets, flanges, miscellaneous fittings, and anchors to interconnect railing members to other work unless otherwise indicated.

M. Provide inserts and other anchorage devices for connecting railings to concrete or masonry work. Fabricate anchorage devices capable of withstanding loads imposed by railings. Coordinate anchorage devices with supporting structure.

2.5 FINISHING

A. Comply with NAAMM’S "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

B. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed products:
   1. Exterior (SSPC Zone 1B): SSPC SP 6/NACE No. 3, "Commercial Blast Cleaning."
   2. Interior (SSPC Zone 1A): SSPC SP 3, "Power Tool Cleaning."
   3. Do not apply primer to galvanized surfaces.

C. Shop-Applied Primer and Field-Applied High-Performance Coating (HPC): Coordinate with Section 099600 - High-Performance Coatings.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine areas and conditions under which miscellaneous metal items are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION
   A. Provide setting drawings, diagrams, templates, instructions and directions for installation of anchorages, such as concrete inserts, anchor bolts, and miscellaneous items having integral anchors, which are to be embedded in concrete or masonry construction. Coordinate delivery of such items to project site.
   B. Provide anchorage devices and fasteners where necessary for securing miscellaneous metal items to in-place construction; including threaded fasteners for concrete and masonry inserts, toggle bolts, through-bolts, lag bolts, wood screws and other connectors as required.
   C. Perform cutting, drilling and fitting required for installation of miscellaneous metal items. Set work accurately in location, alignment and elevation, plumb, level, true and free of rack, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items which are to be built into concrete, masonry or similar construction.
   D. Fit exposed connections accurately together to form tight hairline joints. Weld connections which are not to be left as exposed joints, but cannot be shop welded because of shipping size limitations. Grind joints smooth and touch up shop paint coat. Do not weld, cut or abrade surfaces of exterior units which have been hot-dip galvanized after fabrication, and are intended for bolted or screwed field connections.
   E. Comply with AWS Code for procedures of manual shielded metal-arc welding, appearance and quality of welds made, and methods used in correcting welding work.
   F. Immediately after erection, clean field welds, bolted connections, and abraded areas of shop paint, and paint exposed areas with same material as used for shop painting. Apply by brush or spray to provide minimum dry film thickness of 2 mils.

3.3 PROTECTION
   A. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

END OF SECTION
SECTION 057000
ORNAMENTAL METAL

1.1 SUMMARY
A. Section Includes: Decorative metal fabrications (ORN MET).

1.2 COORDINATION
A. Coordinate installation of anchorages for ornamental metal.
   1. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry.
   2. Deliver such items to Project site in time for installation.
B. Coordinate work directly with other trades as necessary to insure proper fitting, joining to or clearance of their work.
   1. Furnish or exchange shop drawings and resolve required dimensions and details.
   2. Ship work to others as necessary and pay cost of such shipping.

1.3 ACTION SUBMITTALS
A. Shop Drawings:
   1. Indicate component details, materials, finishes, connecting, and joining methods, and relationship to adjoining work.
   2. Include plans, elevations, sections, and details of screen panels and accessories:
   3. Show sign mounting heights, locations of supplementary supports to be provided by others, and accessories. Provide graphic elements and layout for each sign.
B. Samples: Submit samples of each ORN MET material and finish.

1.4 QUALITY ASSURANCE
A. Fabricator and Installer Qualifications: Fabricators and Installers that are well-established and experienced fabricator and installer, acceptable to Owner and Architect, employing skilled workers to custom-fabricate and install Work similar to that required for this Project, whose Work meets or exceeds quality requirements specified, and whose completed Work has a record of successful in-service performance.
B. Welding Qualifications: Qualify procedures and personnel according to applicable requirements of AWS D1.
C. Mockups and Fabrication Samples: Build mockups to verify selections made under Sample submittals to demonstrate aesthetic effects and to set quality standards for fabrication and installation.
   1. Fabricate and install mockup of assembly using materials indicated for the completed Work.
   2. Notify Architect seven days in advance of dates and times when mockups will be constructed.
   3. Demonstrate the proposed range of aesthetic effects and workmanship, installation and finishes.
   4. Obtain Architect's approval of mockups before starting work, fabrication, or construction.
      a. Allow seven days for initial review and each re-review of each mockup.
   5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
D. Pre-Fabrication and Pre-Installation Conference: Prior to commence of fabrication, conduct a conference to ensure understanding of Construction Documents, design intent, installation, and coordination of Work by multiple subcontractors.

1. Attendees: Contractor, Architect, installers, fabricators, and manufacturer’s representatives who are involved in or affected by the installation and its coordination or integration with other materials and installations that have preceded or will follow.

2. Suggested Agenda Items:
   a. Contract Documents comprehension; design intent; alternates; related RFI's.
   b. Fabricator's and Manufacturer's written recommendations; materials options; required performance results.
   c. Submittals; shop drawings; samples; mockups.
   d. Delineation of responsibilities for deferred design, fabrication and installation; coordination with other Work.
   e. Installation procedures; possible conflicts; compatibility issues.
   f. Delivery of materials and fabrications ready for installation; scheduling of deliveries; space and access limitations; protection of adjacent Work.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store decorative metal in a well-ventilated area, away from uncured concrete and masonry, and protected from weather, moisture, soiling, abrasion, extreme temperatures, and humidity.

B. Deliver and store cast-metal products in wooden crates surrounded by enough packing material to ensure that products are not cracked or otherwise damaged.

1.6 FIELD CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with decorative metal by field measurements before fabrication and indicate measurements on Shop Drawings.

1.7 WARRANTY

A. Warranty: Fabricator and installer agree to repair or replace components of ornamental metal assemblies that do not comply with requirements or that fail in materials or installation quality within specified warranty period.

1. Failures including but not limited to the following:
   a. Deterioration resulting from U.V. and weather exposure.
   b. Structural failures including rupturing, cracking, or puncturing.
   c. Deterioration of materials beyond normal weathering.

2. Provide warranty covering panel fabrication defects and loss of specified physical and performance properties, when panels are installed in accordance with manufacturer’s requirements.

3. Provide warranty covering cost of panel removal and installation of replacement panels.

4. Warranty Period: 10 years from date of Substantial Completion.

B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal panels that show evidence of deterioration of factory-applied finishes within specified warranty period.

1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
   a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
   b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
   c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 10 years from date of Substantial Completion.
PART 1 PRODUCTS

2.1 GENERAL REQUIREMENTS

A. General: Provide ornamental metalwork composed of metals of forms and types which comply with requirements of referenced standards and which are free from surface blemishes where exposed to view in finished unit.

1. Exposed to view surfaces exhibiting pitting, seam marks, roller marks, oil canning, stains, discolorations or other imperfections on finished units are not acceptable.

B. Refer to Drawings for configurations.

C. Not Permitted: Vibration harmonics; noises caused by movement of components; vibration transmitted to other building elements; loosening, weakening, or fracturing of attachments or components of system.

1. Testing of the mock-up in a qualified acoustic testing laboratory may be conducted at the Owner’s discretion.

2.2 FABRICATIONS

A. (ORN MET-2) Radiator Cover: Manufactured steel radiator cover with perforated steel screen; provide wall mounting hardware and leveling feet.

2. Finish: Custom finish as selected by Architect.

B. (ORN MET-3) Flush Formed Steel Panel with Blackened Finish: Custom-fabricated, flush formed panels with return at walls & ceilings, as shown on Drawings; protective clear coating w/matte sheen; adhered or concealed fastening.

1. Panel Configuration:
   a. Profile: Flush
   b. Depth: 1 inch, unless shown otherwise.
   c. Sizes: As indicated on Drawings.

2. Steel Sheet: 0.030-inch (1/32-inch, 22 ga.), ASTM A 36.

   a. Clear Coating: As recommended by fabricator to be compatible with blackened finish, for the purpose of protecting finish from rubbing off when contacted.

4. Coordinate with Section 064000 - Architectural Woodwork for WD FAB-1 sliding pocket doors with ORN MET-3 facing.

C. (ORN MET-4) Expanded Metal Ceiling Panels: Formed expanded steel panels with return.

1. Panel Depth: As Shown.

2. Expanded Steel Sheet:
   a. Manufacturer: Amico.
   b. Style: 1/4" - #18.
   c. Minimum Sheet Thickness: 0.42".
   d. Openings:
      1) SWO: 0.110"
      2) LWO: 0.718"

3. Finish: Provide one of the following, in color to match PT-3:
   a. Two-Coat Fluoropolymer: AAMA 621. Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in color coat.
b. Powder-Coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils (0.04 mm). Prepare, treat, and coat metal to comply with resin manufacturer's written instructions.

4. Backer Panel: Medium-density fiberboard (MDF), ANSI A208.2, Grade MD, made with binder containing no urea formaldehyde, with Class B or Class A Flame Spread Rating; thickness as shown.

D. (ORN MET-5) Wall Base: Steel plate or steel angle wall bas as shown on Drawings; welds ground smooth; painted finish to match PT-11.
   1. Steel Plates, Shapes and Bars: ASTM A36; square corners and edges.

E. (ORN MET-6) Formed Expanded Metal Panels:
   1. Panel Depth: As Shown.
   2. Expanded Steel Sheet:
      a. Manufacturer: Amico.
      b. Style: 1/4" - #18.
      c. Minimum Sheet Thickness: 0.42".
      d. Openings:
         1) SWO: 0.110"
         2) LWO: 0.718"
   3. Finish: Provide one of the following, in color to match PT-3:
      a. Two-Coat Fluoropolymer: AAMA 621. Fluoropolymer finish containing not less than 70 percent PVDF resin by weight in color coat.
      b. Powder-Coat Finish: Immediately after cleaning and pretreating, apply manufacturer's standard thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils (0.04 mm). Prepare, treat, and coat metal to comply with resin manufacturer's written instructions.

2.3 ACCESSORIES
A. Fasteners: Provide concealed fasteners for interconnecting components and for attaching decorative metal items to other work unless otherwise indicated.
   1. Fasteners for Anchoring to Other Construction: Unless otherwise indicated, select fasteners of type, grade, and class required to produce connections suitable for anchoring indicated items to other types of construction indicated.
   2. Provide flat-head machine screws for exposed fasteners unless otherwise indicated.

B. Post-Installed Anchors: Fastener systems with an evaluation report acceptable to authorities having jurisdiction, based on ICC-ES AC193 or ICC-ES AC308.
   1. Material for Interior Locations: Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5 unless otherwise indicated.

C. Structural Anchors: For applications indicated to comply with certain design loads, provide anchors with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry and four times the load imposed when installed in concrete, as determined by testing per ASTM E 488 conducted by a qualified independent testing agency.
   1. Carbon-steel components zinc plated to comply with ASTM B 633 or ASTM F 1941, Class Fe/Zn 5, unless otherwise indicated.
   2. Stainless Steel Alloy Group 1 stainless-steel bolts, ASTM F 593, and nuts, ASTM F 594.

D. Sound-Deadening Materials:
3. Gaskets: As required to seal joints in decorative formed metal and to prevent vibration; as recommended by fabricator.

E. Welding Electrodes and Filler Metal: Type and alloy of filler metal and electrodes as recommended by producer of metal to be welded, complying with applicable AWS specifications, and as required for color match, strength and compatibility in fabricated items.

F. Nongaseous grout complying with CE CRD C621. Provide grout specifically recommended by manufacturer for interior and exterior applications of type specified in this section.

G. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.4 FABRICATION

A. General: Provide ornamental metalwork composed of metals of forms and types which comply with requirements of referenced standards and which are free from surface blemishes where exposed to view in finished unit.
   1. Exposed to view surfaces exhibiting pitting, seam marks, roller marks, oil-canning, stains, discolorations or other imperfections on finished units are not acceptable.
   2. Refer to Drawings for configurations.

B. Assemble items in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
   1. Verify dimensions on site prior to shop fabrication.

C. Form ornamental metalwork to required shapes and sizes, with true curves, and angles. Provide components in sizes and profiles indicated, but not less than required to comply with requirements indicated for structural performance.

D. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing the Work.

E. Form simple and compound curves in bars, pipe, tubing, and extruded shapes by bending members in jigs to produce uniform curvature for each configuration required; maintain cross section of member throughout entire bend without buckling, twisting, cracking, or otherwise deforming exposed surfaces.

F. Increase metal thickness or reinforce with concealed stiffeners, backing materials, or both, as needed to provide surface flatness equivalent to stretcher-leveled standard of flatness and sufficient strength for indicated use.
   1. Support joints with concealed stiffeners as needed to hold exposed faces of adjoining sheets in flush alignment.

G. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.

H. Mill joints to a tight, hairline fit. Cope or miter corner joints. Fabricate connections that will be exposed to weather in a manner to exclude water.

I. Provide weep holes where water may accumulate. Locate weep holes in inconspicuous locations.
J. Provide necessary rebates, lugs, and brackets to assemble units and to attach to other work. Cut, reinforce, drill, and tap as needed to receive finish hardware, screws, and similar items unless otherwise indicated.

K. Nonwelded Connections: Fabricate railing systems and handrails for interconnection of members by means of concealed mechanical fasteners and fittings unless otherwise indicated.
   1. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.

L. Welded Connections: Comply with AWS for recommended practices in shop welding. Provide welds behind finished surfaces without distortion or discoloration of exposed side. Clean exposed welded joints of welding flux, and dress on exposed and contact surfaces.
   1. Weld corners and seams continuously and in accordance with recommendations of AWS.
   2. Grind exposed welds smooth and flush, to match and blend with adjoining surface.
   3. Discoloration of finished surfaces is not acceptable.

M. Dissimilar Surfaces:
   1. Bituminous Paint: Coat metals in contact with concrete, masonry, or other dissimilar surfaces with bituminous paint.
   2. Primer: Prime metals in contact with dissimilar metals with primer.

N. Finish exposed surfaces to smooth, sharp, well-defined lines and arises.

O. Form panel miters and copes to be tight fitting, square and in true alignment. Close exposed corners and seams by forming procedures or by welding, brazing or soldering and grinding smooth and flush on exposed surfaces. For exposed metal finishes, use filler metals that will blend and match sheet metal being joined. Comply with recommendations of AWS and NAAMM for welding, brazing and soldering.

P. Consider clearances with adjacent materials and provide correct procedures for erection. Provide supports, anchoring devices, anchor bolts, screws, clips, seals and gaskets, and other accessories.

2.5 FINISHING

A. Comply with NAAMM'S "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.

B. Preparation for Shop Priming: Prepare uncoated ferrous-metal surfaces to comply with minimum requirements indicated below for SSPC surface-preparation specifications and environmental exposure conditions of installed products:
   1. Interior (SSPC Zone 1A): SSPC SP 3, "Power Tool Cleaning."

C. Shop-Applied Primer and Field-Applied High-Performance Coating (HPC): Coordinate with Section 099600 - High-Performance Coatings.

D. Shop-Applied Primer and Field-Applied Paint (PT) or Epoxy Paint (PTE): Coordinate with Section 099000 - Painting.

PART 2 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of decorative formed metal.

B. Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions and directions for installation of items having integral anchors which are to be embedded in concrete or masonry construction. Coordinate delivery of such items to project site.

3.3 INSTALLATION

A. Provide anchorage devices and fasteners where needed to secure decorative metal to in-place construction.

B. Perform cutting, drilling, and fitting required to install decorative metal. Set products accurately in location, alignment, and elevation, measured from established lines and levels. Provide temporary bracing or anchors in formwork for items to be built into concrete, masonry, or similar construction.

C. Fit exposed connections accurately together to form tight, hairline joints or, where indicated, uniform reveals and spaces for sealants and joint fillers. Where cutting, welding, and grinding are required for proper shop fitting and jointing of decorative metal, restore finishes to eliminate evidence of such corrective work.

D. Do not cut or abrade finishes that cannot be completely restored in the field. Return items with such finishes to the shop for required alterations, followed by complete refinishing, or provide new units as required.

E. Install concealed gaskets, joint fillers, insulation, and flashings as work progresses.

F. Restore protective coverings that have been damaged during shipment or installation. Remove protective coverings only when there is no possibility of damage from other work yet to be performed at same location.
   1. Retain protective coverings intact; remove coverings simultaneously from similarly finished items to preclude nonuniform oxidation and discoloration.

G. Field Welding: Comply with applicable AWS specification for procedures of manual shielded metal arc welding and requirements for welding and for finishing welded connections in "Fabrication, General" Article. Weld connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.

H. Field Brazing: Comply with requirements for brazing and for finishing brazed connections in "Fabrication, General" Article. Braze connections that are not to be left as exposed joints but cannot be shop brazed because of shipping size limitations.

I. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.
   1. Coat concealed surfaces of aluminum that will be in contact with grout, concrete, masonry, wood, or dissimilar metals, with a heavy coat of bituminous paint.

3.4 INSTALLED WORK

A. Final Cleaning of Bronze: Apply second coat of microcrystalline wax at time of Substantial Completion.

B. Final Cleaning, Waxing, Polishing of Bronze: Wax and polish to high-gloss sheen.

C. Protect finishes of ornamental metalwork from damage during construction period by use of temporary protective coverings approved by ornamental metalwork fabricator. Remove protective covering at time of Substantial Completion.
D. Restore finishes damaged during installation and construction period so that no evidence remains of correction work. Return items which cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units as required.

END OF SECTION
SECTION 05 72 00
ORNAMENTAL RAILINGS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Custom ornamental handrail and guardrail assemblies (ORN RAIL).
   2. Exterior aluminum railing (ALR-1).
   3. Engineering required to comply with specified performance requirements.

1.2 ACTION SUBMITTALS

A. Product Data: Submit product data for each product used in ornamental metalwork, including finishing materials and methods.

B. Shop Drawings:
   1. Indicate design criteria and applied loads for which the ornamental stair systems have been designed.
   2. Clearly indicate magnitude and location of all forces transferred to the primary building structure by cold-formed metal framing system. Loads shall be provided as unfactored values determined in accordance with ASCE 7-10.
   3. Indicate fabrication and installation of ornamental metalwork, including plans, elevations and details of components and attachments to other units of work. Indicate materials, profiles of each ornamental metalwork member and fitting, joinery, finishes, fasteners, anchorages and accessory items.
   4. Include setting drawings, templates and directions for location and installation of items and anchor bolts and other anchorage devices to be installed as unit of work of other sections.
   5. Shop drawings shall be signed and sealed by the qualified Professional Engineer responsible for their preparation.
   6. Deferred-Design Submittal: Submit shop drawings to Authority Having Jurisdiction for approval prior to commencing with this work on-site.

C. Fabrication Samples: Assembled Samples of railing systems, made from full-size components, including top rail, post, handrail, and infill. Samples need not be full height. Prepare samples of metal of same alloy and gauge to be used for Work. Fabrication shall include the following components:
   1. All vertical and horizontal rails.
   2. Welded and brazed connections.
   3. Fittings and brackets.
   4. Infill panels.
   5. Informational Submittals

D. Installer's Certificate: Signed by manufacture certifying the welders comply with requirements specified under Quality Assurance article.

E. Calculations: Signed engineering calculations prepared by the qualified Professional Engineer shall be submitted upon written request from the Architect/Engineer. Calculations shall indicate structural integrity of members, anchors, fasteners and connections to building structure, in accordance with specified criteria.
1. Engineering Responsibility: Calculations shall be reviewed for stated design assumptions, general compliance to specified requirements, and forces imposed on structure. The accuracy of the design calculations shall be the sole responsibility of the Contractor’s Professional Engineer.

2. Submitted calculations that have not been requested by the Architect/Engineer shall be returned without review.

1.3 QUALITY ASSURANCE

A. Fabricator Qualifications: Firm experienced in successfully producing ornamental metalwork similar to that indicated for this Project, with sufficient production capacity to produce required units without causing delay in Work.

B. Installer Qualifications: Arrange for installation of ornamental metalwork specified in this section by same firm that fabricated unit.

C. Professional Engineer Qualifications: A professional engineer who is legally qualified to practice in the State of Minnesota and who is experienced in providing engineering services of the kind indicated. Engineering services are defined as those performed for installations of ornamental metal railings that are similar to those indicated for this Project in material, design, and extent.

D. Qualify welding processes and welding operators in accordance with the following:
   1. AWS D1.1 Structural Welding Code - Steel.
   2. AWS D1.6, "Structural Welding Code - Stainless Steel."
   3. Certify that each welder employed in unit of work of this section has satisfactorily passed AWS qualification tests for welding processes involved and, if pertinent, has undergone recertification.
   4. Testing for recertification is Contractor’s responsibility.

E. Mockups: Build mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for fabrication and installation.
   1. Build full-height mockups, not less than 24 inches long; consisting of two posts, top rail, infill panels and anchorage components; for each of the following ORN RAIL configurations:
      a. ORN RAIL-3.
      b. ORN RAIL-6.
   2. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 PROJECT CONDITIONS

A. Field Measurements: Verify actual locations of walls and other construction contiguous with railings by field measurements before fabrication and indicate measurements on Shop Drawings.

1.5 COORDINATION

A. Coordinate selection of shop primers with topcoats to be applied over them. Comply with paint and coating manufacturers’ written recommendations to ensure that shop primers and topcoats are compatible with one another.

B. Coordinate installation of anchorages for railings. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.

C. Schedule installation so wall attachments are made only to completed walls. Do not support railings temporarily by any means that do not suit structural performance requirements.
PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design railings, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

1. Structural Performance of Handrails and Railings: Provide handrails and railings capable of withstanding the following structural loads without exceeding allowable design working stress of materials for railings, anchors, and connections:

2. Top Rail of Guards:
   a. Concentrated load of 200 lbf applied at any point and in any direction.
   b. Linear load of 50 plf applied in any direction, not concurrent with above load.

3. Handrails Not Serving as Top Rails:
   a. Concentrated load of 200 lbf applied at any point and in any direction.
   b. Linear load of 50 plf applied in any direction, not concurrent with above load.

B. Control of Corrosion: Prevent galvanic action and other forms of corrosion by insulating metals and other materials from direct contact with incompatible materials.

2.2 ORNAMENTAL RAILINGS

A. Dimensions and Configurations: As shown on Drawings and as described below.

B. (ORN RAIL-3) Wood Handrails: Solid hardwood (WD-1) handrail, 1-1/2 inch outside diameter, on continuous steel bar spline; attached with brackets.

C. (ORN RAIL-4) Handrail, Wall-Mounted:

1. Hand Rail: Steel pipe.

2. Brackets: Bent bar with wall insert.

3. Finish: Shop-primed for (PT) finish.

D. (ORN RAIL-6) Handrail, Floor-Mounted:

1. Hand Rail: Steel pipe.

2. Posts: Steel bar.

E. (ORN RAIL-7) Orchestra Pit Guardrail: Removable guardrail floor-mounted at edge of orchestra pit, with architectural wood work cladding.

1. Concealed Framing: Steel shapes as shown, welded connections except at detachable points.

2. Cladding: WD FAB-3 as specified in Section 064000 - Architectural Woodwork.

F. (ORN RAIL-8) Stage Lift Guardrail: Removable guardrail floor-mounted to stage lift platform.

1. Top Rail: Steel pipe.

2. Posts: Steel bar.

G. (ALR-1) Aluminum Railing:
1. Finish: Color-anodized, black color.

2.3 MATERIALS

A. Materials, General:
   1. Metal Surfaces: Provide materials with smooth, flat surfaces unless otherwise indicated. For components exposed to view in the completed Work, provide materials without seam marks, roller marks, rolled trade names, or blemishes.
   2. Recycled Content of Ferrous Metals: Provide products with average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.

B. Steel:
   1. Steel Pickets, Plates, Shapes and Bars: ASTM A36; square corners and edges.
   2. Bars: Hot-rolled, carbon steel complying with ASTM A 29, Grade 1010; square corners and edges.
   3. Steel Tubing: ASTM A500 or ASTM A 513; square corners and edges.
   4. Steel Pipe: ASTM A53, Type S, Grade A, standard weight and extra-strong as required, galvanized and plain.
   5. Perforated Metal Plate: Cold-rolled steel sheet, ASTM A 1008, or hot-rolled steel sheet, ASTM A 1011, commercial steel Type B.
      a. Thickness:
      b. Perforations: 1/4-inch holes 3/8 inch o.c. in staggered rows.

C. Aluminum: Provide alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with strength and durability properties for each aluminum form required not less than that of alloy and temper designated below.
   1. Extruded Bars and Shapes, Tubing: ASTM B 221, Alloy 6063-T5/T52.
   3. Drawn Seamless Tubing: ASTM B 210, Alloy 6063-T832.

D. Hardwood for Railings: (WD-1) as specified in Section 064000 - Architectural Woodwork.

2.4 ACCESSORIES

A. Fasteners and Anchors: Select fasteners of type, grade, and class required to produce connections suitable for anchoring railings to other types of construction indicated and capable of withstanding design loads.
   1. Stainless-Steel Components: Type 304 stainless-steel fasteners.
   2. Uncoated Steel Components: Plated-steel fasteners complying with ASTM B 633, Class Fe/Zn 25 for electrodeposited zinc coating where concealed; Type 304 stainless-steel fasteners where exposed.
   4. Dissimilar Metals: Provide Type 304 stainless-steel fasteners where indicated and where dissimilar metals are connected. Where dissimilar metals are connected, provide neoprene spacer or washer for isolation.

B. Welding Rods and Bare Electrodes: Select according to AWS specifications for metal alloy welded.

D. Anchoring Cement: Factory-packaged, nonshrink, nonstaining, hydraulic-controlled expansion cement formulation for mixing with water at Project site to create pourable anchoring, patching, and grouting compound. At exterior locations, provide formulation that is resistant to erosion from water exposure without needing protection by a sealer or waterproof coating and that is recommended by manufacturer for exterior use.

2.5 FINISHES

A. Shop-Applied Primer: Coordinate and comply with the following applicable specifications Sections for primer materials, surface preparation and application:
   1. Paint (PT) or Epoxy Paint (PTE): Section 099000 - Painting.
   2. High-Performance Coating (HPC): Section 099600 - High-Performance Coatings.

B. Powder-Coat Finish: Prepare, treat, and coat galvanized metal to comply with resin manufacturer's written instructions and as follows:
   1. Prepare galvanized metal by thoroughly removing grease, dirt, oil, flux, and other foreign matter.
   2. Treat prepared metal with zinc-phosphate pretreatment, rinse, and seal surfaces.
   3. Apply thermosetting polyester or acrylic urethane powder coating with cured-film thickness not less than 1.5 mils.
   4. Color: Custom color as selected by Architect.

C. Color Anodic Finish: AAMA 611, AA-M12C22A44/A42, Architectural Class I, 0.7 mil (0.018 mm) or thicker.

2.6 FABRICATION

A. Fabricate railings to comply with requirements indicated for design, dimensions, member sizes and spacing, details, finish, and anchorage, but not less than that required to support structural loads.
   1. Assemble railings in the shop to greatest extent possible to minimize field splicing and assembly. Disassemble units only as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation. Use connections that maintain structural value of joined pieces.
   2. Cut, drill, and punch metals cleanly and accurately. Remove burrs and ease edges to a radius of approximately 1/32 inch unless otherwise indicated. Remove sharp or rough areas on exposed surfaces.
   3. Form work true to line and level with accurate angles and surfaces.

B. Connections: Fabricate railings with welded connections to greatest extent possible, and mechanical connections as necessary for fabrication and installation.
   1. Welded Connections: Comply with AWS for recommended practices in shop welding. Weld behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded joints of flux, and dress exposed and contact surfaces.
      a. Grind exposed welds smooth and flush, to match and blend with adjoining surface.
      b. Discoloration of finished surfaces is not acceptable.
   2. Mechanical Connections: Connect members with concealed mechanical fasteners and fittings. Fabricate members and fittings to produce flush, smooth, rigid, hairline joints.
      a. Fabricate splice joints for field connection using an epoxy structural adhesive if this is manufacturer's standard splicing method.
      b. Cut, reinforce, drill, and tap as indicated to receive finish hardware, screws, and similar items.
   3. Fabricate connections that will be exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate. Locate weep holes in inconspicuous locations.
C. Finishing: Comply with NAAMM "Metal Finishes Manual" for finish designations and application recommendations, except as otherwise shown and specified.
   1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipment.
   2. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
   3. Fabricate with exposed surfaces smooth, square, and free of surface blemishes, including pitting, rust and scale seam marks, roller marks, rolled trade names, and roughness.
      a. Remove blemishes by filling, grinding, or by welding and grinding, prior to cleaning, treating, and shop priming.
      b. Comply with fabrication requirements, including tolerance limits, of AISC's "Code of Standard Practice for Steel Buildings and Bridges" for Architecturally Exposed Structural Steel.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine gypsum board assemblies, where reinforced to receive anchors, to verify that locations of concealed reinforcements have been clearly marked for Installer. Locate reinforcements and mark locations if not already done.

3.2 INSTALLATION
   A. Fit exposed connections together to form tight, hairline joints.
   B. Perform cutting, drilling, and fitting required for installing railings. Set railings accurately in location, alignment, and elevation; measured from established lines and levels and free of rack.
   C. Provide necessary anchors, plates, angles, hangers and struts as required for connecting stairs to the structure.
   D. Ensure alignment with adjacent construction. Coordinate with related work to ensure no interruption in installation.
   E. Perform necessary cutting and altering for installation of work of other sections. Do not perform any other additional cutting without review of Architect.
   F. Field bolt and weld to match standard of shop bolting and welding. Hide bolts and screws whenever possible. Where not hidden, use flush countersunk fastenings, unless indicated otherwise. Make mechanically fastened joints flush hairline butted. Grind welds smooth and flush.

3.3 INSTALLED WORK
   A. Cleaning:
      1. Clean aluminum and stainless steel by washing thoroughly with clean water and soap, rinsing with clean water, and wiping dry.
      2. Clean copper alloys according to metal finisher's written instructions in a manner that leaves an undamaged and uniform finish matching approved Sample.
      3. Clean wood rails by wiping with a damp cloth and then wiping dry.
B. Touchup Painting: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint are specified in Section 099000 - Painting or Section 099600 - High Performance Coatings.

C. Galvanized Surfaces: Clean field welds, bolted connections, and abraded areas and repair galvanizing to comply with ASTM A 780.

D. Protect finishes of railings from damage during construction period with temporary protective coverings approved by railing manufacturer. Remove protective coverings at time of Substantial Completion.

E. Restore finishes damaged during installation and construction period so no evidence remains of correction work. Return items that cannot be refinished in the field to the shop; make required alterations and refinish entire unit, or provide new units.

END OF SECTION
SECTION 061000
ROUGH CARPENTRY

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Concealed carpentry work not specified in other Sections and not used as exposed work, including:
   1. Miscellaneous wood framing and concealed wood blocking and nailers.
   2. Wood sheathing.
   5. Anchors nails, bolts, and screws.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of process and factory-fabricated product. Indicate component materials and dimensions and include construction and application details.

1.3 INFORMATIONAL SUBMITTALS
A. Certificates:
   1. Submit letter certifying that lumber is kiln-dried to 15 - 19 percent moisture content, well-seasoned, grade marked, trademarked and free from warp.
   2. Submit letter from treatment plant certifying that chemicals and process used and net amount of salts retained are in conformance with specified standards.
   3. Include data for wood-preservative treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Indicate type of preservative used and net amount of preservative retained.
      a. For products receiving a waterborne treatment, include statement that moisture content of treated materials was reduced to levels specified before shipment to Project site.
   4. Include data for fire-retardant treatment from chemical treatment manufacturer and certification by treating plant that treated materials comply with requirements. Include physical properties of treated materials based on testing by a qualified independent testing agency.
      a. For fire-retardant treatments, include physical properties of treated lumber both before and after exposure to elevated temperatures, based on testing by a qualified independent testing agency according to ASTM D 5664.
      b. Submit letter certifying that fire-retardant treatment materials comply with requirements herein stated and local authorities having jurisdiction and that treatment will not bleed through finished surfaces.

1.4 QUALITY ASSURANCE
A. Lumber Standard:
   1. Comply with U.S. Dept. of Commerce Product Standard PS 20, including moisture content and actual sizes related to indicated nominal sizes.
   2. Comply with Standard Grading Rules No. 16 for West Coast Lumber.
   3. Comply with American Softwood Lumber Standard and with application grading rules of inspection agencies certified by American Lumber Standard Committee’s (ALSC) Board of Review.
4. Comply with lumber producer’s inspection agency grading rules certified as conforming to “National Grading Rules for Dimension Lumber” established under Section 10 of PS 20 and local code standard.

C. Mat-Formed Particleboard: Comply with ANSI A208.1. Provide particleboard bearing NPA grade marking.

D. Lumber: Factory-mark each piece of lumber with grade stamp of inspection agency evidencing compliance with grading rule requirements and identifying agency, grade, species, moisture content at time of surfacing and mill.
   1. Seasoning: Kiln-dry lumber to 15 - 19 percent moisture content, well-seasoned, grade marked, trademarked and free from warp.

1.5 DELIVERY, STORAGE AND HANDLING

A. Inspect wood materials for conformance to specified grades, species, and treatment at time of delivery to Project site.
   1. Reject and return unsatisfactory wood materials.

B. Provide facilities for handling and storage of materials to prevent damage to edges, ends and surfaces.

C. Keep carpentry materials dry.
   1. Store lumber and plywood in stacks with provision for air circulation within stacks.
   2. Protect bottom of stacks against contact with damp surfaces. Protect exposed materials against weather.
   3. Stack materials minimum 12 inches off ground, or if on concrete slab-on-grade, minimum 1-1/2 inches, fully protected from weather.
   4. Provide for air circulation within and around stacks and under temporary coverings.

D. Place spacers between each bundle of pressure treated materials treated with waterborne chemicals to provide air circulation.

1.6 PROJECT CONDITIONS

A. Environmental Impact: Products containing following materials will not be permitted:
   1. Urea Formaldehyde.
   2. Chromium in wood pressure treatment products.
   3. Arsenic.

1.7 COORDINATION

A. Coordination: Fit carpentry work to other work; scribe and cope as required for accurate fit, show location of furring, nailers, blocking, grounds and similar supports to allow attachment of other work.
   1. Coordinate work directly with other subcontractors as necessary to insure proper fitting, joining or to clearances of other work. Obtain templates as required to insure proper fitting.
PART 2 PRODUCTS

2.1 WOOD PRODUCTS, GENERAL

A. Lumber: DOC PS 20 and applicable rules of grading agencies indicated. If no grading agency is indicated, provide lumber that complies with the applicable rules of any rules-writing agency certified by the ALSC Board of Review. Provide lumber graded by an agency certified by the ALSC Board of Review to inspect and grade lumber under the rules indicated.
   1. Factory mark each piece of lumber with grade stamp of grading agency.
   2. Where nominal sizes are indicated, provide actual sizes required by DOC PS 20 for moisture content specified. Where actual sizes are indicated, they are minimum dressed sizes for dry lumber.
   3. Provide dressed lumber, S4S, unless otherwise indicated.

B. Maximum Moisture Content of Lumber: 15 percent maximum, unless otherwise indicated.

2.2 LUMBER

A. Dimension Lumber: Finished 4 sides, 15 percent maximum moisture content. Mark lumber "S-DRY".
   1. Light Framing: Construction grade Douglas Fir or Southern Pine, appearance grades where exposed.
   2. Boards: Construction grade.

B. Miscellaneous Lumber: Lumber for support or attachment of other construction, including rooftop equipment curbs and support bases, cant strips, bucks, nailers, blocking, furring, grounds, stripping and similar members.
   1. Grade: No. 3 or standard grade.
   2. Moisture content of 19 percent maximum for lumber items not specified to have wood preservative treatment.

2.3 WOOD SHEATHING

C. (WD SHTG-3) Concealed Sheathing: APA EXT, Rated Structural 1, touch sanded, Exposure 1, 23/32 or 3/4 inch depending on availability, square edge, Douglas Fir.

D. (WD SHTG-4) Concealed Sheathing: APA, C-D touch-sanded plugged. Exposure 1, 1/2 inch, FRT, square edge, Douglas Fir.

E. (WD SHTG-5) Medium-Density Fiberboard: ANSI A208.2, Grade MD, made with binder containing no urea formaldehyde, with Class B or Class A Flame Spread Rating; 3/4-inch thick.

F. (WD SHTG-9): 3/4" plywood, FRT, PT finish

G. (WD SHTG-12) Pegboard: 1/4-inch tempered hardboard.

2.4 PRESERVATIVE PRESSURE TREATMENT

A. Preservative Pressure Treatment: Comply with AWPA Standard U1, Use Category (UC2).
   1. Kiln-dry lumber after treatment to a maximum moisture content of 19 percent. Do not use material that is warped or that does not comply with requirements for untreated material.
2. Preservative Chemicals: Alkaline Copper Quaternary (ACQ) or other waterborne preservative type as listed in Section 4 of AWPA Standards U1, excluding those that contain arsenic or chromium; and acceptable to authorities having jurisdiction.
   a. Field-Applied Treatment: Provide same preservative chemical type as used for factory treatment, or compatible with factory treatment, for application to field-cut surfaces of preservative-treated lumber.
3. Extent of Treatment: Wood nailers and blocking in contact with cementitious materials, and plywood at parapets, and as indicated on Drawings.

2.5 FIRE-RETARDANT TREATMENT AND TREATED MATERIALS
A. General: Provide materials complying with requirements in this article, that are acceptable to authorities having jurisdiction, and with fire-test-response characteristics specified as determined by testing identical products per test method indicated by a qualified testing agency.
   1. Extent of Treatment: Treat all rough carpentry, unless otherwise indicated.
B. Fire- Retardant-Treated Lumber and Plywood by Pressure Process: Products with a flame spread index of 25 or less when tested according to ASTM E 84, and with no evidence of significant progressive combustion when the test is extended an additional 20 minutes, and with the flame front not extending more than 10.5 feet beyond the centerline of the burners at any time during the test.
   1. Complete fabrication prior to treatment to minimize cutting and jointing after treatment.
   2. Coat surfaces cut after treatment with heavy brush coat of same fire-retardant chemical.
   3. After treatment: Material shall be dried to an average moisture content of 15 percent or less for plywood and 19 percent or less for other lumber.
   4. Do not use twisted, warped, bowed or otherwise damaged or defective pieces.
C. Identify fire-retardant-treated wood with appropriate classification marking of qualified testing agency. Each piece to bear:
   1. UL FR-S rating (flame spread and smoke developed less than 25).
   2. Complying with extended 30-minute tunnel test, ASTM E84 or UL 723
   3. Meet interior Type A requirements in AWPA Standard C-20 for lumber and C-27 for plywood.
   4. And shall be registered for use as a wood preservative by the U.S. Environmental Protection Agency.

2.6 ROUGH HARDWARE, FASTENERS AND ANCHORAGE DEVICES
A. Extent: Provide rough hardware required, including nails, screws, bolts, lag screws, cinch anchors, toggle bolts, shot anchors and similar items.
B. General: Provide proper size and type for use intended and for materials to be fastened.
   1. Install adequate hardware to insure substantial and positive anchorage.
   2. Use galvanized for exterior locations and high humidity locations and treated wood, plain finish for other interior locations.
   3. Fasteners, hangers and bearing plates used on or in connection with treated wood shall comply with IBC 2304.9.
C. Nails: Conform to materials standards established under FS FF-N-105.
   1. At exterior work, use galvanized steel nails.
   2. Refer to IBC Nailing Schedule for quality and size.
D. Mechanical Fasteners for Wood Decking: Swaneze stainless steel decking screws.
2.7 TAPES, SEALANTS AND MISCELLANEOUS

A. Adhesive: As recommended by manufacturer of product to be applied for surface material to give permanent adhesion, with material remaining flat to back surface. Comply with local code standards.
   1. Comply with APA AFG-01 for adhesive for use with type of construction panel indicated.
   2. Exterior: Phenolic resin waterproof glue.
   3. Interior: Water-resistant casein and other adhesives suited for particular use.

B. Expansion Material: Dow Chemical Ethafoam. Use where expansion joint material is indicated and not installed under other sections.

C. Concealed Sealants: Polyisobutylene sealant

D. Soft Gasket or Urethane Insulation:
   1. Product: "Shok-Pak" flexible semi-closed cell urethane.
   2. Provide 1/2 inch thicker than joint where foam tape, foam gasket and urethane insulation is indicated and not provided under other sections.
   3. Location: At gaps between framing and other materials.

E. Sill Sealer Gaskets:
   1. Glass-fiber resilient insulation, fabricated in strip form for use as a sill sealer.
   2. Closed-cell neoprene foam, 1/4 inch thick, selected from manufacturer's standard widths to suit width of sill members indicated.

PART 3 EXECUTION

3.1 FURRING, STRIPPING, GROUNDS AND BACKING

A. Install plumb, level, true and square. Anchor substantially for permanent installation. Set and shim to straight edge so finish wall is true and straight.

B. Provide grounds and backing as shown or required. Blocking as required or shown on drawings for plumbing fixtures, brackets, drapery rods, window and door frames, built-in furniture and other woodwork, both interior and exterior.

C. Allow for finishes and shim out to form level surfaces. Verify ground sizes and locations before installation.

3.2 INSTALLATION OF SHEATHING

B. Place roof and wall sheathing with end joints staggered. Secure sheets over firm bearing.
   1. Maintain minimum 1/16 inch and maximum 1/8 inch spacing between joints on walls. Place perpendicular to framing members.

C. Comply with roofing manufacturer's requirements for sheathing attachments.

3.3 SITE TREATMENT OF WOOD MATERIALS

A. Comply with AWPA M4 for applying field treatment to field-cut surfaces of preservative-treated lumber.
   1. Apply preservative treatment in accordance with manufacturer's printed instructions.
   2. Allow preservative to dry prior to erecting members.
END OF SECTION
SECTION 064000
ARCHITECTURAL WOODWORK

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Prefinished wood materials (WD).
   3. Wood-Veneer-Faced Cabinetwork.
   5. Solid Surface Fabrications (SSF).
   8. Requirements for Fabrication and Installation.

1.2 ADMINISTRATIVE REQUIREMENTS
A. Coordination: Coordinate work directly with Work of other Sections as necessary to ensure proper fitting, joining or required clearances of other work.
   1. Exchange and coordinate shop drawings and templates.
   2. Coordinate fabrication schedule.
   3. Coordinate sizes and locations of framing, blocking, furring, reinforcements, and other related units of Work specified in other Sections to ensure that cabinets can be supported and installed as indicated.

B. Veneer Selection Conference: Prior to Pre-Fabrication Conference, conduct conference at veneer supplier’s site at which veneer flitches are made available to Architect to select actual flitches to be used on Project for the purpose of establishing acceptable range of aesthetic qualities, identifying flitches of consistent appearance and designating groups of flitches for specific applications and locations on Project.
   1. Attendees: Veneer supplier, woodwork Fabricator and Installer, wood door Manufacturer, Contractor, Construction Manager and Architect.

1.3 ACTION SUBMITTALS
A. Product Data: For each material and product to complete Work, including; solid hardwood, panel and veneer wood products, core materials, high-pressure decorative laminate, solid-surfacing, fire-retardant-treated materials, cabinetwork and hardware, components for wood fabrications, accessories and finishing materials.

B. Shop Drawings: Indicate dimensions, descriptions of materials and finishes, general construction, specific modifications, component connections, anchorage methods, hardware, and installation procedures, including specific requirements where indicated.
   1. Coordinated Shop Drawings: Coordinate Shop Drawings with shop drawings of other Sections of related Work.
   2. Indicate materials and wood species, component profiles, fastening, jointing, details, finishes and accessories.
   3. For Work to receive matched wood veneers, show veneer leaves with dimensions, grain direction, exposed face, and identification numbers indicating the flitch and sequence within the flitch for each leaf.
4. Show locations and sizes of furring, blocking, and hanging strips, including concealed blocking and reinforcement specified in other Sections.
5. Indicate special requirements for field assembly and installation, including field connection locations, required clearances and tolerances.
6. Indicate provisions for attachment of architectural woodwork and other components performed by others in the field.
7. Indicate locations of plumbing and electrical service field conditions.

C. Samples: Submit full-size units or Samples of sizes indicated, prepared from same material to be used for the Work, with shop-applied transparent finish, that show full range of color and texture variations expected.
   1. Hardwood with Transparent Finish (WD-1): Submit set of at least three units exhibiting approximate limits of variations in color, pattern, texture, or other characteristics inherent in material or product. Apply finish to all faces and edges.
      a. Solid Hardwood with: 3” wide by 12” long,
      b. Hardwood Veneer: 12” by 12”, representative of and selected from actual flitches to be used for Project.
   2. Hardwood Veneered Panels with Transparent Finish for (WD FAB-1,4,5,6,8): 48 inches by 48 inches, with veneers representative of and selected from actual flitches to be used for Project. Include at least one face-veneer seam and finish as specified.
   3. Other Wood and Surfacing Samples: Submit 12 by 12 inch sample for each type, color and finish, with one edge treatment or profile as specified.
      a. (WD-5) Woodwork with Opaque Finish.
      b. (PLAM) Plastic Laminates .
      c. (SSF) Solid Surfacing.
   4. Cabinet Unit Samples: Units may be used as part of work if approved.
      a. Base cabinet with door, drawer, countertop and hardware.
      b. Wall-hung upper cabinet with door and shelf.
   5. Accessories and Hardware: Submit samples of hardware, accessories, and components of wood fabrications and casework.

1.4 INFORMATIONAL SUBMITTALS
A. Qualification Data: For Fabricator and Installer.
B. Evaluation Reports: For fire-retardant-treated materials, from ICC-ES.
C. Site Conditions Reports: Relative humidity and temperature readings taken before, during and after installation. Include readings taken in areas where woodwork is stored on site prior to installation.

1.5 QUALITY ASSURANCE
A. Fabricator and Installer Qualifications:
   1. Fabricator Qualifications: A well-established and experienced fabricator, acceptable to Owner and Architect, employing skilled workers to custom-fabricate millwork, casework and other architectural woodwork similar to that required for this Project, whose Work meets or exceeds quality requirements of specified NAAWS Grade, and whose completed Work has a record of successful in-service performance.
   2. Installer Qualifications: A well-established installer with experience installing millwork, casework, finish carpentry work, and other custom-fabricated woodwork similar to that required for this Project, whose Work meets or exceeds quality requirements of specified NAAWS Grade, and whose completed Work has a record of successful in-service performance.
3. Architect reserves the right to reject woodwork fabricator if it is Architect's opinion that previous performance by fabricator has been unsatisfactory, or if any of the following will not result in required quality within time required for completion:
   a. Shop capacity.
   b. Experience of workers.
   c. Equipment or supply of material.
   d. Previous performance by fabricator has been unsatisfactory.

B. Welding Qualifications: Qualify procedures and personnel in accordance with American Welding Society’s AWS D1 “Structural Welding Code.”

1.6 MOCKUPS
A. Mockups: Provide the following mockups as described below and as directed by Architect. See Section 014339 - Mockups for more information
   1. (WD FAB-1) Sliding Pocket Doors
   2. (WD FAB-3) Flush Wood Panels
   3. (WD FAB-4) Articulated Wood Panels
   4. (WD FAB-6) Proscenium Grille
   5. (WD FAB-7) Valade Grille
   6. (WD FAB-8) Diffusive Panels

1.7 SITE CONDITIONS
A. Delivery, Handling and Storage: Protect woodwork items from damage, dust and dirt. Do not deliver, receive, store or install woodwork materials until storage and installation areas are conditioned in accordance with requirements and recommendations of NAAWS.

B. Environmental Requirements: Use permanent HVAC system or provide temporary systems and controls to establish and maintain site conditions complying with specified requirements.
   1. Do not deliver, receive, store or install architectural woodwork until building is enclosed, wet work is complete, and temporary or permanent HVAC systems are operating in areas where woodwork is stored and installed, and are maintaining temperature and relative humidity at occupancy levels and within the following ranges during the remainder of the construction phase:
      a. Temperature Range: Between 60 and 90 deg F.
      b. Relative Humidity Range: Between 45 and 55 percent.
   2. Fluctuation of Temperature and Relative Humidity Levels: Maintain operation and control of heating, cooling, humidity, ventilation, temporary barriers and similar facilities continuously on a 24-hour basis to avoid rapidly fluctuating ambient levels.
      a. Do not exceed 15 percent fluctuation over any portion of a 7-day period. Do not exceed 25 percent fluctuation over any portion of a 28-day period.
   3. Site Conditions Report: Monitor temperature and relative humidity in areas where woodwork is stored and installed at Project site. Measure and record temperature and relative humidity prior to delivery, throughout storage period and installation, and after installation until time of Substantial Completion. Report recorded values in accordance with Submittals requirements.

C. Field Measurements: Where woodwork is indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication, and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
   1. Locate concealed framing, blocking, and reinforcements that support woodwork by field measurements before being enclosed, and indicate measurements on Shop Drawings.
2. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating woodwork without field measurements. Provide allowance for trimming at site, and coordinate construction to ensure that actual dimensions correspond to established dimensions.

PART 2 PRODUCTS

2.1 ARCHITECTURAL WOODWORK, GENERAL

A. Quality Standards: Provide custom-fabricated architectural woodwork, casework, millwork and other assemblies that are fabricated and installed in accordance with the North American Architectural Woodwork Standards, Adopted and Published jointly by Architectural Woodwork Institute, Architectural Woodwork Manufacturer’s Association of Canada and Woodwork Institute - Current Edition (NAAWS).

1. Comply with requirements of specified NAAWS Grade except where more stringent requirements are indicated in the Contract Documents.

B. Acoustical Performance Requirements for Architectural Woodwork in Acoustically-Critical Spaces:

1. Comply with requirements of Section 018198 - Facility Acoustic Performance Requirements.
2. The following characteristics are not acceptable or permitted in final installed Work:
   a. Vibration harmonics, buzzing, rattling or squeaking.
   b. Noises caused by movement of components;
   c. Loosening, weakening, or fracturing of system components or attachments.

2.2 WOOD MATERIALS

A. Wood Materials, General:

1. Provide specified wood and other materials recommended by fabricator and in compliance with specified NAAWS Grade.
2. Fire-Retardant-Treated Materials: Where fire-retardant-treated materials are indicated, use fire-retardant-treatment formulations that do not bleed through or otherwise adversely affect finishes. Do not use colorants to distinguish treated materials from untreated materials.
3. Wood Moisture Content: 5 to 10 percent.
4. Provide wood products made with binder containing no urea formaldehyde,
5. Dimensions: As indicated on Drawings.
6. Sheathing Thickness: As needed to comply with requirements specified, but not less than thickness indicated.
7. Miscellaneous Lumber: DOC PS 20 and applicable grading rules of inspection agencies certified by ALSC's Board of Review.
8. Dimension Lumber Items: Standard, Stud, or No. 3 grade lumber .
   a. Class B or Class A Flame Spread Rating: Vesta FR by Sierra Pine.
   b. Class C Flame Spread Rating: Arreis by Sierra Pine.
14. Furring, Blocking, Shims, and Hanging Strips: Fire-retardant-treated softwood lumber, kiln dried to less than 15 percent moisture content.

1. Source Limitations: The intent of this requirement is to ensure matching of wood species and finishes by providing solid wood and wood veneers of like species from a single source with resources to provide materials of consistent quality in appearance and physical properties, and by shop-finishing woodwork in single shop using one process for each finish type.
   a. Engage a qualified woodworking firm to assume undivided responsibility for finishing all WD-1 woodwork.
   b. Supply wood veneer facing materials and finishing for wood doors required to be matched with architectural woodwork. Coordinate with Section 081400 - Flush Wood Doors.

2. Shop-Applied Transparent Finish System: Provide wood materials with finish system as specified below and matching Architect’s sample.
   b. First Coat, Stain: Deep penetrating, low VOC, one-coat, UV stable stain.
      1) Product: Sansin Purity Interior Stain.
   c. Second and Third Coats, Build-Up: Deep penetrating, clear, low VOC, UV resistant finish.
      1) Product: Sansin Purity Interior Glacier Finish.
   d. Fourth Coat, Finish: Deep penetrating, clear, low VOC, UV and wear resistant finish.

3. Veneer Matching:
   b. Matching within Panel Face: Center-balance match.
   c. Panel-Matching Method: Blueprint-matched panels and components within each separate area.
   d. Vertical Panel-Matching Method: Continuous match; veneer leaves of upper panels are continuations of veneer leaves of lower panels. At wood panel transoms over wood doors, provide continuous match between door and transom (If applicable).

4. Solid Hardwood Trim on Wood Fabrications: Match trim for compatibility of grain and color to itself and with veneers.

   1. Prefinished: Spray-apply primer and finish coats in shop, defer only final touchup, cleaning, and polishing until after installation.

D. (WD-5) Wood Materials for Opaque Painted Finish: Natural Birch or Poplar, finished in shop or in field.
   1. Field-Finishing: Shop-apply primer compatible with finishing system in accordance with Section 099000 - Painting.
   2. Prefinished: Spray-apply primer and finish coats in shop, defer only final touchup, cleaning, and polishing until after installation.

2.3 COMPONENTS & ACCESSORIES

A. Steel Sub-Framing and Supports: Welded steel framing and bracing as shown on Structural Drawings and as specified in Section 055000 - Metal Fabrications.
   1. Grind welded joints smooth.
2. Finish: Shop-primed and painted, color as selected by Architect. Coordinate with Section 099000 - Painting.

B. Anchors and Accessories: Stainless steel eye-bolt anchors, washers and other fabrication and installation accessories as shown; or other types as required by design engineer and approved by Architect.

C. Fasteners:
   1. Flathead Hex Wood Screw, black.
   2. Stainless steel fasteners with resilient neoprene washer.

D. Installation Accessories: Provide assembly hardware as shown on Drawings, or as recommended by Fabricator and approved by Architect.
   1. Mechanical Fasteners and Anchors: Use material, type, size and finish required for each substrate for secure anchorage and as recommended by architectural woodwork fabricator and installer.
      a. Provide concealed anchors unless otherwise indicated.
      b. Provide metal expansion sleeves or expansion bolts for post-installed anchors.
      c. Use nonferrous-metal or hot-dip galvanized anchors and inserts at inside face of exterior walls.

2. Adhesives: Do not use adhesives that contain urea formaldehyde. VOC Limits for Installation
   Use products that comply with the following limits for VOC content when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
      a. Special-Purpose Contact Adhesive (contact adhesive that is used to bond melamine covered board, metal, unsupported vinyl, rubber, or wood veneer 1/16 inch or less in thickness to any surface): 250 g/L.
      b. Wood Glues: 30 g/L.
      c. Multipurpose Construction Adhesives: 70 g/L.
      d. Contact Adhesive: 80 g/L.

2.4 WOOD FABRICATIONS

A. Architectural Woodwork Fabrications, General: Custom-fabricate, finish and install complete assemblies as indicated in Construction Documents and approved Submittals, including all components and accessories required for complete fabrication and installation. Coordinate with Work of other Sections as indicated and as required to complete the Work.
   2. Dimensions and Configurations: As specified below and as indicated on Drawings.
   3. Hardware and Accessories: Provide all assembly components, as indicated in approved Submittals, for complete installation and operability.

B. Configurations, Dimensions and Components: As indicated on Drawings and as described below:
   1. (WD FAB-1) Sliding Pocket Doors
   2. (WD FAB-3) Flush Wood Panels
   3. (WD FAB-4) Articulated Wood Panels
   4. (WD FAB-6) Proscenium Grille
   5. (WD FAB-7) Valade Grille
   6. (WD FAB-8) Diffusive Panels

C. Fabrication Adhesives: Type as recommended by woodwork fabricator and adhesive manufacturer for intended use. Do not use adhesives that contain urea formaldehyde.

D. Mounting Accessories:
   1. Provide concealed mounting as shown on Drawings.
2. Furring, Blocking, Shims, and Hanging Strips: Kiln dried to less than 15 percent moisture content.
3. Anchors: Select material, type, size, and finish required for each substrate for secure anchorage. Provide metal expansion sleeves or expansion bolts for post-installed anchors.

E. Concealed Fasteners for Panels: Provide corrosion resistant stainless steel, Type 316, mechanical fasteners meeting panel manufacturer’s requirements for fasteners to be used with metal mounting frame.

F. Finish Carpentry: Prefabricated or field-built custom interior carpentry millwork complying with NAAWS Premium Grade for construction, finishes, installation, and other requirements.
1. (WDB-1) Wood Wall Base: Solid WD-1, in profile and dimensions as shown on Drawings.
2. (WDB-5) Wood Wall Base: Solid WD-5, in profile and dimensions as shown on Drawings.

2.5 CABINETS AND COUNTERTOPS
A. Wood Veneer-Faced Cabinets with Transparent Finish:
   2. Type of Construction: Frameless.
   3. Door and Drawer Front Style: Flush overlay.
   4. Exposed, Semi-Exposed and Non-Exposed Wood Components: WD-1 and WD-2, as indicated on Drawings. Comply with veneer matching requirements as indicated in approved Shop Drawings.
   6. Type of Construction: Frameless.
   7. Door and Drawer Front Style: Flush overlay.
   8. Exposed, Semi-Exposed and Non-Exposed Wood Components: WD-5, as indicated on Drawings.

B. Plastic-Laminate-Faced Cabinets:
   2. (PLAM) Basis of Design: Refer to Material Identification List.
   3. Type of Construction: Frameless.
   4. Door and Drawer Front Style: Flush overlay.
   5. Cabinet, Door, and Drawer Front Interface Style: Flush overlay.
   6. High-Pressure Decorative Laminate: NEMA LD 3, grades as indicated or if not indicated, as required by woodwork quality standard.

C. Plastic-Laminate-Faced Countertops:
   2. (PLAM) Basis of Design: Refer to Material Identification List.
   3. High-Pressure Decorative Laminate: NEMA LD 3, Grade HGS; post forming grade (0.039” thick) High Pressure laminate counter top.
   4. Edge Treatment: Post-formed, matching laminate in color, pattern, and finish.

2.6 SOLID SURFACE FABRICATIONS
A. (SSF) Basis of Design: As indicated on Material Identification List.

B. Resinous Solid Surface: Homogeneous solid sheets of filled plastic resin complying with ANSI SS1.

C. Quartz Agglomerate Solid Surface: Solid sheets consisting of quartz aggregates bound together with a matrix of filled plastic resin and complying with the "Physical Characteristics of Materials" Article of ANSI SS1.
D. Adhesives, Sealants and Sealers: Comply with manufacturer’s written instructions for adhesives, sealants and sealers. Do not use adhesives that contain urea formaldehyde.
   1. Sealant: Silicone sealant as recommended by panel manufacturer for application to substrate.
   2. Sealers: As recommended by panel manufacturer for application to substrate.
   3. VOC Limits for Installation Adhesives and Glues, and for Primers and Sealers: Use installation adhesives with VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
   4. Fabrication: Prefabricate countertops in one piece with shop-fabricated edges. Comply with quartz agglomerate manufacturer’s written instructions for adhesives, sealers, fabrication, joining and finishing.

E. Fabrication: Fabricate countertops in shop to greatest degree possible, in one piece with shop-applied eased edges, and in accordance with the following requirements, unless otherwise shown on Drawings.
   1. Configurations: As shown.
   2. Backsplash: Standard single length solid surface pieces; longest length possible to minimize joints. Where indicated provide countertop with coved backsplash.
   3. Inside Corners: Square.
   4. Sinks: Install integral sink bowls in countertops in the shop.

2.7 WALL-MOUNTED SHELVES

A. Brackets for Wall-Mounted Countertops and Shelves:
   1. Provide mounting brackets as shown on Drawings, in size and weight capacity required for use.
      a. Coordinate with Sections 054000, 055000, 061000, 092216 and other applicable Sections for concealed backing, support and anchoring as shown on Drawings.
   2. Steel Supports for Lavatory and Workstations: Provide custom fabricated steel supports in compliance with Section 055000 - Metal Fabrications. Provide in sizes and shapes as shown on Drawings.
      a. Steel Tubing: ASTM A501 or ASTM A500.
      c. Finish: Prefinished or shop-primed for field finish.
   3. (BKT-1) Countertop Brackets: 5mm thick steel bar with 3/4 inch steel strut, holds 1000 lb. per pair, finish in epoxy coated finish in color as indicated or selected.
   4. (BKT-2) Workstation Brackets: 1/8 inch steel; 1-1/2 inch forms with multiple 1/4 inch mounting holes per side; reversible; color as selected by Architect from manufacturer’s standard colors.
      a. Sizes: As required by application.
      b. Capacity: 1,000 pounds minimum.

B. Adjustable Shelf Brackets and Standards: Heavy-duty, 12 ga. steel, zinc-plated.
   4. (B&S-1) Configuration: 3/4"t x 12"d PLAM shelf; painted steel HD brackets

2.8 CABINET HARDWARE AND ACCESSORIES

A. Hinges:
   1. (HDWR-H1): BHMA A156.9, B01361, fixed pin, five knuckle steel hinges, dull chrome, 2-3/4 inch by 0.095 thick.
   2. (HDWR-H2): BHMA A 156.9 B01602, concealed, all-metal hinges, 110 degree opening (unless otherwise noted) self-closing, 3-way adjustable
b. Provide 3 per leaf over 48 inches high, 2 per leaf elsewhere.

B. Door and Drawer Pulls:
1. (HDWR-P3): 106.74.913 by Hafele, aluminum, matte silver finish.

C. Drawer Slides: BHMA A156.9, cold rolled steel, zinc plated with positive stop and full extension.
Provide products with rolling steel balls, nylon rollers meeting or exceeding the following requirements, unless otherwise indicated:
1. (HDWR-S1): Minimum 75 lb. load rating, for use at drawers 16-inches wide or less.
2. (HDWR-S2): Minimum 100 lb. load rating, for use at drawers 24-inches wide or less.
3. (HDWR-S3): Minimum 150 lb. load rating, for use at drawers greater than 24-inches wide, at deep drawers, and drawers with file folder racks.

D. Door Locks: BHMA A156.11, E07121.

E. Drawer Locks: BHMA A156.11, E07041.

F. Shelf Rests, Typical: BHMA A156.9, B04013.

G. Adjustable Shelf Standards and Supports: BHMA A156.9, B04071; with shelf rests, B04081.

H. Cable Passage Grommets: Provide cord grommets in sizes shown, and in color as selected by Architect.
1. (GROM-1) Plastic Grommet Liner and Cap: SG Series or EDP Series by Doug Mockett.
3. (GROM-3) Wood Grommet Cap, No Liner: WG Series by Doug Mockett, matching (WD-__).
5. (GROM-5) Type: TG Series by Doug Mockett; White 95 or Black 90, as selected.

I. Glass Lites for Cabinetwork Doors: (GL-1T) fully-tempered clear float glass; 1/4-inch thickness; ASTM C1036, Type I (transparent glass, flat), Class 1 (clear), Quality q3 (glazing select), and heat-treated to comply with ASTM C1048, Kind FT (fully tempered); with ground and polished flat edges.

2.9 FABRICATION

A. General: Fabricate Work of this Section using materials and methods in accordance with specified NAAWS Grade, and in accordance with reviewed Shop Drawings.
1. Complete fabrication in shop, including component assembly, finishing, and hardware application, to maximum extent possible before shipment to Project site.
2. Join and assemble work to provide durable, strong, rigid units that will not warp or rack during shipping and installation.
3. Disassemble components only as necessary for shipment and installation. Allow for easy handling and passage through building openings.
4. Where necessary for fitting at site, provide ample allowance for scribing, trimming, and fitting.
5. Woodwork in Spaces without Humidification Control: Fabricate Work as necessary to protect installed Work from moisture and damage due to movement and dimensional changes associated with fluctuating temperature and relative humidity levels during construction and after Substantial Completion.

B. Trial fit assemblies at fabrication shop that cannot be shipped completely assembled. Install dowels, screws, bolted connectors, and other fastening devices that can be removed after trial fitting. Verify that various parts fit as intended and check measurements of assemblies against field measurements indicated on Shop Drawings before disassembling for shipment.
C. Shop cut openings, to maximum extent possible, to receive hardware, appliances, plumbing fixtures, electrical work, and similar items. Locate openings accurately and use templates or roughing-in diagrams to produce accurately sized and shaped openings. Sand edges of cutouts to remove splinters and burrs.

D. Metal Framing and Supports:
   1. Welded Connections: Comply with AWS for recommended practices in shop welding. Weld behind finished surfaces without distorting or discoloring exposed side. Clean exposed welded joints of flux, and dress exposed and contact surfaces.
   2. Non-Welded Connections: Fabricate for interconnection of members by means of mechanical fasteners and fittings unless otherwise indicated.

E. Shop Finishing: Pre-finish architectural woodwork at fabrication shop as specified in this Section. Defer only final touchup, cleaning, and polishing until after installation.
   1. Preparation for Finishing: Comply with referenced quality standard for sanding, filling countersunk fasteners, sealing concealed surfaces, and similar preparations for finishing architectural wood cabinets, as applicable to each unit of work.
   2. Pre-finish woodwork at shop, defer only final touchup, cleaning, and polishing until after installation. Finish all surfaces, faces and edges of woodwork. Back-prime concealed surfaces with two coats of sealer or primer.
   3. Backpriming: Apply two coats of sealer or primer, compatible with finish coats, to concealed surfaces. Concealed surfaces of plastic-laminate-clad paneling do not require backpriming when surfaced with plastic laminate.
   4. Primer Application on Steel Framing: Apply shop primer to prepared surfaces of items unless otherwise indicated. Comply with requirements in SSPC-PA 1, “Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel,” for shop painting. Primer need not be applied to surfaces to be embedded in concrete or masonry.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examination and Acceptance of Conditions: Before proceeding with installation, take field measurements, examine substrates, measure temperature and relative humidity and other conditions.
   1. Verify that mechanical and electrical items affecting this section are properly placed, complete, and have been inspected by Architect prior to commencement of installation.
   2. Proceed with installation only after unsatisfactory conditions have been corrected and after building temperature and relative humidity are within specified range. Proceeding with the Work indicates acceptance of surfaces and site conditions.

B. Material Moisture Content and Environmental Requirements: Install products at the time and under conditions that will ensure the best possible results and maintain conditions until Substantial Completion.
   1. Comply with recommendations of NAAWS.
   2. Conditioning: Before installation, condition wood materials and cabinets in accordance with specified site condition requirements.
      a. Do not install unconditioned wood materials and assemblies.
      b. Reject materials that are wet, moisture damaged or mold damaged.

C. Substrate: Before proceeding with installation, examine substrate to receive work for compliance with requirements for installation tolerances and other conditions affecting performance. Installer must approve substrate prior to installation.
D. Field Measurements: Take field measurements as required to fit the Work properly. Recheck measurements before installing each product.
   1. Where portions of the Work are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication.
   2. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
   3. Verify space requirements and dimensions of items shown diagrammatically on Drawings.

3.2 INSTALLATION

A. General: Install architectural woodwork in accordance with North American Architectural Woodwork Standards (NAAWS) and in accordance with approved Shop Drawings.
   1. Install products at the time and under conditions that will ensure the best possible results. Maintain conditions required for product performance until Substantial Completion.
   2. Install free from hammer or tool marks, open joints, slivers or other defects detrimental to appearance or performance.
   3. Set plumb, level, square and true to dimensions shown and required. Allow for finishes and proper clearances where necessary. Use concealed shims where required for alignment.
   4. Tolerances: Install to tolerance of 1/8 inch in 96 inches for level and plumb. Install adjoining work with 1/32-inch maximum offset for flush installation and 1/16-inch maximum offset for reveal installation.
   5. Scribe and cut to fit adjoining work, refinish cut surfaces, and repair damaged finish at cuts.
   6. Coordinate with materials and systems in and adjacent to woodwork and provide cutouts for mechanical and electrical items that penetrate exposed surfaces of trim and rails.
   7. Shop-Fabricated Work: Before installing, examine shop-fabricated work for completion. Assemble shop fabricated work and complete fabrication at Project site to the extent that it was not completed in the shop. Backprime unfinished surfaces that are concealed when installed.
   8. Do not use materials that are unsound, warped, improperly treated or finished, inadequately seasoned, or too small to fabricate with proper jointing arrangements.

B. Anchorage: Adequately anchor, fasten and support members to form secure, substantial and accurate work and to hold required dimensions and prevent twist.
   1. Coordinate installation of anchorages. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors, that are to be embedded in concrete or masonry. Deliver such items to Project site in time for installation.
   2. Provide blocking, attachment plates, anchors and fasteners of adequate size and number to securely anchor each component in place, accurately located and aligned with other portions of the Work.
   3. Provide anchorage type required to accommodate expected movement of wood due to changes in relative humidity without permanent damage to the wood and other components.

C. Fitting: Fit exposed connections together to form hairline joints. Where joint locations in exposed work are not indicated, arrange joints for the best visual effect as determined by Architect.
   1. Provide joints to accommodate expected movement and expansion of woodwork due to changes in relative humidity.

D. Finish Carpentry, Millwork, Wall Base, Trim:
   1. Anchor to blocking built in or directly attached to substrates. Secure with countersunk, concealed fasteners and blind nailing.
   2. Install with minimum number of joints possible, using full-length pieces to greatest extent possible.
   3. Miter corners, countersink nails, drill holes for nails in hardwood.
E. Architectural Wood Fabrications: Install woodwork assemblies in accordance with approved Shop Drawings.

F. Wood Panels: Anchor woodwork to supporting substrate with concealed panel-hanger clips and by blind nailing on backup strips, splined-connection strips, and similar associated trim and framing.
   1. Do not face nail exposed surfaces unless otherwise indicated.
   2. Face-Nailing: Install prefinished boards with butt joints, and use finishing nails for exposed work. Finished work shall be free of hammer marks or open joints.
      a. After installation of woodwork with exposed fasteners, fill exposed nail holes flush with matching filler, sand as needed and touch-up finishes.

G. Solid Surfacing: Install solid surfacing in accordance with approved Shop Drawings and solid surfacing Manufacturer's written instructions and recommendations.

H. Cabinetwork: Install cabinets in accordance with requirements of same NAAWS Grade as item was fabricated.
   1. Install without distortion so doors and drawers fit openings properly and are accurately aligned. Adjust hardware to center doors and drawers in openings and to provide unencumbered operation. Complete installation of hardware and accessory items as indicated.
   2. Anchor cabinets to anchors or blocking built in or directly attached to substrates. Secure with countersunk, concealed fasteners and blind nailing. Use fine finishing nails or finishing screws for exposed fastening, countersunk and filled flush with woodwork. For shop finished items use filler matching finish of items being installed.
   3. Maintain veneer sequence matching of cabinets with transparent finish.

I. Countertops: Anchor securely to base units and other support systems as indicated.

J. Wall-Mounted Shelving and Work-Surfaces: Install standards, brackets and other supports according to manufacturer's written instructions. Fasten to framing members, wood sheathing, wood blocking or metal backing, or use toggle bolts or hollow wall anchors.

K. Finishes: Touch up finishing work specified in this Section after installation of woodwork. Fill nail holes with matching filler where exposed.
   1. Apply specified finish coats including, back-priming, opaque paint, stains and paste fillers if any, to exposed surfaces where only sealer/prime coats are applied in shop.
   2. Refer to Section 099000 - Painting for final finishing of installed architectural woodwork not indicated to be shop finished, and for related brackets and other Work exposed to view.

3.3 INSTALLED WORK

A. Damaged or Non-Compliant Woodwork: Remove and replace materials that are damaged or do not comply with requirements.
   1. Damaged woodwork may be repaired or refinished only when resulting repair work complies with requirements and shows no evidence of repair or refinishing, as determined by Architect.
   2. Remove and replace woodwork materials that are wet, moisture damaged, or mold damaged.
   3. Replace, at no additional cost to Owner, materials that are damaged or that cannot be cleaned to satisfaction of Owner.

B. Adjusting: Adjust movable components of cabinetwork and woodwork assemblies to operate safely, smoothly, easily, and quietly, free from binding, warp, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range, and without binding or damaging assembly components. Lubricate hardware and moving parts. Adjust joinery for uniform appearance.
C. Cleaning: Clean and provide maintenance on completed construction as frequently as necessary through the remainder of the construction period.
   1. Clean interior finish carpentry on exposed and semi-exposed surfaces.
   2. Restore damaged or soiled areas and touch up factory-applied finishes, if any.
   3. Clean cabinetwork, counters, shelves, hardware, fittings and fixtures.

D. Protection: Provide final protection and maintain conditions that ensure installed Work is without damage or deterioration at time of Substantial Completion.
   1. Protect installed products from damage from moisture, dust, dirt and from effects of weather and changing site conditions, throughout construction.
   2. Comply with specified requirements for temperature and relative humidity. Continue to take readings and report until Substantial Completion.

E. Demonstration and Training: Instruct Owner's personnel to operate, adjust and maintain operable components of woodwork assemblies.

END OF SECTION
SECTION 071413

HOT FLUID-APPLIED RUBBERIZED ASPHALT WATERPROOFING

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Reinforced rubberized-asphalt waterproofing system (WP-1).
   2. Protection and drainage course, rigid insulation and flashing.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product, include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing.
   1. Detailed specification of construction and fabrication.
   2. Manufacturer's installation instructions, specifically written for this project including procedures and materials for flashing, splicing and bonding.

B. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins to adjoining waterproofing, and other termination conditions.
   1. Coordinate and provide transition details specific to Project between other adjacent materials including, but not limited to, existing Bentonite/Butyl and other existing waterproofing systems.

1.3 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer.

B. Field quality-control reports.

C. Sample Warranties: For special warranties.

1.4 QUALITY ASSURANCE

A. Installer Qualifications: A qualified firm that is approved, authorized, and/or licensed by waterproofing system manufacturer to install manufacturer's products and that is eligible to receive manufacturer's special warranty.

B. Pre-Installation Conference:
   1. Conduct conference at Project site.
   2. Review waterproofing requirements including surface preparation, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet
flashing, installation procedures, testing and inspection procedures, and protection and repairs.

C. Coordination: Coordinate Work of this Section with Work of other Sections for construction of mockups and for construction of permanent assemblies as indicated in the Construction Documents.

1. Coordinate Work of different Sections that depend on each other for proper installation, connection, and operation.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Store liquid materials in their original undamaged containers in a clean, dry, protected location and within the temperature range required by waterproofing manufacturer.

B. Remove and replace liquid materials that cannot be applied within their stated shelf life.

C. Protect stored materials from direct sunlight.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate, or when temperature is below 0 deg F.

1. Do not apply waterproofing in snow, rain, fog, or mist.

B. Maintain adequate ventilation during application and curing of waterproofing materials.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace waterproofing and sheet flashings that do not comply with requirements or that fail to remain watertight within specified warranty period.

1. Warranty Period: 10 years from date of Substantial Completion.

B. Special Installer's Warranty: Specified form signed by Installer, covering Work of this Section, for warranty period of two years.

1. Warranty includes removing and reinstalling protection board, drainage panels, and insulation.

PART 2 PRODUCTS

2.1 WATERPROOFING SYSTEM

A. Source Limitations: Provide components and accessories; including waterproofing membrane, sheet flashings, protection course, drainage course and insulation; by a single Manufacturer or as approved by Manufacturer for complete warranted waterproofing system.
B. Material Compatibility: Waterproofing materials shall be compatible with one another and adjacent materials under conditions of service and application required, as demonstrated by waterproofing manufacturer based on testing and field experience.

C. Performance Requirements: Installed waterproofing system shall withstand thermally induced movement and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Waterproofing system shall remain watertight.

D. (WP-1) Waterproofing System:

1. Surface Conditioner.
2. Waterproofing Membrane: Base coat of 90 mils thick hot fluid-applied rubberized asphalt; embedded reinforcing for 100 percent coverage, 60 mils embedded uncured neoprene sheet reinforcing at corners; coat of 90 mils hot fluid-applied rubberized asphalt.
3. Drainage Course: 1/4-inch thick HDPE with filter fabric.
4. Insulation: Extruded-polystyrene board.

E. Hot Fluid-Applied, Rubberized-Asphalt Waterproofing Membrane: Single component; 100 percent solids; hot fluid-applied, rubberized asphalt.

2. Other Products and Manufacturers:
   a. Ram Tough 250 by Barrett.
   b. CCW-500R by Carlisle Coatings and Waterproofing.
   c. 790-11 by Henry Company.
   d. Tremproof 6100 by Tremco.

F. Auxiliary Materials: Provide materials recommended by waterproofing manufacturer for intended use and compatible with waterproofing.

1. Primer: ASTM D 41, asphaltic primer,
2. Elastomeric Sheet: 50 mil minimum thickness, uncured neoprene sheet, as recommended by waterproofing system manufacturer.
3. Metal Termination Bars: Manufacturer’s standard, predrilled stainless-steel or aluminum termination bars; approximately 1 by 1/8 inch thick; with stainless-steel anchors.
4. Sealants and Accessories: Manufacturer’s recommended sealants and accessories.

G. Protection Course: Semi-rigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners, conforming to ASTM D 6506.

H. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 sieve, laminated to one side with or without a polymeric film bonded to the other side of a studded, nonbiodegradable, molded-plastic-sheet drainage core, with a vertical flow rate of 9 to 15 gpm/ft..

I. (INSUL-1) Unfaced Wall Insulation Drainage Panels: As specified in Section 072100 - Thermal Insulation.
3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

1. Verify that concrete has cured and aged for minimum time period recommended by waterproofing manufacturer.
2. Ensure substrate is clean and free of depressions, waves or projections and is properly sloped to drainage locations.
3. Ensure curbs, pipes, sleeves, ducts, and vents through substrate are solidly set.
4. Do not proceed until unsatisfactory conditions have been corrected.

B. Verify moisture content of substrate to ensure current moisture content is within membrane manufacturer's requirements.

1. Verify that substrate is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
2. Provide additional drying techniques or equipment to obtain compliance.

C. Bond Test: Apply a test patch of waterproofing membrane to the surface and check its adhesion, per manufacturer's recommendations.

3.2 SURFACE PREPARATION

A. Clean and prepare substrates according to manufacturer's written instructions. Provide clean, dust-free, and dry substrate for waterproofing application.

B. Remove grease, oil, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.

1. Abrasive blast clean concrete surfaces uniformly to expose top surface of fine aggregate according to ASTM D 4259 with a self-contained, recirculating, blast-cleaning apparatus. Remove material to provide a sound surface free of laitance, glaze, efflorescence, curing compounds, concrete hardeners, or form-release agents. Remove remaining loose material and clean surfaces according to ASTM D 4258.

3.3 JOINTS, CRACKS, AND TERMINATIONS

A. Prepare and treat substrates to receive waterproofing membrane, including joints and cracks, deck drains, corners, and penetrations according to manufacturer's written instructions.

1. Rout and fill joints and cracks in substrate. Before filling, remove dust and dirt according to ASTM D 4258.
2. Adhere strip of elastomeric sheet to substrate in a layer of hot rubberized asphalt. Extend elastomeric sheet a minimum of 6 inches on each side of moving joints and cracks or joints and
cracks exceeding 1/8 inch thick, and beyond deck drains and penetrations. Apply second layer of hot fluid-applied, rubberized asphalt over elastomeric sheet.

3. Embed strip of reinforcing fabric into a layer of hot rubberized asphalt. Extend reinforcing fabric a minimum of 6 inches on each side of nonmoving joints and cracks not exceeding 1/8 inch thick, and beyond roof drains and penetrations.

B. At expansion joints and discontinuous deck-to-wall or deck-to-deck joints, bridge joints with elastomeric sheet extended a minimum of 6 inches on each side of joints and adhere to substrates in a layer of hot rubberized asphalt. Apply second layer of hot fluid-applied, rubberized asphalt over elastomeric sheet.

3.4 FLASHING INSTALLATION

A. Install elastomeric sheets at terminations of waterproofing membrane according to manufacturer's written instructions.

B. Prime substrate with asphalt primer.

C. Install elastomeric sheet and adhere to substrates in a layer of hot rubberized asphalt.

D. Extend elastomeric sheet up walls or parapets a minimum of 8 inches above plaza-deck pavers and 6 inches onto deck to be waterproofed.

E. Install termination bars and mechanically fasten to top of elastomeric flashing sheet at terminations and perimeter of waterproofing.

3.5 MEMBRANE APPLICATION

A. Apply primer, at manufacturer's recommended rate, over prepared substrate and allow it to dry.

B. Heat and apply rubberized asphalt according to manufacturer's written instructions.

1. Heat rubberized asphalt in an oil- or air-jacketed melter with mechanical agitator specifically designed for heating rubberized asphalt.

C. Start application with manufacturer's authorized representative present.

D. Reinforced Membrane: Apply hot rubberized asphalt to substrates and adjoining surfaces indicated. Spread to a thickness of 90 mils; embed reinforcing fabric, overlapping sheets 2 inches; spread another 125-mil-thick layer to provide a uniform, reinforced, seamless membrane 215 mils thick.

E. Apply waterproofing over prepared joints and up wall terminations and vertical surfaces to heights indicated or required by manufacturer.

F. Cover waterproofing with protection course with overlapped joints before membrane is subject to backfilling.

3.6 PROTECTION COURSE INSTALLATION

A. Install protection board over membrane as soon as system will allow.
B. Cover waterproofing with protection course with overlapped joints before membrane is subject to construction or foot traffic.

3.7 DRAINAGE PANEL INSTALLATION

A. After electronic membrane integrity tests, specified under Field Quality Control below, are completed, install drainage board over membrane and protection board.

B. Place and secure drainage composite with geotextile facing away from wall or deck substrate, according to manufacturer's written instructions. Use methods that do not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed drainage composite during subsequent construction.

3.8 INSULATION INSTALLATION

A. Install [one or more layers of board insulation to achieve required thickness] [and] [insulation drainage panels] over waterproofed surfaces. Cut and fit to within 3/4 inch of projections and penetrations.

B. On vertical surfaces, set insulation units into rubberized asphalt according to manufacturer's written instructions.

3.9 FIELD QUALITY CONTROL

A. Manufacturer's Field Services: Membrane manufacturer's technical representative shall provide following field services during installation.

1. Pre-form a pre-installation examination and acceptance of substrate and surface preparation for each stage. Issue report.
2. Be present at initial start-up for each process. Confirm application rates and techniques. Issue report.
3. Issue summary report at completion of installation indicating manufacturer's acceptance of installed system and warranty conditions.

B. Testing Agency: Owner will engage a qualified testing agency to inspect substrate conditions, surface preparation, waterproofing application, protection, and drainage components, and to furnish reports to Architect.

3.10 INSTALLED WORK

A. Protect waterproofing from damage and wear during remainder of construction period.

B. Protect installed insulation from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

C. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.
END OF SECTION
SECTION 071700

BENTONITE WATERPROOFING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Bentonite and HDPE waterproofing system (WP-2).
   2. Bentonite waterproofing accessories.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, and installation instructions.
   2. Include manufacturer's written instructions for evaluating, preparing, and treating substrate.
B. Shop Drawings: Include installation details for waterproofing, penetrations, and interface with other work.
C. Samples: Submit sample of bentonite waterproofing panel in accordance with Section 013300.
   1. Waterproofing: 6 inches square.
   2. Protection Course: 6 inches square.

1.3 INFORMATIONAL SUBMITTALS
A. Product Certificates: For each type of waterproofing material.
B. Preconstruction Test Reports: For water samples taken at Project site along with recommendations resulting from these tests.
C. Field quality-control reports.
D. Sample Warranty: For manufacturer's special warranty.

1.4 QUALITY ASSURANCE
A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer, with a minimum of 2 years’ experience in installing bentonite clay waterproofing products
B. Pre-Installation Conference: Conduct conference at Project site. Review waterproofing requirements, including surface preparation, substrate condition and pretreatment, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.
C. Mockups: Build mockups to set quality standards for fabrication and installation.
   1. Build mockup of installation on typical vertical and horizontal surfaces, 10 sq. ft. in size.
   2. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
D. Preinstallation Conference: Conduct conference at Project site.

1.5 DELIVERY, STORAGE, AND HANDLING
A. Deliver materials to Project site in manufacturer's original unopened and undamaged containers.
B. Store materials in a dry, well-ventilated space.
C. Remove and replace bentonite materials that have been prematurely exposed to moisture.

1.6 FIELD CONDITIONS
A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit bentonite waterproofing to be installed according to manufacturer's written instructions and warranty requirements.
   1. Do not apply waterproofing materials to surfaces where ice or frost is visible. Do not apply bentonite waterproofing materials in areas with standing water.
   2. Do not place bentonite clay products in panel or composite form on damp surfaces unless such practice is approved in writing by manufacturer.

1.7 WARRANTY
A. Special Warranty: Manufacturer and Contractor agree to provide labor and materials to repair or replace waterproofing components that do not comply with specified performance requirements or that fail in materials or workmanship within specified warranty period, and to provide such corrections at no cost to Owner and without disruption of Owner’s daily operations.
   1. Warrant that installed waterproofing system shall be free of defects including waterproofing failure resulting from substrate cracking up to 1/8 inch.
   2. Manufacturer's standard warranty covering materials.
   3. Applicator's standard warranty covering workmanship.
   4. Warranty Period: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 WATERPROOFING SYSTEMS
A. Provide complete waterproofing system in accordance with waterproofing Manufacturer's recommendations and requirements for warranty.
B. Source Limitations: Provide system components and accessories by waterproofing Manufacturer or as approved by manufacturer, including bentonite clay granules, mastic, drainage composites, and other accessories.
C. Material Compatibility: Waterproofing materials shall be compatible with one another and adjacent materials under conditions of service and application required, as demonstrated by waterproofing manufacturer based on testing and field experience.
D. Performance Requirements: Installed waterproofing system shall withstand thermally induced movement and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Waterproofing system shall remain watertight.

2.2 COMPOSITE HDPE/BENTONITE WATERPROOFING
A. (WP-2) Provide one of the following as suited for application and Project conditions:
   1. Composite HDPE/Bentonite Membrane:
      a. Minimum 90-mil- thick membrane consisting of a 12-mil- thick, HDPE geomembrane liner bonded to a layer of bentonite clay granules 78 mils thick.
      c. Vapor Permeance: 0.030 perms according to ASTM E 96.
      d. Products and Manufacturers:
         1) Swelltite by CETCO.
         2) TegraTite by TegraSeal.
         3) Paraseal by Tremco.
2. Composite HDPE/Bentonite Membrane with Protective Facing:
   a. Minimum 170-mil-thick membrane consisting of HDPE geomembrane liner bonded to a layer of bentonite clay granules and with a spun polypropylene facing.
   c. Vapor Permeance: 0.031 perms according to ASTM E 96.
   d. Manufacturers and Products:
      1) TegraTite Plus by TegraSeal.
      2) Paraseal LG by Tremco.

2.3 INSTALLATION ACCESSORIES

A. Granular Bentonite: Sodium bentonite clay containing a minimum of 90 percent montmorillonite (hydrated aluminum silicate), with a minimum of 90 percent passing a No. 20 sieve.

B. Granular Bentonite Tubes: Manufacturer's standard 2-inch-diameter, water-soluble tube containing approximately 1.5 lb/ft. of bentonite; hermetically sealed; designed specifically for placing on wall footings at line of joint with exterior base of wall.

C. Bentonite Mastic: Trowelable consistency, bentonite compound, specifically formulated for application at joints and penetrations.

D. Termination Bar: Formed-stainless-steel bars with upper flange to receive sealant.

E. Sealants: As recommended in writing by waterproofing manufacturer. Comply with requirements specified in Section 079000 - Joint Protection.

F. Tapes: Waterproofing manufacturer's recommended tape for joints between sheets, membranes, or panels.

G. Adhesive: Water-based adhesive used to secure waterproofing to both vertical and horizontal surfaces.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for substrate preparations affecting performance of bentonite waterproofing.

B. Verify that substrate is complete and that work that will penetrate waterproofing is complete and rigidly installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Coordinate work in the vicinity of waterproofing to ensure proper conditions for installing the waterproofing system and to prevent damage to waterproofing after installation.

B. Formed Concrete Surfaces: Remove fins and projections. Fill voids, rock pockets, form-tie holes, and other defects with bentonite mastic or cement grout patching material according to manufacturer's written instructions.

C. Horizontal Concrete Surfaces: Remove debris, standing water, oily substances, mud, and similar substances that could impair the bonding ability of concrete or the effectiveness of waterproofing. Fill voids, cracks greater than 1/8 inch, honeycomb areas, and other defects with bentonite mastic or cement grout patching material according to manufacturer's written instructions.
D. Excavation Support and Protection System: If water is seeping, use plastic protection sheets or other suitable means to prevent wetting the bentonite waterproofing. Fill minor gaps and spaces 1/8 inch wide or wider with wood, metal, concrete, or other appropriate filling material. Cover or fill large voids and crevices with cement mortar according to manufacturer's written instructions.

3.3 INSTALLATION, GENERAL

A. Prepare substrates, voids, cracks, and cavities; and install waterproofing and accessories according to manufacturer's written instructions.

1. Before installing, verify the correct side of waterproofing that shall face substrate surface.
2. Apply granular bentonite around penetrations in horizontal surfaces and changes in plane according to manufacturer's details in preparation for bentonite tubes and mastic.
3. Apply bentonite tubes, bentonite mastic, or both at changes of plane, construction joints in substrate, projections, and penetrations.
4. Prime concrete substrates. Primer may be omitted on concrete surfaces that comply with manufacturer's written requirements for dryness, surface texture, and freedom from imperfections.

B. Apply bentonite tubes continuously on footing against base of wall to be waterproofed.

C. Protect waterproofing from damage and wetting before and during subsequent construction operations. Repair punctures, tears, and cuts.

D. Install protection course before backfilling or placing overburden when recommended in writing by waterproofing manufacturer.

E. Place and secure molded-sheet drainage panels according to manufacturer's written instructions. Use adhesives or another method that does not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed molded-sheet drainage panels during subsequent construction.

3.4 COMPOSITE HDPE/BENTONITE MEMBRANE INSTALLATION (WP-2)

A. General: Install a continuous layer of waterproofing membrane with ends and edges lapped a minimum of 4 inches. Stagger end joints between membranes a minimum of 24 inches. Seal joints with permanent seam tape.

B. Below Structural Slabs-on-Grade: Apply waterproofing membrane with HDPE side down and staple ends and edges.

1. Install under footings, grade beams, and pile caps; or continue waterproofing through key joints between footings and foundation walls, and extend a minimum of 8 inches up or beyond perimeter slab forms.
2. Protect waterproofing from damage caused by reinforcing bar supports with sharp edges.

C. Slabs: Starting at lowest point, install a continuous layer of waterproofing membrane, with ends and edges lapped a minimum of 2 inches.

D. Concrete Walls: Apply mastic around penetrations and form continuous 2-inch cant at intersection of footings and walls with mastic.

1. Starting at lowest point, install a layer of waterproofing membrane horizontally, extending a minimum of 6 inches onto the footing. Lap membrane ends and edges a minimum of 2 inches.
2. Secure membrane to wall with continuous adhesive or washer-headed fasteners, and tape terminations of membrane at grade.
3. Termination at Grade: Extend waterproofing membrane to finish grade as indicated. Secure top edge with termination bar. Apply sealant to top edge of termination bar.
E. Excavation Support and Protection (Permanent Shoring): Cut, clean, and treat tiebacks and similar projections. Encase tieback heads, rods, nuts, and plates according to waterproofing manufacturer's written instructions for each configuration. If water is present, cover shoring and lagging with plastic protection sheets; remove plastic sheets before placing concrete.

1. Starting at lowest point, install a layer of waterproofing membrane, with ends and edges lapped minimum of 4 inches and nailed to shoring.
2. Inspect and repair waterproofing membrane after reinforcing steel has been placed. Coordinate and control concrete placement to avoid damage to waterproofing.

3.5 FIELD QUALITY CONTROL
A. Inspection: Arrange for manufacturer's representative to inspect completed waterproofing installation before covering with other construction and provide written report that installation complies with manufacturer's written instructions.

1. Remove and replace applications of bentonite waterproofing where inspection indicates that it does not comply with specified requirements.

3.6 INSTALLED WORK
A. Protect installed waterproofing from precipitation or ground water until concrete pour is completed. Pour concrete as waterproofing installation is completed.

B. Protect waterproofing from damage by concrete pour or other causes. Repair damage areas prior to concrete pour.

END OF SECTION
SECTION 072100

THERMAL INSULATION

1.1 SUMMARY

A. Section Includes:

   1. Extruded-polystyrene board (INSUL-1).

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.

1.3 INFORMATIONAL SUBMITTALS

A. Product Test Reports: For each product, for tests performed by a qualified testing agency.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Protect insulation materials from physical damage and from deterioration by moisture, soiling, and other sources. Store inside and in a dry location. Comply with manufacturer's written instructions for handling, storing, and protecting during installation.

   B. Protect plastic insulation as follows:

      1. Do not expose to sunlight, except to extent necessary for period of installation and concealment.
      2. Protect against ignition at all times. Do not deliver plastic insulating materials to Project site before installation time.
      3. Complete installation and concealment of plastic materials as rapidly as possible in each area of construction.

PART 1 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: Provide insulation and related materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify materials with appropriate markings of applicable testing and inspecting agency.

B. INSUL-26: Mineral-fiber, semi-rigid board; RockWool CavityRock

C. INSUL-30: Polyurethane foam, spray-applied, closed-cell

2.2 EXTRUDED-POLYSTYRENE BOARD INSULATION

A. (INSUL-1) Extruded Polystyrene Board Drainage Panels (Below Grade): ASTM C 578, Type IV, 25-psi minimum compressive strength; unfaced; fabricated with shiplap or channel edges and with one side having grooved drainage channels.

1. Surface Burning Characteristics: Maximum flame-spread and smoke-developed indexes of 25 and 450, respectively, per ASTM E 84.
2. Products and Manufacturers:
   a. Styrofoam SE by Dow Chemical.
   b. Foamular 250 by Owens Corning.
   c. Certifoam by DiversiFoam Products.
   d. GreenGuard CM by Pactiv Building Products.

2.3 SEMI-RIGID MINERAL WOOL

1. Basis of Design: CavityRock by Roxul Inc..
2. Performance Requirements:
   a. Thermal Resistance, ASTM C518: R-value per inch at 75° F = 4.3 hr. ft². F/BTU.
   b. Moisture Absorption, ASTM C1104: 0.07 percent, maximum.
   d. Flame Spread Index, ASTM E84: 0, maximum.
   e. Smoke Developed Index, ASTM E84: 0, maximum.

2.4 SPRAY POLYURETHANE FOAM INSULATION

A. (INSUL-30) Closed-Cell Polyurethane Foam Insulation: ASTM C 1029, Type II.

1. Manufacturers:
   a. BASF Corporation.
   b. Dow Chemical Company.
   c. Henry Company.

2. Minimum density of 1.5 lb/cu. ft., thermal resistivity of 6.2 deg F x h x sq. ft./Btu x in. at 75 deg F.
3. Fire Characteristics per ASTM E84:
   a. Maximum flame-spread of 75
   b. Maximum smoke-developed indices of 450
2.5 INSULATION FASTENERS

A. Products: Subject to compliance with requirements, provide one of the following:

1. Adhesively Attached, Spindle-Type Anchors:
   a. AGM Industries, Inc.; Series T TACTOO Insul-Hangers.
   b. Eckel Industries of Canada Limited; Stic-Klip Type N Fasteners.
   c. Gemco; Spindle Type.

2. Adhesively Attached, Angle-Shaped, Spindle-Type Anchor:
   a. Gemco; 90-Degree Insulation Hangers.

3. Insulation-Retaining Washers:
   a. AGM Industries, Inc.; RC150.
   b. AGM Industries, Inc.; SC150.
   c. Gemco; Dome-Cap.
   d. Gemco; R-150.
   e. Gemco; S-150.

4. Insulation Standoff:
   a. Gemco; Clutch Clip.

5. Anchor Adhesives:
   a. AGM Industries, Inc.; TACTOO Adhesive.
   b. Eckel Industries of Canada Limited; Stic-Klip Type S Adhesive.
   c. Gemco; Tuff Bond Hanger Adhesive.

B. Adhesively Attached, Spindle-Type Anchors: Plate welded to projecting spindle; capable of holding insulation of thickness indicated securely in position indicated with self-locking washer in place; and complying with the following requirements:

1. Plate: Perforated galvanized carbon-steel sheet, 0.030 inch (0.762 mm) thick by 2 inches (50 mm) square.

2. Spindle: Copper-coated, low carbon steel, fully annealed, 0.105 inch (2.67 mm) in diameter, length to suit depth of insulation indicated.

C. Adhesively Attached, Angle-Shaped, Spindle-Type Anchors: Angle welded to projecting spindle; capable of holding insulation of thickness indicated securely in position indicated with self-locking washer in place; and complying with the following requirements:

1. Angle: Formed from 0.030-inch- (0.762-mm-) thick, perforated, galvanized carbon-steel sheet with each leg 2 inches (50 mm) square.

2. Spindle: Copper-coated, low carbon steel, fully annealed, 0.105 inch (2.67 mm) in diameter, length to suit depth of insulation indicated.

D. Insulation Standoff: Spacer fabricated from galvanized mild-steel sheet for fitting over spindle of insulation anchor to maintain air space of dimension indicated between face of insulation and substrate to which anchor is attached.
E. Anchor Adhesive: Product with demonstrated capability to bond insulation anchors securely to substrates indicated without damaging insulation, fasteners, and substrates.

PART 2 EXECUTION

3.1 PREPARATION

A. Clean substrates of substances that are harmful to insulation, including removing projections capable of puncturing insulation or vapor retarders, or that interfere with insulation attachment.

3.2 INSTALLATION

A. Comply with insulation manufacturer's written instructions applicable to products and applications.

B. Provide sizes to fit applications and selected from manufacturer's standard thicknesses, widths, and lengths. Apply single layer of insulation units unless multiple layers are otherwise shown or required to make up total thickness or to achieve R-value.

C. Install insulation that is undamaged, dry, and unsoiled and that has not been left exposed to ice, rain, or snow at any time.

D. Cut and trim insulation neatly to fit spaces. Butt edges and ends tight. Fit insulation tight against mechanical, electrical and other items which protrude through plane of insulation.

E. Extend insulation to envelop entire area to be insulated. Fit tightly around obstructions and fill voids with insulation. Remove projections that interfere with placement.

F. Water-Piping Coordination: If water piping is located on inside of insulated exterior walls, coordinate location of piping to ensure that it is placed on warm side of insulation and insulation encapsulates piping.

G. Anchor Installation: Install board insulation on concrete substrates by adhesively attached, spindle-type insulation anchors as follows:

1. Fasten insulation anchors to concrete substrates with insulation anchor adhesive according to anchor manufacturer's written instructions. Space anchors according to insulation manufacturer's written instructions for insulation type, thickness, and application.

2. Apply insulation standoffs to each spindle to create cavity width indicated on Drawings between concrete substrate and insulation.

3. After adhesive has dried, install board insulation by pressing insulation into position over spindles and securing it tightly in place with insulation-retaining washers, taking care not to compress insulation.

4. Where insulation will not be covered by other building materials, apply capped washers to tips of spindles.

H. Adhesive Installation: Install with adhesive or press into tacky waterproofing or dampproofing according to manufacturer's written instructions.

I. Rigid Board Installation: Install rigid insulation to maintain continuous and complete thermal protection for building spaces and elements.
1. Install pads of adhesive spaced approximately 24 inches o.c. both ways on inside face and as recommended by manufacturer. Fit courses of insulation between wall ties and other obstructions, with edges butted tightly in both directions. Press units firmly against inside substrates.
2. Supplement adhesive attachment of insulation by securing boards with two-piece wall ties designed for this purpose and specified in Section 042000 - Unit Masonry.

3.3 INSTALLED WORK

A. Protection: Protect installed insulation and vapor retarders from damage due to harmful weather exposures, physical abuse, and other causes. Provide temporary coverings or enclosures where insulation is subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.

END OF SECTION
SECTION 072700
AIR BARRIER

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Complete air- and moisture-barrier assembly, including accessories and materials to bridge and seal air leakage pathways and gaps.

1.2 DEFINITIONS
A. Air-Barrier Material: A primary element that provides a continuous barrier to the movement of air.
B. Air-Barrier Accessory: A transitional component of the air barrier that provides continuity.
C. Air-Barrier Assembly: The collection of air-barrier materials and accessory materials applied to an opaque wall, including joints and junctions to abutting construction, to control air movement through the wall.

1.3 ACTION SUBMITTALS
A. Product Data: Submit manufacturer's instructions for surface conditioner compatibility, primer, mastic, membrane, temperature range for application of barrier materials.
B. Shop Drawings: For complete moisture barrier assemblies.
   1. Show locations and extent of air barrier. Include details for substrate joints and cracks, counterflashing strips, penetrations, inside and outside corners, terminations, and tie-ins with adjoining construction.
   2. Include details of interfaces with other materials that form part of air barrier.

1.4 INFORMATIONAL SUBMITTALS
A. Product Certificates: From air-barrier manufacturer, certifying compatibility of air barriers and accessory materials with Project materials that connect to or that come in contact with air barrier.
B. Compatibility:

1.5 QUALITY ASSURANCE
A. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
B. Manufacturer's Field Services: Where indicated, engage a factory-authorized service representative to inspect field-assembled components and equipment installation, including service connections. Report results in writing as specified in Section 013300 "Submittal Procedures."
C. Pre-Installation Conference: Prior to installation of barrier, conduct pre-installation conference at project site.
   1. Attendance: Contractor, job superintendent, subcontractors, supplier and manufacturer's technical representative.
   2. Agenda: Cover installation and coordination procedures, protective measures and related conditions.
   3. Review air-barrier requirements and installation, special details, mockups, air-leakage and bond testing, air-barrier protection, and work scheduling that covers air barriers.
D. Mockups: Provide materials and installation of air barrier for integrated mockup. Coordinate with Section 014339 - Mockups.
1.6 PRECONSTRUCTION TESTING

A. Preconstruction Adhesion and Compatibility Testing: Test for compliance with requirements for specified performance and test methods.
   1. Bond Strength: Test for cohesive and adhesive strength according to ASTM E 736. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
   2. Density: Test for density according to ASTM E 605. Provide density indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
   3. Verify that manufacturer, through its own laboratory testing or field experience, attests that primers or coatings are compatible with fireproofing.
   4. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
   5. For materials failing tests, obtain applied-fireproofing manufacturer's written instructions for corrective measures including the use of specially formulated bonding agents or primers.

1.7 PROJECT CONDITIONS

A. Do not apply barrier during inclement weather or when air temperature is below 40 degrees F., unless manufacturer's written application instructions indicate otherwise.

B. Do not apply barrier to damp, frozen, dirty, dusty, or surfaces unacceptable to manufacturer.

1.8 WARRANTY

A. Warranty shall provide for making good, within period of 3 years, at no cost to Owner, failures of barrier to resist penetration of water, except where such failures are:
   1. Result of structural failures of building.
   2. Cracking of membrane due to temperature or shrinkage is not considered as structural failure.

B. Repair and make good barrier membrane and pay for and repair or replace affected or damaged materials or surfaces at no cost to Owner.

1.9 COORDINATION

A. Coordinate installation of moisture barrier with other systems including interface conditions at window and door openings, and to other waterproofing systems.

B. Coordinate installation of assembly over moisture barrier to protect moisture barrier from UV exposure.

PART 2 PRODUCTS

2.1 ASSEMBLY REQUIREMENTS

A. General: Provide complete air- and moisture-barrier assembly meeting the following performance requirements:
   1. Performs as a drainage plane flashed to discharge liquid-water caused by incidental condensation or water penetration to the exterior.
   2. Performs as a continuous air-barrier and vapor-barrier.
   3. Accommodates substrate movement, sealing substrate expansion and control joints, construction material changes, penetrations, tie-ins to installed waterproofing and through-wall flashing, and transitions at perimeter conditions without deterioration and without air leakage exceeding specified limits.
   4. System Air Leakage Limit, ASTM E 283 or ASTM E 783: Maximum 0.04 cfm/sq. ft. of surface area at 1.57 lbf/sq. ft.
B. Source Limitations: Obtain primary moisture barrier assembly materials and accessories from single source from single manufacturer.

C. Material Compatibility: Assembly materials shall be compatible with one another and with adjacent materials, as demonstrated by manufacturer based on testing and field experience.

2.2 VAPOR, WATER & AIR BARRIER

A. Modified Bituminous Sheet: 40-mil-thick, self-adhering sheet consisting of 36 mils of rubberized asphalt laminated to a 4-mil-thick, cross-laminated polyethylene film with release liner on adhesive side; formulated for application with primer that complies with VOC limits of authorities having jurisdiction.

1. Physical and Performance Properties:
   a. Air Permeance, ASTM E 2178: Maximum 0.004 cfm/sq. ft. of surface area at 1.57-lbf/sq. ft. pressure difference.
   b. Water Vapor Permeance, ASTM E 96, Water Method: Maximum 0.10 perm.
   c. Tensile Strength, ASTM D 412, Die C: Minimum 250 psi.
   d. Ultimate Elongation, ASTM D 412, Die C: Minimum 200 percent.
   f. Water Absorption, ASTM D 570: Maximum 0.15 percent weight gain after 48-hour immersion at 70 deg F.

2. Products and Manufacturers:
   b. CCW-705 by Carlisle Coatings & Waterproofing.
   c. PW 100/40 AVB by Protecto Wrap Company.
   d. Sealight Air-Shield by W. R. Meadows Inc.
   e. ExoAir 110/110LT by Tremco.
   f. Blueskin SA by Henry Company.

2.3 ASSEMBLY ACCESSORIES

A. General: Provide compatible assembly components recommended by membrane manufacturer to produce a complete air- and moisture-barrier assembly.

B. Cleaner: As recommended by membrane manufacturer to clean substrates and surfaces to be lapped.

C. Primer: Use manufacturer's recommended solvent-based or water-based primers for concrete and concrete masonry substrates or glass-matt faced sheathing.

D. Flashing and Other Assembly Components:
   1. Substrate-Patching Membrane
   2. Crack Treatment Strips
   3. Joint Reinforcing Strips
   4. Counterflashing Strips
   5. Roof Termination Strips: For terminating at compatible roofing membrane.
   6. Opening Termination Strips: For terminating at windows, doors, curtain walls, and storefront systems.
   7. Termination Mastic.
   8. Adhesives and Tapes.

E. Joint Sealant: Provide joint sealants in compliance with Section 079200 - Joint Sealants.

F. Sprayed Polyurethane Foam Sealant: One- or two-component, foamed-in-place, polyurethane foam sealant, 1.5- to 2.0-lb/cu. ft. density; flame-spread index of 25 or less according to ASTM E 162; with primer and noncorrosive substrate cleaner recommended by foam sealant manufacturer.
G. Stainless-Steel Sheet: ASTM A 240, Type 304, 0.0250 inch thick, and Series 300 stainless-steel fasteners.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.

1. Verify that substrates are sound and free of oil, grease, dirt, excess mortar, or other contaminants.
2. Verify that concrete has cured and aged for minimum time period recommended by barrier manufacturer.
3. Verify that concrete is visibly dry and free of moisture. Test for capillary moisture by plastic sheet method according to ASTM D 4263.
4. Verify that masonry joints are flush and completely filled with mortar.
5. Verify that sleeves, ties, and other penetrating components that pass through surfaces to receive barrier are rigidly installed.
6. Verify that surfaces are free of cracks, depressions, waves or projections which may be detrimental to successful installation.
7. Ensure that exterior sheathing panels are stabilized with corners and edges fastened with appropriate screws.

B. Proceed with installation only after unsatisfactory conditions have been corrected. Starting Work of this Section means acceptance of substrate and site conditions.

3.2 SURFACE PREPARATION

A. Clean, prepare, and treat substrate according to manufacturer’s written instructions. Provide clean, dust-free, and dry substrate for moisture barrier application.

1. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
2. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids in concrete with substrate-patching membrane.
3. Remove excess mortar from masonry ties, shelf angles, and other obstructions.

B. At changes in substrate plane, apply sealant or termination mastic beads at sharp corners and edges to form a smooth transition from one plane to another.

C. Cover gaps in substrate plane and form a smooth transition from one substrate plane to another with stainless-steel sheet mechanically fastened to structural framing to provide continuous support for moisture barrier membrane.

D. Joint and Crack Treatment: Prepare, fill, prime, and treat joints and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D 4258.

1. Bridge and cover isolation joints, expansion joints and discontinuous wall-to-wall, deck-to-wall, and deck-to-deck joints with overlapping modified bituminous strips.

3.3 INSTALLATION, GENERAL

A. Transition Strips: Install strips, transition strips, and accessory materials according to manufacturer’s written instructions to form a seal with adjacent construction and maintain a continuous air barrier.

1. Where directed by manufacturer's written instructions, apply before or after application of membrane to create a shingle effect and maintain continuity of the air barrier assembly from top to bottom of structure.
2. Coordinate with installation of roofing membrane and base flashing to ensure continuity of air barrier with roofing membrane.
3. Use transition membranes to tie into opening frames, spandrel panels, floor intersections and changes in substrates.
4. Apply in accordance with manufacturer's instructions, positioning, lapping, sealing and protecting as required.

B. Wall Openings: Prime concealed, perimeter frame surfaces of windows, curtain walls, storefronts, and doors. Apply so that a minimum of 3 inches of coverage is achieved over each substrate.

C. Seal top of through-wall flashings to moisture barrier with an additional 6-inch wide.
   1. At Non-Metallic Through Wall Flashing: Use modified bituminous strip.

3.4 INSTALLATION OF SHEET MEMBRANE

A. General: Install sheet membrane moisture barrier and accessory materials according to manufacturer's written instructions and according to recommendations in ASTM D 6135.
   1. When ambient and substrate temperatures range between 25 and 40 deg F, install self-adhering, modified bituminous air-barrier sheet produced for low-temperature application. Do not install low-temperature sheet if ambient or substrate temperature is higher than 60 deg F.

B. Corners: Prepare, prime, and treat inside and outside corners according to ASTM D 6135.
   1. Install modified bituminous strips centered over vertical inside corners. Install 3/4-inch fillets of termination mastic on horizontal inside corners.

C. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations with termination mastic and according to ASTM D 6135.

D. Apply primer to substrates at required rate and allow it to dry. Limit priming to areas that will be covered by air-barrier sheet on same day. Reprime areas exposed for more than 24 hours.
   1. Prime glass-fiber-surfacéd gypsum sheathing with number of prime coats needed to achieve required bond, with adequate drying time between coats.

E. Apply and firmly adhere modified bituminous sheets horizontally over area to receive air barrier. Accurately align sheets and maintain uniform 2-1/2-inch minimum lap widths and end laps. Overlap and seal seams, and stagger end laps to ensure airtight installation.
   1. Apply sheets in a shingled manner to shed water without interception by any exposed sheet edges.
   2. Roll sheets firmly to enhance adhesion to substrate.

F. Apply continuous modified bituminous sheets over modified bituminous strips bridging substrate cracks, construction, and contraction joints.

G. CMU: Install barrier sheet horizontally against the CMU beginning at base of wall. Align top edge of air-barrier sheet immediately below protruding masonry ties or joint reinforcement or ties, and firmly adhere in place.
   1. Overlap horizontally adjacent sheets a minimum of 2 inches and roll seams.
   2. Apply overlapping sheets with bottom edge slit to fit around masonry reinforcing or ties. Roll firmly into place.
   3. Seal around masonry reinforcing or ties and penetrations with termination mastic.
   4. Continue the membrane into all openings in the wall, such as doors and windows, and terminate at points to maintain an airtight barrier that is not visible from interior.

H. Seal exposed edges of sheet at seams, cuts, penetrations, and terminations not concealed by metal counterflashings or ending in reglets with termination mastic.
I. Connect and seal exterior wall air-barrier membrane continuously to roofing-membrane air barrier, concrete below-grade structures, floor-to-floor construction, exterior glazing and window systems, glazed curtain-wall systems, storefront systems, exterior louvers, exterior door framing, and other construction used in exterior wall openings, using accessory materials.

J. Wall Openings: Prime concealed, perimeter frame surfaces of windows, curtain walls, storefronts, and doors. Apply transition material or flashing so that a minimum of 3 inches of coverage is achieved over each substrate. Maintain 3 inches of full contact over firm bearing to perimeter frames with not less than 1 inch of full contact.
   1. Modified Bituminous Transition Strip: Roll firmly to enhance adhesion.
   2. Elastomeric Flashing Sheet: Apply adhesive to wall, frame, and flashing sheet. Install flashing sheet and termination bars, fastened at 6 inches o.c. Apply lap sealant over exposed edges and on cavity side of flashing sheet.
   3. Preformed Silicone-Sealant Extrusion: Set in full bed of silicone sealant applied to walls, frame, and membrane.

K. Fill gaps in perimeter frame surfaces of windows, curtain walls, storefronts, doors, and miscellaneous penetrations of air-barrier membrane with foam sealant.

L. At end of each working day, seal top edge of air-barrier material to substrate with termination mastic.

M. Apply joint sealants forming part of air-barrier assembly within manufacturer’s recommended application temperature ranges. Consult manufacturer when sealant cannot be applied within these temperature ranges.

N. Repair punctures, voids, and deficient lapped seams in air barrier. Slit and flatten fishmouths and blisters. Patch with air-barrier sheet extending 6 inches beyond repaired areas in all directions.

O. Do not cover air barrier until it has been tested and inspected by Owner’s testing agency.

P. Correct deficiencies in or remove air barrier that does not comply with requirements; repair substrates and reapply air-barrier components.

3.5 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Inspections: Air-barrier materials, accessories, and installation are subject to inspection for compliance with requirements. Inspections may include the following:
   1. Continuity of air-barrier system has been achieved throughout the building envelope with no gaps or holes.
   2. Continuous structural support of air-barrier system has been provided.
   3. Masonry and concrete surfaces are smooth, clean, and free of cavities, protrusions, and mortar droppings.
   4. Site conditions for application temperature and dryness of substrates have been maintained.
   5. Maximum exposure time of materials to UV deterioration has not been exceeded.
   6. Surfaces have been primed, if applicable.
   7. Laps in strips and transition strips have complied with minimum requirements and have been shingled in the correct direction (or mastic has been applied on exposed edges), with no fishmouths.
   8. Termination mastic has been applied on cut edges.
   9. Strips and transition strips have been firmly adhered to substrate.
   10. Compatible materials have been used.
   11. Transitions at changes in direction and structural support at gaps have been provided.
   12. Connections between assemblies (air-barrier and sealants) have complied with requirements for cleanliness, surface preparation and priming, structural support, integrity, and continuity of seal.
13. All penetrations have been sealed.

C. Tests: As determined by Owner's testing agency from among the following tests:
   1. Quantitative Air-Leakage Testing: Air-barrier assemblies will be tested for air leakage according to ASTM E 783.
   2. Adhesion Testing: Air-barrier assemblies will be tested for minimum air-barrier adhesion of 30 lbf/sq. in. according to ASTM D 4541 for each 600 sq. ft. of installed air barrier or part thereof.

D. Air barriers will be considered defective if they do not pass tests and inspections.
   1. Apply additional air-barrier material, according to manufacturer's written instructions, where inspection results indicate insufficient thickness.
   2. Remove and replace deficient air-barrier components for retesting as specified above.

E. Repair damage to air barriers caused by testing; follow manufacturer's written instructions.

3.6 CLEANING AND PROTECTION

A. Protect moisture barrier assembly from damage during application and for remainder of construction period; in accordance with manufacturer's written instructions.
   1. Protect barrier from contact with incompatible materials and sealants not approved by barrier manufacturer.
   2. Protect barrier from exposure to UV light and harmful weather exposure as required by manufacturer.
   3. If exposed to UV light or to harmful weather for more than 30 days, remove and replace barrier; or, as approved by moisture barrier manufacturer, repair and prepare the overexposed membrane and install additional, full-thickness, barrier in accordance with manufacturer’s written recommendations.

B. Clean spills, stains, and soiling from construction that would be exposed in the completed Work, using cleaning agents and procedures recommended by manufacturer of affected construction.

END OF SECTION
SECTION 074200
METAL PANELS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Formed Flush Aluminum Plate Panels (MP-1).
   2. Formed Box-Rib-Profile Panels (MP-2).
   3. Formed Angled-Profile Panels (MP-3).
   4. Framing and accessories for metal panels.
   5. Engineering required to comply with specified performance requirements.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each type of panel and accessory.
B. Shop Drawings: Include fabrication and installation layouts of metal panels; details of edge conditions, joints, panel profiles, corners, anchorages, attachment system, trim, flashings, closures, and accessories; and special details.
   1. Indicate dimensions, panel layout, construction details, method of anchorage, method of installation.
   2. Panel layout to match layout as indicated on Drawings.
C. Delegated Design Submittal and Shop Drawings: Where professional design services or certifications by a qualified Professional Engineer are specifically required of the Contractor by the Contract Documents, submit shop drawings submittal package with the delegated design submittal requirements in accordance with Section 013300 - Submittal Procedures.
   1. Calculations: Upon request from the Architect/Engineer only, Contractor shall submit calculations in accordance with Section 013300 – Submittal Procedures.
D. Samples: Metal panels, 36 inches long by actual panel width. Include fasteners, closures, and other metal panel accessories.

1.3 INFORMATIONAL SUBMITTALS
A. Samples: Submit color samples for selection in accordance with Section 013300.
   1. Metal Panels: 36 inches long by actual panel width. Include fasteners, closures, and other metal panel accessories.
B. Qualification Data: For fabricator and installer.

1.4 QUALITY ASSURANCE
A. Panel system fabricator and attachment system shall be approved by the panel manufacturer.
B. Fabricator and Installer Qualifications: A single entity, well-established and experienced in metal panel fabrication and installation, acceptable to Owner and Architect, employing skilled workers who custom-fabricate and install metal panels similar to those required for this Project and whose work has a record of successful in-service performance.
   1. Installer Qualifications: Fabricator of metal panels for this project.
2. Experience: Having successfully completed a minimum of 10 previous projects similar in nature, size, and extent to this Project; being familiar with special requirements indicated; and having complied with requirements of authorities having jurisdiction.

3. Architect reserves the right to reject metal panel fabricator if it is Architect's opinion that previous performance by fabricator has been unsatisfactory, or if any of the following will not result in required quality within time required for completion:
   a. Shop capacity and capabilities.
   b. Experience of workers.
   c. Installation capabilities and equipment.
   d. Quality or supply of material.

C. Mockups: Fabricate and erect in place. Mock-up to illustrate shape, joints, anchoring and attachment points, perforations and finish in accordance with approved sample.
   1. Joints Included in Mock-Up: Outside corner with corner bar typical in-field joint, in-field joint with snap cover, inside corner, expansion joints.
   2. Obtain Architect's acceptance of visual qualities of mock-ups before start of work. Accepted unit establishes minimum standard for work. Unit may be incorporated into work.

1.5 ENVIRONMENTAL CONDITIONS

A. Field Measurements: should be taken prior to the completion of shop fabrication whenever possible. However, coordinate fabrication schedule with construction progress as directed by the Contractor to avoid delay of work. Field fabrication may be allowed to ensure proper fit. However, field fabrication shall be kept to an absolute minimum with the majority of the fabrication being done under controlled shop conditions.

B. Verify dimensions by field measurement before panel fabrication. Design units to provide for adjustment and fitting of components during field installation. Preassemble units at shop to minimize mechanical joints, splicing and field assembly of units.

1.6 COORDINATION

A. Coordinate work directly with other trades as necessary to insure proper fitting, joining or to clearances of other work. Obtain templates as required to insure proper fitting. Verify dimensions and exchange shop drawings.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of metal panels and sub-framing systems that fail in materials or workmanship within specified warranty period.
   1. Failures including but not limited to the following:
      a. Deterioration resulting from U.V. and weather exposure.
      b. Structural failures including rupturing, cracking, or puncturing.
      c. Deterioration of materials beyond normal weathering.
   2. Provide warranty covering panel fabrication defects and loss of specified physical and performance properties, when panels are installed in accordance with manufacturer's requirements.
   3. Provide warranty covering cost of panel removal and installation of replacement panels.
   4. Warranty Period: 10 years from date of Substantial Completion.

B. Special Warranty on Panel Finishes: Manufacturer's standard form in which manufacturer agrees to repair finish or replace metal panels that show evidence of deterioration of factory-applied finishes within specified warranty period.
   1. Exposed Panel Finish: Deterioration includes, but is not limited to, the following:
a. Color fading more than 5 Hunter units when tested according to ASTM D 2244.
b. Chalking in excess of a No. 8 rating when tested according to ASTM D 4214.
c. Cracking, checking, peeling, or failure of paint to adhere to bare metal.

2. Finish Warranty Period: 10 years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Contractor shall engage a qualified Professional Engineer to provide delegated design services in accordance with Section 013300 – Submittal Procedures

B. Structural Performance: Design panels and connections in accordance with applicable codes and standards, capable of withstanding project design loads, within limits and under conditions indicated, without excessive stress or deflection.
1. Design Loads: Design and construct metal panel, including anchorages, to withstand attached dead loads, live loads and the following wind:
   b. Wind Loads: Provisions of ASCE 7-10 as indicated in the Construction Documents.
2. All other related items that are shop or field fastened to panels for purposes of placing and anchoring panels; clip angles and other members used to connect panels to structural steel or backup and shim, bolts, nuts, girts and steel angle clips at concealed connections.
3. System to accommodate movement of components without buckling, undue stress on fasteners, or other detrimental effects, when subject to seasonal temperature ranges.

C. Thermal Movement: System to provide for expansion and contraction within system components caused by cycling temperature range of 170 degrees F without causing detrimental effects to system or components.

D. Not Permitted: Vibration harmonics; wind whistles; noises caused by thermal movement; thermal movement transmitted to other building elements; loosening, weakening or fracturing of attachments or components of system.

2.2 MANUFACTURERS & FABRICATORS

A. Single Source Responsibility: Provide metal panel products by a single firm for each type of metal panel.

B. Manufacturers and Fabricators: Subject to specified requirements, provide Basis of Design product or equivalent product as approved by Architect from one of the following manufacturers:
1. ATAS International, Inc.
2. Benchmark; a Kingspan Group Company.
4. Dri-Design
5. Firestone Building Products.
6. IMETCO (Innovative Metals Company, Inc.)
7. M.G. McGrath Sheet Metal.
8. Metal Sales Manufacturing Corporation.
9. Morin; a Kingspan Group company.
11. Protean Construction Products, Inc.
12. Sobotec.
2.3 METAL PANELS

A. (MP-1) Flush Formed Aluminum Plate Panels: Dry-joint, pressure-equalized rainscreen system; aluminum plate panels, fabricated from single sheets of aluminum formed into profile for installation method indicated. Include attachment assembly components and panel stiffeners as required.
   2. Panel Configuration:
      a. Profile: Flush profile as shown on Drawings.
      b. Depth: As shown.
      c. Sizes: Varying, as shown.
   3. Aluminum Sheet: 0.125 inch thick, tension-leveled, smooth aluminum sheet, ASTM B 209.
   4. Finish: Color-anodized, AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
      a. Color: Black, as selected by Architect.

B. (MP-2) Roll-Formed Box-Rib-Profile Panels: Box-shaped (90-degree) ribs, with interlocking tongue and groove joints, installed with concealed clip fasteners. Include attachment assembly components and accessories.
   2. Panel Configuration:
      a. Profiles: Multiple, as selected by Architect from Manufacturer's full range.
      b. Panel Depth: 1-1/2 inch.
      c. Sizes: As shown.
      d. Rib Orientation: As shown.
   3. Aluminum Sheet: 0.063 inch thick, tension-leveled, smooth aluminum sheet, ASTM B 209.
   4. Metallic-Coated Steel Sheet: Zinc-coated (galvanized) steel sheet complying with ASTM A 653, G90 coating designation, or aluminum-zinc alloy-coated steel sheet complying with ASTM A 792, Class AZ50 coating designation; structural quality. Prepainted by the coil-coating process to comply with ASTM A 755.
      a. Nominal Thickness: 0.028 inch (24 ga.).
   5. PVDF Fluoropolymer Finish: AAMA [621] [2605], containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat [and in clear topcoat].
      a. Two-Coat System: Primer and color coat.
      b. Three-Coat System: Primer, color coat and clear topcoat.
      c. Mica Two-Coat System: Primer, color coat with suspended mica flakes.
      d. Metallic Three-Coat System: Primer, color coat and clear topcoat with suspended metallic flakes.

C. (MP-3) Roll-Formed Angled-Rib-Profile Panels: Angle profile ribs, with interlocking tongue and groove joints, installed with concealed clip fasteners. Include attachment assembly components and accessories.
   1. Basis of Design: Morin Pulse Wall Series; PULSE 1, PULSE 2, PULSE 3, PULSE 4 & PULSE 9
   2. Panel Configuration:
      a. Profiles: Multiple, as selected by Architect from Manufacturer's full range.
      b. Panel Depth: 1-1/2 inch.
      c. Sizes: As shown.
      d. Rib Orientation: As shown.
   3. Aluminum Sheet: 0.063 inch thick, tension-leveled, smooth aluminum sheet, ASTM B 209.
   4. Metallic-Coated Steel Sheet: Zinc-coated (galvanized) steel sheet complying with ASTM A 653, G90 coating designation, or aluminum-zinc alloy-coated steel sheet complying with ASTM A 792, Class AZ50 coating designation; structural quality. Prepainted by the coil-coating process to comply with ASTM A 755.
      a. Nominal Thickness: 0.028 inch (24 ga.).
5. PVDF Fluoropolymer Finish: AAMA [621] [2605], containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat [and in clear topcoat].
a. Two-Coat System: Primer and color coat.
b. Three-Coat System: Primer, color coat and clear topcoat.
c. Mica Two-Coat System: Primer, color coat with suspended mica flakes.
d. Metallic Three-Coat System: Primer, color coat and clear topcoat with suspended metallic flakes.

6. Color: COLOR: METALLIC - 3 VARIATIONS OF CHAMPAGNE TO MATCH ARCHITECTS SAMPLE

2.4 SYSTEM COMPONENTS

A. Wall Panel Accessories: Provide components required for a complete wall panel assembly including trim, copings, fascia, mullions, sills, corner units, clips, flashings, sealants, gaskets, fillers, closure strips, and similar items. Match material and finish of panels unless otherwise indicated.

B. Aluminum Extrusions: ASTM B 221, alloy and temper recommended by manufacturer for type of use and finish indicated.

C. Metal Subframing and Furring: ASTM C 645, cold-formed, metallic-coated steel sheet, ASTM A 653, G90 coating designation or ASTM A 792, Class AZ50 aluminum-zinc-alloy coating designation unless otherwise indicated. Provide manufacturer's standard sections as required for support and alignment of metal panel system.
   1. Subframing Anchors: Self-tapping screws, bolts, nuts, self-locking rivets and bolts, end-welded studs, and other suitable fasteners designed to withstand design loads. Provide EPDM or neoprene sealing washers.
      a. Subframing-to-Concrete: Stainless steel or zinc-coated, self-tapping (Tapcon).
      b. Subframing-to-Steel Stud: Zinc-coated, self-tapping

2. Fasteners for Miscellaneous Metal Framing: Of type, material, size, corrosion resistance, holding power, and other properties required to fasten miscellaneous metal framing members to substrates.

D. Flashing and Trim: Formed from 0.018-inch-minimum thickness, zinc-coated (galvanized) steel sheet or aluminum-zinc alloy-coated steel sheet prepainted with coil coating. Provide flashing and trim as required to seal against weather and to provide finished appearance. Locations include, but are not limited to, bases, drips, sills, jambs, corners, endwalls, framed openings, rakes, fasciae, parapet caps, soffits, reveals, and fillers. Finish flashing and trim with same finish system as adjacent metal panels.

E. Panel Sealants: Provide sealant type recommended by manufacturer that are compatible with panel materials, are nonstaining, and do not damage panel finish. Refer to Section 079000 - Joint Sealants.
   1. Sealant Tape: Pressure-sensitive, 100 percent solids, gray polysobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch wide and 1/8 inch thick.
   2. Joint Sealant for Exterior and Exposed Seals: ASTM C 920 silicone sealant; of type, grade, class, and use classifications required to seal joints in metal panels and remain watertight; and as recommended in writing by metal panel manufacturer.

2.5 FABRICATION

A. General: Fabricate and finish metal panels and accessories at the factory to greatest extent possible, by manufacturer's standard procedures and processes, as necessary to fulfill indicated performance requirements demonstrated by laboratory testing.
1. Comply with indicated profiles and with dimensional and structural requirements.
2. Shop fabricate system and assemble units ready for installation.
3. Panel fabricator shall field measure as required to insure level, square and true to line, installation.

B. Sheet Metal Flashing and Trim: Fabricate flashing and trim to comply with manufacturer's recommendations and recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, metal, and other characteristics of item indicated.
   1. Form exposed sheet metal accessories that are without excessive oil canning, buckling, and tool marks and that are true to line and levels indicated, with exposed edges folded back to form hems.
   3. Seams for Other Than Aluminum: Fabricate nonmoving seams in accessories with flat-lock seams. Tin edges to be seamed, form seams, and solder.
   4. Sealed Joints: Form nonexpansion, but movable, joints in metal to accommodate sealant and to comply with SMACNA standards.
   5. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces of accessories exposed to view.
   6. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal recommended in writing by metal panel manufacturer.
      a. Size: As recommended by SMACNA's "Architectural Sheet Metal Manual" or metal wall panel manufacturer for application but not less than thickness of metal being secured.

2.6 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

D. Finishes for Concealed Surfaces: Comply with NAAMM's "Metal Finishes Manual" for recommendations for applying and designating finishes.
   1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
   2. Concealed Steel Items: Galvanized in accordance with ANSI/ASTM A653 to 2.0 oz/sq ft primed with iron oxide paint.
   3. Apply one coat of bituminous paint to concealed aluminum and steel surfaces in contact with cementitious or dissimilar materials.
   4. Primer: FS TT-P-31; for shop application and field touch-up.
   5. Touch-Up Primer for Galvanized Surfaces: FS TT-P-641; TT-P-645.
PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, metal wall panel supports, and other conditions affecting performance of work.
   1. Examine wall framing to verify that girts, angles, channels, studs, and other structural panel support members and anchorage have been installed within alignment tolerances required by metal wall panel manufacturer.
   2. Examine wall sheathing to verify that sheathing joints are supported by framing or blocking and that installation is within flatness tolerances required by metal wall panel manufacturer.

B. Examine roughing-in for components and systems penetrating metal wall panels to verify actual locations of penetrations relative to seam locations of metal wall panels before metal wall panel installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 METAL PANEL INSTALLATION

A. General: Install metal panels according to manufacturer’s written instructions in orientation, sizes, and locations indicated on Drawings. Install panels perpendicular to girts and subgirts unless otherwise indicated. Anchor metal wall panels and other components of the Work securely in place, with provisions for thermal and structural movement.
   1. Shim or otherwise plumb substrates receiving metal wall panels.
   2. Flash and seal metal wall panels at perimeter of all openings. Fasten with self-tapping screws. Do not begin installation until weather barrier and flashings that will be concealed by metal wall panels are installed.
   3. Install screw fasteners in predrilled holes.
   4. Locate and space fastenings in uniform vertical and horizontal alignment.
   5. Install flashing and trim as metal wall panel work proceeds.
   6. Locate panel splices over, but not attached to, structural supports. Stagger panel splices and end laps to avoid a four-panel lap splice condition.
   7. Apply elastomeric sealant continuously between metal base channel (sill angle) and concrete and elsewhere as indicated or, if not indicated, as necessary for waterproofing.
   8. Align bottom of metal wall panels and fasten with blind rivets, bolts, or self-tapping screws. Fasten flashings and trim around openings and similar elements with self-tapping screws.
   9. Provide weathertight escutcheons for pipe and conduit penetrating exterior walls.

B. Fasteners: Use fasteners of type and size that will secure wall components in compliance with design load requirements, without corroding.
   1. Steel Wall Panels: Use stainless-steel fasteners for surfaces exposed to the exterior; use galvanized steel fasteners for surfaces exposed to the interior.
   2. Aluminum Wall Panels: Use aluminum or stainless-steel fasteners for surfaces exposed to the exterior; use aluminum or galvanized steel fasteners for surfaces exposed to the interior.
   3. Copper Wall Panels: Use copper, stainless-steel or hardware-bronze fasteners.
   4. Stainless-Steel Wall Panels: Use stainless-steel fasteners.
   5. Conceal fasteners and expansion provisions, where possible, in exposed work and locate to minimize possibility of leakage.
C. Metal Protection: Do not install metal wall panel system with non-compatible materials. Protect the metal wall panels from masonry and products containing lime by leaving the protective coating on the zinc until project and clean-up completion. Where dissimilar metals will contact each other or corrosive substrates, protect against galvanic action as recommended by metal wall panel manufacturer.

D. Joint Sealers: Install gaskets, joint fillers, and sealants where indicated and where required for weathertight performance of metal wall panel assemblies. Provide types of gaskets, fillers, and sealants indicated or, if not indicated, types recommended by metal wall panel manufacturer.

1. Seal metal wall panel end laps with double beads of tape or sealant, full width of panel. Seal side joints where recommended by metal wall panel manufacturer.
2. Prepare joints and apply sealants to comply with requirements in Division 07 Section "Joint Sealants."

3.3 ACCESSORY INSTALLATION

A. General: Install accessories with positive anchorage to building and weathertight mounting, and provide for thermal expansion. Coordinate installation with flashings and other components.

1. Install components required for a complete metal wall panel assembly including trim, copings, corners, seam covers, flashings, sealants, gaskets, fillers, closure strips, and similar items.

B. Miscellaneous Framing: Install subgirts, base angles, sills, furring, and other miscellaneous wall panel support members and anchorages according to ASTM C 754, metal wall panel manufacturer's written recommendations, and approved Shop Drawings.

1. Install girts tight to moisture barrier (MB).

C. Flashing and Trim: Comply with performance requirements, manufacturer's written installation instructions, and SMACNA's "Architectural Sheet Metal Manual." Provide concealed fasteners where possible, and set units true to line and level as indicated. Install work with laps, joints, and seams that will be permanently watertight and weather resistant.

1. Install exposed flashing and trim that is without excessive oil canning, buckling, and tool marks and that is true to line and levels indicated, with exposed edges folded back to form hems. Install sheet metal flashing and trim to fit substrates and to result in waterproof and weather-resistant performance.
2. Expansion Provisions: Provide for thermal expansion of exposed flashing and trim. Space movement joints at a maximum of 10 feet with no joints allowed within 24 inches of corner or intersection. Where lapped expansion provisions cannot be used or would not be sufficiently weather resistant and waterproof, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with mastic sealant (concealed within joints).

3.4 TOLERANCES

A. Panel Erection Tolerances: Erect formed metal panel sheet metal work plumb and true, in alignment and in relation to lines and dimensions shown. Variations of 1/8 inch in 10 feet, non-accumulative, is maximum permissible for plumb, warp, bow and alignment.

1. Maximum Offset From True Alignment Between Adjacent Members Butting In Line: 1/16 inch.
2. Maximum Variation from Plane or Location Indicated on Drawings: 1/8 inch.

3.5 CLEANING AND PROTECTION

A. Remove temporary protective coverings and strippable films, if any, as metal wall panels are installed, unless otherwise indicated in manufacturer's written installation instructions. On completion of metal wall panel installation, clean finished surfaces as recommended by metal wall panel manufacturer. Maintain in a clean condition during construction.
B. After metal wall panel installation, clear weep holes and drainage channels of obstructions, dirt, and sealant.

C. Replace metal wall panels that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION
PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Fully-adhered TPO membrane roofing systems (TPO).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product indicated.
B. Shop Drawings: For roofing system. Include plans, elevations, sections, details, and attachments to other work.
   1. Base flashings and membrane terminations.
   2. Tapered insulation, including slopes.
   3. Roof plan showing orientation of steel roof deck and orientation of membrane roofing and fastening spacings and patterns for mechanically fastened membrane roofing.
   4. Insulation fastening patterns for corner, perimeter, and field-of-roof locations.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified Installer and manufacturer.
B. Manufacturer Certificates: Signed by roofing manufacturer certifying that roofing system complies with requirements specified in "Performance Requirements" Article.
   1. Submit evidence of compliance with performance requirements.
C. Field quality-control reports.

1.4 QUALITY ASSURANCE
A. Manufacturer Qualifications: A qualified manufacturer that is UL listed for membrane roofing system identical to that used for this Project.
B. Installer Qualifications: A qualified firm that is approved, authorized, or licensed by membrane roofing system manufacturer to install manufacturer's product and that is eligible to receive manufacturer's special warranty.

1.5 PROJECT CONDITIONS
A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit roofing system to be installed according to manufacturer's written instructions and warranty requirements.

1.6 WARRANTY
A. Special Warranty: Manufacturer's standard or customized form, without monetary limitation, in which manufacturer agrees to repair or replace components of membrane roofing system that fail in materials or workmanship within specified warranty period.
   1. Special warranty includes membrane roofing, base flashings, roof insulation, fasteners, cover boards, substrate board, roofing accessories, and other components of membrane roofing system.
   2. Warranty Period: 20 years from date of Substantial Completion.
PART 1 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Installed roofing system and flashings shall withstand specified uplift pressures, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Roof system and flashings shall remain watertight.
   1. Accelerated Weathering: Roof membrane shall withstand 2000 hours of exposure when tested according to ASTM G 152, ASTM G 154, or ASTM G 155.
   2. Impact Resistance: Roof membrane shall resist impact damage when tested according to ASTM D 3746, ASTM D 4272, or the "Resistance to Foot Traffic Test" in FM Approvals 4470.

B. Wind Uplift Resistance: Design roofing system to resist wind uplift pressures in accordance with FM Global Requirements when tested according to FM Approvals 4474, UL 580, or UL 1897.

2.2 ROOFING SYSTEM, GENERAL

A. Material Compatibility: Provide roofing materials that are compatible with one another under conditions of service and application required, as demonstrated by membrane roofing manufacturer based on testing and field experience.

B. Source Limitations: Obtain roofing system components from same manufacturer as membrane roofing or approved by membrane roofing manufacturer.

C. Manufacturers: Provide Basis of Design or approved equivalent roofing system, from one of the following manufacturers:
   1. Carlisle SynTec Incorporated.
   2. Firestone Building Products Company.
   3. GAF Materials Corporation.
   5. Johns Manville Roofing Systems
   6. Mule-Hide Products, Co..
   7. Stevens Roofing Systems; Division of JPS Elastomerics.
   8. Versico Incorporated.

D. System Basis of Design: Sure-Weld TPO Fully-Adhered System by Carlisle SynTec.

2.3 SYSTEM CONFIGURATIONS

A. System Configurations: As indicated in Drawings and indicated below.

B. (TPO-1) Fully-Adhered TPO Roof System over Composite Concrete Deck:
   2. Insulation: Polyisocyanurate boards, fully-adhered base layer, fully-adhered upper layers built-up as required to achieve specified R-value.
   3. Cover Board: Gypsum board type.
   4. Roof Membrane: 60 mils membrane, fully-adhered.

C. (TPO-2) Fully-Adhered TPO Roof System over Metal Deck:
   3. Insulation: Polyisocyanurate boards, mechanically-fastened base layer, fully-adhered upper layers built-up as required to achieve specified R-value.
   4. Cover Board: Gypsum board type.
   5. Roof Membrane: 60 mils membrane, fully-adhered.
2.4 PRIMARY ROOFING MEMBRANE
   A. Thermoplastic Polyolefin (TPO) Sheet: ASTM D 6878, internally-reinforced with fabric or scrim.
      1. Thickness: 60 mils, nominal.
      2. Exposed Face Color: White.

2.5 AUXILIARY ROOFING MATERIALS
   A. Provide auxiliary materials recommended by roofing system manufacturer for intended use and compatible with membrane roofing.
      1. Adhesives and Sealants: Complying with VOC limits of authorities having jurisdiction.
   B. Sheet Flashing: Manufacturer's standard sheet flashing of same material, type, reinforcement, thickness, and color as roof membrane.
   C. Bonding Adhesive: Manufacturer's water-based adhesive.
   D. Metal Termination Bars: Manufacturer's standard predrilled stainless-steel or aluminum bars, approximately 1 by 1/8 inch thick; with anchors.
   E. Metal Battens: Manufacturer's standard aluminum-zinc-alloy-coated or zinc-coated steel sheet, approximately 1 inch wide by 0.05 inch thick, prepunched.
   F. Fasteners: Factory-coated steel fasteners and metal or plastic plates meeting corrosion-resistance provisions in FMG 4470, designed for fastening membrane to substrate, and acceptable to membrane roofing system manufacturer.
   G. Slip Sheet: Manufacturer's standard, of thickness required for application.
   H. Prefabricated Pipe Flashings: As recommended by roof membrane manufacturer.
   I. Miscellaneous Accessories: Provide pourable sealers, preformed cone and vent sheet flashings, preformed inside and outside corner sheet flashings, T-joint covers, in-seam sealants, termination reglets, cover strips, and other accessories.

2.6 SUBSTRATE BOARD
   A. Substrate Board: ASTM C1177, glass-mat-faced, water-resistant gypsum substrate board.
      1. Thickness: As shown.
      2. Surface finish: Factory primed or unprimed, as recommended by system Manufacturer.
      4. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Approvals 4470, designed for fastening substrate board to roof deck.

2.7 VAPOR RETARDER
   A. Self-Adhering-Sheet Vapor Retarder: ASTM D1970, polyethylene film laminated to layer of rubberized asphalt adhesive, minimum 40-mil- total thickness; maximum permeance rating of 0.1 perm; cold applied, with slip-resisting surface and release paper backing. Provide primer when recommended by vapor retarder manufacturer.

2.8 INSULATION
   A. General: Preformed roof insulation boards manufactured or approved by roof system manufacturer.
      2. Provide flat boards and factory-tapered boards as required to achieve minimum slope of 1/4 inch per 12 inches, unless otherwise shown.
3. Provide preformed saddles, crickets, tapered edge strips, and other insulation shapes where indicated for sloping to drain. Fabricate to slopes indicated.

B. Polyisocyanurate Board Insulation: ASTM C1289, Type II, Grade 3, Class 1 or 2 as required by Manufacturer, felt or glass-fiber mat facer on both major surfaces; with 25 psi minimum compressive strength.

C. Insulation Accessories: Provide roof insulation accessories recommended by insulation manufacturer for intended use and compatibility with other roofing system components.
   1. Full-Spread Applied Insulation Adhesive: Insulation manufacturer’s recommended spray-applied, low-rise, two-component urethane adhesive formulated to attach roof insulation to substrate or to another insulation layer.
   2. Fasteners: Factory-coated steel fasteners and metal or plastic plates complying with corrosion-resistance provisions in FM Global 4470, designed for fastening roof insulation and cover boards to substrate, and acceptable to roofing system manufacturer.

2.9 COVER BOARD
   A. Cover Board: ASTM C1177, glass-mat-faced, water-resistant gypsum substrate board.
      1. Thickness: As shown.
      2. Surface finish: Factory primed or unprimed, as recommended by system Manufacturer.
   B. Protection Mat: Woven or nonwoven polypropylene, polyolefin, or polyester fabric, water permeable and resistant to UV degradation, type and weight as recommended by roofing system manufacturer for application.

2.10 WALKWAYS
   A. Flexible Walkways: Factory-formed, nonporous, heavy-duty, slip-resisting, surface-textured walkway pads or rolls, approximately 3/16 inch thick, and acceptable to membrane roofing system manufacturer.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work:
      1. Verify that roof openings and penetrations are in place, curbs are set and braced, and roof-drain bodies are securely clamped in place.
      2. Verify that wood cant, blocking, curbs, and nailers are securely anchored to roof deck at penetrations and terminations and that nailers match thicknesses of insulation.
   B. Steel Roof Deck:
      1. Verify that surface plane flatness and fastening of steel roof deck complies with requirements in Section 053100 - Steel Decking.
      2. Perform fastener-pullout tests according to roof system manufacturer’s recommendations. Submit test result within 24 hours of performing tests. Include manufacturer’s requirements for any revision to previously submitted fastener patterns required to achieve specified wind uplift requirements.
   C. Concrete Roof Deck: Verify that minimum concrete drying period recommended by roofing manufacturer has passed.
1. Verify that concrete substrate is visibly dry and free of moisture, and that minimum concrete internal relative humidity is not more than 75 percent, or as recommended by roofing system manufacturer, when tested according to ASTM F2170.
   a. Test Frequency: One test probe per each 1000 sq. ft. of roof deck, with not less than three test probes.
   b. Submit test reports within 24 hours of performing tests.
2. Verify that concrete-curing compounds that impair adhesion of roofing components to roof deck have been removed.
3. Precast Concrete Roof Decks: Verify that joints in precast concrete roof decks have been grouted flush with top of concrete.

D. Proceed with installation only after unsatisfactory conditions have been corrected.
E. Proceed with installation of roofing only after substrate construction has been completed, and after penetrating components have been installed, so that membrane will not be penetrated or damaged by subsequent work.

3.2 PREPARATION
A. Clean substrate of dust, debris, moisture, and other substances detrimental to roofing installation according to roofing manufacturer's written instructions. Remove sharp projections.
B. Prevent materials from entering and clogging roof drains and conductors and from spilling or migrating onto surfaces of other construction. Remove roof-drain plugs when no work is taking place or when rain is forecast.

3.3 INSTALLATION, GENERAL
A. Install roofing system according to roofing system manufacturer's written instructions, SPRI's Directory of Roof Assemblies assembly requirements, and FM Global Property Loss Prevention Data Sheet 1-29.
B. Complete terminations and base flashings and provide temporary seals to prevent water from entering completed sections of roofing system at end of workday or when rain is forecast. Remove and discard temporary seals before beginning work on adjoining roofing.
C. Coordinate installation and transition of roofing system component serving as an air barrier with air barrier specified under Section 072700 - Air Barriers.

3.4 SUBSTRATE BOARD INSTALLATION
A. Install substrate board with long joints in continuous straight lines, with end joints staggered not less than 24 inches in adjacent rows.
   1. Steel Roof Decks: Install substrate board at right angle to flutes of deck. Locate end joints over crests of steel roof deck.
   2. Tightly butt substrate boards together.
   3. Cut substrate board to fit tight around penetrations and projections, and to fit tight to intersecting sloping roof decks.
   4. Fasten substrate board to top flanges of steel deck according to recommendations in Manufacturer's written instructions and FM Global Property Loss Prevention Data Sheet 1-29.
   5. Fasten substrate board to top flanges of steel deck to resist uplift pressure at corners, perimeter, and field of roof according to roofing system manufacturers' written instructions.

3.5 VAPOR RETARDER INSTALLATION
A. Completely seal vapor retarder at terminations, obstructions, and penetrations to prevent air movement into roofing system.
B. Self-Adhering-Sheet Vapor Retarder: Prime substrate if required by manufacturer. Install self-adhering-sheet vapor retarder over area to receive vapor retarder, side and end lapping each sheet a minimum of 3-1/2 and 6 inches, respectively.
1. Extend vertically up parapet walls and projections to a minimum height equal to height of insulation and cover board.
2. Seal laps by rolling.

3.6 INSULATION INSTALLATION
A. General: Comply with roofing system and insulation manufacturer’s written instructions for installing roof insulation.
1. Coordinate installing roofing system components so insulation is not exposed to precipitation or left exposed at end of workday.
2. Trim insulation neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
3. Make joints between adjacent insulation boards not more than 1/4 inch in width.
4. Fill gaps exceeding 1/4 inch with insulation.
5. At internal roof drains, slope insulation to create a square drain sump with each side equal to the diameter of the drain bowl plus 24 inches. Trim insulation so that water flow is unrestricted.
6. Cut and fit insulation within 1/4 inch of nailers, projections, and penetrations.
7. Install with joints staggered from joints in adjacent rows and in previous layers, in accordance with roofing manufacturer’s instructions.
B. Base Layer Installation Over Metal Decking: Mechanically attach base layer of insulation and substrate board using mechanical fasteners specifically designed and sized for fastening specified board-type roof insulation to metal decks.
1. Fasten insulation according to requirements in SPRI’s Directory of Roof Assemblies for specified Wind Uplift Load Capacity.
2. Fasten insulation to resist specified uplift pressure at corners, perimeter, and field of roof.
C. Base Layer Installation Over Concrete Decks: Adhere base layer of insulation in accordance with Manufacturer’s written instructions.
D. Upper Layers of Insulation: Adhere each layer of insulation to substrate using adhesive according to Manufacturer’s written instructions.
E. Insulation Installation for Ballasted System: Loosely lay base layer over substrate and each subsequent upper layer.

3.7 INSTALLATION OF COVER BOARDS
A. Install cover boards over insulation with long joints in continuous straight lines with end joints staggered between rows. Offset joints of insulation below a minimum of 6 inches in each direction.
1. Trim cover board neatly to fit around penetrations and projections, and to fit tight to intersecting sloping roof decks.
2. At internal roof drains, conform to slope of drain sump. Trim cover board so that water flow is unrestricted.
3. Cut and fit cover board tight to nailers, projections, and penetrations.
4. Adhere cover board to substrate using adhesive according to Manufacturer’s written instructions.

3.8 ROOF MEMBRANE INSTALLATION, GENERAL
A. Adhere roof membrane over area to receive roofing according to roofing system manufacturer’s written instructions.
B. Unroll membrane roof membrane and allow to relax before installing.
C. Start installation of roofing in presence of roofing system manufacturer's technical personnel and Owner's testing and inspection agency.

D. Accurately align roof membrane, and maintain uniform side and end laps of minimum dimensions required by manufacturer. Stagger end laps.

E. Seams: Clean seam areas, overlap roofing, and hot-air weld side and end laps of roof membrane and sheet flashings to ensure a watertight seam installation.
   1. Test lap edges with probe to verify seam weld continuity. Apply lap sealant to seal cut edges of roof membrane and sheet flashings.
   2. Verify field strength of seams a minimum of twice daily, and repair seam sample areas.
   3. Repair tears, voids, and lapped seams in roof membrane that do not comply with requirements.

3.9 ADHERED ROOF MEMBRANE INSTALLATION

A. Bonding Adhesive: Apply to substrate and underside of roof membrane at rate required by manufacturer, and allow to partially dry before installing roof membrane. Do not apply to splice area of roof membrane.

3.10 BASE FLASHING INSTALLATION

A. Install sheet flashings and preformed flashing accessories, and adhere to substrates according to roofing system manufacturer's written instructions.

B. Apply bonding adhesive to substrate and underside of sheet flashing at required rate, and allow to partially dry. Do not apply to seam area of flashing.

C. Flash penetrations and field-formed inside and outside corners with cured or uncured sheet flashing.

D. Clean splice areas, apply splicing cement, and firmly roll side and end laps of overlapping sheets to ensure a watertight seam installation.

E. Terminate and seal top of sheet flashings and mechanically anchor to substrate through termination bars.

3.11 WALKWAY INSTALLATION

A. Flexible Walkways: Install flexible walkways at locations indicated on Drawings, in accordance with roof membrane manufacturer's warranty requirements. Heat weld to substrate or adhere walkway products to substrate with compatible adhesive according to roofing system manufacturer's written instructions.

B. Roof-Paver Walkways: Install walkway roof pavers at locations as shown on Drawings, in accordance with manufacturer's written instructions.

3.12 FIELD QUALITY CONTROL

A. Testing Agency: Owner will engage a qualified testing agency to inspect substrate conditions, surface preparation, roof membrane application, flashings, protection, and drainage components, and to furnish reports to Architect.

B. Flood Testing: Flood test each roofing area for leaks, according to recommendations in ASTM D5957, after completing roofing and flashing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
   1. Perform tests before overlying construction is placed.
   2. Flood each area for minimum of 24 hours.
   3. After flood testing, repair leaks, repeat flood tests, and make further repairs until roofing and flashing installations are watertight.
a. Cost of retesting is the responsibility of the Contractor.

4. Testing agency shall prepare survey report indicating locations of initial leaks, if any, and final survey report.

C. Final Roof Inspection: Arrange for roofing system manufacturer's technical personnel to inspect roofing installation on completion, in presence of Architect, and to prepare inspection report.
   1. Notify Architect and Owner 48 hours in advance of date and time of inspection.

D. Repair or remove and replace components of roofing system where inspections indicate that they do not comply with specified requirements.

E. Roofing system will be considered defective if it does not pass tests and inspections.
   1. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.

3.13 INSTALLED WORK

A. Protect roofing system from damage and wear during remainder of construction period. When remaining construction will not affect or endanger roofing, inspect roofing for deterioration and damage, describing its nature and extent in a written report, with copies to Architect and Owner.

B. Correct deficiencies in or remove membrane roofing system that does not comply with requirements; repair substrates; and repair or reinstall membrane roofing system to a condition free of damage and deterioration at time of Substantial Completion and according to warranty requirements.

C. Clean overspray and spillage from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

END OF SECTION
SECTION 076200
SHEET METAL & FLASHING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Prefinished sheet metal flashing, roof edges and parapets, coping, expansion and contraction
      joint covers, parapet wall covers (SMF).
   2. Manufactured roof edge and coping systems (CP).
   3. Flexible membrane flashing.

1.2 COORDINATION
A. Coordinate with Section 074200 - Metal Panels for coping and other sheet metal work by metal
   panel (MP) fabricator.
B. Coordinate sheet metal layout and seams with penetrations and with joints and seams in adjacent
   materials.
C. Coordinate sheet metal installation with adjoining roofing and wall materials, joints, and seams to
   provide leakproof, secure, and noncorrosive installation.
D. Coordinate work of this section with interfacing and adjoining work for proper sequencing of each
   installation. Ensure best possible weather resistance and durability of work and protection of
   materials and finishes.

1.3 ACTION SUBMITTALS
A. Product Data: For manufactured components. Include construction details, material descriptions,
   dimensions of individual components and profiles, and finishes for each manufactured product and
   accessory. Include identification of material, thickness, weight, and finish for each type.
B. Shop Drawings: For sheet metal flashing and trim. Include plans, elevations, sections, and
   attachment details. Indicate installation layouts, expansion-joint locations, spacing of fasteners,
   cleats, clips, and other attachments. Distinguish between shop- and field-assembled work.
C. Samples: For each type of sheet metal and finishes, 12 inches long by actual width of unit,
   including finished seam and in required profile.

1.4 INFORMATIONAL SUBMITTALS
A. Qualification Data: For fabricator and manufacturers.

1.5 QUALITY ASSURANCE
A. Fabricator Qualifications: Employs skilled workers who custom fabricate sheet metal flashing and
   trim similar to that required for this Project and whose products have a record of successful in-
   service performance.
B. Pre-Installation Conference: Conduct a conference to review and discuss the following:
   1. Review construction schedule. Verify availability of materials, Installer's personnel, equipment,
      and facilities needed to make progress and avoid delays.
   2. Review special roof details, roof drainage, roof-penetration flashing, equipment curbs, and
      condition of other construction that affect sheet metal flashing and trim.
3. Review requirements for insurance and certificates if applicable.
4. Review sheet metal flashing observation and repair procedures after flashing installation.

C. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for fabrication and installation.
   1. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.6 DELIVERY, STORAGE, AND HANDLING
A. Protect mechanical and other finishes on exposed surfaces from damage by applying strippable, temporary protective film before shipping, and protect film from exposure to sunlight and high humidity.
B. Do not store materials in contact with other materials that might cause staining, denting, or other surface damage. Store sheet metal materials away from uncured concrete and masonry.

1.7 WARRANTY
A. Special Finish Warranty: Submit manufacturer's 20 year written warranty covering failure of the factory-applied exterior finish on sheet metal and agreeing to repair finish or replace sheet metal that evidences finish deterioration. Deterioration of finish includes, but is not limited to, color fade, chalking, cracking, peeling, and loss of film integrity.
B. Weathertight Warranty: In which Installer agrees to repair or replace components of sheet metal flashing that fail in materials or workmanship within 5 years of Date of Substantial Completion. Failures include, but are not limited to, the following:
   1. Structural failures including, but not limited to, rupturing, cracking, or puncturing.
   2. Wrinkling or buckling.
   3. Loose parts.
   4. Failure to remain weathertight, including uncontrolled water leakage.
   5. Deterioration of metals, metal finishes, and other materials beyond normal weathering, including nonuniformity of color or finish.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. General: Sheet metal flashing and trim assemblies shall withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failure due to defective manufacture, fabrication, installation, or other defects in construction. Completed sheet metal flashing and trim shall not rattle, leak, or loosen, and shall remain watertight.
B. FM Approvals Listing: Manufacture and install copings and roof edge flashings that are listed in FM Approvals’ "RoofNav" and approved for windstorm classification, [Class 1-60] [Class 1-75] [Class 1-90] [Class 1-105] [Class 1-120]. Identify materials with name of fabricator and design approved by FM Approvals.
C. SPRI Wind Design Standard: Manufacture and install copings and roof edge flashings tested according to SPRI ES-1 and capable of resisting the following design pressure:
   1. Design Pressure: As indicated on Drawings.
D. Thermal Movement: Allow for thermal movements from ambient and surface temperature changes to prevent buckling, opening of joints, overstressing of components, failure of joint sealants, failure of connections, and other detrimental effects. Base calculations on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

E. Install sheet metal and trim to withstand wind loads, structural movement, thermally induced movement, and exposure to weather without failing, rattling, leaking and fastener disengagement.

F. Water Infiltration: Provide sheet metal flashing and trim that do not allow water infiltration to building interior.

2.2 ALUMINUM FLASHING

A. (SMF-1) Prefinished Aluminum Sheet: ASTM B 209, alloy as standard with manufacturer for finish required, with temper as required to suit forming operations and performance required; with smooth and flat surface.

1. Thickness: 0.040 inch, minimum.

2. Fasteners: Aluminum or Series 300 stainless steel.

3. Finish: Custom color as selected by Architect to match MP-2.
   a. Color-Anodized Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
   b. PVDF Fluoropolymer Finish: AAMA 2605, containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat [and in clear topcoat].
      1) Two-Coat System: Primer and color coat.
      2) Three-Coat System: Primer, color coat and clear topcoat.
      3) Mica Two-Coat System: Primer, color coat with suspended mica flakes.
      4) Metallic Three-Coat System: Primer, color coat and clear topcoat with suspended metallic flakes.
   c. Concealed Finish: Pretreat with manufacturer's standard acrylic or polyester backer finish, consisting of prime coat and wash coat with minimum total dry film thickness of 0.5 mil.

2.3 MANUFACTURED ROOF SPECIALTIES

A. Manufacturers: Subject to compliance with requirements, provide Basis of Design product or approved equal by one of the following:

1. Allied Signals, Inc..
2. ATAS International, Inc.
3. Castle Metal Products.
5. Hickman Company, W. P.
8. Merchant & Evans, Inc.
9. Metal-Era, Inc.
10. Metal-Fab Manufacturing, LLC.

B. (CP-1) and (CP-2) Manufactured Aluminum Copings: Manufactured coping system consisting of snap-on coping cap, concealed anchorage; factory- mitered and continuously-welded corners and end cap, and concealed splice plates with same finish as coping caps.

1. Coping-Cap: Extruded aluminum, 0.125-inch thick, ASTM B 221, alloy and temper recommended by manufacturer for type of use and finish indicated.
2. Anchor Support Cleat: Concealed, 20 gauge galvanized-steel sheet, 12 inches wide, with stainless steel spring mechanically locked to cleat.
3. Fasteners: Aluminum or Series 300 stainless steel.

C. Finishes:
1. CP-1 Color: Custom color as selected by Architect to match adjacent MP-1 or MP-2.
2. CP-2 Color: Custom color as selected by Architect to match MP-3.
3. Color-Anodized Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
4. PVDF Fluoropolymer Finish: AAMA 2605, containing not less than 70 percent polyvinylidene fluoride (PVDF) resin by weight in color coat [and in clear topcoat].
   a. Two-Coat System: Primer and color coat.
   b. Three-Coat System: Primer, color coat and clear topcoat.
   c. Mica Two-Coat System: Primer, color coat with suspended mica flakes.
   d. Metallic Three-Coat System: Primer, color coat and clear topcoat with suspended metallic flakes.
5. Concealed Finish: Pretreat with manufacturer’s standard acrylic or polyester backer finish, consisting of prime coat and wash coat with minimum total dry film thickness of 0.5 mil.

2.4 FLEXIBLE MEMBRANE FLASHING
A. (MEMB FLASH-1) Self-Adhering, High-Temperature Sheet Membrane Flashing: Minimum 30 mils thick, consisting of a slip-resistant polyethylene- or polypropylene-film top surface laminated to a layer of butyl- or SBS-modified asphalt adhesive, with release-paper backing; specifically designed to withstand high metal temperatures beneath metal roofing and flashing. Provide primer according to written recommendations of underlayment manufacturer.
   2. Low-Temperature Flexibility: ASTM D 1970; passes after testing at minus 20 deg F or lower.
   3. Manufacturers and Products:
      a. Carlisle Coatings & Waterproofing Inc.; CCW WIP 300HT
      b. Carlisle Coatings & Waterproofing Inc.; CCW MiraDRI WIP 300 High Temperature
      c. Grace Construction Products; Grace Ultra.
      d. Grace Construction Products; Grace Ice and Water Shield HT.
      e. Henry Company; Blueskin PE200 HT.
      f. Owens Corning; WeatherLock Metal High-Temperature Underlayment.
      g. Protecto Wrap Company; Protecto Jiffy Seal Ice & Water Guard HT.
      h. SDP Advanced Polymer Products Inc; Palisade SA-HT.
B. (MEMB FLASH-2) EPDM Rubber Sheet Membrane Flashing: ASTM D 6134, Type I, 60-mil- thick flexible sheet, unreinforced, formed from EPDM.
   1. Manufacturers:
      a. Carlisle Coatings & Waterproofing Inc..
      b. Firestone Building Products.
      c. JohnsManville.
      d. Versico.
   2. Accessories: Furnish auxiliary materials including sheet flashing and bonding adhesive, recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.

2.5 ACCESSORIES
A. General: Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items as required for complete sheet metal flashing and trim installation and as recommended by manufacturer of primary sheet metal unless otherwise indicated.
B. Anchorage: Nails and screws of hot dip zinc coated steel. Use screws where exposed anchorage is required. Screws minimum 1-1/2 inch long with neoprene washer under screw head. Exposed surfaces with finish to match color of sheet metal.

C. Fasteners: Wood screws, annular threaded nails, self-tapping screws, self-locking rivets and bolts, and other suitable fasteners designed to withstand design loads and recommended by manufacturer of primary sheet metal or manufactured item.

D. Sealant Tape: Pressure-sensitive, 100 percent solids, polyisobutylene compound sealant tape with release-paper backing. Provide permanently elastic, nonsag, nontoxic, nonstaining tape 1/2 inch wide and 1/8 inch thick.

E. Bituminous Coating: Cold-applied asphalt emulsion according to ASTM D 1187.

2.6 FABRICATION

A. General: Custom fabricate sheet metal flashing and trim to comply with recommendations in SMACNA's "Architectural Sheet Metal Manual" that apply to design, dimensions, geometry, metal thickness, and other characteristics of item indicated. Fabricate items at the shop to greatest extent possible.

1. Fabricate sheet metal flashing and trim in thickness or weight needed to comply with performance requirements, but not less than that specified for each application and metal.

2. Obtain field measurements for accurate fit before shop fabrication.

3. Form sheet metal flashing and trim without excessive oil canning, buckling, and tool marks and true to line and levels indicated, with exposed edges folded back to form hems.

4. Conceal fasteners and expansion provisions where possible. Exposed fasteners are not allowed on faces exposed to view.

B. Fabrication Tolerances: Fabricate sheet metal flashing and trim that is capable of installation to a tolerance of 1/4 inch in 20 feet on slope and location lines as indicated and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

C. Sealed Joints: Form nonexpansion but movable joints in metal to accommodate elastomeric sealant.

D. Expansion Provisions: Where lapped expansion provisions cannot be used, form expansion joints of intermeshing hooked flanges, not less than 1 inch deep, filled with butyl sealant concealed within joints.

E. Fabricate cleats and attachment devices from same material as accessory being anchored or from compatible, noncorrosive metal.

F. Finishes:

1. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

2. Protect mechanical and painted finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

3. Appearance of Finished Work: Noticeable variations in same piece are unacceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrate and conditions under which flashing and sheet metal work is to be performed. Do not proceed with work until unsatisfactory conditions have been corrected.
3.2 INSTALLATION
A. Install sheet metal work in accordance with reviewed shop drawings and Architectural Sheet Metal Manual with sharp clean breaks.
B. Lower edge of flashing, counter flashing and exposed metal edges shall be turned back into hemmed edge.
C. Flashing shall be securely fastened and water and weatherproof. Neatly install with sharp clean breaks. Metal work at roof shall meet roofer’s requirements and approval.
D. Butt and locked joint in metal work shall be watertight. Joints shall be lapped in direction of flow.
E. Provide lead wedges where required to hold metal firmly in place.
F. Install work with proper allowance for expansion and contraction from thermal changes.
G. Prior to starting work, nailers and blocking shall be true to size and line and securely anchored. Do not proceed until corrections are made so straight, level, plumb and properly sized work results.
H. Carefully form flashings, including at masonry, to conform to material dimensions as shown and according to field dimensions as verified.
I. Join lengths of gutters and downspouts with formed seams sealed watertight. Flash and seal gutters to downspouts. Slope gutters to downspout.

3.3 LOCATION OF JOINTS IN METAL
A. Center roof edge cover joints on other building features, symmetrical on facade, with joints not to exceed 10 feet o.c., as directed by Architect.
B. Joints in other metal work may be placed where convenient to metal lengths, not to exceed 10 feet lengths.
C. Cut metal for installations to maintain uniform 1/4 inch joint.

3.4 CONSTRUCTION OF END JOINTS
A. Butt Joints with Backplate for Expansion: Provide backplates same gauge and metal as flashing, 6 inch wide (2-7/8 inch each side of joint) conforming to exact shape of back of metal and full profile of metal after forming (except hems).
   1. At both ends of each length of flashing metal, provide not less than 3 bent clips riveted near end, to receive backplate. Backplates are to slip under bent clips and shall form tight contact with flashing or cover metal.
   2. In installation, butter bed of sealant on backplate and slide section of metal onto backplate, such that backplate fits into clips to hold metal tight and in perfect alignment. Repeat until metal has been set. At joints, install screws with neoprene washers through backplate without fastening to metal flashing length. (Notch out ends of flashing metal to accommodate screw heads and to eliminate obstructions for metal expansion.) Provide screw with neoprene washer at center of each length of roof metal flashing. Provide keepers or cleats to keep metal in place.
B. Locked Cover Strips: Cover strip shall have same profile as flashing and be formed with single lock seam to metal each side of joint. Locked seam joints shall have about 3/4 inch seam lock, with flashing spaced about 3/8 inch and shall permit movement at each joint.
C. Lapped Joints: Lap 3 inches in direction of water flow. At counterflashings, lock bottom edges together.
D. Sealant: Apply concealed sealant in accordance with requirements of Section 079000 - Joint Sealers.
E. At corners, inside or outside type, provide neat corner sections built-up in shop; with soldered joints and follow profile of adjacent metal. No nails permitted at exposed surfaces of exposed roof metal, only screws shall be used. Set roof edges in cooperation with roofer. Form angles to lesser degrees than required to insure snug fit after installation.

3.5 MEMBRANE FLASHING
   A. Install membrane flashing over metal flashing with termination bar and sealant at top edge. Install membrane in accordance with manufacturer’s directions to maintain watertight integrity of flashing materials and installation. Lengths shall be as long as possible by rolls of material. Lap ends minimum 2 inches, seal entire lap with adhesive and clean free of residue.

3.6 COUNTERFLASHING AND CURB FLASHING
   A. Install metal counterflashing after membrane flashing is installed. Secure with screws through neoprene washers and locate not to exceed 18 inches o.c. Lap joints and lock lower edges together.
   B. Install counterflashing to provide watertight closure over top of roofing flashing. Corners at curbs shall be sealed watertight. Height of counterflashing above membrane as indicated, with counterflashing carried down 45 degrees cant strip to about 1/2 inch above roof insulation. Bottom edge shall be hemmed to eliminate sharp edges.
   C. Counter-flash mechanical and electrical items projecting through membrane roofing.

3.7 ERECTION TOLERANCES
   A. Installation Tolerances: Shim and align sheet metal flashing and trim within installed tolerance of 1/4 inch in 20 feet on slope and location lines indicated on Drawings and within 1/8-inch offset of adjoining faces and of alignment of matching profiles.

3.8 INSTALLED WORK
   A. Cleaning: Clean exposed metal surfaces of substances that interfere with uniform oxidation and weathering. Clean off excess sealants.
   B. Protection: Remove temporary protective coverings and strippable films as sheet metal flashing and trim are installed unless otherwise indicated in manufacturer’s written installation instructions. On completion of installation, remove unused materials and clean finished surfaces as recommended by sheet metal flashing and trim manufacturer. Maintain sheet metal flashing and trim in clean condition during construction.
   C. Damaged Work: Replace sheet metal flashing and trim that have been damaged or that have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION
SECTION 07 72 00
ROOF CURBS

GENERAL

1.1 SUMMARY
A. Section Includes: Roof curbs.

1.2 COORDINATION
A. Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.
B. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of roof accessory.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
B. Shop Drawings: For roof accessories.
   1. Include plans, elevations, keyed details, and attachments to other work. Indicate dimensions, loadings, and special conditions. Distinguish between plant- and field-assembled work.
C. Delegated-Design Submittal: For roof curbs indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   1. Detail mounting, securing, and flashing of roof-mounted items to roof structure. Indicate coordinating requirements with roof membrane system.
   2. Wind-Restraint Details: Detail fabrication and attachment of wind restraints. Show anchorage details and indicate quantity, diameter, and depth of penetration of anchors.

1.4 INFORMATIONAL SUBMITTALS
A. Coordination Drawings: Roof plans, drawn to scale, and coordinating penetrations and roof-mounted items. Show the following:
   1. Size and location of roof accessories specified in this Section.
   2. Method of attaching roof accessories to roof or building structure.
   3. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
   4. Required clearances.
B. Sample Warranties: For manufacturer's special warranties.

1.5 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For roof accessories to include in operation and maintenance manuals.
PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Roof accessories shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

B. Delegated Design: Engage a qualified professional engineer, as defined in Section 014000 "Quality Requirements," to design roof curbs to comply with wind performance requirements, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

C. Wind-Restraint Performance: As indicated on Drawings.

2.2 ROOF CURBS

A. Manufacturers:
   1. Curbs, Inc..
   2. The Pate Co..
   4. Thybar Corporation.

B. Roof Curbs: Internally reinforced roof-curb units capable of supporting superimposed live and dead loads, including equipment loads and other construction indicated on Drawings, bearing continuously on roof structure, and capable of meeting performance requirements; with welded or mechanically fastened and sealed corner joints and integrally formed deck-mounting flange at perimeter bottom.

C. Size: Coordinate dimensions with roughing-in information or Shop Drawings of equipment to be supported.

D. Supported Load Capacity: Coordinate load capacity with information on Shop Drawings of equipment to be supported.

E. Material: Zinc-coated (galvanized) steel sheet, thickness as recommended by Manufacturer for intended use.
   1. Finish: Two-coat fluoropolymer.
   2. Color: As selected by Architect from manufacturer’s full range.

F. Construction:
   1. Curb Profile: Manufacturer's standard compatible with roofing system.
   2. On ribbed or fluted metal roofs, form deck-mounting flange at perimeter bottom to conform to roof profile.
   3. Top Surface: Level top of curb, with roof slope accommodated by sloping deck-mounting flange or by use of leveler frame.
   4. Sloping Roofs: Where roof slope exceeds 1:48, fabricate curb with perimeter curb height tapered to accommodate roof slope so that top surface of perimeter curb is level. Equip unit with water diverter or cricket on side that obstructs water flow.
   5. Insulation: Factory-installed glass-fiber board insulation.
   6. Liner: Same material as curb, of manufacturer’s standard thickness and finish.
   8. Wind Restraint Straps and Base Flange Attachment: Provide wind restraint straps, welded strap connectors, and base flange attachment to roof structure at perimeter of curb, of size and spacing required to meet wind uplift requirements.
9. Platform Cap: Where portion of roof curb is not covered by equipment, provide weathertight platform cap formed from 3/4-inch thick plywood covered with metal sheet of same type, thickness, and finish as required for curb.

10. Metal Counterflashing: Manufacturer's standard, removable, fabricated of same metal and finish as curb.

2.3 MISCELLANEOUS MATERIALS

A. Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items required by manufacturer for a complete installation.

B. Fasteners: Roof accessory manufacturer's recommended fasteners suitable for application and metals being fastened. Match finish of exposed fasteners with finish of material being fastened. Provide nonremovable fastener heads to exterior exposed fasteners. Furnish the following unless otherwise indicated:
   1. Fasteners for Zinc-Coated or Aluminum-Zinc Alloy-Coated Steel: Series 300 stainless steel or hot-dip zinc-coated steel according to ASTM A153/A153M or ASTM F2329.

C. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, PVC, or silicone or a flat design of foam rubber, sponge neoprene, or cork.

2.4 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.

B. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.

C. Verify dimensions of roof openings for roof accessories.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install roof accessories according to manufacturer's written instructions.
   1. Install roof accessories level; plumb; true to line and elevation; and without warping, jogs in alignment, buckling, or tool marks.
   2. Anchor roof accessories securely in place so they are capable of resisting indicated loads.
   3. Use fasteners, separators, sealants, and other miscellaneous items as required to complete installation of roof accessories and fit them to substrates.
   4. Install roof accessories to resist exposure to weather without failing, rattling, leaking, or loosening of fasteners and seals.

B. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.
1. Coat concealed side of uncoated aluminum and stainless steel roof accessories with bituminous coating where in contact with wood, ferrous metal, or cementitious construction.

2. Underlayment: Where installing roof accessories directly on cementitious or wood substrates, install a course of underlayment and cover with manufacturer's recommended slip sheet.

C. Roof Curb Installation: Install each roof curb so top surface is level.

D. Seal joints as required by roof accessory manufacturer.

END OF SECTION
SECTION 07 72 33
ROOF HATCHES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Prefabricated roof hatches and accessories for straight ladder access (RH-1).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product indicated. Include construction details, materials, dimensions of individual components and profiles, and finishes.
B. Shop Drawings: Include plans, elevations, keyed details, and attachments to other work. Indicate dimensions, loadings, and special conditions. Distinguish between plant- and field-assembled work.

1.3 QUALITY ASSURANCE
A. Standards: Comply with the following:
   1. SMACNA's "Architectural Sheet Metal Manual" details for fabrication of units, including flanges and cap flashing to coordinate with type of roofing indicated.
   2. NRCA's "Roofing and Waterproofing Manual" details for installing units.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Cover and curb shall be thermally broken to prevent heat transfer between interior and exterior surfaces.
B. Entire assembly shall be weathertight with fully welded corner joints on cover and curb.

2.2 MANUFACTURERS
A. Manufacturers: Subject to compliance with requirements, provide Basis of Design or equivalent products by one of the following:
   1. Babcock-Davis.
   2. Bilco Company.
   4. Thybar Corporation.

2.3 VERTICAL LADDER ACCESS (THERMALLY-BROKEN)
A. (RH-1) Thermally-Broken, Ladder Access
   1. Basis-of-Design: Type E-50TB Roof Hatch by The BILCO Company.
      a. Size: 36 inches by 36 inches.
   2. Performance characteristics:
      a. Cover and curb shall be thermally broken to prevent heat transfer between interior and exterior surfaces.
      b. Cover shall be reinforced to support a minimum live load of 40 psf (195kg/m2) with a maximum deflection of 1/150th of the span or 20 psf (97kg/m2) wind uplift.
      c. Operation of the cover shall be smooth and easy with controlled operation throughout the entire arc of opening and closing.
d. Operation of the cover shall not be affected by temperature.
e. Entire hatch shall be weather tight with fully welded corner joints on cover and curb.

3. Modifications for Acoustic Performance: Provide continuous sound-seal gasket at cover perimeter.

4. Cover: Shall be 11 gauge (2.3mm) aluminum with a 5” (127mm) beaded flange with formed reinforcing members. Interior and exterior surfaces shall be thermally broken to minimize heat transfer and to resist condensation. Cover shall have a heavy extruded EPDM rubber gasket bonded to the cover interior to assure a continuous seal when compressed to the top surface of the curb.

5. Cover insulation: Shall be 3” (75mm) thick polyisocyanurate with an R-value = 20.3 (U=0.279 W/m²K), fully covered and protected by an 18 gauge (1mm) aluminum liner.

6. Curb: Shall be 12” (305mm) in height and of 11 gauge (2.3mm) aluminum. Interior and exterior surfaces shall be thermally broken to minimize heat transfer and to resist condensation. The curb shall be formed with a 5-1/2" (140mm) flange with 7/16” (11mm) holes provided for securing to the roof deck. The curb shall be equipped with an integral metal cap flashing of the same gauge and material as the curb, fully welded at the corners, that features the Bil-Clip® flashing system, including stamped tabs, 6” (153mm) on center, to be bent inward to hold single ply roofing membrane securely in place.

7. Curb insulation: Shall be 3” (75mm) thick polyisocyanurate with an R-value = 20.3 (U=0.279 W/m²K).

8. Lifting mechanisms: Manufacturer shall provide compression spring operators enclosed in telescopic tubes to provide, smooth, easy, and controlled cover operation throughout the entire arc of opening and closing. The upper tube shall be the outer tube to prevent accumulation of moisture, grit, and debris inside the lower tube assembly. The lower tube shall interlock with a flanged support shoe welded to the curb assembly.

9. Hardware
   a. Heavy stainless steel pintle hinges shall be provided
   b. Cover shall be equipped with a spring latch with interior and exterior turn handles
   c. Roof hatch shall be equipped with interior and exterior padlock hasps.
   d. The latch strike shall be a stamped component bolted to the curb assembly.
   e. Cover shall automatically lock in the open position with a rigid hold open arm equipped with a 1” (25mm) diameter red vinyl grip handle to permit easy release for closing.
   f. Compression spring tubes shall be an anti-corrosive composite material and all other hardware shall be zinc plated and chromate sealed. [For installation in highly corrosive environments or when prolonged exposure to hot water or steam is anticipated, specify Type 316 stainless steel hardware].
   g. Cover hardware shall be bolted into heavy gauge channel reinforcing welded to the underside of the cover and concealed within the insulation space.

10. Finishes: Factory finish shall be mill finish aluminum.

PART 3 EXECUTION

3.1 INSPECTION
   A. Verify that roof hatch installation will not disrupt other trades. Verify that the substrate is dry, clean, and free of foreign matter. Report and correct defects prior to any installation.

3.2 INSTALLATION
   A. Install roof hatches in accordance with manufacturer’s recommendations.
   B. Coordinate with installation of roofing system and related flashings. Provide weather tight installation.
C. Anchor units securely to supporting structural substrates, adequate to withstand lateral and thermal stresses as well as inward and outward loading pressures.

D. Test operate units and adjust for proper operation.

E. Clean and lubricate joints and hardware.

END OF SECTION
SECTION 077236
SMOKE VENTS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Prefabricated, acoustically-rated automatic smoke vents with upward acting doors, complete with support curb, operable hardware, counterflashings and automatic venting; and motorized operating system (SV-1).

1.2 COORDINATION
A. Coordinate layout and installation of roof accessories with roofing membrane and base flashing and interfacing and adjoining construction to provide a leakproof, weathertight, secure, and noncorrosive installation.
B. Coordinate dimensions with rough-in information or Shop Drawings of equipment to be supported.
C. Coordinate motorized operating system and accessory devices to be compatible, including:
   1. Motor controllers.
   2. Torque, speed, and horsepower requirements of the load.
   3. Ratings and characteristics of supply circuit and required control sequence.
   4. Ambient and environmental conditions of installation location.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of smoke vent indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
B. Shop Drawings: Include plans, elevations, keyed details, and attachments to other work. Indicate dimensions, loadings, and special conditions. Distinguish between plant- and field-assembled work.
   1. Include diagrams for power, signal, and control wiring.
C. Samples: For each exposed product and for each color and texture specified, prepared on Samples of size to adequately show color.

1.4 INFORMATIONAL SUBMITTALS
A. Coordination Drawings: Roof plans, drawn to scale, and coordinating penetrations and roof-mounted items. Show the following:
   1. Size and location of roof accessories specified in this Section.
   2. Method of attaching roof accessories to roof or building structure.
   3. Other roof-mounted items including mechanical and electrical equipment, ductwork, piping, and conduit.
   4. Required clearances.
B. Product Test Reports and Certificates: For each type of acoustic smoke vent assembly, for tests performed by a qualified testing agency.
   1. Submit certified copies of 1/3 Octave Band Transmission Loss test data and STC rating as issued by an accredited independent acoustical laboratory.
1.5 **CLOSEOUT SUBMITTALS**

A. Operation and Maintenance Data: For roof accessories to include in operation and maintenance manuals.

1.6 **QUALITY ASSURANCE**

A. Provide units which have been tested, listed and labeled by FM.

B. Laboratory Certification: Acoustical testing of submitted doors assemblies shall be conducted in an accredited independent acoustical laboratory.
   1. Sound transmission loss values shall be determined in accordance with ASTM E90.
   2. Sound Transmission Class (STC) shall be determined in accordance with ASTM E413.

1.7 **MAINTENANCE AGREEMENT**

A. Continuing Maintenance Proposal: Submit proposal to the Owner, in the form of a standard yearly (or other period) maintenance agreement, starting on date of Substantial Completion. State services, obligations, conditions, and terms for agreement period and for future renewal options.

**PART 2 PRODUCTS**

2.1 **PERFORMANCE REQUIREMENTS**

A. General Performance: Entire smoke vent shall be weathertight with fully welded corner joints on cover and curb, and shall withstand exposure to weather and resist thermally induced movement without failure, rattling, leaking, or fastener disengagement due to defective manufacture, fabrication, installation, or other defects in construction.

B. Loads: Covers shall be reinforced to support a minimum live load of 40 psf with a maximum deflection of 1/150th of the span or 90 psf wind uplift.
   1. When release is actuated, lid shall open against 10 psf snow or wind load and lock in position.

C. Acoustical Performance Requirements: Provide smoke vent assemblies identical to those of assemblies tested as sound-retardant units by an acoustical testing agency, and have the following minimum ratings:
   1. Sound Transmission Class (STC) Rating per ASTM E413: STC 50, and with energy average over the 1/3 octave band center frequencies as follows:

<table>
<thead>
<tr>
<th>Octave Band Center Frequency, Hz</th>
<th>Minimum Sound Transmission Loss (dB re 20 µPa)</th>
</tr>
</thead>
<tbody>
<tr>
<td>125</td>
<td>28</td>

<tr>
<td>250</td>
<td>39</td>
</tr>
<tr>
<td>500</td>
<td>42</td>
</tr>
<tr>
<td>1000</td>
<td>43</td>
</tr>
<tr>
<td>2000</td>
<td>46</td>
</tr>
<tr>
<td>4000</td>
<td>51</td>
</tr>
</tbody>
</table>

D. Standards: Provide smoke vents that are:
   1. Tested and listed to comply with UL 793.
   2. Labeled by an approved testing agency in accordance with IBC section 1703.5.
   3. Manufactured, installed, tested and maintained in accordance with NFPA 204.
   4. Tested, listed and labeled by FM Approvals.

2.2 **PRODUCTS AND MANUFACTURERS**

A. Source Limitations: Obtain steel acoustic smoke vent assemblies, including lids, curbs, sound control seals, hardware and other components from single source from single manufacturer.

B. Products and Manufacturers: Subject to compliance with specified requirements, provide Basis of Design or equivalent product as approved by Architect, by one of the following Manufacturers:
1. Babcock-Davis.
2. Bilco Company.
3. Dur-Red Products
5. Thybar Corporation.

2.3 ACOUSTICALLY-RATED SMOKE VENTS
A. (SV-1) Hatch-Type Heat and Smoke Vents: Acoustically-rated, quad-leaf automatic hatch-type smoke vent; insulated double-walled upper (exterior) and lower (interior) door panels with continuous weathertight perimeter gaskets; equipped with automatic self-lifting mechanisms and UL-listed fusible links rated at 165 deg F; mounted on double-walled insulated curbs; equipped with electric motorized operating system as recommended by smoke vent Manufacturer.
2. Size: 66 inches by 144 inches.
3. Heat and Smoke Vent Standard: Provide units that have been tested and listed to comply with UL 793 and are FM Approved.
   a. Roof vents must be labeled by an approved testing agency as outline in IBC section 1703.5.

2.4 COMPONENTS
A. Covers, Upper (Exterior) and Lower (Interior): 14 gauge paint bond G-90 galvanized steel with a 5-inch beaded flange with formed reinforcing members.
   1. Gasket: PVC gaskets shall be permanently adhered to the underside of the covers and on top of the curb.
   2. Cover Insulation: Shall be fiberglass of 3" (76mm) in thickness, fully covered and protected by a 14 gauge paint bond G-90 galvanized steel liner.
   3. Each upper cover shall be equipped with a positive automatic hold-open arm with red vinyl grip release, and a heavy extruded thermoplastic rubber gasket fitted into a retainer that is mechanically fastened to the interior of the cover to assure a continuous seal when compressed to the top surface of the curb.
   4. Each lower cover shall be continuously hinged and shall be 14 gauge paint bond G-90 galvanized steel prime painted. Insulation in the lower covers shall be glass fiber 2" thick fully covered and protected by a 22 gauge paint bond G-90 galvanized steel liner prime painted.
B. Curb: Double-walled insulated curbs, welded or mechanically fastened and sealed corner joints, integral condensation gutter, and cap flashing.
   1. Steel: 14 gauge galvanized steel inner curb, 14 gauge galvanized steel outer curb.
   2. Curb Insulation: 3-inches fiberglass insulation, fully enclosed by a 14 gauge paint bond G-90 galvanized steel liner.
C. Hinge: Zinc plated steel tamper proof hinge contained within vent as part of spring assembly.
D. Springs: High pressure gas springs enclosed in telescoping tubes, designed to open vent covers automatically against 10 pounds per square foot wind or snow load when released.
E. Hardware: Manufacturer's standard, corrosion resistant or hot-dip galvanized; with hinges, hold-open devices, and independent manual-release devices for inside and outside operation of lids.
F. Lifting Mechanisms: Corrosion resistant gas springs open covers automatically against a 10 lb/ft² snow/wind load; with built in dampers to assure a controlled rate of opening and automatically lock the covers in the full open position. Provide release mechanism to allow the covers to be closed.
G. Latch Mechanism: 24 or 110-volt electric thermo-link release mechanism linked to alarm system to release vent electrically. Provide positive hold/release mechanism with a separate latching point for each cover controlled by a single UL listed 165°F fusible link. Fusible link shall be curb mounted on a non-hinged end to allow the latching mechanism to be easily reset from the roof level.
1. Provide cover-mounted rigging release devices, 165 degree fusible links, secure rigging underside of each cover.
2. Design latching mechanisms to securely hold the covers in the closed position against wind uplift forces without overstressing fusible links.

2.5 ELECTRIC MOTOR OPERATING SYSTEM

A. Provide operating system suitable for Project conditions, designed for smoke vent size, type, weight, and operation frequency; and in accordance with the following requirements:

B. Motors: For each new smoke vent unit, provide two (2) single-phase, single-speed electric motors, with capacity and torque characteristics sufficient to start, accelerate, and operate connected loads at designated speeds, at installed altitude and environment, with indicated operating sequence, and without exceeding nameplate ratings or considering service factor; with manufacturer's standard weatherproof enclosures.
1. Electrical Characteristics: 115 VAC motors with 24 VDC relay to allow electric actuation.
2. Limit Switches: Equip each motorized door with adjustable switches interlocked with motor controls and set to automatically stop door at fully opened and fully closed positions.

C. Controls: For each new and existing smoke vent unit, provide one (1) wall-mounted three-button-operated station with dual contacts to operate both motors.
1. Remote Control Station: Momentary-contact, three-button-operated with open, stop, and close function; located remotely at stage level.
2. Coordinate wiring requirements and electrical characteristics of motors and other electrical devices with building electrical system and each location where installed.
3. Comply with NFPA 70 and manufacturer's written instructions for grounding of electric-powered motors, controls, and other devices.
4. Indicator Switches: Provide two (2) indicator switches per unit (1 per set of covers); enclosed type with top plunger actuator.
   a. Indicator Switch Basis of Design: Model BZE6-2RQ by Honeywell, or Equal as approved by smoke vent manufacturer.

2.6 MISCELLANEOUS MATERIALS

A. General: Provide materials and types of fasteners, protective coatings, sealants, and other miscellaneous items required by manufacturer for a complete installation.
1. Installation at Sloping Roofs: Where slope or roof deck exceeds 1:48, fabricate curb with perimeter curb height that is constant. Equip hatch with water diverter or cricket on side that obstructs water flow.

B. Glass-Fiber Board Insulation: ASTM C 726, thickness as indicated.

C. Fasteners: Roof accessory manufacturer's recommended fasteners suitable for application and metals being fastened. Match finish of exposed fasteners with finish of material being fastened. Provide nonremovable fastener heads to exterior exposed fasteners. Furnish the following unless otherwise indicated:
1. Fasteners for Steel: Series 300 stainless steel or hot-dip zinc-coated steel according to ASTM A 153 or ASTM F 2329.

D. Gaskets: Manufacturer's standard tubular or fingered design of neoprene, EPDM, PVC, or silicone or a flat design of foam rubber, sponge neoprene, or cork.
E. Elastomeric Sealant: ASTM C 920, elastomeric polymer sealant as recommended by roof accessory manufacturer for installation indicated; low modulus; of type, grade, class, and use classifications required to seal joints and remain watertight.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, to verify actual locations, dimensions, and other conditions affecting performance of the Work.

B. Verify that substrate is sound, dry, smooth, clean, sloped for drainage, and securely anchored.

C. Verify dimensions of roof openings for roof accessories.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install roof accessories according to manufacturer's written instructions.
   1. Install roof accessories level, plumb, true to line and elevation, and without warping, jogs in alignment, excessive oil canning, buckling, or tool marks.
   2. Anchor roof accessories securely in place so they are capable of resisting indicated loads.
   3. Use fasteners, separators, sealants, and other miscellaneous items as required to complete installation of roof accessories and fit them to substrates.
   4. Install roof accessories to resist exposure to weather without failing, rattling, leaking, or loosening of fasteners and seals.

B. Metal Protection: Protect metals against galvanic action by separating dissimilar metals from contact with each other or with corrosive substrates by painting contact surfaces with bituminous coating or by other permanent separation as recommended by manufacturer.

C. Heat and Smoke Vent Installation: Install and test heat and smoke vents and their components for proper operation according to NFPA 204.

3.3 TESTING AND ADJUSTING

A. Engage a factory-authorized service representative to perform startup service.
   1. Perform installation and startup checks according to manufacturer's written instructions.
   2. Test and adjust controls and safety devices. Replace damaged and malfunctioning controls and equipment.

B. Adjust hardware and moving parts to function smoothly so that doors operate easily, free of warp, twist, or distortion.
   1. Adjust exterior doors and components to be weather-resistant.
   2. Adjust seals to provide tight fit around entire perimeter.

C. Adjust limit switches so covers do not over-open, and will close properly from the open position.

D. Lubricate bearings and sliding parts as recommended by manufacturer.

END OF SECTION
SECTION 07 81 00
APPLIED FIREPROOFING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Wet-mix sprayed fireproofing.

1.2 ACTION SUBMITTALS
A. Product Data: For products used.

1.3 INFORMATIONAL SUBMITTALS
A. Manufacturer’s Certificates: Provide certificates from fireproofing manufacturer, for each fireproofing product required, indicating that:
   1. Steel to receive sprayed fireproofing is unprimed or that sprayed fireproofing manufacturer certify primers applied to steel in shop or field are compatible with sprayed-on fireproofing and will not impair its performance under fire exposure for applications indicated, as provided by ASTM E119 test. Include test and other data as evidence. Coordinate with structural steel Sections.
   2. Each fireproofing product complies with specified product requirements and is suitable for use indicated.
   3. Sprayed fireproofing has been completed in accordance with requirements to provide necessary fire resistance ratings. Provide Ratings Certificate.

1.4 QUALITY ASSURANCE
A. Fireproofing Installer: Licensed, qualified, experienced and approved by manufacturer to apply fireproofing materials as specified. Applicator to have been in continuous business for not less than the past 5 years. Applicator shall provide, in writing, names of previous projects, comparable in type and size, successfully completed on time.

1.5 PRECONSTRUCTION TESTING
A. Preconstruction Adhesion and Compatibility Testing: Test for compliance with requirements for specified performance and test methods.
   1. Bond Strength: Test for cohesive and adhesive strength according to ASTM E 736. Provide bond strength indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
   2. Density: Test for density according to ASTM E 605. Provide density indicated in referenced fire-resistance design, but not less than minimum specified in Part 2.
   3. Verify that manufacturer, through its own laboratory testing or field experience, attests that primers or coatings are compatible with fireproofing.
   4. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
   5. For materials failing tests, obtain applied-fireproofing manufacturer’s written instructions for corrective measures including the use of specially formulated bonding agents or primers.
PART 2 PRODUCTS

2.1 SPRAY-APPLIED FIRE-RESISTIVE MATERIALS

A. Assemblies: Provide fireproofing, including auxiliary materials, according to requirements of each fire-resistance design and manufacturer's written instructions.

B. Sprayed-on Fire-resistant Coating: Cementitious fireproofing, Wet-mix setting based type as defined by Underwriters Laboratories and free from asbestos, actinolite, amosite, anthophyllite, chrysotile and tremolite. No mineral fiber fireproofing allowed.
   1. Cementitious Wet Mix Admixtures: Materials (with and without aggregate) which, when mixed in accordance with accompanying instructions forms a slurry or mortar providing properties necessary for conveyance and application to building structures.
   2. Fire-Resistance Design: Indicated on Drawings, tested according to ASTM E 119 or UL 263 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
      a. Steel members are to be considered unrestrained unless specifically noted otherwise.
      b. UL design listings must state that the loading was determined by Allowable Stress Design Method or Load and Resistance Factor Design Method. UL design listings requiring a load restriction factor are not allowed.

3. VOC Content: Products shall comply with VOC

C. Standard Density: Meeting or exceeding 15 pounds per cubic foot per ASTM E605, no fungal growth per ASTM G21. For concealed locations and in plenum ceilings and above suspended ceilings.
   1. Products and Manufacturers:
      a. Monokote MK-6 by Grace Construction Products.
      b. Pyrolite 15 by Carboline Fireproof Products Division.
      c. Cafco-300 by Isolotek.
      d. Southwest Fireproofing Type 5GP by AD Fire Protection Systems.

D. Auxiliary Fireproofing Materials: Provide type compatible with sprayed-on fireproofing products and substrate that are approved for use indicated by manufacturer of sprayed-on fireproofing, and are approved by nationally recognized testing laboratories or other testing and inspecting agency acceptable to authorities having jurisdiction for use in fire-resistance rated designs indicated.

E. Substrate Primers: Type approved by manufacturer of sprayed-on fireproofing for substrate and for conditions of exposure indicated.

F. Adhesive for Bonding Fireproofing: Type recommended by manufacturer of sprayed-on fireproofing manufacturer.

G. Mixing: Perform mixing and preparation of materials at project using mechanical equipment, in accordance with manufacturer's printed directions to achieve performance criteria specified herein.

PART 3 EXECUTION

3.1 AREA PREPARATION

A. Provide necessary measures for protection of workers and public, as required under regulation of U.S. Occupational Safety and Health Act (OSHA), and applicable local ordinances, and code regulations.
B. Provide protection for workmen applying fireproofing and for other workers who are in vicinity of application of mixing operations. Provide necessary measures for protection of general public and for prevention of air pollution as required. Enclose exterior openings at areas where spray application will be in progress.

C. Provide masking, drop cloths, or other satisfactory covering for materials which are not to receive fireproofing to prevent damage from contamination from overspray or fallout of materials.

3.2 EXAMINATION

A. Examine surfaces to which this work is to be attached or applied and notify Architect if conditions exist which are detrimental to proper and expeditious installation of work. Starting of work shall imply acceptance of substrate for adhesion and performance of work as specified. Substrate is in satisfactory condition if it complies with following:

1. Substrate complies with requirements of section in which substrate and related work is specified and is free of oil, grease, rolling compounds, incomplete primers, loose mill scale, dirt or other foreign substances capable of impairing bond of fireproofing with substrate under conditions of normal use or fire exposure.

2. Objects which will penetrate fireproofing, including clips, hangers, support sleeves and similar items have been securely attached to substrates.

3. Substrates are not obstructed by ducts, piping, equipment and other suspended construction that could interfere with application of fireproofing and until it has dried.

B. Cooperate with coordination and scheduling of work of this section with work of other sections so not to delay job progress.

C. Clips, hangers, supports, sleeves and other attachments to fireproofing bases, as covered under other sections of specifications, are to be placed by other trades prior to application of fireproofing material, where these materials can be anticipated in advance.

D. Ducts, piping or conduit or other suspended equipment that could interfere with uniform application of fireproofing material are to be positioned after application of sprayed fireproofing, unless fireproofing applicator agrees to their installation prior to fireproofing.

E. Prior to application of fireproofing material, ascertain that steel is acceptable to receive fireproofing. Steel shall be free of oil, grease, loose mill scale, or other substance that may impair proper adhesion.

3.3 SURFACE PREPARATION

A. Clean surface to receive sprayed fireproofing to remove mill scale, dirt, grime, oil, grease, dust, loose rust, rolling compounds, incompatible primers and other foreign material which will impair satisfactory bonding of fireproofing to substrate.

B. Cover other work which might be damaged by fallout or overspray of fireproofing materials during application. Provide temporary enclosure as may be required to confine operations, protect environment, and to ensure adequate ambient conditions for temperature and ventilation.

C. Notify Contractor of surface condition which cannot be corrected by normal cleaning methods and requires correction of conditions prior to application of sprayed fireproofing.

3.4 APPLICATION

A. Commencement of application of fireproofing shall be deemed as acceptance by applicator of suitability of surface to receive work and acceptance of responsibility for failure of bond between fireproofing and substrate.
B. Apply spray fireproofing using manufacturer's authorized installer in accordance with manufacturer's directions and instructions and in conformance with city and state codes, regulations and requirements having jurisdiction. Qualified manufacturer's representative shall be present for initial application to guide and assist applicator's personnel.

C. Sprayed Fireproofing: Apply to areas and surfaces which are scheduled to be fireproofed and to proper thicknesses to achieve fireproofing hours.
   1. Control thickness of fireproofing by utilizing workable depth gauge to assure that minimum thickness has been applied.

D. Ventilation: Make provisions to properly dry fireproofing after application. In enclosed areas lacking natural ventilation, provide mechanical air circulation and ventilation.

E. Equipment, Mixing and Application: In accordance with manufacturer's written specification and application instructions. Mechanically control material and water ratio on project site.

F. Qualified Personnel: Provide to supervise application.

G. Bonding Adhesive: Apply to underside of steel roof deck units which do not have concrete topping and where required by appropriate UL Design. Bonding adhesive is optional in other conditions unless recommended by manufacturer of sprayed fire protection material (SFRM). Apply bonding adhesives in accordance with manufacturer's written application instructions.

H. Do not install fireproofing prior to completion of concrete work on steel pan stairs. Apply to underside of roof deck assemblies only after roofing system is complete and roof traffic has ceased.

I. Cracking: No cracking of fireproofing material allowed per UL requirements. Repair cracks at no additional cost to Owner by removing existing fireproofing and reapplying.

3.5 PATCHING, REPAIRING, CLEANING AND PROTECTION

A. Perform patching and repairing of sprayed fireproofing, due to cutting by other trades, by fireproofing applicator. Work shall be paid for by trades that performed cutting, as directed and at no additional cost.
   1. Coordinate installation of fireproofing with other work in order to minimize need for other trades to cut or remove fireproofing. As other trades successively complete installations of their work, maintain protection of structure's fireproofing by patching areas which have been removed or damaged prior to concealment of fireproofing by other work.

B. After completion of fireproofing work, remove equipment and clean walls, floors, equipment, pipes and conduit of over sprayed fireproofing materials.

C. Cleaning: Immediately upon completion of sprayed operations in each containable area, remove over-spray and fall-out materials from surfaces of other work and clean exposed surfaces to remove evidence of soiling.

D. Cure exposed wet-mix fireproofing materials in compliance with fireproofing manufacturer's recommendations to prevent premature drying.

E. Protect fireproofing according to advice of fireproofing manufacturer and installer from damage resulting from construction operations or other causes so that fireproofing will be without damage or deterioration at time of Substantial Completion.

3.6 FIELD QUALITY CONTROL

A. At Owner's option Architect may select, and Owner will pay, independent testing laboratory to sample and verify thickness and density of fireproofing in accordance with provisions of ASTM E605, and cohesion/adhesion as per ASTM E736.
1. Minimum testing as follows:
   a. Randomly Selected Bay: Test each fireproofed element for thickness and density as per ASTM E605 and displacement method per AWCI Tech Manual 12-A, 5.4.5.
   b. Randomly Selected Typical Structural Elements: Test for cohesion/adhesion as per E736.
   c. Perform minimum of 5 tests of each kind.

B. Contractor and sub-contractor for this Section shall cooperate with testing agency in furnishing samples for testing, and other testing agency procedures.
   1. Should tested fireproofing fail to meet performance criteria, remove fireproofing, reinstall and retest at no additional cost to Owner.
   2. Correct unacceptable work and pay for further testing required to prove acceptability of installation.
   3. Patch test areas as required to re-establish fireproofing integrity.

END OF SECTION
SECTION 078400
FIRESTOPPING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
1. Firestop joint sealant and backing, including intumescent elastomeric compounds and sealants.
2. Rigid boards, forms, wraps and accessories.
3. Fiber packing and fiber fill.
4. Wool fiber insulation and fire-safing insulation.
5. Other firestopping as indicated.

1.2 ACTION SUBMITTALS
A. Product Data: Manufacturer's specifications and technical data for each material including the following.
1. Composition and limitations.
2. Manufacturer's installation instructions.
3. Furnish sleeve size schedule indicating size of penetrating item, insulation thickness (where applicable), and minimum annular space requirements.

B. Proposed UL System Drawings - Special Installation Drawings: Prior to starting installation of firestopping, firestopping manufacturer and installer shall review specific conditions applicable for Project, and identify each condition for firestopping and prepare individual U.L. Designs or manufacturers engineering judgements identification numbers, and installation drawings for each condition.
1. Submit 3 Special Installation Drawings for each condition, 1 set for Owner, 1 set for Architect’s File Copy, and 1 set for Building Official.
2. Submit other information as may be requested by Building Official.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For Installer.
B. Product Test Reports: For each penetration firestopping system, for tests performed by a qualified testing agency.
C. Installer Certificates: From Installer indicating that penetration firestopping systems have been installed in compliance with requirements and manufacturer's written instructions.

1.4 QUALITY ASSURANCE
A. Installer Qualifications: Firm experienced in installation or application of systems similar in complexity to those required for this Project, plus the following.
1. Acceptable to or licensed by manufacturer, State or local authority where applicable.
2. Not less than 2 years’ experience with systems.
3. Successfully completed not less than 5 comparable scale projects using this system.

B. Field Samples: First two applications for each firestopping condition will be reviewed by Owner’s Representative and the Architect, and when accepted by the local Building Official shall become a standard of performance for remaining Work.
1. Correct areas, modify method of application/installation, or adjust as directed by local code official to comply with specified requirements.
2. Maintain field samples accessible to serve as a standard of quality for this Section.

1.5 DELIVERY, STORAGE AND HANDLING
A. Deliver, store and handle to prevent damage, staining and disfigurement in original, new, and unopened packages and containers bearing manufacturer's name and label identifying contents. Do not freeze.
B. Where limited shelf life of product is noted by date on container or packing list, take note and do not use out of date material.

1.6 ENVIRONMENTAL REQUIREMENTS
A. Store firestopping materials out of weather, in cool, dry place, out of direct sunlight, at temperatures below 90 degrees F, not less than 40 degrees F and as recommended by manufacturer.
B. Use of Foam Products: Store unmixed liquid components in original, unopened containers at temperature of 65 to 80 degrees F for 12 hours minimum before use. Use forced air ventilation in areas having less than 2 cubic feet of free air for each pound of liquid mixture being foamed.

1.7 PROJECT CONDITIONS
A. Environmental Requirements: Comply with fireproofing material manufacturer's recommendations for temperature and humidity conditions before, during, and after installation of fireproofing.
B. Ventilation Requirements: Comply with fireproofing material manufacturer's recommendations during and after installation of fireproofing by natural or mechanical means.
C. Sleeves: Unless otherwise called for, sleeves passing through walls, slabs, beams, bridging, columns, shall be minimum of 1/2 inch greater in inside diameter than external diameter of pipe passing through sleeves, or insulation diameter. Verify sleeve size required with manufacturer of firestopping used. Pipe insulation shall be continuous through sleeves. Space between sleeve and pipe or duct and annular opening space shall be provided with a firestop system. Notify Contractor immediately of deviation from above sleeving requirements.
D. Fire Dampers: Firestopping of annular spaces around fire dampers shall be placed before installation of damper's anchoring flanges.

1.8 SEQUENCING
A. Sequence and coordinate application of firestopping with other related work specified in other Sections to comply with the following requirements:
   1. Provide temporary enclosures to prevent deterioration of firestopping for interior applications due to exposure to unfavorable environmental conditions.
   2. Do not install enclosing or concealing construction until after firestopping has been applied, inspected, tested, and corrections have been made to any defective firestopping.

PART 2 PRODUCTS

2.1 MANUFACTURERS
A. Single Source Responsibility for Materials: Obtain firestopping materials from one manufacturer for entire project.
1. This does not restrict Contractor from subcontracting installation of firestopping to multiple subcontracts, but does require all installers do use the same manufacturer throughout the Project and be licensed by that manufacturer for the installation of firestopping.

B. Acceptable manufacturers and products (FSTOP): Products listed in UL Fire Resistance Directory for UL System involved, that are manufactured by one of the following:
   1. 3M Fire Protection Products.
   2. Hilti Construction Chemicals, Inc.
   3. Grace Construction Products
   4. Nelson Firestop Products
   5. Rectorseal Company
   6. Specified Technologies Inc.
   7. Tremco
   8. US Gypsum Company

2.2 THROUGH-PENETRATION FIRESTOPPING OF FIRE RATED CONSTRUCTION

A. Fire-Test Response Characteristics: Provide through-penetration firestop systems that comply with the following requirements and those of this specification Section:
   1. Firestopping tests are performed by a qualified testing and inspecting agency. A qualified testing and inspecting agency is UL, ITS, or another agency performing testing and follow-up inspection services for firestop systems acceptable to authorities having jurisdiction.
   2. Through-penetration firestop systems are identical to those tested per ASTM E 814. Provide rated systems complying with the following requirements:
      a. Through-penetration firestop system products bear classification marking of qualified testing and inspecting agency.
      b. Through-penetration firestop systems correspond to those indicated by reference to through-penetration firestop system designations listed by the following:
         1) UL in “Fire Resistance Directory.”
         2) ITS in “Directory of Listed Products.”

B. Fire Rated Construction Design Requirements: Maintain barrier fire resistance ratings including resistance to cold smoke at all penetrations, connections with other surfaces or types of construction, at separations required to permit building movement and sound or vibration absorption, and at other construction gaps.

C. Through-Penetration Fire Stopping Schedule: Assembly designs are specified generally under UL system categories by penetrating item. Manufacturers’ product applications must have specific UL system designations. The schedules on the following page indicate which Series of UL Classified Through Penetration Fire Stopping (TPFS) assemblies are acceptable for this Project based on barrier type, construction and penetrant type. The TPFS Series listed are generic in nature; ex: Series C-AJ-2000 includes all designs from 2001 through 2999 from all manufacturers; note that each manufacturer has its own number for tested assemblies. The Contractor will select appropriate TPFS assemblies for each condition encountered.

D. Refer to Schedule at the end of this section.

E. Design of firestopping described by this Section is responsibility of Contractor. Individual through-penetration systems, construction-gap firestopping, through-penetration smoke-stopping, and construction-gap smoke-stopping will be selected by Contractor to meet requirements of Contract Documents and governing codes. Actual selection of individual designs or systems is responsibility of Contractor, and ‘Single Source Responsibility for Materials’ is required.
F. Systems or devices listed in the UL Fire Resistance Directory under categories XHCR and XHEZ may be used, providing that they conform to the construction type, penetrant type, annular space requirements, and fire rating involved in each separate instance, and that the system be symmetrical for wall applications. Systems or devices must be asbestos-free.

1. Additional requirements: Withstand the passage of cold smoke either as an inherent property of the product, or by the use of a separate product included as a part of the UL system or device, and designed to perform this function.

2.3 FIRESTOPPING, GENERAL

A. Compatibility: Provide through-penetration firestop systems that are compatible with one another, with the substrates forming openings, and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.

B. Accessories: Provide components for each through-penetration firestop system that are needed to install fill materials and to comply with "Performance Requirements" Article. Use only components specified by through-penetration firestop system manufacturer and approved by the qualified testing and inspecting agency for firestop systems indicated. Accessories include, but are not limited to, the following items:

1. Permanent forming/damming/backing materials, including the following:
   a. Slag-rock-wool-fiber insulation.
   b. Sealants used in combination with other forming/damming/backing materials to prevent leakage of fill materials in liquid state.
   c. Fire-rated form board.
   d. Fillers for sealants.
2. Temporary forming materials.
5. Steel sleeves.

2.4 FILL MATERIALS

A. General: Provide through-penetration firestop systems containing the types of fill materials indicated in the Through-Penetration Firestop System Schedule at the end of Part 3 by reference to the types of materials described in this Article. Fill materials are those referred to in directories of the referenced testing and inspecting agencies as fill, void, or cavity materials.

B. At Noise Critical Spaces: Provide permanently non-hardening systems at penetrations through fire-rated partitions and slabs, and at head of fire-rated partitions.

1. Gun or Trowel-Applied Intumescent Sealant: 3M “CPW-25WB+” or approved equal.
2. Moldable Intumescent Putty: 3M “Moldable Fire Stop” or approved equal.
3. Non-Intumescent Silicone Sealant: 3M “Silicone Fire Stop”, USG “Smokeseal” or approved equal) may be used in lieu of the sealant on foam rod in noise-sensitive fire-rated walls.

C. Cast-in-Place Firestop Devices: Factory-assembled devices for use in cast-in-place concrete floors and consisting of an outer metallic sleeve lined with an intumescent strip, a radial extended flange attached to one end of the sleeve for fastening to concrete formwork, and a neoprene gasket.

D. Latex Sealants: Single-component latex formulations that after cure do not re-emulsify during exposure to moisture.

E. Firestop Devices: Factory-assembled collars formed from galvanized steel and lined with intumescent material sized to fit specific diameter of penetrant.
F. Intumescent Composite Sheets: Rigid panels consisting of aluminum-foil-faced elastomeric sheet bonded to galvanized steel sheet.

G. Intumescent Putties: Nonhardening dielectric, water-resistant putties containing no solvents, inorganic fibers, or silicone compounds.

H. Intumescent Wrap Strips: Single-component intumescent elastomeric sheets with aluminum foil on one side.

I. Mortars: Prepackaged, dry mixes consisting of a blend of inorganic binders, hydraulic cement, fillers, and lightweight aggregate formulated for mixing with water at Project site to form a nonshrinking, homogeneous mortar.

J. Pillows/Bags: Reusable, heat-expanding pillows/bags consisting of glass-fiber cloth cases filled with a combination of mineral-fiber, water-insoluble expansion agents and fire-retardant additives.

K. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, nonshrinking foam.

L. Silicone Sealants: Moisture-curing, single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below:
   1. Grade for Horizontal Surfaces: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces.
   2. Grade for Vertical Surfaces: Nonsag formulation for openings in vertical and other surfaces.

M. Wiring devices: Ez-Path Fire Rated Pathway by Specified Technologies, Inc.
   1. Fire-rated wiring devices containing intumescent material that allows cable to pass through device and adjusts automatically to cable additions or removals.
   2. F Rating: Equal to rating of barrier in which device is installed.
   3. Capable of allowing a 0 to 100-percent visual fill of cables.
   4. Sufficient size to accommodate quantity and size of electrical wires and data cables required.
   5. Provide with steel wall plates allowing for single or multiple devices to be ganged together.

2.5 MIXING

A. For those products requiring mixing before application, comply with through-penetration firestop system manufacturer's written instructions for accurate proportioning of materials, water (if required), type of mixing equipment, selection of mixer speeds, mixing containers, mixing time, and other items or procedures needed to produce products of uniform quality with optimum performance characteristics for application indicated.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning: Clean out openings immediately before installing through-penetration firestop systems to comply with written recommendations of firestop system manufacturer and the following requirements:
   1. Remove from surfaces of opening substrates and from penetrating items foreign materials that could interfere with adhesion of through-penetration firestop systems.
2. Clean opening substrates and penetrating items to produce clean, sound surfaces capable of developing optimum bond with through-penetration firestop systems. Remove loose particles remaining from cleaning operation.

3. Remove laitance and form-release agents from concrete.

4. Do not allow caulks containing solvents to come in direct contact with plastic pipe.

B. Priming: Prime substrates where recommended in writing by through-penetration firestop system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

3.3 THROUGH-PENETRATION FIRESTOP SYSTEM INSTALLATION

A. General: Install through-penetration firestop systems to comply with "Performance Requirements" Article and firestop system manufacturer's written installation instructions and published drawings for products and applications indicated.

B. Install forming/damming/backing materials and other accessories of types required to support fill materials during their application and in the position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

1. After installing fill materials, remove combustible forming materials and other accessories not indicated as permanent components of firestop systems.

C. Install fill materials for firestop systems by proven techniques to produce the following results:

1. Fill voids and cavities formed by openings, forming materials, accessories, and penetrating items as required to achieve fire-resistance ratings indicated.

2. Apply materials so they contact and adhere to substrates formed by openings and penetrating items.

3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 INSTALLATION

A. Use methods and materials indicated in firestopping systems shown in Referenced Standards.

B. Install penetration seal materials in accordance with instructions in UL Building Materials Directory and in accordance with manufacturer's printed instructions.

C. Install sealant, including forming, packing and other accessory materials to fill opening around services penetrating floors and walls to provide firestops with fire resistance ratings indicated for floor or wall assembly in which penetration occurs.

1. Use masking tape to protect finished substrates and products adjacent to sealant materials.

2. Apply sealant as specified under Section 079200 - Joint Protection, and as recommended by sealant manufacturer; apply bead to depth of 1-1/2 inches to fill void above support, or if mineral wool support is used to depth of 1/2 inch thick. Tool sealant immediately after application and before skin forms.

3. If using foam sealant, immediately after mixing, pour or inject liquid foam into penetration opening, not more than 1/3 full to compensate for expansion during cure or in strict accordance with sealant manufacturer's recommendations. Do not exceed measured snap time of foam sealant. Do not remove dams for 24 hours minimum to allow foam to fully cure.

D. At sleeved pipes or other sleeved penetration, firestop annular space between sleeve and its contained pipe or duct with resilient firestopping sealant system to permit movement of pipe or duct without damage to firestopping sealant.

E. Seal holes and voids made by penetrations to ensure effective fire and smoke barrier.
F. Patch penetrations caused by cutting or presence of unused or abandoned openings or boxes using materials compatible with barrier construction and with fire rating equal to or greater than barrier rating.

G. For plumbing sleeves, construct time rated walls after placement of penetrating materials if possible, and to fit rated construction materials tightly to or directly upon material of penetration.

H. Large Openings: Close unused portions of large openings (annular spaces) made for later installation of pipes and ducts with solid fill equal to barrier rating or with applicable firestopping sealant system.

   1. Where both horizontal dimensions exceed 4 inches in structural floor openings, firestop annular spaces with concrete, or other rated assembly. Provide dowels and reinforcement, within such fill, equal to that specified for slab.

   2. In rated concrete or masonry wall openings where both height and width exceed thickness of rated materials, firestop annular spaces with masonry or other solid fill.

   3. Use fiber fill, solid fill or fiber packing to make up remainder of barrier thickness where required width of firestopping sealant system is less than barrier.

I. Install firestopping materials capable of supporting same loading as floor at floor openings more than four inches in width without penetrating item and subject to traffic or loading.

J. Install firestopping at least equal to barrier fire rating in and around penetrations of floor structures, exterior walls and interior walls noted as time rated fire barriers or smoke barriers.

K. Unused or abandoned openings or boxes or penetrations caused by cutting shall be patched with materials compatible with barrier construction and with fire rating equal to or greater than barrier fire-rating.

L. Use firestopping sealant systems at narrow spaces and at spaces with dimensions less than barrier thickness.

M. Fill void spaces completely with firestopping material.

N. Protect materials from damage on surfaces subject to traffic. Provide firestopping in floors flush with top of slab, sleeve or housekeeping pad.

3.5 IDENTIFICATION

A. Identify through-penetration firestop systems with pressure-sensitive, self-adhesive, preprinted vinyl labels. Attach labels permanently to surfaces of penetrated construction on both sides of each firestop system installation where labels will be visible to anyone seeking to remove penetrating items or firestop systems. Include the following information on labels:

   Warning – Fire-stop System
   DO NOT DISTURB
   Notify Building Management of Any Damage

   Manufacturer’s System No. ____________
   UL System No: ________________
   Contractor: ____________________
   Date Installed: ________________
   Manufacturer: ________________
3.6 FIELD QUALITY CONTROL

A. Inspecting Agency: Owner will engage a qualified independent inspecting agency to inspect through-penetration firestop systems and to prepare test reports.
   1. Inspecting agency will state in each report whether inspected through-penetration firestop systems comply with or deviate from requirements.

B. Proceed with enclosing through-penetration firestop systems with other construction only after inspection reports are issued.

C. Where deficiencies are found, repair or replace through-penetration firestop systems so they comply with requirements.

D. Manufacturer's Field Services: Firestopping manufacturer's technical representative shall provide the following field services during application.
   1. Perform a pre-installation examination and acceptance of substrate and voids scheduled for firestopping. Issue report.
   2. Be present at initial start-up for each process. Confirm application techniques. Issue report.
   3. Issue a summary report at completion of installation indicating manufacturer's acceptance of installed system and compliance with UL Design requirements.

3.7 ADJUSTING AND CLEANING

A. Clean up spills of liquid components.

B. Neatly cut and trim materials.

C. Remove equipment, materials and debris, leaving area in undamaged, clean condition.

END OF SECTION
SECTION 078443
JOINT FIRESTOPPING

PART 1 - GENERAL

1.1 SUMMARY

A. Section Includes: Fire-resistant joint systems (FRJS) for the following:
   1. Head-of-wall joints.
   2. Joints at cold formed exterior wall framing and floor slab.

1.2 SUBMITTALS

A. Product Data: For each type of product indicated.
B. Shop Drawings: For each fire-resistant joint system, show each kind of construction condition in which joints are installed and relationships to adjoining construction. Include fire-resistant joint system design designation of testing and inspecting agency acceptable to authorities having jurisdiction that demonstrates compliance with requirements for each condition indicated.
   1. Submit documentation, including illustrations, from a qualified testing and inspecting agency that is applicable to each fire-resistant joint system configuration for construction and penetrating items.
C. Product Certificates: For each type of fire-resistant joint system, signed by product manufacturer.
D. Qualification Data: For Installer.
E. Compatibility and Adhesion Test Reports: From fire-resistant joint system manufacturer indicating the following:
   1. Materials forming joint substrates have been tested for compatibility and adhesion with fill materials.
   2. Interpretation of test results and written recommendations for primers and substrate preparation needed for adhesion.
F. Research/Evaluation Reports: For each type of fire-resistant joint system.

1.3 QUALITY ASSURANCE

A. Source Limitations: Obtain fire-resistant joint systems for each kind of joint and construction condition indicated through one source from a single manufacturer.
B. Preconstruction Compatibility and Adhesion Testing: Submit to fire-resistant joint system manufacturers, for testing indicated below, samples of materials that will contact or affect fill materials.
   1. Use manufacturer's standard test methods to determine whether priming and other specific joint preparation techniques are required to obtain rapid, optimum adhesion of fill materials to joint substrates.
      a. Perform tests under environmental conditions replicating those that will exist during installation.
   2. Submit no fewer than nine pieces of each type of material, including joint substrates, forming materials, and miscellaneous materials.
   3. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
4. For materials failing tests, obtain fire-resistant joint system manufacturer's written instructions for corrective measures, including the use of specially formulated primers.

1.4 DELIVERY, STORAGE, AND HANDLING

A. Deliver fire-resistant joint system products to Project site in original, unopened containers or packages with qualified testing and inspecting agency's classification marking applicable to Project and with intact and legible manufacturers' labels identifying product and manufacturer, date of manufacture, lot number, shelf life, curing time, and mixing instructions for multicomponent materials.

B. Store and handle materials for fire-resistant joint systems to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

1.5 PROJECT CONDITIONS

A. Environmental Limitations: Do not install fire-resistant joint systems when ambient or substrate temperatures are outside limits permitted by fire-resistant joint system manufacturers or when substrates are wet due to rain, frost, condensation, or other causes.

B. Ventilate fire-resistant joint systems per manufacturer's written instructions by natural means or, if this is inadequate, forced-air circulation.

1.6 COORDINATION

A. Coordinate construction of joints to ensure that fire-resistant joint systems are installed according to specified requirements.

B. Coordinate sizing of joints to accommodate fire-resistant joint systems.

C. Do not cover up fire-resistant joint system installations that will become concealed behind other construction until Owner's inspecting agency and building inspector, if required by authorities having jurisdiction, have examined each installation.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General: For joints in the following constructions, provide fire-resistant joint systems that are produced and installed to resist spread of fire according to requirements indicated, resist passage of smoke and other gases, and maintain original fire-resistance rating of assembly in which fire-resistant joint systems are installed:

1. Fire-resistance-rated load-bearing walls, including partitions, with fire-protection-rated openings.
2. Fire-resistance-rated non-load-bearing walls, including partitions, with fire-protection-rated openings.
3. Exterior curtain-wall assemblies and fire-resistance-rated floor assemblies.
4. Exterior stud wall assemblies and fire-resistance-rated floor assemblies.

B. Fire Resistance of Joint Systems: Assembly ratings (and movement capabilities) indicated, but with assembly ratings not less than that equaling or exceeding fire-resistance rating of constructions in which joints are located, as determined by UL 2079.

C. Fire Resistance of Perimeter Fire-Containment Systems: Integrity and insulation ratings indicated as determined by UL 2079.
D. Fire-Test-Response Characteristics: Provide fire-resistant joint systems that comply with the following requirements and those specified in "Performance Requirements" Article:
1. Fire-resistance tests are performed by a qualified testing and inspecting agency. A qualified testing and inspecting agency is UL or another agency performing testing and follow-up inspection services for fire-resistant joint systems acceptable to authorities having jurisdiction.
2. Fire-resistant joint systems are identical to those tested per ICBO ES AC30 and are qualified for types of joints and joint movement capabilities indicated in a current Evaluation Report by the ICBO Evaluation Service.
3. (Fire-resistant joint systems are identical to those tested per UL 2079 [and ICBO ES AC30 and are qualified for joint movement capabilities indicated in a current ICBO Evaluation Report by the ICBO Evaluation Service].[ Perimeter fire-containment systems are identical to those tested per UL 2079.] Provide rated systems complying with the following requirements:
   a. Fire-resistant joint system products bear classification marking of qualified testing and inspecting agency.
   b. Fire-resistant joint systems correspond to those indicated by referencing system designations listed by the following:
      1) UL in its "Fire Resistance Directory."

2.2 PRODUCTS AND MANUFACTURERS
A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:
1. Basis-of-Design Products: The design for each fire-resistant joint system is based on products named in Part 2 articles. Subject to compliance with requirements, provide either the named products or comparable products by one of the following:
   a. Fire-resistant joint systems:
      1) 3M Fire Protection Products Systems, Inc.
      2) Specified Technologies, Inc.
      3) A/D Fire Protection Systems Inc.
      4) Hilti, Inc.
      5) RectorSeal Corporation (The)
      6) United States Gypsum Company.
   b. Perimeter Fire-Containment Systems:
      1) Specified Technologies Inc.
      2) United States Gypsum Company.
B. Compatibility: Provide fire-resistant joint systems that are compatible with joint substrates, under conditions of service and application, as demonstrated by fire-resistant joint system manufacturer based on testing and field experience.
C. Accessories: Provide components of fire-resistant joint systems, including forming materials, that are needed to install fill materials and to comply with Part 1 "Performance Requirements" Article. Use only components specified by fire-resistant joint system manufacturer and approved by the qualified testing and inspecting agency for systems indicated.

2.3 FIRE-RESISTANT JOINT SYSTEMS
A. Where UL-classified fire-resistant joint systems are indicated, they refer to alphanumeric designations listed in UL's "Fire Resistance Directory" under product Category XHBN.
B. (FRJS-1) Head-of-Wall, Fire-resistant joint system at interior partitions:
   1. Basis-of-Design UL-Classified Product: UL HW-D joint type or similar systems from Intertek to be selected based on actual conditions and subject to approval through submittals. Provide engineering judgment acceptable to Architect and authority having jurisdiction for head of wall conditions where a tested system is not available for the actual conditions.
2. Assembly Rating: 1 hour or 2 hour to be consistent with wall ratings shown on Drawings.
3. Nominal Joint Width: As shown.
4. Movement Capabilities: Class II, 18.75 percent movement in compression and extension.

C. (FRJS-4) Floor-to-Wall: Fire-rated concrete floor assembly to precast structural concrete wall.
   1. Basis-of-Design UL-Classified Product: UL FW-D joint type or similar systems from Omega point laboratory to be selected based on actual conditions and subject to approval through submittals. Provide engineering judgment acceptable to Architect and authority having jurisdiction for conditions where a tested system is not available for the actual conditions.

D. (FRJS-5) Wall-to-Wall, Fire-resistant joint system at interior partitions:
   1. Basis-of-Design UL-Classified Product: UL WW-S joint type or similar systems from Omega point laboratory to be selected based on actual conditions and subject to approval through submittals.

E. (FRJS-6) Floor to Floor, Fire-resistant joint system at interior concrete floors:
   1. Basis-of-Design UL-Classified Product: UL FF-D joint type or similar systems from Omega point laboratory to be selected based on actual conditions and subject to approval through submittals.
   3. For use at slab isolation joints where fire-rating must be maintained, and for other joints that need a fire-rated acoustical sealant.

2.4 PERIMETER FIRE-CONTAINMENT SYSTEMS

A. Where UL-classified perimeter fire-containment systems are indicated, they refer to alphanumeric designations listed in UL's "Fire Resistance Directory" under product Category XHDG.

B. (FRJS-2) Perimeter Fire-Containment System at Curtain Walls
   1. Basis-of-Design System: Provide CW-D type listed by UL or CEJ type listed by Intertek for joint conditions. Provide engineering judgment acceptable to Architect and authority having jurisdiction if a tested, listed system is not available.
   2. Assembly Rating: 1 hour or 2 hour to be consistent with assembly ratings shown on Drawings.
   3. Joint Width: As shown.
   4. Movement Capability: Joint system capable of withstanding total horizontal movement of 25 percent compression and elongation and a total vertical shear movement of 12.5 percent.

C. (FRJS-3) Perimeter Fire-Containment System at Exterior Stud Walls
   1. Basis-of-Design System: Provide CW-S type listed by UL or CEJ type listed by Intertek for joint conditions. Provide engineering judgment acceptable to Architect and authority having jurisdiction if a tested, listed system is not available.
   2. Assembly Rating: 1 hour or 2 hour to be consistent with assembly ratings shown on Drawings.
   3. Joint Width: As shown.
   4. Movement Capability: Joint system capable of withstanding total horizontal movement of 25 percent compression and elongation and a total vertical shear movement of 12.5 percent.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for joint configurations, substrates, and other conditions affecting performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 PREPARATION

A. Surface Cleaning: Clean joints immediately before installing fire-resistant joint systems to comply with fire-resistant joint system manufacturer's written instructions and the following requirements:
   1. Remove from surfaces of joint substrates foreign materials that could interfere with adhesion of fill materials.
   2. Clean joint substrates to produce clean, sound surfaces capable of developing optimum bond with fill materials. Remove loose particles remaining from cleaning operation.
   3. Remove laitance and form-release agents from concrete.

B. Priming: Prime substrates where recommended in writing by fire-resistant joint system manufacturer using that manufacturer's recommended products and methods. Confine primers to areas of bond; do not allow spillage and migration onto exposed surfaces.

C. Masking Tape: Use masking tape to prevent fill materials of fire-resistant joint system from contacting adjoining surfaces that will remain exposed on completion of Work and that would otherwise be permanently stained or damaged by such contact or by cleaning methods used to remove smears from fire-resistant joint system materials.
   1. Remove tape as soon as possible without disturbing fire-resistant joint system's seal with substrates.

3.3 INSTALLATION

A. General: Install fire-resistant joint systems to comply with Part 1 "Performance Requirements" Article and fire-resistant joint system manufacturer's written installation instructions for products and applications indicated.

B. Install forming/packing/backing materials and other accessories of types required to support fill materials during their application and in position needed to produce cross-sectional shapes and depths required to achieve fire ratings indicated.

C. Install fill materials for fire-resistant joint systems by proven techniques to produce the following results:
   1. Fill voids and cavities formed by openings and forming/packing/backing materials as required to achieve fire-resistance ratings indicated.
   2. Apply fill materials so they contact and adhere to substrates formed by joints.
   3. For fill materials that will remain exposed after completing Work, finish to produce smooth, uniform surfaces that are flush with adjoining finishes.

3.4 FIELD QUALITY CONTROL

A. Inspecting Agency: Owner will engage a qualified independent inspecting agency to inspect fire-resistant joint systems and to prepare inspection reports.
   1. Inspecting agency will state in each report whether inspected fire-resistant joint systems comply with or deviate from requirements.

B. Proceed with enclosing fire-resistant joint systems with other construction only after inspection reports are issued and inspecting agency has approved installed fire-resistant joint systems.

C. If deficiencies are found, repair or replace fire-resistant joint systems so they comply with requirements.

3.5 CLEANING AND PROTECTION

A. Clean off excess fill materials adjacent to joints as Work progresses by methods and with cleaning materials that are approved in writing by fire-resistant joint system manufacturers and that do not damage materials in which openings occur.
B. Provide final protection and maintain conditions during and after installation that ensure fire-resistant joint systems are without damage or deterioration at time of Substantial Completion. If damage or deterioration occurs despite such protection, cut out and remove damaged or deteriorated fire-resistant joint systems immediately and install new materials to produce fire-resistant joint systems complying with specified requirements.

END OF SECTION
SECTION 079100
PREFORMED JOINT SEALS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Preformed, foam joint seals.
   2. Preformed extruded-silicone joint seals.
B. Related Requirements:
   1. Section 079200 - Joint Sealants: For liquid sealants applied over preformed seals in dual seal systems.

1.2 ACTION SUBMITTALS
A. Product Data: For each preformed joint seal product.
B. Samples for Initial Selection: Manufacturer's color charts showing the full range of colors available for each product exposed to view.
C. Samples for Verification: For each type and color of preformed joint seal required, provide Samples with joint seals in 1/2-inch wide joints formed between two 6-inch long strips of material matching the appearance of exposed surfaces adjacent to joint seals.
D. Preformed Joint Seal Schedule: Include the following information:
   1. Joint seal location and designation.
   2. Joint width and movement capability.
   3. Joint seal manufacturer and product name.
   4. Joint seal color.

1.3 PROJECT CONDITIONS
A. Joint Substrate Conditions: Do not proceed with joint installation until contaminants capable of interfering with their adhesion are removed from joint substrates.
B. Compatibility and Adhesion Testing: Ascertain joint seal compatibility and adhesion with adjacent materials using laboratory testing procedures.

PART 2 PRODUCTS

2.1 PREFORMED JOINT SEALS
A. Compatibility: Provide joint seal and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by manufacturer, based on testing and field experience.
B. Colors: Colors as selected by Architect from manufacturer's standard colors. Acceptance of sealant will depend on range of standard colors available for selection.
C. Preformed Foam Joint Seal: Manufacturer's standard preformed, precompressed, open-cell foam sealant manufactured from urethane foam with minimum density of 10 lb/cu. ft. and impregnated with a nondrying, water-repellent agent. Factory produce in precompressed sizes in roll or stick form to fit joint widths indicated; coated on one side with a pressure-sensitive adhesive and covered with protective wrapping.
1. Manufacturers and Products:
   a. Dayton Superior Specialty Chemicals; Polytite Standard.
   b. EMSEAL Joint Systems, Ltd.; Emseal 25V.
   c. Sandell Manufacturing Co., Inc.; Polyseal.
   d. Schul International, Inc.; Sealtite or Sealtite 50N.
   e. Willseal USA, LLC; Willseal 150 or Willseal 250.

D. Preformed Extruded Silicone Joint Seal: Manufacturer's standard sealant consisting of precured low-modulus silicone extrusion, in sizes to fit joint widths indicated, combined with a neutral-curing silicone sealant for bonding extrusions to substrates.

1. Manufacturers and Products:
   a. Dow Corning Corporation; 123 Silicone Seal.
   b. GE Advanced Materials - Silicones; UltraSpan US1100.
   d. Pecora Corporation; Sil-Span.
   e. Sealex, Inc.; ImmerSeal.

2.2 PREPARATORY MATERIALS

A. Primer: Material recommended by preformed-joint-seal manufacturer for joint substrates indicated.

B. Cleaners for Nonporous Surfaces: Chemical cleaners acceptable to preformed joint seal manufacturer, free of oily residues or other substances capable of staining or harming joint substrates and adjacent nonporous surfaces, and formulated to promote best adhesion to joint substrates.

C. Masking Tape: Nonstaining, nonabsorbent material compatible with preformed joint seals and surfaces adjacent to joints.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine joints indicated to receive preformed joint seals, with Installer present, for compliance with requirements for joint configuration, installation tolerances, and other conditions affecting preformed-joint seal performance.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Surface Cleaning of Joints: Clean out joints immediately before installing preformed joint seals to comply with preformed joint seal manufacturer's written instructions and the following requirements:

   1. Remove all foreign material from joint substrates that could interfere with adhesion of preformed joint seal, including dust, paints (except for permanent protective coatings tested and approved for seal adhesion and compatibility by seal manufacturer), old joint sealants, oil, grease, waterproofing, water repellents, water, surface dirt, and frost.

   2. Clean porous joint substrate surfaces by brushing, grinding, mechanical abrading, or a combination of these methods to produce a clean, sound substrate capable of developing optimal bond with preformed joint seals. Remove loose particles remaining after cleaning operations above by vacuuming or blowing out joints with oil-free compressed air. Porous joint substrates include the following:

      a. Concrete.
      b. Masonry.
      c. Unglazed surfaces of ceramic tile.
      d. Exterior insulation and finish systems.
3. Remove laitance and form-release agents from concrete.
4. Clean nonporous joint substrate surfaces with chemical cleaners or other means that do not stain, harm substrates, or leave residues capable of interfering with adhesion of joint seals. Nonporous joint substrates include the following:
   a. Metal.
   b. Glass.
   c. Porcelain enamel.
   d. Glazed surfaces of ceramic tile.

B. Joint Priming: Prime joint substrates where recommended by preformed joint seal manufacturer or as indicated by tests or prior experience. Apply primer to comply with joint seal manufacturer's written instructions. Confine primers to areas of joint seal bond; do not allow spillage or migration onto adjoining surfaces.

C. Masking Tape: Use masking tape where required to prevent contact of adhesive or primer with adjoining surfaces that otherwise would be permanently stained or damaged by such contact or by cleaning methods required to remove smears. Remove tape immediately after tooling without disturbing joint seal.

3.3 INSTALLATION

A. General: Comply with preformed joint seal manufacturer’s written installation instructions for products and applications indicated unless more stringent requirements apply.

B. Installation of Preformed, Foam Joint Seals:
   1. Install each length of seal immediately after removing protective wrapping.
   2. Firmly secure compressed joint seals to joint gap side to obtain full bond using exposed pressure-sensitive adhesive or field-applied adhesive as recommended by manufacturer.
   3. Do not pull or stretch material. Produce seal continuity at splices, ends, turns, and intersections of joints.
   4. For applications at low ambient temperatures, heat foam joint seal material in compliance with manufacturer’s written instructions.

C. Installation of Precured, Extruded-Silicone Joint Seals:
   1. Apply masking tape to each side of joint, outside of area to be covered by seal system.
   2. Apply silicone sealant to each side of joint to produce a bead of size complying with preformed silicone seal system manufacturer’s written instructions and covering a bonding area of not less than 3/8 inch. Hold edge of sealant bead 1/4 inch inside masking tape.
   3. Press silicone extrusion into sealant to wet extrusion and substrate. Use a roller to apply consistent pressure and ensure uniform contact with substrate.
   4. Complete installation of seal system in horizontal joints before installing in vertical joints. Lap vertical joints over horizontal joints. At ends of joints, cut silicone extrusion with a razor knife.

3.4 PROTECTION

A. Protect preformed joint seals from damage resulting from construction operations or other causes so seals are without deterioration or damage at time of Substantial Completion. If, despite such protection, damage or deterioration occurs, cut out, remove, and repair damaged or deteriorated seals immediately so installations with repaired areas are indistinguishable from original work.

END OF SECTION
SECTION 079200
JOINT SEALANTS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Exterior and interior sealants.

1.2 ACTION SUBMITTALS
A. Product Data: For each joint-sealant product.
   1. Submit Manufacturer's certifications that products comply with specified requirements and with local regulations for VOC content.
B. Color Samples:
   1. Samples for Initial Selection: Manufacturer's color charts consisting of actual strips of cured sealants showing the full range of colors available for each product exposed to view.
   2. Samples for Verification: For each kind and color of joint sealant selected, provide Samples with joint sealants in 1/2-inch wide joints formed between two 6-inch long strips of material matching the appearance of exposed surfaces adjacent to joint sealants.
C. Product Schedule: Cross-reference products using "SLNT" designation in Part 2 of this Section, with Sealant Schedule in Part 3 of this Section, to locations and applications. Indicate proposed product, product type and color.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified testing agency.
B. Sample Warranties: For special warranties.
C. Quality Control Submittals:
   1. Product Test Reports: For each kind of joint sealant.
   2. Preconstruction Laboratory Test Reports: From sealant manufacturer, indicating the following:
   4. Statement of compliance for compatibility of sealant with adjacent materials and coatings.
   5. Field-Adhesion-Test Reports: For each sealant application tested.

1.4 QUALITY ASSURANCE
A. Installer Qualifications: Engage experienced Installer who has completed joint sealant applications similar in material, design, and extent to that indicated for Project that have resulted in construction with record of successful in-service performance.
B. Provide materials for exterior envelope from a single manufacturer.
C. Compatibility: Verify compatibility of silicone sealant with materials in contact with sealant. Provide list of stone materials and verify that silicone sealant will not stain or damage stone work.
D. Mockups: Install sealant in mockups of assemblies specified in other Sections that are indicated to receive joint sealants specified in this Section. Use materials and installation methods specified in this Section.

1.5 PRECONSTRUCTION TESTING
A. Preconstruction Field-Adhesion Testing: Before installing sealants, field test their adhesion to Project joint substrates as follows:
1. Locate test joints where indicated on Project or, if not indicated, as directed by Architect.
2. Conduct field tests for each kind of sealant and joint substrate.
3. Notify Architect seven days in advance of dates and times when test joints will be erected.
4. Arrange for tests to take place with joint-sealant manufacturer's technical representative present.
   a. For joints with dissimilar substrates, verify adhesion to each substrate separately; extend cut along one side, verifying adhesion to opposite side. Repeat procedure for opposite side.
6. Report whether sealant failed to adhere to joint substrates or tore cohesively. Include data on pull distance used to test each kind of product and joint substrate. For sealants that fail adhesively, retest until satisfactory adhesion is obtained.
7. Evaluation of Preconstruction Field-Adhesion-Test Results: Sealants not evidencing adhesive failure from testing, in absence of other indications of noncompliance with requirements, will be considered satisfactory. Do not use sealants that fail to adhere to joint substrates during testing.

1.6 DELIVERY, STORAGE, AND HANDLING
A. Deliver materials to project site in original unopened containers or bundles with labels informing about manufacturer, product name and designation, color, expiration period for use, pot life, curing time and mixing instructions for multi component materials.
B. Store and handle materials to prevent their deterioration or damage due to moisture, temperature changes, contaminants, or other causes.

1.7 PROJECT CONDITIONS
A. Weather Conditions: Do not proceed with installation of sealant under adverse weather conditions, or when temperatures are below or above manufacturer's recommended limitations for installation.
   1. Proceed with work only when forecasted weather conditions are favorable for proper cure and development of high early bond strength.
   2. Wherever joint width is affected by ambient temperature variation, apply elastomeric sealant only when temperatures are in lower third of manufacturer's recommended installation temperature range, so that sealant will not be subjected to excessive elongation and bond stress at subsequent low temperatures.
B. Joint Width Conditions: Do not proceed with installation of joint sealers when joint widths are less than allowed by joint sealer manufacturer for application indicated.
C. Joint Substrate Conditions: Do not proceed with installation of joint sealers until contaminants capable of interfering with their adhesion are removed from joint substrates.
D. Compatibility and Adhesion Testing: Ascertain sealant compatibility and adhesion with adjacent materials using laboratory testing procedures.

PART 2 PRODUCTS

2.1 SEALANT, GENERAL
A. Compatibility: Provide joint sealants, backings, and other related materials that are compatible with one another and with joint substrates under conditions of service and application, as demonstrated by joint-sealant manufacturer, based on testing and field experience.
B. Sealant Colors: In accordance with approved sealant color schedule.
1. Colors as selected by Architect from manufacturer’s standard colors. Acceptance of sealant will depend on range of standard colors available for selection.

2. Custom Color:

C. VOC Content of Interior Sealants: Provide sealants and sealant primers for use inside the weatherproofing system that comply with the following limits for VOC content when calculated according to 40 CFR 59, Part 59, Subpart D (EPA Method 24):

1. Architectural Sealants: 250 g/L.
2. Sealant Primers for Nonporous Substrates: 250 g/L.
3. Sealant Primers for Porous Substrates: 775 g/L.

2.2 POLYURETHANE SEALANT

A. 1-Part Polyurethane Sealants: Polyurethane based one part elastomeric sealant, complying with FS-TT-S-00230C, Type II Class A, with elongation and compression of not less than 25 percent. ASTM C920, Type S, Class 25, Grade NS.

1. Acceptable Manufacturers and Products:
   b. Tremco Incorporated: Dymonic.
   c. Pecora Corporation: Dynatrol I.
   d. Tremco Incorporated: Vulkem 116.

B. 2-Part Polyurethane Sealant for Horizontal Applications: Self-leveling polyurethane based 2 part elastomeric sealant, complying with FS-TT-S-00227E, Type I, Class A, with shore A hardness of not less than 30 and elongation and compression of not less than 25 percent. ASTM C920, Type M, Class 25, Grade P.

1. Acceptable Manufacturers and Products:

2.3 SILICONE SEALANT

A. Low-Modulus Silicone Rubber Sealant: Silicone rubber based, one part neutral cure elastomeric sealant with plus 50 percent to minus 50 percent movement complying with FS-TT-S-001543, Class A, and recommended by manufacturer for joints.

1. Acceptable Manufacturers and Products:
   b. Dow Corning Corporation: 795 Building Sealant.
   c. BASF Building Systems: Sonolastic Omniseal or OmniPlus.
   d. Pecora Corporation: 864 Silicone.
   e. Tremco Construction Division: Spectrem 3.

B. Medium-Modulus Silicone Rubber Sealant: Silicone rubber based, specifically designed for weatherproofing stone or other porous materials, two part moisture cure elastomeric sealant with plus 50 percent to minus 50 percent movement and recommended by manufacturer for stone joints.

1. Acceptable Manufacturers and Products:
   b. Dow Corning Corporation: 756 Building Sealant.
   c. Tremco Construction Division: Spectrem 2.

C. Ultra Low-Modulus Silicone Rubber Sealant: Silicone rubber based, one part neutral cure elastomeric sealant with plus 100 percent to minus 50 percent movement complying with FS-TT-S-001543, Class A.

1. Acceptable Manufacturers and Products:
b. Tremco Construction Division: Spectrem 1.

D. Silyl-Terminated Polyurethane Joint Sealant (STPU): ASTM C920, Type S, Grade NS, Class 12.5, for Us NT.
   1. Product and Manufacturer:
      a. Dymonic FC, by Tremco Incorporated;
      b. Dyanflex SC, by Pecora Corporation

E. Silicone Sealant, Mildew-Resistant: ASTM C 920; Type S; Grade NS; Class 25; Uses NT, G, A, and, as applicable to nonporous joint substrates indicated, O; formulated with fungicide, intended for sealing interior nonporous substrates that are subject to in-service exposures of high humidity and extreme temperatures.
   1. DAP Inc.; 100 percent Silicone Kitchen and Bath Sealant.
   2. Dow Corning Corporation; Dow Corning 786.
   3. GE Silicones; a division of GE Specialty Materials; Sanitary 1700.
   5. Pecora Corporation; Pecora 898 Sanitary Silicone Sealant.
   6. Tremco Incorporated; Tremsil 600 White.

2.4 ACRYLIC SEALANT

A. Acrylic Sealants: General purpose, paintable acrylic-emulsion sealant. Caulk with approximately 12-1/2 percent elongation complying with ASTM C834.
   1. Acceptable Manufacturers and Products:
      a. Tremco Incorporated: Acrylic Latex 834.
      b. BASF Building Systems: Sonolac.

2.5 JOINT SEALANT BACKING

A. Joint Sealant Backer Rod Manufacturers:
   1. Denver Foam, Backer Rod Manufacturing, Inc.
   2. Sonneborn Sonolastic, BASF Building Systems.
   3. Construction Foam Products, Nomaco Inc..

B. General: Provide sealant backings of material that are nonstaining; are compatible with joint substrates, sealants, primers, and other joint fillers; and are approved for applications indicated by sealant manufacturer based on field experience and laboratory testing.

C. Cylindrical Sealant Backings: ASTM C 1330, Type C (closed-cell material with a surface skin), as approved in writing by joint-sealant manufacturer for joint application indicated, and of size and density to control sealant depth and otherwise contribute to producing optimum sealant performance.

D. Bond-Breaker Tape: Polyethylene tape or other plastic tape recommended by sealant manufacturer for preventing sealant from adhering to rigid, inflexible joint-filler materials or joint surfaces at back of joint. Provide self-adhesive tape where applicable.

2.6 PREPARATORY MATERIALS

A. Joint Primer: Non-staining type recommended by sealant manufacturer to suit application.

B. Joint Cleaner: Non-corrosive type recommended by sealant manufacturer; compatible with joint forming materials.
PART 3 EXECUTION

3.1 EXAMINATION

A. Examine joint surfaces, backing, and anchorage of units forming sealant rabbet, and conditions under which sealant work is to be performed. Do not proceed with sealant work until unsatisfactory conditions have been corrected.

3.2 JOINT SURFACE PREPARATION

A. Clean joint surfaces immediately before installation of sealant. Remove dirt, insecure coatings, moisture and other substances which would interfere with bond of sealant.

B. Etch concrete and masonry joint surfaces to remove excess alkalinity, unless sealant manufacturer's printed instructions indicate that alkalinity does not interfere with sealant bond and performance. Etch with 5 percent solution of muriatic acid; neutralize with dilute ammonia solution, rinse thoroughly with water and allow to dry before sealant application.

C. Roughen joint surfaces on vitreous coated and similar non-porous materials, wherever sealant manufacturer's data indicates lower bond strength than for porous surfaces. Rub with fine abrasive cloth or steel wool to produce dull sheen.

D. Ensure that joint forming materials are compatible with sealant.

E. Examine joint dimensions and size materials to achieve required width/depth ratios. Use joint filler to achieve required joint depths, to allow sealants to perform properly.

3.3 SEALANT APPLICATION

A. Apply sealant in accordance with manufacturer's printed instructions. Perform work in accordance with ASTM C804.

B. Prime or seal joint surfaces. Do not allow primer/sealer to spill or migrate onto adjoining surfaces.

C. Install sealant backer rod for liquid elastomeric sealant, except where recommended to be omitted by sealant manufacturer for application shown.

D. Install bond breaker tape wherever required by manufacturer's recommendations to ensure that elastomeric sealant will perform properly.

E. Employ only proven installation techniques, which will ensure that sealant will be deposited in uniform, continuous ribbons without gaps or air pockets, with complete “wetting” of joint bond surfaces equally on opposite sides.

1. Except as otherwise indicated, fill sealant rabbet to slightly concave surface, slightly below adjoining surfaces. Where horizontal joints are between horizontal surface and vertical surface, fill joint to form slight cove, so that joint will not trap moisture and dirt.

F. Install sealant to depth as shown or, if not shown, as recommended by sealant manufacturer but within following general limitations, measured at center (thin) section of bead:

1. For sidewalks, pavements and similar joints sealed with elastomeric sealant and subject to traffic and other abrasion and indentation exposures, fill joints to depth equal to 75 percent of joint width, but not more than 5/8 inch deep nor less than 3/8 inch deep.

2. For normal moving joints sealed with elastomeric sealant, but not subject to traffic, fill joint to depth equal to 50 percent of joint width, but not more than 1/2 inch deep nor less than 1/4 inch deep.

G. Interior joints not subject to movement, these are:

1. Gypsum board to masonry joints.
2. Gypsum board to hollow metal joints.
3. Gypsum board to concrete joints.

H. Do not allow sealant or compounds to overflow or flow onto adjoining surfaces, or to migrate into voids of adjoining surfaces including rough texture surfaces. Use masking tape or other precautionary devices to prevent staining of adjoining surfaces, by either primer/sealer or sealant.

I. Remove excess and spillage of sealant promptly as work progresses. Clean adjoining surfaces by whatever means may be necessary to eliminate evidence of spillage, without damage to adjoining surfaces or finishes.

J. Rope Wicks: Where wicks for weeping masonry cavity occur in sealant, cut wick flush with sealant face and do not seal wick ends.

3.4 PROTECTION AND CLEANING

A. Protect joint sealers during and after curing period from contact with contaminating operations or other causes so that they are without deterioration or damage at time of Substantial Completion.

1. If, despite such protection, damage or deterioration occurs, cut out and remove damaged or deteriorated joint sealers immediately and reseal joints with new materials to produce joint sealer installations with repaired areas indistinguishable from original work.

B. Clean off excess sealant or sealant smears adjacent to joints as work progresses by methods and with cleaning materials approved by manufacturers of joint sealers and of products in which joints occur.

3.5 JOINT-SEALANT SCHEDULE

A. General: Provide sealant where indicated (SLNT) or as required to achieve a weather-tight assembly.

1. Joint-Sealant Colors: As selected by Architect from manufacturer’s full range of colors.

2. The following schedule is not intended to be all-inclusive and some may not be applicable to this Project.

B. Exterior Joints:

1. Horizontal Surfaces Subject to Traffic:
   a. Joint Locations:
      1) Isolation and contraction joints in cast-in-place concrete slabs.
      2) Joints between plant-precast architectural concrete paving units.
      3) Tile control and expansion joints.
      4) Joints between different materials listed above.
      5) Other joints as indicated.
   b. 2-Part polyurethane sealant, self-leveling, traffic grade, Class 25.

2. Horizontal Surfaces Subject to Traffic and Water Immersion:
   a. Polyurethane sealant, submersible, multi-component, self-leveling, traffic grade.

3. Vertical Surfaces and Horizontal Surfaces Not Subject to Traffic:
   a. Joint Locations:
      1) Construction joints in cast-in-place concrete.
      2) Control and expansion joints in unit masonry.
      3) Joints between metal panels.
      4) Joints between different materials listed above.
   b. Silicone single component, nonsag, neutral curing, Class 25.
   c. Silicone multicomponent, nonsag, neutral curing.

4. Perimeter joints between materials listed above and frames of doors, windows, and louvers:
   a. Silicone multicomponent, nonsag, neutral curing.

5. Vertical Surfaces and Horizontal Surfaces Not Subject to Traffic:
   a. Joint Locations:
      1) Unit Masonry Glazed Aluminum Framing System.
2) Metal Panel to Glazed Aluminum Framing System.
   b. Silicone Ultra Low-Modulus Silicone Rubber Sealant.

C. Interior Joints:

1. Horizontal Surfaces Subject to Traffic:
   a. Joint Locations:
      1) Isolation joints in cast-in-place concrete slabs.
      2) Other joints as indicated.
   b. 2-Part polyurethane sealant, self-leveling, traffic grade, Class 25.

2. Vertical Surfaces and Horizontal Surfaces Not Subject to Traffic: Acrylic-based.
   a. Control and expansion joints on exposed interior surfaces of exterior walls.
   b. Perimeter joints of exterior openings where indicated.
   c. Tile control and expansion joints.
   d. Vertical joints on exposed surfaces of interior unit masonry, concrete, walls, and partitions.
      1) (CMU) to (CMU): Low modulus silicone sealant.
   e. Perimeter joints between interior wall surfaces and frames of interior doors, windows and elevator entrances.
   f. Joints between plant-precast structural concrete units.
   g. Other joints as indicated.

   a. Joints between plumbing fixtures and adjoining walls, floors, and counters.
   b. Tile control and expansion joints where indicated.
   c. Other joints as indicated.

END OF SECTION
SECTION 079513
EXPANSION JOINT COVER ASSEMBLIES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Joint cover assemblies (EXP JT).

1.2 ACTION SUBMITTALS
A. Shop Drawings: Submit for each item of work in accordance with Section 013300. Indicate joint device profiles, dimensions, locations in the Work, affected adjacent construction, anchorage devices, available colors and finish, and locations of splices.
B. Samples: Submit samples in accordance with Section 013300. Submit one 12 inch long sample of each joint, in size illustrating profile, dimension, color, and finish selected.
C. Expansion Joint Cover Assembly Schedule: Prepared by or under the supervision of the supplier. Include the following information in tabular form:
   1. Manufacturer and model number for each expansion joint cover assembly.
   2. Expansion joint cover assembly location cross-referenced to Drawings.
   3. Nominal, minimum, and maximum joint width.
   4. Movement direction.
   5. Materials, colors, and finishes.
   6. Product options.

1.3 QUALITY ASSURANCE
A. Installer Qualifications: Installer of expansion control joints shall be approved by manufacturer of control joints.

PART 2 PRODUCTS

2.1 SYSTEM DESCRIPTION AND PERFORMANCE REQUIREMENTS
A. Expansion Joint Systems: Provide expansion control systems of design, basic profile, materials, and operation indicated. Provide units with capability to accommodate variations in adjacent surfaces.
   1. Furnish units in longest practicable lengths to minimize field splicing. Install with hairline mitered corners where expansion control systems change direction or abut other materials.
   2. Include factory-fabricated closure materials and transition pieces, T-joints, corners, curbs, cross-connections, and other accessories as required to provide continuous expansion control systems.
   3. Source Limitations: Obtain each expansion control systems from single source from single manufacturer.
B. Coordination: Coordinate installation of exterior wall and soffit expansion control systems with roof expansion control systems to ensure that wall transitions are watertight. Roof expansion joint assemblies are specified elsewhere.
C. Fire Performance Characteristics: Where indicated, provide expansion joint cover assemblies identical to those of assemblies whose fire resistance has been determined per UL 2079, NFPA 251, or ASTM E119 and E814 including hose stream test at full-rated period by nationally recognized testing and inspecting organization or by another means, as acceptable to authorities having jurisdiction.

2.2 MANUFACTURERS
A. Manufacturers: Provide Basis of Design or equivalent products by one of the following Manufacturers:
   2. MM Systems Corporation
   3. Balco Inc.
   4. Watson-Bowman-Acme Corporation
   5. Pawling Corporation
   7. Nystroms, Inc.
   8. InPro Corporation

2.3 MATERIALS
A. Aluminum: ASTM B 221, Alloy 6063-T5 for extrusions; ASTM B 209, Alloy 6061-T6 for sheet and plate. Apply manufacturer's standard protective coating on aluminum surfaces to be placed in contact with cementitious materials.
B. Stainless Steel: ASTM A 240 or ASTM A 666, Type 304 for plates, sheet, and strips. Remove tool and die marks and stretch lines or blend into finish.

2.4 SEALS AND BARRIERS
A. Extruded Preformed Seals: Single or multicellular elastomeric profiles as classified under ASTM D2000, designed with or without continuous, longitudinal, internal baffles. Formed to fit compatible frames.
   1. Resilient Filler: Elastomer; exhibiting Shore A hardness of durometer 65A.
   2. Color: As selected from manufacturer's standard colors.
B. Elastomeric Seals: ASTM E 1783; preformed elastomeric membranes or extrusions to be installed in metal frames.
C. Compression Seals: ASTM E 1612; preformed elastomeric extrusions having an internal baffle system and designed to function under compression.
D. Cellular Foam Seals: Extruded, compressible foam designed to function under compression.
E. Fire Barriers: Any material or material combination, when fire tested after cycling, designated to resist the passage of flame and hot gases through a movement joint and to meet performance criteria for required fire-resistance rating.
F. Moisture Barrier: Flexible elastomeric material, minimum 45 mils thick.

2.5 ACCESSORIES
A. Accessories: Manufacturer's standard anchors, clips, fasteners, set screws, spacers, and other accessories compatible with material in contact, as indicated or required for complete installations.
B. Elastomeric Concrete: Modified epoxy or polyurethane extended into a prepackaged aggregate blend, specifically designed for bonding to concrete substrates.
C. Nonmetallic, Shrinkage-Resistant Grout: ASTM C 1107, factory-packaged, nonmetallic aggregate grout, noncorrosive, nonstaining, mixed with water to consistency suitable for application and a 30-minute working time.

2.6 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 PREPARATION

A. Deliver inserts and rough-in frames to job site at appropriate time for building-in. Provide templates and rough-in measurements as required.

B. Provide spall-free level, bottom blockout parallel to deck surface in concrete to dimensions indicated. Blockout shall be open and dry.

C. Before starting work notify Architect in writing of conflicts detrimental to installation or operation of units.

3.2 INSTALLATION

A. Install components in accordance with reviewed shop drawings and manufacturer's printed instructions.

B. Prepare and place expansion joints in accordance with manufacturer's printed instructions.

C. Install expansion joints true, plumb and level, flush with adjacent surfaces.

D. Securely and rigidly anchor to substrate to prevent movement or misalignment.

E. Installation of Fire Barriers: Install fire barriers in accordance with federal, state, and local building codes using manufacturer's recommended procedures. Install transition and end joints to provide continuous fire resistance and in accordance with manufacturer's instructions.

F. Do not remove strippable protective material until finish work in adjacent areas is complete. Protective material is removed, clean exposed metal surfaces to comply with manufacturer's instructions.

G. Protect finished installation in accordance with Section 017700. Prevent traffic from crossing joints until entire assembly has cooled and is firmly cured.

END OF SECTION
SECTION 081113
HOLLOW METAL DOORS AND FRAMES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:

1. Standard and custom hollow metal doors and frames.
2. Steel sidelight, borrowed lite and transom frames.
3. Louvers installed in hollow metal doors.
4. Light frames and glazing installed in hollow metal doors.

B. Related Sections:

1. Division 04 Section "Unit Masonry" for embedding anchors for hollow metal work into masonry construction.
2. Division 08 Section "Flush Wood Doors".
3. Division 08 Section "Glazing" for glass view panels in hollow metal doors.
4. Division 08 Section "Door Hardware".
5. Division 09 Sections "Exterior Painting" and "Interior Painting" for field painting hollow metal doors and frames.
6. Division 28 Section "Access Control" for access control devices installed at door openings and provided as part of a security access control system.

C. Codes and References: Comply with the version year adopted by the Authority Having Jurisdiction.

1. ANSI/SDI A250.8 - Recommended Specifications for Standard Steel Doors and Frames.
2. ANSI/SDI A250.4 - Test Procedure and Acceptance Criteria for Physical Endurance for Steel Doors, Frames, Frames Anchors and Hardware Reinforcing.
3. ANSI/SDI A250.6 - Recommended Practice for Hardware Reinforcing on Standard Steel Doors and Frames.
4. ANSI/SDI A250.10 - Test Procedure and Acceptance Criteria for Prime Painted Steel Surfaces for Steel Doors and Frames.
5. ANSI/SDI A250.11 - Recommended Erection Instructions for Steel Frames.
6. ASTM A1008 - Standard Specification for Steel Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy and High-Strength Low-Alloy with Improved Formability.
7. ASTM A653 - Standard Specification for Steel Sheet, Zinc-Coated (Galvanized) or Zinc-Iron Alloy-Coated (Galvannealed) by the Hot-Dip Process.
11. ANSI/BHMA A156.115 - Hardware Preparation in Steel Doors and Frames.
16. UL 10C - Positive Pressure Fire Tests of Door Assemblies.
17. UL 1784 - Standard for Air Leakage Tests of Door Assemblies.

1.3 SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, core descriptions, hardware reinforcements, profiles, anchors, fire-resistance rating, and finishes.

B. Door hardware supplier is to furnish templates, template reference number and/or physical hardware to the steel door and frame supplier in order to prepare the doors and frames to receive the finish hardware items.

C. Shop Drawings: Include the following:

1. Elevations of each door design.
2. Details of doors, including vertical and horizontal edge details and metal thicknesses.
3. Frame details for each frame type, including dimensioned profiles and metal thicknesses.
4. Locations of reinforcement and preparations for hardware.
5. Details of anchorages, joints, field splices, and connections.
6. Details of accessories.
7. Details of moldings, removable stops, and glazing.
8. Details of conduit and preparations for power, signal, and control systems.

D. Samples for Verification:

1. Samples are only required by request of the architect and for manufacturers that are not current members of the Steel Door Institute.

1.4 QUALITY ASSURANCE

A. Source Limitations: Obtain hollow metal doors and frames through one source from a single manufacturer wherever possible.

B. Quality Standard: In addition to requirements specified, furnish SDI-Certified manufacturer products that comply with ANSI/SDI A250.8, latest edition, "Recommended Specifications for Standard Steel Doors and Frames".
C. Fire-Rated Door Assemblies: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection ratings indicated, based on testing at positive pressure according to UL10C (neutral pressure at 40" above sill) or UL 10C.

1. Oversize Fire-Rated Door Assemblies Construction: For units exceeding sizes of tested assemblies, attach construction label certifying doors are built to standard construction requirements for tested and labeled fire rated door assemblies except for size.

2. Temperature-Rise Limit: Where indicated and at vertical exit enclosures (stairwell openings) and exit passageways, provide doors that have a maximum transmitted temperature end point of not more than 450 deg F (250 deg C) above ambient after 30 minutes of standard fire-test exposure.

   a. Smoke “S” Label: Doors to bear “S” label, and include smoke and draft control gasketing applied to frame and on meeting stiles of pair doors.

D. Fire-Rated, Borrowed-Light Frame Assemblies: Assemblies complying with NFPA 80 that are listed and labeled, by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire-protection ratings indicated, based on testing according to NFPA 257. Provide labeled glazing material.

E. Energy Efficient Exterior Openings: Comply with minimum thermal ratings, based on ASTM C1363. Openings to be fabricated and tested as fully operable, thermal insulating door and frame assemblies.

1. Thermal Performance (Exterior Openings): Independent testing laboratory certification for exterior door assemblies being tested in accordance with ASTM C1363 and meet or exceed the following requirements:
   a. Door Assembly Operable U-Factor and R-Value Ratings: U-Factor 0.29, R-Value 3.4, including insulated door, thermal-break frame and threshold.

2. Air Infiltration (Exterior Openings): Independent testing laboratory certification for exterior door assemblies being tested in accordance with ASTM E283 to meet or exceed the following requirements:
   a. Rate of leakage of the door assembly shall not exceed 0.25 cfm per square foot of static differential air pressure of 1.567 psf (equivalent to 25 mph wind velocity).

F. Sound Transmission Class (STC) Rated Doors: Provide sound transmission class rated doors fabricated as sound-reducing types with testing according to ASTM E 90, and classifications according to ASTM E 413. Submit manufacturer’s written results of STC ratings from testing performed by a qualified independent testing agency for sound resistant doors.

G. Pre-Submittal Conference: Conduct conference in compliance with requirements in Division 01 Section “Project Meetings” with attendance by representatives of Supplier, Installer, and Contractor to review proper methods and procedures for installing hollow metal doors and frames and to verify installation of electrical knockout boxes and conduit at frames with electrified or access control hardware.
1.5 DELIVERY, STORAGE, AND HANDLING

A. Deliver hollow metal work palletized, wrapped, or crated to provide protection during transit and Project site storage. Do not use non-vented plastic.

B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.

C. Store hollow metal work under cover at Project site. Place in stacks of five units maximum in a vertical position with heads up, spaced by blocking, on minimum 4-inch high wood blocking. Do not store in a manner that traps excess humidity.

1. Provide minimum 1/4-inch space between each stacked door to permit air circulation. Door and frames to be stacked in a vertical upright position.

1.6 PROJECT CONDITIONS

A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.7 COORDINATION

A. Coordinate installation of anchorages for hollow metal frames. Furnish setting drawings, templates, and directions for installing anchorages, including sleeves, concrete inserts, anchor bolts, and items with integral anchors. Deliver such items to Project site in time for installation.

1.8 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace doors that fail in materials or workmanship within specified warranty period.

B. Warranty includes installation and finishing that may be required due to repair or replacement of defective doors.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. MATERIALS ARE SPECIFIED IN ACCORDANCE WITH THE PREMIER/ASSA ABLOY GPO CONTRACT #PP-FA-663.

B. Manufacturers: Subject to compliance with requirements, provide steel doors and frames from a SDI Certified manufacturer:

1. CECO Door Products (C).
2. Curries Company (CU).
3. Pioneer Industries (PI).
2.2 MATERIALS

A. Cold-Rolled Steel Sheet: ASTM A 1008/A 1008M, Commercial Steel (CS), Type B; suitable for exposed applications.

B. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, Commercial Steel (CS), Type B; with minimum G60 (Z180) or A60 (ZF180) metallic coating.

C. Frame Anchors: ASTM A 653/A 653M, Commercial Steel (CS), Commercial Steel (CS), Type B; with minimum G60 (Z180) or A60 (ZF180) metallic coating.

2.3 HOLLOW METAL DOORS

A. General: Provide 1-3/4 inch doors of design indicated, not less than thickness indicated; fabricated with smooth surfaces, without visible joints or seams on exposed faces unless otherwise indicated. Comply with ANSI/SDI A250.8 and ANSI/NAAMM HMMA 867.

B. Exterior Doors (Energy Efficient): Face sheets fabricated of commercial quality hot-dipped zinc coated steel that complies with ASTM A924 A60. Provide doors complying with requirements indicated below by referencing ANSI/SDI A250.8 for level and model, ANSI/SDI A250.4 for physical performance level, and HMMA 867 for door construction.

1. Design: Flush panel.
2. Core Construction: Foamed in place polyurethane and steel stiffened laminated core with no stiffener face welds, in compliance with HMMA 867 "Laminated Core".
   a. Provide 22 gauge steel stiffeners at 6 inches on-center internally welded at 5" on-center to integral core assembly, foamed in place polyurethane core chemically bonded to all interior surfaces. No stiffener face welding is permitted.
   b. Thermal properties to rate at a fully operable minimum U-Factor 0.29 and R-Value 3.4, including insulated door, thermal-break frame and threshold.
3. Level/Model: Level 3 and Physical Performance Level A (Extra Heavy Duty), Minimum 16 gauge (0.053 inch - 1.3-mm) thick steel, Model 2.
4. Vertical Edges: Vertical edges to be mechanically interlocked with hairline seam. Beveled Lock Edge, 1/8 inch in 2 inches (3 mm in 50 mm).
5. Top and Bottom Edges: Reinforce tops and bottoms of doors with a continuous steel channel not less than 16 gauge, extending the full width of the door and welded to the face sheet. Doors with an inverted top channel to include a steel closure channel, screw attached, with the web of the channel flush with the face sheets of the door. Plastic or composite channel fillers are not acceptable.
6. Hinge Reinforcement: Minimum 7 gauge (3/16") plate 1-1/4" x 9".
7. Hardware Reinforcements: Fabricate according to ANSI/SDI A250.6 with reinforcing plates from same material as door face sheets.

C. Interior Doors: Face sheets fabricated of commercial quality cold rolled steel that complies with ASTM A 1008/A 1008M. Provide doors complying with requirements indicated below by referencing ANSI/SDI A250.8 for level and model and ANSI/SDI A250.4 for physical performance level:

1. Design: Flush panel.
2. Core Construction: Manufacturer's standard kraft-paper honeycomb, or one-piece polystyrene core, securely bonded to both faces.
   a. Fire Door Core: As required to provide fire-protection and temperature-rise ratings indicated.

3. Level/Model: Level 3 and Physical Performance Level A (Extra Heavy Duty), minimum 16 gauge (0.053-inch - 1.3-mm) thick steel, Model 2.
4. Vertical Edges: Vertical edges to have the face sheets spot welded and filled full height with an epoxy filler. Welds are to be ground, filled and dressed smooth. Beveled Lock Edge, 1/8 inch in 2 inches (3 mm in 50 mm).
5. Top and Bottom Edges: Reinforce tops and bottoms of doors with a continuous steel channel not less than 16 gauge, extending the full width of the door and welded to the face sheet.
6. Hinge Reinforcement: Minimum 7 gauge (3/16") plate 1-1/4" x 9" or minimum 14 gauge continuous channel with pierced holes, drilled and tapped.
7. Hardware Reinforcements: Fabricate according to ANSI/SDI A250.6 with reinforcing plates from same material as door face sheets.

D. Manufacturers Basis of Design:
   1. Curries Company (CU) - Polystyrene Core - 707 Series (interior doors).

E. Acceptable Manufacturers:
   1. Curries Company (CU)
   2. CECO Industries (CE)
   3. Steelcraft Doors and Frames (ST)

2.4 HOLLOW METAL FRAMES

A. General: Comply with ANSI/SDI A250.8 and with details indicated for type and profile.

B. Thermal Break Frames: Subject to the same compliance standards and requirements as standard hollow metal frames. Tested for thermal performance in accordance with NFRC 102, and resistance to air infiltration in accordance with NFRC 400. Where indicated provide thermally broken frame profiles available for use in both masonry and drywall construction. Fabricate with 1/16" positive thermal break and integral vinyl weatherstripping.

   1. Frames: Minimum 14 gauge (0.067-inch -1.7-mm) thick steel sheet.
   2. Manufacturers Basis of Design:

D. Interior Frames: Fabricated from cold-rolled steel sheet that complies with ASTM A 1008/A 1008M.
1. Frames: Minimum 16 gauge (0.053-inch -1.3-mm) thick steel sheet for door openings up to 48 inches in width.
2. Frames: Minimum 14 gauge (0.067-inch -1.7-mm) thick steel sheet for door openings greater than 48 inches in width.
3. Manufacturers Basis of Design:
   a. Curries Company (CU) - CM Series.
   b. Curries Company (CU) - M Series.

E. Acceptable Manufacturers:
1. Curries Company (CU)
2. CECO Industries (CE)
3. Steelcraft Doors and Frames (ST)

F. Fire rated frames: Fabricate frames in accordance with NFPA 80, listed and labeled by a qualified testing agency, for fire-protection ratings indicated.

G. Hardware Reinforcement: Fabricate according to ANSI/SDI A250.6 Table 4 with reinforcement plates from same material as frames.

2.5 FRAME ANCHORS

A. Jamb Anchors:
1. Masonry Type: Adjustable strap-and-stirrup or T-shaped anchors to suit frame size, formed from A60 metallic coated material, not less than 0.042 inch thick, with corrugated or perforated straps not less than 2 inches wide by 10 inches long; or wire anchors not less than 0.177 inch thick.
2. Stud Wall Type: Designed to engage stud and not less than 0.042 inch thick.

B. Floor Anchors: Floor anchors to be provided at each jamb, formed from A60 metallic coated material, not less than 0.042 inches thick.

C. Mortar Guards: Formed from same material as frames, not less than 0.016 inches thick.

2.6 LIGHT OPENINGS AND GLAZING

A. Stops and Moldings: Provide stops and moldings around glazed lites where indicated. Form corners of stops and moldings with butted or mitered hairline joints at fabricator's shop. Fixed and removable stops to allow multiple glazed lites each to be removed independently. Coordinate frame rabbet widths between fixed and removable stops with the type of glazing and installation indicated.

B. Moldings for Glazed Lites in Doors and Loose Stops for Glazed Lites in Frames: Minimum 20 gauge thick, fabricated from same material as door face sheet in which they are installed.
2.7 ACCESSORIES

A. Mullions and Transom Bars: Join to adjacent members by welding or rigid mechanical anchors.

B. Grout Guards: Formed from same material as frames, not less than 0.016 inches thick.

2.8 FABRICATION

A. Fabricate hollow metal work to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal. Where practical, fit and assemble units in manufacturer's plant. When shipping limitations so dictate, frames for large openings are to be fabricated in sections for splicing or splining in the field by others.

B. Tolerances: Fabricate hollow metal work to tolerances indicated in ANSI/SDI A250.8.

C. Hollow Metal Doors:

1. Exterior Doors: Provide optional weep-hole openings in bottom of exterior doors to permit moisture to escape where specified.
2. Glazed Lites: Factory cut openings in doors with applied trim or kits to fit. Factory install glazing where indicated.
3. Astragals: Provide overlapping astragals as noted in door hardware sets in Division 08 Section "Door Hardware" on one leaf of pairs of doors where required by NFPA 80 for fire-performance rating or where indicated. Extend minimum 3/4 inch beyond edge of door on which astragal is mounted.
4. Continuous Hinge Reinforcement: Provide welded continuous 12 gauge strap for continuous hinges specified in hardware sets in Division 08 Section "Door Hardware".
5. Electrical Raceways: Provide hollow metal doors to receive electrified hardware with concealed wiring harness and standardized Molex™ plug connectors on both ends to accommodate up to twelve wires. Coordinate connectors on end of the wiring harness to plug directly into the electrified hardware and the through-wire transfer hardware or wiring harness specified in hardware sets in Division 08 Sections "Door Hardware" and "Access Control Hardware". Wire nut connections are not acceptable.

D. Hollow Metal Frames:

1. Shipping Limitations: Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated of same thickness metal as frames.
2. Welded Frames: Weld flush face joints continuously; grind, fill, dress, and make smooth, flush, and invisible.
   a. Welded frames are to be provided with two steel spreaders temporarily attached to the bottom of both jambs to serve as a brace during shipping and handling. Spreaders are for bracing only and are not to be used to size the frame opening.
3. Continuous Hinge Reinforcement: Provide welded continuous 12 gauge straps for continuous hinges specified in hardware sets in Division 08 Section "Door Hardware".
4. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated for removable stops, provide security screws at exterior locations.

5. Mortar Guards: Provide guard boxes at back of hardware mortises in frames at all hinges and strike preps regardless of grouting requirements.

6. Floor Anchors: Weld anchors to bottom of jambs and mullions with at least four spot welds per anchor.

7. Jamb Anchors: Provide number and spacing of anchors as follows:
   a. Masonry Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:
      1) Two anchors per jamb up to 60 inches high.
      2) Three anchors per jamb from 60 to 90 inches high.
      3) Four anchors per jamb from 90 to 120 inches high.
      4) Four anchors per jamb plus 1 additional anchor per jamb for each 24 inches or fraction thereof above 120 inches high.
   b. Stud Wall Type: Locate anchors not more than 18 inches from top and bottom of frame. Space anchors not more than 32 inches o.c. and as follows:
      1) Three anchors per jamb up to 60 inches high.
      2) Four anchors per jamb from 60 to 90 inches high.
      3) Five anchors per jamb from 90 to 96 inches high.
      4) Five anchors per jamb plus 1 additional anchor per jamb for each 24 inches or fraction thereof above 96 inches high.
      5) Two anchors per head for frames above 42 inches wide and mounted in metal stud partitions.

8. Door Silencers: Except on weatherstripped or gasketed doors, drill stops to receive door silencers. Silencers to be supplied by frame manufacturer regardless if specified in Division 08 Section "Door Hardware".

9. Bituminous Coating: Where frames are fully grouted with an approved Portland Cement based grout or mortar, coat inside of frame throat with a water based bituminous or asphaltic emulsion coating to a minimum thickness of 3 mils DFT, tested in accordance with UL 10C and applied to the frame under a 3rd party independent follow-up service procedure.

E. Hardware Preparation: Factory prepare hollow metal work to receive template mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping according to the Door Hardware Schedule and templates furnished as specified in Division 08 Section "Door Hardware."

1. Locate hardware as indicated, or if not indicated, according to ANSI/SDI A250.8.
2. Reinforce doors and frames to receive non-template, mortised and surface mounted door hardware.
3. Comply with applicable requirements in ANSI/SDI A250.6 and ANSI/DHI A115 Series specifications for preparation of hollow metal work for hardware.
4. Coordinate locations of conduit and wiring boxes for electrical connections with Division 26 Sections.
2.9 STEEL FINISHES

A. Prime Finishes: Doors and frames to be cleaned, and chemically treated to insure maximum finish paint adhesion. Surfaces of the door and frame exposed to view to receive a factory applied coat of rust inhibiting shop primer.

   I. Shop Primer: Manufacturer’s standard, fast-curing, lead and chromate free primer complying with ANSI/SDI A250.10 acceptance criteria; recommended by primer manufacturer for substrate; and compatible with substrate and field-applied coatings.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. General Contractor to verify the accuracy of dimensions given to the steel door and frame manufacturer for existing openings or existing frames (strike height, hinge spacing, hinge back set, etc.).

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Remove welded in shipping spreaders installed at factory. Restore exposed finish by grinding, filling, and dressing, as required to make repaired area smooth, flush, and invisible on exposed faces.

B. Prior to installation, adjust and securely brace welded hollow metal frames for square, level, twist, and plumb condition.

C. Tolerances shall comply with SDI-117 “Manufacturing Tolerances Standard Steel Doors and Frames.”

D. Drill and tap doors and frames to receive non-template, mortised, and surface-mounted door hardware.

3.3 INSTALLATION

A. General: Install hollow metal work plumb, rigid, properly aligned, and securely fastened in place; comply with Drawings and manufacturer’s written instructions.

B. Hollow Metal Frames: Install hollow metal frames of size and profile indicated. Comply with ANSI/SDI A250.11 and NFPA 80 at fire rated openings.

   I. Set frames accurately in position, plumbed, leveled, aligned, and braced securely until permanent anchors are set. After wall construction is complete and frames properly set and
secured, remove temporary braces, leaving surfaces smooth and undamaged. Shim as necessary to comply with installation tolerances.

2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, and secure with post-installed expansion anchors.

3. Masonry Walls: Coordinate installation of frames to allow for solidly filling space between frames and masonry with mortar.

4. Grout Requirements: Do not grout head of frames unless reinforcing has been installed in head of frame. Do not grout vertical or horizontal closed mullion members.

C. Hollow Metal Doors: Fit hollow metal doors accurately in frames, within clearances specified below. Shim as necessary.

1. Non-Fire-Rated Standard Steel Doors:
   a. Jambs and Head: 1/8 inch plus or minus 1/16 inch.
   b. Between Edges of Pairs of Doors: 1/8 inch plus or minus 1/16 inch.
   c. Between Bottom of Door and Top of Threshold: Maximum 3/8 inch.

2. Fire-Rated Doors: Install doors with clearances according to NFPA 80.

D. Field Glazing: Comply with installation requirements in Division 08 Section “Glazing” and with hollow metal manufacturer’s written instructions.

3.4 ADJUSTING AND CLEANING

A. Final Adjustments: Check and readjust operating hardware items immediately before final inspection. Leave work in complete and proper operating condition. Remove and replace defective work, including hollow metal work that is warped, bowed, or otherwise unacceptable.

B. Remove grout and other bonding material from hollow metal work immediately after installation.

C. Prime-Coat and Painted Finish Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat, or painted finishes, and apply touchup of compatible air drying, rust-inhibitive primer, zinc rich primer (exterior and galvanized openings) or finish paint.

END OF SECTION 081113
SECTION 08 14 00
FLUSH FLUSH WOOD DOORS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Interior solid core flush wood doors:
      a. Fire-rated flush wood doors.
      b. Non-rated flush wood doors.
   2. Shop-priming of field-painted doors.
   3. Factory finishing.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of door. Include details of core and edge construction and trim for openings. Include factory-finishing specifications.
B. Shop Drawings: Indicate location, size, and hand of each door; elevation of each kind of door; construction details not covered in Product Data; and the following:
   1. Dimensions and locations of blocking.
   2. Dimensions and locations of mortises and holes for hardware.
   3. Dimensions and locations of cutouts.
   4. Undercuts.
   5. Requirements for veneer matching.
   6. Doors to be factory finished and finish requirements.
   7. Fire-protection ratings for fire-rated doors.
C. Samples:
   1. Wood Veneer with Transparent Finish: Provide set of 3 samples, approximately 8 by 10 inches, showing typical range of color and grain to be expected in finished work.

1.3 INFORMATIONAL SUBMITTALS
A. Certification: Submit certification that doors and frames comply with NFPA 252 or UL-10.
B. Field Conditions Reports.

1.4 DELIVERY, STORAGE, AND HANDLING
A. Protect wood doors from damage, dust and dirt. Do not deliver, receive, store or install wood doors until storage and installation areas are conditioned in accordance with requirements and recommendations of NAAWS.
B. Comply with requirements of referenced standards and with manufacturer's written instructions.
C. Package doors individually in cardboard cartons and wrap bundles of doors in plastic sheeting
   1. Use opaque plastic sheeting for natural finished doors.
   2. Mark each door on top and bottom edges with opening number used on Shop Drawings
D. Stack wood doors as recommended by door manufacturer.
1.5 FIELD CONDITIONS

A. Environmental Requirements: Use permanent HVAC system or provide temporary systems and controls to establish and maintain site conditions complying with specified requirements.
   1. Do not deliver, receive, store or install woodwork until building is enclosed, wet work is complete, and temporary or permanent HVAC systems are operating in areas where woodwork is stored and installed, and are maintaining temperature and relative humidity at occupancy levels and within the following ranges during the remainder of the construction phase:
      a. Temperature Range: Between 60 and 90 deg F.
      b. Relative Humidity Range: Between 25 and 55 percent.

2. Fluctuation of Temperature and Relative Humidity Levels:
   a. Do not exceed 15 percent fluctuation over any portion of a 7-day period and not to exceed 25 percent fluctuation over any portion of a 28-day period.
   b. Maintain operation and control of heating, cooling, humidity, ventilation, temporary barriers and similar facilities continuously on a 24-hour basis to avoid rapidly fluctuating ambient levels.

B. Site Conditions Report: Monitor temperature and relative humidity in areas where woodwork is stored and installed at Project site. Record temperature and relative humidity prior to delivery, throughout storage period and installation, and after installation until time of Substantial Completion. Report recorded values in accordance with Submittals requirements.

1.6 WARRANTY

A. Special Warranty: Signed by Manufacturer, Installer, and Contractor, in which Manufacturer agrees to repair or replace doors that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Warping (bow, cup, or twist) more than 1/4 inch in a 42-by-84-inch section.
      b. Telegraphing of core construction in face veneers exceeding 0.01 inch in a 3-inch span.
   2. Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Rated Wood Doors: Doors complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing at positive pressure according to NFPA 252 or UL 10C.
   1. Provide gasket as required by door manufacturer in compliance with UL10C, Category A.
   2. Oversized Fire-Rated Door Assemblies: For door assemblies exceeding sizes of tested assemblies, provide oversize fire door label or certificate of inspection, from a testing and inspecting agency acceptable to authorities having jurisdiction, stating that doors comply with requirements of design, materials, and construction.
   3. Fire-Rated Wood Door and Frame Assemblies: Provide wood doors and frames which are identical in materials and construction to units tested in door and frame assemblies in accordance ASTM E152 and which are labeled and listed for ratings indicated by UL or other testing and inspection agency acceptable to authorities having jurisdiction.
   4. Temperature Rise Rating: [Where indicated] [At vertical exit enclosures and exit passageways], provide doors which have Temperature Rise Rating of 450 degrees F maximum in 30 minutes of fire exposure.
B. Smoke- and Draft-Control Door Assemblies: Listed and labeled for smoke and draft control, based on testing according to UL 1784.

### 2.2 WOOD DOORS, GENERAL

A. Quality Standards: Provide wood doors fabricated and installed in accordance with specified Grade classification of the *North American Architectural Woodwork Standards, Adopted and Published jointly by Architectural Woodwork Institute, Architectural Woodwork Manufacturer’s Association of Canada and Woodwork Institute - Current Edition* (NAAWS)

1. Comply with NAAWS Premium Grade, except where more stringent requirements are indicated in the Contract Documents.

B. Material Requirements for Sustainability:

1. Low-Emitting Adhesives and Binders: Provide doors made with adhesives and composite wood products that do not contain urea formaldehyde.
2. Particleboard: Straw-based particleboard complying with ANSI A208.1, Grade LD-2 or M-2, except for density.

C. Source Limitations: Obtain flush wood doors from single manufacturer.

D. Manufacturers:

1. Algoma Group.
2. Buell Door Co..
3. Ideal Wood Products.
4. Weyerhauser Co..

E. WDMA I.S.1-A Performance Grade: Extra Heavy Duty.

1. Screw Withdrawal: 700 lbf at faces, 400 lbf at edges.

G. Mineral-Core for Fire-Rated Doors: Noncombustible mineral product complying with requirements of referenced quality standard and testing and inspecting agency for fire-protection rating indicated.

2. Edge Construction: At hinge stiles, provide laminated-edge construction with improved screw-holding capability and split resistance. Comply with specified requirements for exposed edges.

H. Construction: Five plies. Stiles and rails are bonded to core, then entire unit is abrasive planed before veneering. Faces are bonded to core using a hot press.

I. Adhesives: Type I per WDMA TM-6, waterproof.

J. Low-Emitting Materials: Provide doors made with adhesives and composite wood products that do not contain urea formaldehyde.

1. Facing and Crossband Adhesive: Type 1 waterproof.
2. Door Construction: Type 2.

K. Lite Kit: Provide frames that are flush to face of door, in species of wood to match face of door or veneer wrapped mineral core for fire rated doors.

### 2.3 DOOR FACING AND FINISHES

A. Wood-Veneer Faced Doors with Transparent Finish: NAAWS Premium grade, with Grade AA faces, 1/50 inch thick before final sanding.

1. Wood Species, Cut and Finish: Rift-Sliced Red Oak (WD-1), as specified in Section 064000 - Architectural Woodwork.
2. Veneer Matching:
   b. Assembly of Veneer Leaves on Door Faces: Balance match.
   c. Pair and Set Match: Provide for doors hung in same opening.
   d. Room Match: Match door faces within each separate room or area of building.
   e. Blueprint Match: Where indicated, provide doors with faces produced from same flitches as adjacent wood paneling and arranged to provide blueprint match with wood paneling. Comply with requirements in Section 064000 - Architectural Woodwork.
   f. Exposed Vertical and Top Edges: Same species as faces.

3. Transparent Finish: Shop-applied, NAAWS Premium Grade, System 5 Conversion Varnish.
   a. Shop Priming for Transparent Finish: Shop prime faces and all four edges with stain, other required pretreatments, and first coat of transparent finish. Seal edges of cutouts and mortises with first coat of finish.

B. Doors with Opaque Painted Finish: (WD-5) as specified in Section 064000 - Architectural Woodwork.
   1. Shop Priming of Field-Applied Opaque Finish: Shop prime faces, all four edges, edges of cutouts, and mortises with one coat of wood primer specified in Section 099000 - Painting.

2.4 FABRICATION

A. Fabricate wood doors in accordance with requirements of specified NAAWS Grade.

B. Fabricate Work of this Section using materials, methods and quality control procedures necessary for installed units to withstand dimensional changes that can be expected resulting from temperature and humidity variations at project location when interior spaces do not have humidity control. Seal each surface to help mitigate dimensional change resulting from temperature and humidity variations.

C. Fabricate and label fire-rated doors in accordance with requirements of Underwriters’ Laboratories (UL), UL-10C, Category A Positive Pressure, with intumescent required for compliance contained within the door (concealed) and requiring no additional installation of intumescent products.

D. Fabricate doors with hardware blocking as follows:
   1. Provide head and sill rails on all doors.
   2. Provide adequate blocking for doors specified with concealed overhead stops and surface mounted closers.
   3. Provide lock-block at fire-rated, mineral core doors at latch side only.
   4. Provide cross blocking only when exit devices are specified for door.
   5. Provide hook block for pivots, or when floor bolts are specified under Section 087100 - Door Hardware.

E. Provide doors with minimum 1-1/4 inch thick edge strips, of wood species to match face veneers except as required for UL rating.

F. Make cut-outs and provide stops for glass and louvers. Seal cut-outs prior to installation of moldings.
   1. For full light doors: Provide cut out from flush wood door, with vertical grain direction.

G. Bevel strike edge of single acting doors 1/8 inch in 2 inches. Radius strike edge of double-acting swing doors 2-1/8 inches.

H. Prepare doors to receive hardware. Refer to Section 087100 – Door Hardware and NFPA 80 for hardware requirements including UL-10C.
1. Factory pre-machine doors for all mortised hardware, including pilot holes for hinge screws and lock fronts.
2. Prefit and bevel to net opening size less approximately 3/16 inch in width and provide 1/4 inch clearance above finished floor, unless otherwise indicated on drawings.

I. Fire-Rated Pair of Doors; greater than 20 minute: If astragal is required, to comply with fire rated labeling requirements for pairs of fire rated doors, provide door manufacturer's standard tested astragal.
   1. Shop apply astragals.
   2. Shop apply matching veneer wrap to conceal metal astragal at wood faced doors.
   3. Install concealed intumescent seals per UL-10C where required by code.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examination and Acceptance of Conditions: Before proceeding with installation, examine openings to receive wood doors and other conditions for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Verify that frames comply with indicated requirements for type, size, location, and swing characteristics and have been installed with level heads and plumb jambs.
   2. Material Moisture Content and Environmental Requirements: Comply with recommendations of NAAWS.
      c. Do not install woodwork that has not been conditioned to average prevailing humidity conditions in installation areas.
   3. Reject doors with defects.
   4. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the Work indicates acceptance of surfaces and conditions. Architectural woodwork Installer shall approve substrate prior to installation.

3.2 INSTALLATION
A. Hardware: Prepare doors to receive hardware in accordance with Section 087100 - Door Hardware.
B. Install doors to comply with manufacturer's written instructions, referenced quality standard, and as indicated.
   1. Install fire-rated doors in corresponding fire-rated frames according to NFPA 80.
   2. Install smoke- and draft-control doors according to NFPA 105.
C. Job-Fitted Doors: Align and fit doors in frames with uniform clearances and bevels as indicated below; do not trim stiles and rails in excess of limits set by manufacturer or permitted for fire-rated doors. Machine doors for hardware. Seal cut surfaces after fitting and machining.
   1. Clearances: Provide 1/8 inch at heads, jambs, and between pairs of doors. Provide 1/8 inch from bottom of door to top of decorative floor finish or covering. Where threshold is shown or scheduled, provide 1/4 inch from bottom of door to top of threshold.
   2. Comply with NFPA 80 for fire-rated doors.
   3. Factory-Finished, Job-Fitted Doors: Restore finish before installation if fitting or machining is required at Project site.
D. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.
E. Wood Doors with Sound Seals: Undercut of door shall be 3/8-inch maximum for doors to be equipped with automatic door bottoms (sound seals).
F. Ensure that smoke and sound gaskets are in-place before prefinished door installation.

### 3.3 INSTALLED WORK

A. Damaged or Non-Compliant Work: Remove and replace materials that are damaged or do not comply with requirements.
   1. Damaged finish may be repaired or refinished if resulting repair work complies with requirements and shows no evidence of repair or refinishing.

B. Adjusting: Adjust movable components to operate safely, smoothly, easily, and quietly, free from binding, warp, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range, and without binding or damaging assembly components.
   1. Lubricate hardware and moving parts in accordance with Manufacturer’s written instructions.
   2. Operation: Rehang or replace doors that do not swing or operate freely.

C. Cleaning: Clean and maintain installed work as frequently as necessary through the remainder of the construction period.

D. Protection: Provide final protection and maintain conditions that ensure installed Work is without damage or deterioration at time of Substantial Completion.
   1. At clear finished doors, do not partially cover door surfaces with paper, cardboard, or other opaque covering that will create uneven aging of wood veneer.

E. Finished Doors: Replace doors that are damaged or that do not comply with requirements. Doors may be repaired or refinished if Work complies with requirements and shows no evidence of repair or refinishing.

END OF SECTION
SECTION 081433
STILE AND RAIL WOOD DOORS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Exterior stile and rail wood doors.
   2. Interior stile and rail wood doors.
   3. Wood door frames.
   4. Factory fitting stile and rail wood doors to frames and factory machining for hardware.
   5. Factory finishing.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product, including the following:
   1. Details of construction and glazing.
   2. Door frame construction.
   3. Factory-machining criteria.

B. Shop Drawings: Indicate location, size, and hand of each door; elevation of each type of door; construction details not covered in Product Data, including those for stiles, rails, panels, and moldings (sticking); and other pertinent data, including the following:
   1. Door schedule indicating door and frame location, type, size, fire protection rating, and swing.
   2. Door elevations, dimensions and location of hardware, lite locations, and glazing thickness.
   3. Details of frame for each frame type, including dimensions and profile.
   4. Details of electrical raceway and preparation for electrified hardware, access control systems, and security systems.
   5. Dimensions and locations of mortises and holes for hardware.
   6. Clearances and undercuts.
   7. Requirements for veneer matching.
   8. Doors to be factory finished and application requirements.

C. Samples for Initial Selection: For factory-finished doors and frames.

D. Samples for Verification:
   1. Factory finishes applied to actual door face materials, approximately 8 by 10 inches, for each material and finish. For each wood species and transparent finish, provide set of three Samples showing typical range of color and grain to be expected in finished Work.
   2. Corner sections of doors, approximately 8 by 10 inches, with door faces and edges representing actual materials to be used.

1.3 INFORMATIONAL SUBMITTALS

A. Field quality control reports.

1.4 CLOSEOUT SUBMITTALS.

A. Special warranties.
B. Record Documents: For fire-rated doors, list of door numbers and applicable room name and number to which door accesses.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Comply with requirements of referenced standard and manufacturer's written instructions.
B. Package doors individually in opaque plastic bags or cardboard cartons.
C. Mark each door on top and bottom rail with opening number used on Shop Drawings.

1.6 FIELD CONDITIONS

A. Environmental Limitations: Do not deliver or install doors until spaces are enclosed and weather-tight, wet work in spaces is complete and dry, and HVAC system is operating and maintaining temperature and relative humidity levels designed for building occupants for the remainder of construction period.

1.7 WARRANTY

A. Special Warranty: Manufacturer agrees to repair or replace doors[ and frames] that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Delamination of veneer.
      b. Warping (bow, cup, or twist) more than 1/4 inch in a 42-by-84-inch section.
      c. Telegraphing of core construction in face veneers exceeding 0.01 inch in a 3-inch span.
   2. Warranty shall also include installation and finishing that may be required due to repair or replacement of defective doors and frames.
   3. Warranty shall be in effect during specified period of time from date of Substantial Completion.

PART 2 PRODUCTS

2.1 STILE & RAIL WOOD DOORS

A. Source Limitations: Obtain stile and rail wood doors from single manufacturer.
B. Products and Manufacturers: Provide Basis of Design or equivalent as approved by Architect by one of the following Manufacturers:
   1. Algoma Group.
   2. Buell Door Co..
   3. Ideal Wood Products.
   5. Weyerhauser Co..
C. Basis of Design: Aspiro Series, Harring Model A112A by Masonite Architectural.
D. Stile and Rail Wood Panel Doors: Exterior doors, 12-panel design, complying with WDMA I.S. 6A, and with other requirements specified.
   1. Performance Grade: Extra Heavy Duty.
   2. Grade: Premium.
3. Finish: Transparent.
5. Stile and Rail Construction: Veneered, structural composite lumber. Select veneers for similarity of grain and color, and arrange for optimum match between adjacent pieces.
   a. Use veneers not less than 1/16 inch thick.
6. Raised-Panel Construction: Veneered, wood-based panel product with mitered, raised rims made from matching clear lumber.
   a. Particleboard: Wood-based particleboard; ANSI A208.4, Grade LD-2 as required to meet WDMA Performance Duty level specified without added blocking.
7. Stile and Rail Widths: As indicated on Drawings.
9. Molding Profile (Sticking): As selected by Architect from manufacturer’s full range.
10. Use only materials that comply with referenced standards and other requirements specified.
   a. Assemble exterior doors, including components, with wet-use adhesives complying with ASTM D5572 for finger joints and with ASTM D5751 for joints other than finger joints.
   b. Assemble interior doors, including components, with either dry-use or wet-use adhesives complying with ASTM D5572 for finger joints and with ASTM D5751 for joints other than finger joints.
11. Mark, label, or otherwise identify stile and rail wood doors as complying with WDMA I.S. 6A and grade specified.

2.2 FABRICATION

A. Factory fit doors to suit frame-opening sizes indicated, with the following uniform clearances and bevels unless otherwise indicated:
   1. Clearances:
      a. Provide 1/8 inch at heads, jambs, and between pairs of doors.
      b. Provide 1/2 inch from bottom of door to top of decorative floor finish or covering.
      c. Where threshold is shown on Drawings or scheduled, provide not more than 3/8 inch from bottom of door to top of threshold.
   2. Bevel non-fire-rated doors 1/8 inch in 2 inches at lock and hinge edges.
B. Fabricate stile and rail wood doors in sizes indicated for field fitting.
C. Factory machine doors for hardware that is not surface applied.
   1. Locate hardware to comply with DHI-WDHS-3.
   2. Comply with final hardware schedules, door frame Shop Drawings, BHMA-156.115-W, and hardware templates.
   3. For doors scheduled to receive electrified locksets, provide factory-installed raceway and wiring to accommodate specified hardware.
   4. Coordinate measurements of hardware mortises in metal frames to verify dimensions and alignment before factory machining.
D. Glazed Openings: Factory install glazing in doors, complying with Section 088000 “Glazing.” Install glass using manufacturer’s standard elastomeric glazing sealant complying with ASTM C920. Secure glass in place with removable wood moldings. Miter wood moldings at corner joints.
E. Transom and Side Panels:
   1. Fabricate matching panels with same construction, exposed surfaces, and finish as specified for associated doors.
   2. Finish bottom edges of transoms and top edges of rabbeted doors same as door stiles.
   3. Fabricate door and transom panels with full-width, solid-lumber meeting rails.
4. Provide factory-installed spring bolts for concealed attachment into jambs of metal door frames.

F. Exterior Doors: Factory treat exterior doors with water-repellent preservative after fabrication has been completed but before factory finishing.
   2. Flash top of outswinging doors with manufacturer's standard metal flashing.

2.3 FACTORY FINISHING

A. Comply with referenced quality standard for factory finishing.
   1. Complete fabrication, including fitting doors for openings and machining for hardware that is not surface applied, before finishing.
   2. Finish faces, all four edges, edges of cutouts, and mortises.

B. Transparent Finish: WDMA I.S. 6A Premium Grade.
   2. Staining, effect and Sheen: Match Architect's approved sample.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine doors and installed door frames, with Installer present, before hanging doors.
   1. Verify that installed frames comply with indicated requirements for type, size, location, and swing characteristics and have been installed with level heads and plumb jambs.
   2. Reject doors with defects.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Hardware Installation: Section 087100 - Door Hardware.

B. Install doors and frames to comply with manufacturer's written instructions and referenced quality standard, and as indicated.

C. Align and fit doors in frames with uniform clearances and bevels as indicated below.
   1. Do not trim stiles and rails in excess of limits set by manufacturer or permitted for fire-rated doors.

D. Machine doors for hardware.

E. Seal edges of doors, edges of cutouts, and mortises after fitting and machining.

F. Clearances:
   1. Provide 1/8 inch at heads, jambs, and between pairs of doors.
   2. Provide 1/8 inch from bottom of door to top of decorative floor finish or covering unless otherwise indicated on Drawings.
   3. Where threshold is shown on Drawings or scheduled, provide 1/4 inch from bottom of door to top of threshold unless otherwise indicated.

G. Bevel non-fire-rated doors 1/8 inch in 2 inches at lock and hinge edges.

H. Factory-Fitted Doors: Align in frames for uniform clearance at each edge.
I. Factory- Finished Doors: Restore finish before installation if fitting or machining is required at Project site.

3.3 ADJUSTING

A. Operation: Rehang or replace doors that do not swing or operate freely.

B. Finished Doors: Replace doors that are damaged or do not comply with requirements. Doors may be repaired or refinished if Work complies with requirements and shows no evidence of repair or refinishing.

END OF SECTION
SECTION 08 31 00
ACCESS DOORS & PANELS

PART 1 GENERAL

1.1 SUMMARY
   A. Section Includes: Access panels (AP).

1.2 ACTION SUBMITTALS
   A. Product Data: For each type of door and frame indicated. Include construction details relative to materials, individual components and profiles, finishes, and fire ratings (if required) for access doors and frames.
   B. Schedule: Provide complete access panel schedule, including types, general locations, sizes, construction details, latching or locking provisions, and other data pertinent to installation.

1.3 COORDINATION
   A. Access Panel Schedule: Determine specific locations and sizes for access doors needed to gain access to concealed equipment, and indicate on schedule specified in "Submittals" Article.
   B. Verification: Determine specific locations and sizes for access doors needed to gain access to concealed equipment, and indicate on schedule specified in "Submittals" Article.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
   A. Fire-Rated Access Doors and Frames: Assemblies complying with NFPA 80 that are listed and labeled by a qualified testing agency, for fire-protection and temperature-rise limit ratings indicated, according to NFPA 252 or UL 10B.

2.2 PRODUCTS AND MANUFACTURERS
   A. Products and Manufacturers: Subject to compliance with specified requirements, provide Basis of Design or approved equivalent by one of the following manufacturers:
      1. J.L. Industries
      2. Karp Associates Inc.
      3. Milcor Inc.
      4. Potter Roemer

2.3 ACCESS PANELS
   A. General:
      1. Sizes: As shown on Drawings.
      2. Latch and Lock Hardware:
         a. Quantity: Furnish number of latches and locks required to hold doors tightly closed.
         b. Keys: Furnish two keys per lock and key all locks alike.
      3. Accessories: Provide accessories as required for complete and operable installation.
         a. Expansion shields
         b. Steel frame
         c. Continuous steel hinge
d. Automatic closing and locking device  
e. Flush key operated cylinder lock  
f. Anchorage  

B. (AP-1) Non-Rated Steel Access Door with Exposed Flanges: General purpose flush access door with exposed flanges; face of door flush with frame, with 1-inch exposed flange and concealed, removable, button hinge.  
1. Steel Sheet:  
a. Door Material: Nominal 0.062 inch (16 gauge). Fold on all four sides for structural rigidity.  
b. Frame Material: Nominal 0.062 inch, (16 gauge). Provide 1/4-inch mounting holes and easy install tabs.  
c. Finish: Paintable powder-coat, white.  

C. (AP-2) Fire-rated, flush metal access panel complying with UL, and self-closing door.  
1. Milcor: Style URF flush panel for gypsum board (and veneer plaster),  
2. Milcor: Style CFRAD flush panel for gypsum board (and veneer plaster),  
3. Provide fire-rated access doors, B label at fire rated walls or ceilings.  

1. Basis of Design: Bauco Plus II.  

E. (AP-4) Non-Rated Stainless Steel Access Door with Exposed Flanges: General purpose flush access door with exposed flanges; face of door flush with frame, with 1-inch exposed flange and concealed, removable, button hinge.  
1. Stainless-Steel Sheet, Type 304:  
a. Door Material: Nominal 0.063 inch (16 gauge).  
b. Frame Material: Nominal 0.063 inch (16 gauge).  
c. Finish: No. 4 finish.  

F. Non-Rated Steel Access Door with Concealed Flanges and Gypsum Board Insert: General purpose flush access door with a flange that will accept drywall compound for a concealed frame appearance; door face recessed to accept gypsum board insert; concealed mudded-in flange and concealed hinge.  
1. Steel Sheet:  
a. Door Material: Nominal 0.062 inch (16 gauge). Fold on all four sides for structural rigidity.  
b. Frame Material: Nominal 0.062 inch, (16 gauge). Provide 1/4-inch mounting holes and easy install tabs.  
c. Finish: Paintable powder-coat, white.  

G. Hinges: Concealed spring, button type, to allow for door removal.  

2.4 MATERIALS  
A. Materials:  
1. Aluminum Sheet for Door: Nominal 0.045 inch, with mill finish.  

B. Steel Plates, Shapes, and Bars: ASTM A 36.  

C. Steel Sheet: Uncoated or electrolytic zinc coated, ASTM A 879, with cold-rolled steel sheet substrate complying with ASTM A 1008, Commercial Steel (CS), exposed.  

D. Metallic-Coated Steel Sheet: ASTM A 653, Commercial Steel (CS), Type B; with minimum G60 or A60 metallic coating.  

E. Stainless-Steel Sheet, Strip, Plate, and Flat Bars: ASTM A 666, [Type 304] [Type 316]. Remove tool and die marks and stretch lines, or blend into finish.
F. Aluminum Extrusions: ASTM B 221, Alloy 6063.
G. Aluminum Sheet: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated.
H. Frame Anchors: Same material as door face.
I. Inserts, Bolts, and Anchor Fasteners: Hot-dip galvanized steel according to ASTM A 153/A 153M or ASTM F 2329.

2.5 FABRICATION
A. General: Provide access door and frame assemblies manufactured as integral units ready for installation.
B. Metal Surfaces: For metal surfaces exposed to view in the completed Work, provide materials with smooth, flat surfaces without blemishes. Do not use materials with exposed pitting, seam marks, roller marks, rolled trade names, or roughness.
C. Doors and Frames: Grind exposed welds smooth and flush with adjacent surfaces. Furnish mounting holes, attachment devices and fasteners of type required to secure access doors to types of supports indicated.
   1. For concealed flanges with drywall bead, provide edge trim for gypsum panels securely attached to perimeter of frames.
   2. For concealed flanges with plaster bead for full-bed plaster applications, provide zinc-coated expanded-metal lath and exposed casing bead welded to perimeter of frames.

2.6 FINISHES
A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.
D. Factory Primed: Apply manufacturer's standard, lead- and chromate-free, universal primer immediately after surface preparation and pretreatment.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine substrates for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION
A. Deliver inserts and rough-in frames to job site at appropriate time for building-in. Provide templates and rough-in measurements as required.
B. Before starting work notify Architect in writing of conflicts detrimental to installation or operation of units.
C. Verify with Architect location of access panels.

D. Advise installers of other work about specific requirements relating to access door and floor door installation, including sizes of openings to receive access door and frame, as well as locations of supports, inserts, and anchoring devices.

3.3 INSTALLATION

A. Comply with manufacturer's written instructions for installing access panels and frames, and floor doors and frames.

B. Install plumb, square and level, securely fastened, properly anchored and ready for full, complete operation and use.

C. Set frames accurately in position and attach securely to supports with plane of face panels aligned with adjacent finish surfaces.

D. Install access doors with trimless frames and floor doors flush with adjacent finish surfaces or recessed to receive finish material.

E. Adjust doors and hardware, after installation, for proper operation.

END OF SECTION
SECTION 083300
ACOUSTICAL FIRE & SMOKE RATED DOORS

PART 1 GENERAL

1.01 GENERAL REQUIREMENTS

A. Provide all materials, labor, equipment and services necessary to furnish, deliver and install all work under this section as shown on the contract documents, specified herein, and as specified by the job conditions.

1.02 DESCRIPTION

A. Related work specified elsewhere:
   1. Metal Fabrication.   Section 05 50 00
   2. Rough Carpentry.   Section 06 10 00
   3. Painting:   Section 09 91 00
   4. Electrical:   Division 26

1.03 SUBMITTALS

A. Procedures: Furnish submittals in accordance with the general requirements specified.

B. Shop Drawing: Furnish shop drawings for architect's approval. Include elevations, sections, and details indicating dimensions, materials, finishes, conditions for anchorage and support of each door.

C. Certifications:
   1. Submit manufacturer’s Underwriters Laboratories (UL), Warnock Hersey (WH) or Factory Mutual Research (FM) laboratory test report verifying product compliance in accordance with the required fire and smoke ratings.
   2. Provide certification from an accredited acoustical testing laboratory of product compliance noting a minimum 34 STC rating. Assembly shall have been tested in accordance with Laboratory Sound Transmission Loss (ASTM E-90) and STC determination (ASTM E-413).
   3. Submit manufacturer’s Code Compliance Research Report published by an independent third-party testing agency that is certified by the International Accreditation Service confirming compliance of the fire door assembly in accordance with the International Building Code.

D. Product Literature: Submit manufacturer’s technical literature describing the product to be used under this section.

E. Maintenance and Operating Manuals: Furnish complete manuals describing the materials, devices and procedures to be followed in operating and maintaining all doors under this section. Include manufacturer’s brochures and parts lists describing the actual materials used in the product.

1.04 QUALITY ASSURANCE

A. Fire & Smoke Rated Assemblies: Provide all doors with fire and smoke resistance rating required to comply with governing regulations which are inspected, tested, listed and labeled by UL, WH or FM and complying with NFPA 80 for class of opening. Provide units tested in accordance with the requirements of UL 10B, UL 1784, NFPA 252, ASTM E-152. Provide testing laboratory label permanently fastened to each fire and smoke door assembly.

B. Regulatory Requirements:
   1. Comply with applicable requirements of the laws, codes, ordinances and regulations of federal,
state and municipal authorities having jurisdiction.
2. Listed under a certified Code Compliance Research Report in accordance with the applicable sections of the International Building Code.

C. Testing: Provide documentation from a certified testing agency that the fire door's self-closing governor mechanism and fire door operator have been tested for a minimum of 50,000 cycles and 500 self closing trip tests.

D. Manufacturer Requirements: Door manufacturer shall have been in the business of and have experience in manufacturing the type of product covered under this specification section as well as giving credible service for a minimum of five (5) years. Provide list of at least ten (10) completed projects which include the products covered under this section.

1.05 DELIVERY, STORAGE AND HANDLING

A. General: Deliver and store materials in manufacturer's original packaging, labeled to show name, brand and type. Store materials in a protected dry location off the ground in accordance with manufacturer's instructions.

1.06 WARRANTY

A. Door Warranty: Provide Two (2) Year Warranty signed by the manufacturer and installer agreeing to repair or replace work which has failed as a result of defects in materials or workmanship. Upon notification within the warranty period, such defects shall be repaired at no cost to the owner.

PART 2 PRODUCTS

2.01 ACOUSTICAL FIRE & SMOKE RATED DOORS

A. CD-3: Manufacturer: Rolling Fire Door shall be model ERD10 by Cookson Door.
   a. Provide doors with Underwriters' Laboratories, Inc. label for the fire rating classification - 45 MIN Rating
   b. Color: PT-1
B. CD-4: Manufacturer: Vertical Acting Fire Door system - Acoustical fire and smoke rated door shall be Auto-Set® System model FSFD-STC-M-G as manufactured by McKEON.
   a. Provide doors with Underwriters' Laboratories, Inc. label for the fire rating classification - 90 MIN Rating

2.02 MATERIALS

A. Curtain: Shall be assembled of G90 galvanized steel interlocking slats. Slats shall have endlocks locking each end of all alternate slats to act as a wearing surface and maintain slat alignment. Curtain shall be formed of 20 gauge front and back panel slats. Slats shall be filled with acoustical core with the front and back panel slats having a positive interlock, snap-in back panel slats are not acceptable.
   1. Slats: Shall be of a cross section not less than 3" wide by 1 7/16" deep.
B. Bottom Bar: Shall consist of two (2) angles, each not less than 2" x 2" x 1/8" steel formed to fit slats. Bottom bar shall be provided with continuous form fitted acoustical seals.
C. Guides: Each guide assembly shall be fabricated of a minimum 3" x 3" steel support angle or tube, a 3" x 4" inner guide angle and a 4" x 4" outer guide angle. Support tubes shall be constructed with a slip joint at the top to provide for thermal expansion and guide angles shall be provided with slotted holes to allow for thermal expansion.
   1. Acoustical Seals: Provide internal, fully concealed UL Classified acoustical smoke seals,
located within each guide assembly, as required to maintain the minimum 34 STC rating. Externally mounted smoke seals shall not be acceptable.

D. Mounting Brackets: Fabricated of hot rolled 3/16” steel plate minimum, brackets shall be provided to house ends of the counterbalance barrel assembly.

E. Hood: Shall be provided to entirely enclose curtain and counterbalance barrel assembly. Hood shall be fabricated 22 gauge G90 galvanized steel and designed to match brackets. Top and bottom shall be bent and reinforced for stiffness.
   1. Sound Baffle: Provide self adjusting internal sound baffle with integral lintel acoustical smoke seals as required to maintain the minimum 34 STC rating.

F. Counterbalance Assembly: Fire door shall be counterbalanced by means of adjustable steel helical torsion springs attached to shaft enclosed in pipe with required mounting blocks or rings for attachment of curtain. Grease sealed bearings or self-lubricating graphite bearings shall be attached to the spring barrel which shall be fabricated of hot formed structural quality carbon steel seamless pipe.

G. Electric Motor Operator: Fire door shall be provided with a compact power unit designed and built by the door manufacturer. Operator shall be equipped with an adjustable screw-type limit switch to break the circuit at termination of travel. High efficiency planetary gearing running in an oil bath, shall be furnished together with a centrifugal governor, magnetic operated brake and a fail-safe magnetic release device, completely housed to protect against damage, dust and moisture. An efficient overload protection device, which will break the power circuit and protect against damage to the motor windings shall be integral with the unit. Operator is to be housed in a NEMA type 1 enclosure.
   1. Motor: Shall be intermediate duty, thermally protected, ball bearing type with a class A or better insulation. Horsepower of motor is to be 1/3hp minimum or of manufacturer's recommended size, which ever is greater.
   2. Starter: Shall be size "0" magnetic reversing starter, across the line type with mechanical and electrical interlocks, with 10 amp continuous rating and 24 volt control circuit. Reducer: Planetary gear type, 80% efficiency minimum.
   3. Brake: Magnetically activated, integral within the operator's housing.
   4. Control Station: Provide flush mount key switch control station marked open, close and stop.

H. Self-Closing Mechanism: The fire door is to be designed with a centrifugal governor as an integral part of the operator's construction. The automatic release mechanism shall be activated by a fusible link, smoke detector or fire alarm. When activated the door is released and begins to close due to gravitational force. The speed of the door is governed by a centrifugal governor, designed to match the normal operating speed of the door, at a rate of not greater than 9” per second or less than 6” per second.

I. Magnetic Release with 10 Second Time Delay: A fail-safe magnetic release device shall be built into the operator as an integral part of the release mechanism. When power is interrupted to the release mechanism by the smoke detector or fire alarm, the door shall begin to self-close. In the event of power failure the time delay shall prevent the fire door from closing for a period of 10 seconds. Once the 10 seconds have lapsed, the fire door shall self-close. Once power has been restored to the release mechanism the automatic reset time delay as well as the fire door shall automatically reset themselves.

J. Obstruction Sensing Safety Edge: The fire door shall be designed with an obstruction sensing safety edge. In the event that the safety edge meets an obstruction during the normal closing operation, the door shall stop, reverse and return to the open position. In the event the safety edge meets an obstruction during the self-closing operation, the door shall come to rest on the
obstruction and once the obstruction has been removed the fire door shall continue to the fully closed position.

K. Easy Trip Test Feature: The fire door shall be designed so that it may be trip tested simply by cutting power to the operator. By turning the power switch off, the door shall self-close. Once the fire door has satisfactorily closed, it shall be reset simply by turning the power back on. No ladders or tools shall be needed to reset the door or the time delay unit.

L. True Test Panel: Fire doors shall be provided with a True Test panel. The test panel shall activate all the fire doors to close via gravity not power and shall be in accordance with NFPA Bulletin 80. Only one test panel shall be required to test all the fire doors on this project.

M. Finish: After completion of fabrication, clean all metal surfaces to remove dirt and chemically treat to provide for paint adhesion. Curtain assembly is to receive a prime coat finish of .2 mils of epoxy primer and .8 mils of polyester paint in a McKEON Black finish.

PART 3 EXECUTION

3.01 EXAMINATION

A. Examine surfaces and field conditions to which this work is to be performed and notify architect if conditions of surfaces exist which are detrimental to proper installation and timely completion of work.

B. Verify all dimensions taken at job site affecting the work. Notify the architect in any instance where dimensions vary.

C. Coordinate and schedule work under this section with work of other sections so as not to delay job progress.

3.02 INSTALLATION

A. Perform installation using only factory approved and certified representatives of the door manufacturer.

B. Install door assemblies at locations shown in perfect alignment and elevation, plumb, level, straight and true.

C. Adjust door installation to provide uniform clearances and smooth non-binding operation.

D. Install wiring in accordance with applicable local codes and the National Electrical Code Standard. Materials shall be UL listed.

E. Test door closing sequence when activated by the building's fire alarm system. Reset door after successful test.

3.03 PROTECTION AND CLEANING

A. Protect installed work using adequate and suitable means during and after installation until accepted by owner.

B. Remove, repair or replace materials which have been damaged in any way.

C. Clean surfaces of grime and dirt using acceptable and recommended means and methods.
END OF SECTION
SECTION 083323
OVERHEAD COILING DOORS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Motor-operated, insulated overhead coiling doors (CD-1) and (CD-2).

1.2 ACTION SUBMITTALS
A. Product Data: For each type and size of overhead coiling door and accessory. Include the following:
   1. Construction details, material descriptions, dimensions of individual components, profiles for slats, and finishes.
   2. Rated capacities, operating characteristics, electrical characteristics, and furnished accessories.
B. Shop Drawings: For each installation and for special components not dimensioned or detailed in manufacturer’s product data. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Show locations of controls, locking devices and other accessories.
   3. Wiring Diagrams: For power, signal, and control wiring.
C. Samples: For each type of exposed finish required, prepared on 12-inch long curtain slats.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified Installer.
B. Maintenance Data: For overhead coiling doors to include in maintenance manuals.

1.4 QUALITY ASSURANCE
A. Installer Qualifications: Manufacturer’s authorized representative who is trained and approved for both installation and maintenance of units required for this Project.

PART 2 PRODUCTS

2.1 COILING DOORS
A. Source Limitations: Obtain overhead coiling doors from single source from single manufacturer.
   1. Obtain operators and controls from overhead coiling door manufacturer.
B. Manufacturers: Subject to compliance with requirements, provide Basis of Design or equivalent products by one of the following:
   1. Cookson Company.
   2. Cornell Iron Works, Inc.
   3. McKeon Rolling Steel Door Company, Inc.
   4. Overhead Door Corporation.
C. (CD-1) and (CD-2) Insulated, Motor-Operated, Overhead Coiling Door:
2. Steel Door Curtain: Galvanized steel, flat profile slats.
   a. Insulated-Slat Interior Facing: Metal.
   b. Curtain R-Value: 6.0 deg F x h x sq. ft./Btu.
3. Insulation: Fill slats for insulated doors with manufacturer's standard thermal insulation complying with maximum flame-spread and smoke-developed indexes of 75 and 450, respectively, according to ASTM E 84 or UL 723. Enclose insulation completely within slat faces.
4. Curtain Jamb Guides: Galvanized steel with exposed finish matching curtain slats. Provide continuous integral wear strips to prevent metal-to-metal contact and to minimize operational noise.
5. Hood: Match curtain material and finish.
   a. Shape: Square.
   b. Mounting: Face of wall.
   c. Locking Devices: Equip door with locking device assembly; inside and outside with cylinders.
6. Finishes: Manufacturer's powder-coated finish, color as selected by Architect from manufacturer's full range.
   b. Bonderized coating for prime coat adhesion.
   c. Corrosion inhibiting primer .2 mils per side.
   d. Thermo-setting polyester top coat with a minimum thickness of .6 mils each side.
   e. Color: Custom color as selected by Architect to match PT-__.

D. Electric Door Operator: Model MG (Industrial Duty Gear Head) Operator by Cookson.
1. Operator Location: Top of hood.
5. Sensor Edge Bulb Color: As selected by Architect from manufacturer's full range.

E. Control Station: As selected by Architect.
1. Surface mounted: "Open/Close/Stop" push buttons; NEMA 1
2. Surface mounted: "Open/Close" key switch with "Stop" push button; NEMA 3R
3. Surface mounted: "Open/Close/Stop," push buttons with keyed lock-out, not masterkeyable; NEMA 4

F. Control Operation: As selected by Architect.
1. Constant Pressure to Close:
   a. No sensing device required
   b. Two-wire, electric sensing edge seal extending full width of door bottom bar. Contact before door fully closes shall cause door to immediately stop downward travel and reverse direction to the fully opened position. Provide a [retracting safety cord and reel] [self-coiling cable] connection to control circuit.
   a. Two-wire, E.L.R. electric sensing/weather edge seal extending full width of door bottom bar. Provide a [retracting safety cord and reel] [self-coiling cable] connection to control circuit.
   b. NEMA 4X photo eye sensors consisting of a transmitter and receiver that are to be mounted within 6" (152.4 mm) of the floor, projecting an IR beam across the entire width of the door. Electrical contractor to provide low voltage wiring from the transmitter and receiver to the door operator.
c. NEMA 1 photo eye sensors consisting of a transmitter and receiver that are to be mounted within 6” (152.4 mm) of the floor, projecting an IR beam across the entire width of the door. Electrical contractor to provide low voltage wiring from the transmitter and receiver to the door operator.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine surfaces and field conditions to which this work is to be performed and notify architect if conditions of surfaces exist which are detrimental to proper installation and timely completion of work.

B. Verify all dimensions taken at job site affecting the work. Notify the architect in any instance where dimensions vary.

C. Coordinate and schedule work under this section with work of other sections so as not to delay job progress.

3.2 INSTALLATION

A. Perform installation using only factory approved and certified representatives of the door manufacturer.

B. Install overhead coiling doors and operating equipment complete with necessary hardware, anchors, inserts, hangers, and equipment supports; according to manufacturer's written instructions and as specified.

C. Install overhead coiling doors, hoods, and operators at the mounting locations indicated for each door.

D. Accessibility: Install overhead coiling doors, switches, and controls along accessible routes in compliance with regulatory requirements for accessibility.

E. Smoke-Control Doors: Install according to NFPA 80 and NFPA 105.

F. Adjust door installation to provide uniform clearances and smooth non-binding operation.

G. Install wiring in accordance with applicable local codes and the National Electrical Code Standard. Materials shall be UL listed.

H. Test door closing sequence when activated by the building's fire alarm system. Reset door after successful test.

3.3 INSTALLED WORK

A. Remove, repair or replace materials which have been damaged in any way.

B. Start-Up Service: Engage a factory-authorized service representative to perform startup service.
   1. Perform installation and startup checks according to manufacturer's written instructions.
   2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

C. Adjusting: Adjust hardware and moving parts to function smoothly so that doors operate easily, free of warp, twist, or distortion.
   1. Lubricate bearings and sliding parts as recommended by manufacturer.

D. Demonstration: Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain overhead coiling doors.
E. Cleaning: Clean surfaces of grime and dirt using acceptable and recommended means and methods.

F. Protection: Protect installed work using adequate and suitable means during and after installation until accepted by owner.

END OF SECTION
SECTION 083473
SOUND CONTROL DOOR ASSEMBLIES

PART 1 - GENERAL

1.1 SUMMARY
A. Section Includes: Metal sound control doors, door frames, glass and glazing, perimeter sealing devices, door hinges and accessories (SCDA).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product. Include sound ratings, construction details, material descriptions, core descriptions and finishes.
B. Shop Drawings: For fabrication and installation of door panels, door frames, hardware, and acoustical seals, including:
   1. Elevations of each door design.
   2. Details of sound control seals, door bottoms, and thresholds.
   3. Details of doors, including vertical- and horizontal-edge details and metal thicknesses.
   4. Frame details for each frame type, including dimensioned profiles and metal thicknesses.
   5. Locations of reinforcements and preparations for hardware.
   7. Anchorages, joints, field splices, and connections.
   8. Accessories, moldings, removable stops, and glazing.

1.3 INFORMATIONAL SUBMITTALS
A. Product Certificates: For each type of sound control door assembly.
B. Product Test Reports: For each sound control door assembly, for tests performed by a qualified testing agency.
   1. Submit certified copies of 1/3 Octave Band Transmission Loss test data and STC rating as issued by an accredited independent acoustical laboratory.
C. Schedule: Provide a schedule of sound control door assemblies prepared using same reference numbers for details and openings as those on Drawings. Coordinate with the Door Hardware Schedule.

1.4 QUALITY ASSURANCE
A. Laboratory Certification: Acoustical testing of submitted doors assemblies shall be conducted in an accredited independent acoustical laboratory. Sound transmission loss values shall be determined in accordance with ASTM E90-90. Sound Transmission Class (STC) shall be determined in accordance with ASTM E413-87.
B. Certification of acoustical tests must be submitted by Contractor for approval prior to installation.
C. Installer Qualifications: An entity that employs installers and supervisors who are trained and approved by manufacturer.
D. Acoustical Testing Agency Qualifications: An independent agency accredited as an acoustical laboratory according to the National Voluntary Laboratory Accreditation Program of NIST.
E. Fabrication shall not proceed until written approval of Submittal has been issued.
F. Door Weight: The force in pounds required to open and operate each door panel shall be in accordance with the requirements of the Americans with Disabilities Act.

1.5 DELIVERY, STORAGE, AND HANDLING
A. Deliver doors and frames palletized, wrapped, or crated to provide protection during transit and project-site storage. Avoid the use of nonvented plastic.
   1. Provide additional protection to prevent damage to factory-finished units.
B. Deliver welded frames with two removable spreader bars across bottom of frames, tack welded to jambs and mullions.

1.6 COORDINATION
A. Coordinate installation of anchorages for sound control door assemblies. Furnish setting drawings, templates, and directions for installing anchorages. Deliver sleeves, inserts, anchor bolts, and items with integral anchors to project site in time for installation.

1.7 WARRANTY
A. Special Warranty: Manufacturer agrees to repair or replace components of sound control door assemblies that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Failure to meet sound rating requirements.
      b. Faulty operation of sound seals.
      c. Deterioration of metals, metal finishes, and other materials beyond normal use or weathering.
   2. Warranty Period: Five years from date of Substantial Completion.

1.8 FIELD QUALITY CONTROL
A. Refer to Field Quality Control article in Part 3.
B. Contractor shall guarantee acoustical performance in the field of the Sound Retardant Steel Doors. The acoustical performance rating in the field shall not be less than a Noise Isolation Class (NIC) 5 dB lower than the laboratory STC rating of the door assembly when tested in the field in accordance with the noise reduction test procedure ASTM 336-75.
C. The field test will be conducted by the Architect's acoustical consultant. The manufacturer's representatives should be present to observe testing procedures and conditions. Approval of test data to be given by Architect or representative of Architect.
D. The requirement that the Contractor, at the time of bidding, submit certification of STC rating as obtained in an accredited acoustical laboratory, is mandatory. The guarantee of the achievement of acoustical performance of the NIC rating in the field will not be accepted as a substitute for the laboratory test certification. Complete compliance with the acoustical performance specifications, both laboratory and field, is required of the Contractor to be eligible as a bidder on the furnishing and installation of the Sound Retardant Steel Doors.
PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Acoustic Performance: Provide pre-hung sound control door and frame assemblies with sound rating specified, as calculated by ASTM E 413 when tested in an operable condition according to ASTM E 90; and identical to those of assemblies tested as sound-retardant units by an acoustical testing agency.

1. (SCDA-1) Sound Rating: STC 51; with and a minimum 28 dB at the 125 Hz 1/3-octave band.

B. Fire-Rated Assemblies: Complying with NFPA 80 and listed and labeled by a qualified testing agency acceptable to authorities having jurisdiction for fire-protection ratings indicated, based on testing at positive pressure according to NFPA 252 or UL 10C.

1. Smoke- and Draft Control Assemblies: Provide an assembly with gaskets listed and labeled for smoke and draft control by a qualified testing agency acceptable to authorities having jurisdiction, based on testing according to UL 1784 and installed in compliance with NFPA 105.

2.2 PRODUCTS AND MANUFACTURERS

A. Source Limitations: Obtain steel sound control door assemblies, including doors, frames, sound control seals, hinges, thresholds, and other items essential for sound control, from single source from single manufacturer.

B. (SCDA-1) Sound Control Door Assemblies: Acoustically-tested and rated assembly, consisting of steel frames with pre-hung, factory-adjusted steel doors, factory-installed hardware, including cam-lift hinges, continuous sound gasketing, threshold and other door hardware as scheduled. Provide factory-installed glazing as scheduled. Provide fire-rated assembly as scheduled.

C. Basis of Design: Subject to compliance with specified requirements, provide one of the following:

1. QuietSwing Series - Architectural Sound Control Doors by Noise Barriers, LLC.

2.3 FRAMES

A. Frames: Fabricate sound control door frames with corners mitered, reinforced, and continuously welded the full depth and width of frame. Fabricate according to NAAMM-HMMA 865.

1. Weld frames according to NAAMM-HMMA 820.
2. Exterior Frames: Fabricate from metallic-coated steel sheet 0.079-inch nominal thickness or thicker as required to provide STC rating indicated.
3. Interior Frames: Fabricate from cold-rolled steel sheet unless otherwise indicated, 0.075-inch nominal thickness or thicker as required to provide STC rating indicated.
4. Hardware Reinforcement: Fabricate according to NAAMM-HMMA 865 of same material as face sheets.
5. Head Reinforcement: Metallic-coated steel channel or angle stiffener, 0.108-inch nominal thickness. Provide for grouted frames installed in masonry openings greater than 48 inches
6. Jamb and Floor Anchors: As recommended by door assembly manufacturer.
8. Plaster Guards: Metallic-coated steel sheet, not less than 0.026 inch thick. Provide at grouted frames.
B. Frame Fabrication: Fabricate sound control frames to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal. Where practical, fit and assemble units in manufacturer's plant. To ensure proper assembly at Project site, clearly identify work that cannot be permanently factory assembled before shipment.
   1. Weld flush face joints continuously; grind, fill, dress, and make smooth, flush, and invisible. Where frames are fabricated in sections due to shipping or handling limitations, provide alignment plates or angles at each joint, fabricated from same thickness metal as frames.
   2. Provide countersunk, flat- or oval-head exposed screws and bolts for exposed fasteners unless otherwise indicated.
   3. Floor Anchors: Weld anchors to bottom of jambs and mullions with at least four spot welds per anchor.
   4. Jamb Anchors: Provide number and spacing of anchors as recommended by dorr assembly manufacturer.
   5. Head Reinforcement: For grouted frames more than 48 inches wide, weld continuous head reinforcement to back of frame at head full width of opening.
   6. Hardware Preparation: Factory prepare sound control frames to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping.
      a. Reinforce frames to receive nontemplated mortised and surface-mounted door hardware.
      b. Locate hardware as indicated, or if not indicated, according to NAAMM-HMMA 831, “Recommended Hardware Locations for Custom Hollow Metal Doors and Frames.”
   7. Plaster Guards: Weld guards to frame at back of hardware cutouts and glazing-stop screw and sound control seal preparations to close off interior of openings in frames to be grouted.
   8. Tolerances: Fabricate frames to tolerances indicated in NAAMM-HMMA 865.

C. Shop Primer Finish: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with SDI A250.10 acceptance criteria; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

2.4 STEEL DOORS

A. Doors: Flush-design sound control doors, [thickness as required to provide STC rating, of seamless construction; with manufacturer's standard sound-retardant core as required to provide STC and fire rating indicated. Construct doors with smooth, flush surfaces without visible joints or seams on exposed faces or stile edges. Fabricate according to NAAMM-HMMA 865.
   1. Interior Doors: Fabricate from cold-rolled steel sheet unless otherwise indicated, 0.048-inch nominal thickness or thicker as required to achieve STC rating indicated.
   2. Core: Manufacturer's standard sound control core.
   3. Loose Stops for Glazed Lites in Doors: Same material as face sheets.
   4. Top and Bottom Channels: Closed with continuous channels of same material as face sheets, spot welded to face sheets not more than 6 inches o.c.
   5. Hardware Reinforcement: Same material as face sheets.

B. Materials:
   1. Cold-Rolled Steel Sheet: ASTM A 1008, Commercial Steel (CS), Type B, suitable for exposed applications.
   2. Glazing: As required by sound control door assembly manufacturer to comply with sound control and fire-rated-door labeling requirements.

C. Door Fabrication: Sound control doors to be rigid and free of defects, warp, or buckle. Accurately form metal to required sizes and profiles, with minimum radius for thickness of metal.
   1. Comply with requirements in NFPA 80 for fire-rated and smoke control doors.
   2. Seamless Edge Construction: Fabricate doors with faces joined at vertical edges by welding; welds shall be ground, filled, and dressed to make them invisible and to provide a smooth, flush surface.
3. Glazed Lites: Factory install glazed lites according to requirements of tested assembly to achieve STC rating indicated. Provide fixed stops and moldings welded on secure side of door.

4. Hardware Preparation: Factory prepare sound control doors to receive templated mortised hardware; include cutouts, reinforcement, mortising, drilling, and tapping.
   a. Reinforce doors to receive nontemplated mortised and surface-mounted door hardware.
   b. Locate door hardware as indicated, or if not indicated, according to NAAMM-HMMA 831, "Recommended Hardware Locations for Custom Hollow Metal Doors and Frames."

5. Tolerances: Fabricate doors to tolerances indicated in NAAMM-HMMA 865.

D. Shop Primer Finish: Manufacturer's standard, fast-curing, lead- and chromate-free primer complying with SDI A250.10 acceptance criteria; recommended by primer manufacturer for substrate; compatible with substrate and field-applied coatings despite prolonged exposure.

2.5 HARDWARE

A. Sound Control Door Hardware: Manufacturer's standard sound control system, including head and jamb seals, door bottoms, cam-lift hinges, and thresholds, as required by testing to achieve STC and fire rating indicated.

1. Head and Jamb Seals: One of the following:
   a. Neoprene Compression Seals: One-piece units consisting of closed-cell sponge neoprene seal held in place by metal retainer, with retainer cover of same material as door frame; attached to door frame with concealed screws.
   b. Silicone Compression Seals: One-piece units consisting of silicone compression bulb and stabilizer flange; attached to door frame adhesively.
   c. Magnetic Seals: One-piece units consisting of closed-cell sponge neoprene seal and resiliently mounted magnet held in place by metal retainer, with retainer cover of same material as door frame; attached to door frame with concealed screws.

2. Door Bottoms: Neoprene or silicone gasket held in place by metal housing; mortised into bottom edge of door.

3. Cam-Lift Hinges: Full-mortise template type that raises door 1/2 inch when door is fully open; with hardened pin; fabricated from stainless steel.

4. Thresholds: Flat, smooth, unfluted type as recommended by manufacturer; fabricated from [clear-anodized aluminum] [stainless steel].
   a. Color: [Light bronze] [Medium bronze] [Dark bronze] [Black] [Match Architect's sample] [As selected by Architect from full range of industry colors and color densities].

2.6 INSTALLATION ACCESSORIES

A. Mineral-Fiber Insulation: Insulation composed of rock-wool fibers, slag-wool fibers, or glass fibers.

B. Grout: Comply with ASTM C 476, with a slump of not more than 4 inches as measured according to ASTM C 143.

C. Corrosion-Resistant Coating For Grouted Frames: Cold-applied asphalt mastic, compounded for 15-mil dry film thickness per coat. Provide inert-type noncorrosive compound free of asbestos fibers, sulfur components, and other deleterious impurities.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements and other conditions affecting performance of the Work.
B. Examine roughing-in for embedded and built-in anchors to verify actual locations of sound control door frame connections before frame installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prior to installation, adjust and securely brace sound control door frames to the following tolerances:
   1. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
   2. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
   3. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
   4. Plumbness: Plus or minus 1/16 inch, measured at jambs on a perpendicular line from head to floor.

B. Drill and tap doors and frames to receive nontemplated mortised and surface-mounted door hardware.

3.3 INSTALLATION

A. General: Install sound control door assemblies plumb, rigid, properly aligned, and securely fastened in place; comply with manufacturer's written instructions.

B. Frame Installation: Install sound control door frames in sizes and profiles indicated.
   1. Set frames accurately in position; plumbed, aligned, and braced securely until permanent anchors are set. After wall construction is complete, remove temporary braces, leaving surfaces smooth and undamaged.
      a. At fire-rated openings, install frames according to NFPA 80.
   2. Floor Anchors: Provide floor anchors for each jamb and mullion that extends to floor, and secure with postinstalled expansion anchors.
   4. In-Place Concrete or Masonry Construction: Secure frames in place with postinstalled expansion anchors. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
   5. In-Place Gypsum Board Partitions: Secure frames in place with postinstalled expansion anchors through floor anchors at each jamb. Countersink anchors, and fill and make smooth, flush, and invisible on exposed faces.
   6. Ceiling Struts: Extend struts vertically from top of frame at each jamb to supporting construction above unless frame is anchored to masonry or to other structural support at each jamb. Bend top of struts to provide flush contact for securing to supporting construction above. Provide adjustable wedged or bolted anchorage to frame jamb members.
   7. Grouted Frames: Solidly fill space between frames and substrate with grout. Take precautions, including bracing frames, to ensure that frames are not deformed or damaged by grout forces.
   8. Installation Tolerances: Adjust sound control door frames for squareness, alignment, twist, and plumbness to the following tolerances:
      a. Squareness: Plus or minus 1/16 inch, measured at door rabbet on a line 90 degrees from jamb perpendicular to frame head.
      b. Alignment: Plus or minus 1/16 inch, measured at jambs on a horizontal line parallel to plane of wall.
      c. Twist: Plus or minus 1/16 inch, measured at opposite face corners of jambs on parallel lines, and perpendicular to plane of wall.
d. Plumbness: Plus or minus 1/16 inch, measured at jambs on a perpendicular line from head to floor.

C. Doors: Fit sound control doors accurately in frames, within clearances indicated below. Shim as necessary.
   1. Non-Fire-Rated Doors: Fit non-fire-rated doors accurately in frames with the following clearances:
      b. Head with Butt Hinges: 1/8 inch.
      c. Head with Cam-Lift Hinges: As required by manufacturer, but not more than 3/8 inch.
      d. Sill: Manufacturer’s standard.
      e. Between Edges of Pairs of Doors: 1/8 inch.
   2. Fire-Rated Doors: Install fire-rated doors with clearances according to NFPA 80.

D. Sound Control Seals: Where seals have been factory prefitted and preinstalled and subsequently removed for shipping, reinstall seals and adjust according to manufacturer’s written instructions.

E. Cam-Lift Hinges: Install hinges according to manufacturer’s written instructions.

F. Thresholds: Set thresholds in full bed of sealant complying with requirements in Section 079200 - Joint Sealants.

G. Glazing: Comply with installation requirements in Section 088000 - Glazing and with sound control door assembly manufacturer’s written instructions.
   1. Secure stops with countersunk flat- or oval-head machine screws spaced uniformly not more than 9 inches o.c. and not more than 2 inches o.c. from each corner.

3.4 FIELD QUALITY CONTROL

A. Testing Agency for Field Testing: Engage Architect’s Acoustics Consultant to perform tests and inspections.
   1. Acoustical testing and inspecting agency shall select one sound control door(s) at random from sound control door assemblies that are completely installed for testing.
   2. Field tests shall be conducted according to ASTM E 336, with results calculated according to ASTM E 413. Acceptable field NIC values shall be within 5 dB of laboratory STC values.
   3. Inspection Report: Acoustical testing agency shall submit report in writing to Architect and Contractor within 24 hours after testing.
   4. If tested door fails, replace or rework all sound control door assemblies to bring them into compliance at Contractor’s expense.
      a. Additional testing and inspecting at Contractor’s expense will be performed to determine if replaced or additional work complies with specified requirements.

B. Prepare test and inspection reports.

3.5 ADJUSTING AND CLEANING

A. Final Adjustments: Check and adjust seals, door bottoms, and other sound control hardware items right before final inspection. Leave work in complete and proper operating condition.

B. Remove and replace defective work, including defective or damaged sound seals and doors and frames that are warped, bowed, or otherwise unacceptable.
   1. Adjust gaskets, gasket retainers, and retainer covers to provide contact required to achieve STC rating.

C. Prime-Coat Touchup: Immediately after erection, sand smooth rusted or damaged areas of prime coat and apply touchup of compatible, rust-inhibitive, air-drying primer.
D. Metallic-Coated Surfaces: Clean abraded areas of doors and repair with galvanizing repair paint according to manufacturer's written instructions.

END OF SECTION
SECTION 084400
ALUMINUM CURTAIN WALLS, STOREFRONTS & ENTRANCES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Glazed aluminum-framed curtain walls, storefronts and entrances (AFS).
   2. Anchors, brackets, reinforcements and attachments.
   3. Design and fabrication of system with required reinforcement to meet design intent of systems specified and performance required.
   4. Field testing of glazed aluminum curtain walls.
   5. Engineering required to comply with specified performance requirements.

1.2 COORDINATION
A. Pre-installation Conference: Before beginning curtain wall installation, conduct pre-installation conference at Project site with curtain wall system manufacturer, installer, Architect, Owner and other interested parties to review procedures, schedules, and coordination of curtain wall installation with other elements of Work.
B. Field Measurements: Verify actual supporting and adjoining construction by field measurements before fabrication; and indicate recorded measurements on final Shop Drawings.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
B. Shop Drawings: For glazed aluminum curtain walls. Include plans, elevations, sections, full-size details, and attachments to other work.
   1. Include details of provisions for assembly expansion and contraction and for draining moisture occurring within the assembly to the exterior.
   2. Include full-size isometric details of each type of vertical-to-horizontal intersection of glazed aluminum curtain walls, showing the following:
      a. Joinery, including concealed welds.
      b. Anchorage.
      c. Expansion provisions.
      d. Glazing.
      e. Flashing and drainage.
   3. Show connection to and continuity with adjacent thermal, weather, air, and vapor barriers.
C. Samples: Submit samples illustrating prefinished aluminum surface, specified glass and insulated infill panels, including glazing edge and corner, and glazing materials.
D. Fabrication Sample: Of each vertical-to-horizontal intersection of assemblies, made from 12-inch lengths of full-size components and showing details of the following:
   1. Joinery, including concealed welds.
   2. Anchorage.
   5. Flashing and drainage.
E. Manufacturer's Thermal Analysis: Submit report of thermal analysis performed by Manufacturer for this Project, evaluating the surface temperatures and dew point of installed and glazed curtain wall system, under typical conditions temperature, relative humidity and wind speed. Performance requirement of no condensation under the following conditions:
   1. Exterior Dry Bulb Temperature: 10 degrees F.
   2. Interior Dry Bulb Temperature: 74 degrees F.
   3. Relative Humidity: 35 percent.

F. Delegated Design Submittal and Shop Drawings: Where professional design services or certifications by a qualified Professional Engineer are specifically required of the Contractor by the Contract Documents, in accordance with the delegated design submittal requirements in Section 013300 - Submittal Procedures.

G. Calculations: Upon request from the Architect/Engineer only, submit calculations in accordance with Section 013300 – Submittal Procedures.

H. Certifications:
   1. Manufacturer certificate signed by manufacturer certifying compliance with requirements of Quality Assurance article.
   2. Installer certificates signed by manufacturer certifying that installer complies with requirements of Quality Assurance article.
   3. Professional Engineer certificate signed by manufacturer certifying that Professional Engineer complies with requirements of Quality Assurance article.

1.4 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.2, “Structural Welding Code – Aluminum”.

B. Structural-Sealant Glazing: Comply with ASTM C 1401 for design and installation of curtain wall assemblies.

C. Product Options: Information on Drawings and in Specifications establishes requirements for aesthetic effects and performance characteristics of assemblies. Aesthetic effects are indicated by dimensions, arrangements, alignment, and profiles of components and assemblies as they relate to sightlines, to one another, and to adjoining construction.
   1. Do not change intended aesthetic effects, as judged solely by Architect, except with Architect's approval. If changes are proposed, submit comprehensive explanatory data to Architect for review.

1.5 MOCKUPS

A. Mockup Pre-Installation Conference: Before beginning curtain wall mock-up construction and installation, conduct pre-installation conference at Project site with curtain wall system manufacturer, installer, Architect, Owner and other interested parties to review procedures, schedules, and coordination of curtain wall installation with other elements of Work.
   1. Provide system fabrication sample for pre-installation meeting.

B. Provide mockups of curtain wall system in accordance with Contract Documents to be field-tested for air and water infiltration.
   1. Architect will observe complete installation of curtain wall mock-up.
   2. Mock-up shall including intermediate mullion, sill muntin, and vision glass light.
   3. Coordinate with Work of other sections to include adjacent assemblies required to be included in mock-up and in accordance with Section 014339.
4. Mock-ups to demonstrate aesthetic effects and set quality standards for fabrication and installation.
5. Mock-ups to demonstrate component assembly including integral glazing materials, weep drainage system, attachments, and anchors.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Engineering Responsibility: Engage a qualified Professional Engineer to provide delegated design services in accordance with Section 013300 – Submittal Procedures

B. General Performance: Comply with performance requirements specified, as determined by testing of glazing systems representing those indicated for this Project without failure due to defective manufacture, fabrication, installation, or other defects in construction.
   1. Maintain continuous air and vapor barrier throughout assembly primarily in line with (inside) pane of glass and heal bead of glazing sealant.
   2. Glazed aluminum framing systems shall withstand movements of supporting structure including, but not limited to, story drift, twist, column shortening, long-term creep, and deflection from uniformly distributed and concentrated live loads.
   3. Failure also includes the following:
      a. Thermal stresses transferring to building structure.
      b. Glass breakage.
      c. Noise or vibration created by wind and thermal and structural movements.
      d. Loosening or weakening of fasteners, attachments, and other components.
      e. Failure of operating units.

4. Thermal Movement: System to provide for expansion and contraction within system components caused by cycling temperature change without causing detrimental effects to system or components.
   a. Temperature Change: 120 deg F, ambient; 180 deg F, material surfaces.

C. Structural Loads: Design and construct curtainwall system, including anchorages, to withstand dead loads of curtainwall system and wind loads caused by pressure and suction of wind acting normal to plane of wall as calculated in accordance with requirements of authorities having jurisdiction or ANSI/ASCE 7-10, whichever are more stringent.
   1. Wind Load Provisions of ANSI/ASCE 7-10 as shown on Structural Drawings.
   2. Deflection of Framing Members: At design wind pressure, as follows:
      a. Deflection Normal to Wall Plane: When subjected to design wind loads or concentrated maintenance loads shall be limited to following:
         1) Spans up to 13 feet-6 inches: limit deflection to L/175.
         2) Spans greater than 13 feet-6 inches: limit deflection to L/240 plus 1/4 inch.
         3) Cantilevered members: limit deflection to lesser of 2L/175 or 3/4 inch.
         4) No permanent deformation in excess of 0.2 percent of its span.
         5) The deflection of any member (such as vertical jambs) shall not impair the function of system or damage any joint seals as warranted by the manufacturer.
      b. Deflection Parallel to Glazing Plane: Shall not exceed an amount which will reduce the glass bite below 75 percent of design dimension, and member shall have a minimum 1/8 inch clearance between itself and edge of fixed panel, glass or fixed part immediately below.
         1) Structural Support Movement: System to accommodate anticipated interstory differential live load vertical movement of 5/16 inch (downward) in addition to anticipated thermal movement.
2) Sidesway Movement: System to accommodate anticipated interstory differential drift of H/400 in any horizontal direction.

2.2 THERMAL AND INFILTRATION PERFORMANCE REQUIREMENTS

A. Water Penetration under Static Pressure: Test according to ASTM E 331 as follows:
   1. No evidence of water penetration through fixed glazing and framing areas [including entrance doors] when tested according to a minimum static-air-pressure differential of 20 percent of positive wind-load design pressure, but not less than 15 lbf/sq. ft..
   2. Maximum Water Leakage: No uncontrolled water penetrating assemblies or water appearing on assemblies’ normally exposed interior surfaces from sources other than condensation. Water leakage does not include water controlled by flashing and gutters, or water that is drained to exterior.

B. Energy Performance: Certified and labelled by manufacturer for energy performance as follows:
   1. Thermal Transmittance: Maximum U-factor when tested in accordance with NFRC 100.
      a. Fixed Glazing and Framing: Not more than 0.29 Btu/sq. ft. x h x deg F.
      b. Entrance Doors: Not more than 0.77 Btu/sq. ft. x h x deg F.
   2. Air Leakage: Maximum when tested in accordance with ASTM E283.
      a. Fixed Glazing and Framing: Not more than 0.06 cfm/sq. ft. at a static-air-pressure differential of 6.24 lbf/sq. ft..
      b. Entrance Doors: Not more than 1.0 cfm/sq. ft. at a static-air-pressure differential of 1.57 lbf/sq. ft..
   3. Condensation Resistance Factor: Minimum CRF when tested in accordance with AAMA 1503.
      a. Fixed Glazing and Framing: Not less than 80.
      b. Entrance Doors: 68.
   4. Solar Heat Gain Coefficient: Maximum SHGC when tested in accordance with NFRC 200.
      a. Fixed Glazing and Framing: Not more than 0.45.
      b. Entrance Doors: Not more than 0.40.

C. Structural Sealant: Capable of withstanding tensile and shear stresses imposed by structural-sealant-glazed assemblies without failing adhesively or cohesively. When tested for preconstruction adhesion and compatibility, cohesive failure of sealant shall occur before adhesive failure.
   1. Structural Sealant Joint Design:
      a. Designed to carry gravity loads of glazing.
      b. Designed to produce tensile or shear stress of less than 20 psi.
      c. Design reviewed and approved by structural-sealant manufacturer.
   2. Compatibility: Provide glazing sealants that are compatible with one another and with other materials they will contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.

2.3 BASIS OF DESIGN SYSTEMS

A. Single Source Responsibility: To ensure quality of appearance and performance, obtain materials for all glazed framing and entrance systems specified in this Section from a single manufacturer, capable of providing all specified systems with same profile dimensions and extrusion profiles as Basis of Design.

B. Manufacturers: Subject to specified requirement, provide Basis of Design or equivalent system as approved by Architect:
   1. Kawneer Company.
   2. VistaWall International.
C. (AFS-1), (AFS-2) and (AFS-3) Aluminum Curtain Wall Systems: High-performance extruded profile aluminum framing, thermally-broken with interior tubular section insulated from exterior pressure plate; matching stops and mullion caps; with structural-sealant-glazed where indicated; special mullion cap profiles as indicated; internal weep drainage system: glass and glazing, doors and door frames.
   1. Basis of Design: 1600 UT Wall by Kawneer.
   2. Configurations:
      a. (AFS-1): Captured glazing system with special shape mullion caps and structural sealant glazing where shown. Internally reinforced.
      b. (AFS-2): Structural sealant glazed system.
      c. (AFS-3): Captured glazing system with 6-inch deep mullion caps.
   3. Finish: Color Anodized, AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.

D. (AFS-4) Aluminum Storefront Systems: Thermally-broken aluminum framing and entrances, designed to accept 1 inch glazing material; matching stops and mullion caps; with structural-sealant-glazed where indicated.
   2. Finish: Color Anodized, AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.

   1. Profiles: 4-inch medium stiles, 4-inch top rail, and 10-inch bottom rail.
   2. Door Construction: 1-3/4-inch overall depth, with minimum 3/16-inch-thick, extruded-aluminum tubular rail and stile members. Mechanically fasten corners with reinforcing brackets that are deeply penetrated and fillet welded or that incorporate concealed tie rods.
      a. Thermal Construction: High-performance plastic connectors separate aluminum members exposed to the exterior from members exposed to the interior.
      b. Glazing Stops and Gaskets: Square, snap-on, extruded-aluminum stops and preformed gaskets.
   3. Framing Members: Manufacturer's standard extruded aluminum, minimum 0.125 inch thick and reinforced as required to support imposed loads.
      a. Nominal Size: As indicated on Drawings.
      b. Backer Plates: Manufacturer's standard, continuous backer plates for framing members, if not integral, where framing abuts adjacent construction.
   4. Finish: Color Anodized, AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
   5. Door Hardware: As specified in Section 087100 - Door Hardware.
      a. Hinges shall be minimum 5 knuckle ball bearing type, 2 pair per door leaf. Doors that open out of the occupied space shall have two non-removable hinge pins - top and bottom. Continuous hinges shall be used on all exterior doors, including main entrance and vestibule doors.
   6. Entrance doors and frames shall be prepared for building security systems prior to installation. Preparation prior to installation of frames and doors shall be the responsibility of the frame and door provider.

2.4 SYSTEM COMPONENTS & MATERIALS

A. Framing Members: Manufacturer's extruded- or formed-aluminum framing members of thickness required and reinforced as required to support imposed loads.
   1. Pressure Caps: Manufacturer's standard aluminum components that mechanically retain glazing.
2. Jamb Receptors: Provide as shown on Drawings.
3. Aluminum: Alloy and temper recommended by manufacturer for type of use and finish indicated.
   a. Sheet and Plate: ASTM B 209.
   b. Extruded Bars, Rods, Shapes, and Tubes: ASTM B 221.
   d. Structural Profiles: ASTM B 308/B 308M.
4. Brackets and Reinforcements: Manufacturer's standard high-strength aluminum with nonstaining, nonferrous shims for aligning system components.

B. Steel Reinforcement: With manufacturer's standard corrosion-resistant primer complying with SSPC-PS Guide No. 12.00 applied immediately after surface preparation and pretreatment. Select surface preparation methods according to recommendations in SSPC-SP COM and prepare surfaces according to applicable SSPC standard.
1. Structural Shapes, Plates, and Bars: ASTM A 36.
2. Cold-Rolled Sheet and Strip: ASTM A 611.

Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.
4. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
5. Reinforce members as required to receive fastener threads.
6. Fasteners Exposed to Weather: 300 Series stainless steel, type and size recommended by curtain wall manufacturer with exposed portions matching finish curtain wall system.
7. Silicone Sheet Flashing: Extruded or preformed silicone weather-barrier transition sheet recommended by curtain wall manufacture.

C. Anchors: Three-way adjustable anchors with minimum adjustment of 1 inch that accommodate fabrication and installation tolerances in material and finish compatible with adjoining materials and recommended by manufacturer.
1. Concrete and Masonry Inserts: Hot-dip galvanized cast-iron, malleable-iron, or steel inserts complying with ASTM A 123 or ASTM A 153 requirements.

D. Accessories:
1. Concealed Flashing: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding flashing compatible with adjacent materials.
2. Bituminous Paint: Cold-applied asphalt-mastic paint complying with SSPC-Paint 12 requirements except containing no asbestos, formulated for 30-mil thickness per coat.
3. Sealant: Comply with Section 079000 - Joint Protection for weatherseal sealant and backing rod.

E. Insulated Panels: Laminated, metal-faced flat panels with no deviations in plane exceeding 0.8 percent of panel dimension in width or length.
1. Overall Panel Thickness: As indicated.
2. Exterior Skin, Both Faces: Aluminum sheet, Manufacturer's standard thickness for finish and texture indicated.
   a. Texture: Smooth.
3. Thermal Insulation Core: Manufacturer's standard rigid, closed-cell, polyisocyanurate board.
4. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   a. Flame-Spread Index: 25 or less.
   b. Smoke-Developed Index: 450 or less.

F. Glazing: Comply with Section 088000 - Glazing for the following:
1. Glass and Glazing
2. Glazing Gaskets
3. Glazing Sealants
4. Structural Glazing Sealants

2.5 FABRICATION

A. Aluminum Framing: Fabricate framing components that, when assembled, have the following characteristics:
   1. Profiles that are sharp, straight, and free of defects or deformations.
   2. Accurately fitted joints with ends coped or mitered.
   3. Physical and thermal isolation of glazing from framing members.
   4. Accommodations for thermal and mechanical movements of glazing and framing to maintain required glazing edge clearances.
   5. Provisions for field replacement of glazing from exterior.
   6. Fasteners, anchors, and connection devices that are concealed from view to greatest extent possible.
   7. Components curved to indicated radii.
   8. Conceal fasteners wherever possible.
   9. Reinforce work as necessary for performance requirements, and for support to structure.
   10. Separate dissimilar metals and aluminum in contact with concrete utilizing protective coating or preformed separators, which will prevent contact and corrosion.
   11. Comply with Section 088000 for glazing requirements.
   12. Shop-fabricate and assemble to greatest extent possible.
   13. Maintain accurate relation of planes and angles, with hairline fit of contacting members.
   14. Seal horizontals and direct moisture accumulation to exterior.
   15. Provide flashings and other materials used internally or externally that are corrosive resistant, non-staining, non-bleeding and compatible with adjoining materials.
   16. Provide manufacturer's extrusions and accessories to accommodate expansion and contraction due to temperature changes without detrimental to appearance or performance.

B. Welding:
   2. Use recommended electrodes and methods to avoid distortion and discoloration.
   3. Weld in concealed locations to greatest extent possible to minimize distortion or discoloration of finish. Remove weld spatter and welding oxides from exposed surfaces by descaling or grinding.
   4. Grind exposed welds smooth and flush with adjacent surfaces; restore mechanical finish.

C. Flashing: Form from sheet aluminum with same finish as extruded sections. Apply finish after fabrication. Material thickness as required to suit condition without deflection or "oil-canning".

D. Entrances:
   1. Door Frames: Fabricate tubular and channel frame assemblies, as indicated, with either welded or mechanical joints in accordance with manufacturer's standards, reinforced as necessary to support required loads. Reinforce as required to support loads imposed by door operation and for installing entrance door hardware.
      a. At exterior doors, provide compression weather stripping at fixed stops.
      b. At interior doors, provide silencers at stops to prevent metal-to-metal contact. Install three silencers on strike jamb of single-door frames and two silencers on head of frames for pairs of doors.
2. Stile-and-Rail Doors: Provide tubular frame members, fabricated with mechanical joints using heavy inserted reinforcing plates and concealed tie-rods or j-bolts, or fabricate with structurally welded joints, at manufacturer's option. Reinforce doors as required for installing entrance door hardware.
   a. At pairs of exterior doors, provide sliding-type weather stripping retained in adjustable strip and mortised into door edge.
   b. At exterior doors, provide weather sweeps applied to door bottoms.

3. Glazing: Fabricate doors to facilitate replacement of glass or panels, without disassembly of door stiles and rails. Provide snap-on extruded aluminum glazing stops, with exterior stops anchored for non-removal.

4. Entrance Door Hardware Installation: Factory install entrance door hardware to the greatest extent possible. Cut, drill, and tap for factory-installed entrance door hardware before applying finishes.

E. Form or extrude aluminum shapes before finishing.

F. Other Finishes:
   1. Concealed Steel Items: Galvanized in accordance with ANSI/ASTM A653 to 2.0 oz/sq ft primed with iron oxide paint.
   2. Apply one coat of bituminous paint to concealed aluminum and steel surfaces in contact with cementitious or dissimilar materials.
   3. Primer: FS TT-P-31; for shop application and field touch-up.
   4. Touch-Up Primer for Galvanized Surfaces: FS TT-P-641; TT-P-645.

2.6 SOURCE QUALITY CONTROL

A. Structural Sealant: Perform quality-control procedures complying with ASTM C 1401 recommendations including, but not limited to, assembly material qualification procedures, sealant testing, and assembly fabrication reviews and checks.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
   1. Verify wall openings and adjoining air and vapor seal materials are ready to receive work of this Section.
   2. Proceed with installation only after unsatisfactory conditions have been corrected.
   3. Beginning of installation means acceptance of existing conditions.

3.2 PREPARATION

A. Coordinate dimensions, tolerances, and method of attachment with other work.
   1. Variation from Plane: 0.06 inches every 3 feet maximum or 0.25 inches per 100 feet, whichever is less.
   2. Misalignment of Two Adjoining Members Abutting in Plane: 0.015 inches.

B. Prepare surfaces that are in contact with structural sealant according to sealant manufacturer's written instructions to ensure compatibility and adhesion. Preparation includes, but is not limited to, cleaning and priming surfaces.

3.3 INSTALLATION

A. General:
1. Comply with manufacturer's written instructions.
2. Do not install damaged components.
3. Fit joints to produce hairline joints free of burrs and distortion.
4. Install components plumb and level, securely anchored, and without warp, twist or other distortion.
   a. Maintain assembly dimensional tolerances, aligning with adjacent work.
5. Install components to drain water passing joints, condensation occurring in glazing channels, condensation occurring within framing members, and moisture migrating within the system to the exterior.
6. Adjust weather-stripping contact and hardware movement to provide specified performance and proper operation.
7. Provide thermal isolation where components penetrate insulation.
8. Coordinate attachment and seal of air and vapor retarder materials. Install sill flashings.
9. Pack fibrous insulation in shim spaces at perimeter of assembly to maintain continuity of thermal barrier.

B. Metal Protection:
1. Where aluminum is in contact with dissimilar metals, protect against galvanic action by painting contact surfaces with primer, applying sealant or tape, or installing nonconductive spacers as recommended by manufacturer for this purpose.
2. Where aluminum is in contact with concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

C. Anchorage: Provide alignment attachments and shims required to permanently fasten system to building structure as indicated on Shop Drawings.
1. Use method of attachment to structure permitting sufficient adjustment to accommodate construction tolerances and irregularities.
2. Install anchors with separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.
3. Provide separators and isolators to prevent metal corrosion and electrolytic deterioration and to prevent impeding movement of moving joints.

D. Welding: Where welding is required, weld components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.
1. Do not cut, trim, weld or braze component parts during erection in manner which would damage finish, decrease strength, or result in visual imperfection or failure in performance. Return component parts which require alteration to shop prefabrication, if possible, or for replacement with new parts.

E. Install glass and glazing and glazed-in metal panels in accordance with Section 088000.

F. Install perimeter sealant and backing materials in accordance with Section 079000.

G. Erection Tolerances: Install structural-sealant-glazed curtain walls to comply with the following maximum tolerances:
1. Plumb: 1/8 inch in 10 feet; 1/4 inch in 40 feet.
2. Level: 1/8 inch in 20 feet; 1/4 inch in 40 feet.
3. Alignment:
   a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2 inch wide, limit offset from true alignment to 1/16 inch.
   b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch wide, limit offset from true alignment to 1/8 inch.
   c. Where surfaces are separated by reveal or protruding element of 1 inch wide or more, limit offset from true alignment to 1/4 inch.
4. Location: Limit variation from plane to 1/8 inch in 12 feet; 1/2 inch over total length.
3.4 FIELD TESTING

A. Testing Agency: Owner will engage a qualified testing agency to perform tests and inspections.

B. Field Quality Control, General: Perform field quality control testing to measure performance of installed curtain wall assemblies and to set standards for workmanship and quality of subsequent assembly installation.
   1. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
   2. Reports: Prepare test and inspection reports. Submit in accordance with Section 013300.
   3. Repair areas damaged by testing.
   4. Curtain walls will be considered defective if they do not pass tests and inspections.

C. Test Areas: Perform the following tests on integrated mockup or on representative area of installed curtain wall, in location and of size as determined by the Architect. Test area shall include perimeter caulking, typical splices, frame intersections, and at least 2 entire lites containing an intermediate horizontal member (if applicable).

D. Air Infiltration and Water Penetration Tests: Perform field testing in accordance with AAMA 503, using same minimum static-air-pressure differential as used for laboratory testing. No field reduction allowed.
   1. Complete a minimum of three successful tests for both air infiltration and water penetration, achieving satisfactory results and meeting specified requirements.
   2. Perform tests in each test area as directed by Architect. Perform at least three tests, prior to 10, 30, and 70 percent completion.
   3. Retesting: Make corrections to and retest area until satisfactory results are achieved.
   4. Field Testing Performance Requirements:
      a. Air Infiltration: Maximum allowable rate of air leakage shall not exceed 0.06 CFM per square foot.
      b. Water Penetration: No evidence of water penetration.

E. Structural-Sealant Adhesion Test: Test structural sealant according to recommendations in ASTM C 1401, Destructive Test Method A, "Hand Pull Tab (Destructive)," Appendix X2.

3.5 INSTALLED WORK

A. Protection: Provide final protection and maintain conditions in a manner acceptable to the Installer, that shall ensure that the glazed wood curtain walls shall be without damage at time of Substantial Completion.
   1. Protective Coverings: Protect the work for the duration of construction. Such protection shall avoid development of non-uniformity in finishes, shall not impair a residue which would adversely affect the adhesion of sealants, nor cause other deleterious effects in the work. Temporarily remove such protection when requested by the Architect for inspection of finishes, and completely remove protection when no longer required.

B. Maintenance Instructions: Instruct the Owner’s personnel who will be responsible for window washing and snow removal after the time of final acceptance.

END OF SECTION
SECTION 08 5659 - SERVICE AND TELLER WINDOW UNITS

PART 1 GENERAL

1.01 SECTION INCLUDES
A. Service and teller window units.

1.02 REFERENCE STANDARDS

1.03 ADMINISTRATIVE REQUIREMENTS
A. Coordinate work with adjacent materials specified in other sections and as indicated on drawings and approved shop drawings.

1.04 SUBMITTALS
A. See Section 01 3000 - Administrative Requirements, for submittal procedures.
B. Product Data: Submit manufacturer's product data for specified products indicating materials, operation, glazing, finishes, and installation instructions.
C. Shop Drawings: Indicate configuration, sizes, rough-in, mounting, anchors and fasteners, and installation clearances.
D. Test Data: Test reports for specific window model and glazing to be furnished, showing compliance with all specified requirements; window and glazing may be tested separately, provided window test sample adequately simulates the glazing to be used.
E. Samples for Selection of Finishes:
   1. Color Anodized Finishes: Submit two samples, 4 inch by 4 inch (100 mm by 100 mm) in size illustrating metal finishes for each finish specified.
F. Manufacturer Qualification Statement.
G. Installer Qualification Statement.
H. Warranty: Submit manufacturer warranty and ensure that forms have been completed in Owner's name and registered with manufacturer.

1.05 QUALITY ASSURANCE
A. Manufacturer Qualifications: Company specializing in manufacturing products specified in this section with at least ten years documented experience, and with ability to provide test reports showing that their standard manufactured products meet the specified requirements.
B. Installer Qualifications: Company specializing in performing work of the type specified and with at least three years of documented experience.

1.06 DELIVERY, STORAGE, AND HANDLING
A. Deliver units in manufacturer's original packaging and unopened containers with identification labels intact.
B. Store units in area protected from exposure to weather and vandalism.

1.07 WARRANTY
A. Provide manufacturer's warranty agreeing to repair or replace units and their components that fail in materials or workmanship within five years from Date of Substantial Completion.

PART 2 PRODUCTS

2.01 MANUFACTURERS
A. Service and Teller Window Units:

2.02 SERVICE AND TELLER WINDOW UNITS
A. Location:  Built within exterior wall, as indicated on drawings.
B. Type of Use: Walk-up.
C. Window Type: Sliding, single horizontal.
   3. Window Size: 47-1/2 inch wide by 43-1/2 inch high
      a. Finish: Color anodized, black. To match adjacent Curtain Wall.
D. Glazing: Single (monolithic), clear.
E. Products:

2.03 ASSEMBLY COMPONENTS
A. Windows: Factory-fabricated, finished, and glazed, with extruded aluminum frame and glazing stops; complete with hardware and anchors.
   1. Provide window units that are re-glazable from the secure side without dismantling the non-secure side of framing.
   2. Rigidly fit and secure joints and corners with internal reinforcement. Make joints and connections flush, hairline, and weatherproof. Fully weld corners.
   3. Apply factory finish to exposed surfaces.
   4. Wind Design: Design and size components to withstand dead loads and live loads caused by pressure and negative wind loads acting normal to plane of window as calculated in accordance with applicable code.

2.04 MATERIALS
A. Aluminum Extrusions: Minimum 1/8 inch (3.2 mm) thick frame and sash material complying with ASTM B221 and ASTM B221M.
B. Insulating Glass: Double pane insulating vision glass; 5/8 inch (15.9 mm) thick, minimum.
   1. Low-E coating on No. 2 surface.
C. Sealant for Setting Sills and Sill Flashing: Non-curing butyl type.

2.05 FINISHES
A. Class I Color Anodized Finish: AAMA 611 AA-M12C22A42 Integrally colored anodic coating not less than 0.7 mils (0.018 mm) thick.

2.06 ACCESSORIES
A. Hardware and Security Devices for Sliding Windows:

PART 3 EXECUTION
3.01 EXAMINATION
A. Verify that window openings are ready for installation of windows.
B. Verify that correct embedded anchors are in place and in proper location; repair or replace anchors as required to achieve satisfactory installation.
C. Notify Architect if conditions are not suitable for installation of units; do not proceed until conditions are satisfactory.

3.02 INSTALLATION
   A. Install in accordance with manufacturer’s instructions.
   B. Install units in correct orientation (inside/outside or secure/non-secure).
   C. Anchor units securely in manner so as to achieve performance specified.
   D. Set sill members and sill flashing in continuous bead of sealant.
   E. Remove and replace defective work.

3.03 ADJUSTING
   A. Adjust operating components for smooth operation while also maintaining a secure, weather-tight enclosure and a tight fit at the contact points; lubricate operating hardware.

3.04 CLEANING
   A. Remove protective material from factory finished surfaces.
   B. Clean exposed surfaces promptly after installation without damaging finishes.

3.05 DEMONSTRATION
   A. Train Owner’s maintenance personnel to adjust, operate, and maintain operable units.
      1. Instructor: Manufacturer’s training personnel.
      2. Location: At project site.
      3. Use operation and maintenance manual as training reference, supplemented with additional training materials as required.

3.06 PROTECTION

END OF SECTION
SECTION 085673
SOUND CONTROL WINDOW UNITS

PART 1 GENERAL

1.1 SUMMARY
   A. Section Includes: Factory-glazed, acoustically-rated window units (SCWU).

1.2 ACTION SUBMITTALS
   A. Product Data: For each type of product. Include construction details, material descriptions, glazing and fabrication methods, dimensions of individual components and profiles, hardware, and finishes for aluminum windows.
   B. Shop Drawings: Showing installation details, elevations and details of all unit sections, hardware and accessories, anchorage and hardware.

1.3 INFORMATIONAL SUBMITTALS
   A. STC Certification and Test Reports: Submit certification of Sound Transmission Class (STC) rating, along with transmission loss values within individual 1/3 octave band frequencies, for all acoustical doors with glazing and other details, performed by an accredited independent acoustical laboratory. Testing shall be in accordance with the latest version of ASTM-E90.
   B. Letter of certification stating that partition framing is suitable for the installation and proper operation and acoustic performance.
   C. Field quality-control reports.

1.4 QUALITY ASSURANCE
   A. Manufacturer Qualifications: A manufacturer capable of fabricating aluminum windows that meet or exceed performance requirements indicated and of documenting this performance by test reports, and calculations.
   B. Installer Qualifications: An installer acceptable to aluminum window manufacturer for installation of units required for this Project.

1.5 DELIVERY, STORAGE, AND HANDLING
   A. Deliver products in manufacturer's original packaging. Store materials indoors in location that is secure, dry, and has stable temperature. Handle in accordance with manufacturer's instructions to prevent damage.
   B. Use special care in handling to prevent twisting, warping, nicking, and other damage.

1.6 SITE CONDITIONS
   A. Field Measurements: Where work is indicated to fit to other construction, verify dimensions of other construction by field measurement before fabrication and indicate measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the work.
      1. Locate concealed framing, blocking, and reinforcements that support woodwork by field measurement before being enclosed and indicate measurements on shop drawings.
1.7 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace aluminum windows that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Failure to meet performance requirements.
      b. Structural failures including excessive deflection, water leakage, condensation, and air infiltration.
      c. Faulty operation of movable sash and hardware.
      d. Deterioration of materials and finishes beyond normal weathering.
      e. Failure of insulating glass.

PART 2 PRODUCTS

2.1 SOUND-CONTROL ALUMINUM WINDOWS

A. Single Source: All components to be products supplied by the single manufacturer, and shall comply with specified laboratory acoustical ratings as tabulated at end of this section.

B. Manufacturers:
   1. Milco
   2. Mon-Ray Inc.
   3. Peerless Products

C. Aluminum-framed, factory-glazed window units; acoustically tested & rated; prefinished matte black. Provide in sizes and configurations as indicated on Drawings and as described below.

D. (SCWU-1) Fixed Units: At Control Room.
   1. Basis of Design: DeVAC 650-AL by Mon-Ray Inc.
   2. (GL-12) Laminated Clear Glass: 1/2-inch unit consisting of 2 plies of 1/4-inch, heat-treated clear glass, laminated with 0.090-inch clear PVB Interlayer.
   3. Sound Transmission Class (STC): Rated for not less than STC 32 when tested for laboratory sound transmission loss according to ASTM E 90 and determined by ASTM E 413.

E. (SCWU-2) Fixed Units: At Projection.
   1. Basis of Design: DeVAC 650-AL by Mon-Ray Inc.
   2. (GL-5) Non-Reflective, Ultra-Clear Glass: Glass Substrate: 3/8-inch thick, ultra-clear, low-iron float glass with a visible light transmission exceeding 90 percent through a 6.0mm test sample; select glazing quality (q3), Type I, Class I, free of defects that affect normal viewing.
      a. Anti-Reflective Coating: On each face, providing residual reflection of less than 1 percent when viewed at a 90 degree angle.
   3. Sound Transmission Class (STC): Rated for not less than STC 32 when tested for laboratory sound transmission loss according to ASTM E 90 and determined by ASTM E 413.

F. (SCWU-2) Operable Units: At Control Room.
   1. Basis of Design: DeVAC 650-AL-2E by Mon-Ray Inc.
   2. (GL-12) Laminated Clear Glass: 1/2-inch unit consisting of 2 plies of 1/4-inch, heat-treated clear glass, laminated with 0.090-inch clear PVB Interlayer.
   3. Sound Transmission Class (STC): Rated for not less than STC 50 when tested for laboratory sound transmission loss according to ASTM E 90 and determined by ASTM E 413.
G. Frames and Sashes: Extruded aluminum shapes, aluminum alloy 6063-T6 Architectural Grade homogenized aluminum primary billet, minimum nominal wall thickness of .062”, except frame sills which have a nominal wall thickness of .093” in the primary walls and track.

H. Frame Finish: Provide with Manufacturer’s standard color-anodized or fluoropolymer finish, and in accordance with the following:
   1. Color-Anodized Finish: Class I, AA-M12C22A42/A44; nonspecular as fabricated mechanical finish; etched, medium matte chemical finish.
   2. Fluoropolymer Finish: High-performance, two-coat fluoropolymer finish complying with AAMA 2605 and containing not less than 70 percent PVDF resin by weight in color coat.

I. Thermal Barrier: Tongue and groove fit to aluminum extrusions, minimum 1/4-inch wide. No screws, connections or fittings span the thermal barrier. Provides complete metal separation of the frame members.

J. Weather-stripping: Double weather-stripped silicone-coated woven pile with mylar side fins or center fins.
   1. Silicone treated; UV stabilized polypropylene pile with an integral polypropylene fin running through the center; bonded to a non-shrinking backing, which shall slide into extruded ports in the aluminum frame and sash. All weather-strip shall be staked in place.
   2. Vinyl weather-stripping will not be accepted.

K. Glazing Gasket: Silicone or closed-cell neoprene to meet performance requirements

L. Hardware: Spring loaded stainless steel plunger lock. Interior meeting rails to have continuous grip rails.

M. Perimeter Sealant: Non-hardening acoustic sealant as specified in Section 092900 - Gypsum Board.

2.2 FABRICATION

A. Window Unit Construction: Identical to that of the acoustically tested unit.

B. Shop-fabricate complete unit, including glazing.
   1. Entire unit including frame, seals, glass and mullions shall be factory fabricated and shipped to site ready for installation in roughed opening.
   2. Window system shall include: glass, steel framing and trim, and all accessory items as shown on the drawings and required for a complete installation, including caulking and anchorage to adjacent construction.

C. Framing: Continuous extrusions, square cut at corners and precision machined, with continuous non-conductive rigid vinyl thermal barrier.
   1. Corners fastened with minimum of four stainless steel screws.
   2. Sill is tubular and weeped to prevent the accumulation of moisture or debris. The weep system allows drainage of water from cavities in sill.
   3. Sill section allows for anchorage without bridging thermal barrier.

D. Sash: Hollow tubular extrusions, square cut and milled to allow telescoped joints at each corner.
   1. Screws, axles and pins are stainless steel.
   2. Sashes are removable from inside, without tools, for cleaning.
PART 3 EXECUTION

3.1 EXAMINATION
A. Examination and Acceptance of Conditions: Before proceeding with installation, examine conditions for compliance with requirements for installation tolerances and other conditions affecting performance.
   1. Space Requirements: Take field measurements as required to fit the Work properly. Verify space requirements and dimensions of items shown diagrammatically on Drawings.

B. Proceed with installation only after unsatisfactory conditions have been corrected. Proceeding with the Work indicates acceptance of surfaces and conditions.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION
A. General: Comply with manufacturer’s written instructions for installing windows, hardware, accessories, and other components. For installation procedures and requirements not addressed in manufacturer’s written instructions, comply with installation requirements in ASTM E 2112.
   1. Install windows level, plumb, square, true to line, without distortion or impeding thermal movement, anchored securely in place to structural support, and in proper relation to wall flashing and other adjacent construction to produce weathertight construction.
   2. Install windows and components to drain condensation, water penetrating joints, and moisture migrating within windows to the exterior.
   3. Separate aluminum and other corrodible surfaces from sources of corrosion or electrolytic action at points of contact with other materials.

B. Comply with manufacturer’s written instructions and recommendations for installing products in applications indicated.

C. Attachment: Provide blocking, attachment plates, anchors and fasteners of adequate size and number to securely anchor each component in place, accurately located and aligned with other portions of the Work. Where size and type of attachments are not indicated, verify size and type required for load conditions.

D. Sealant: Seal joints between windows and surrounding construction with non-hardening sealant.
   1. Provide joint backing in all joints where a suitable backstop to receive sealant is otherwise not available.
   2. Pack joints with joint backing to provide depth equal to 1/2 of width. Caulk joint width cannot be less than 1/4” nor more than 1/2” unless recommended otherwise by the manufacturer.

3.3 FIELD TESTING VERIFICATION
A. If required, the owner will retain the services of an independent acoustical consultant to conduct field sound transmission tests at any designated window locations where acoustical performance is suspected by the architect of not being in compliance with these specifications. The tests shall be conducted in accordance with ASTM E-336 to determine the Field Sound Transmission Class (FSTC) or Noise Isolation Class (NIC), as applicable and feasible. If such results indicate acoustical performance more than 5 points less than the specified STC ratings, it shall be the responsibility of the manufacturer and contractor, at their expense, to correct such deficiencies by methods approved by the architect prior to incorporation. Sound transmission tests shall be repeated and corrective measures implemented until the established performance requirements are met. If the architect determines that the materials are not as specified herein, all costs for the initial tests, as well as costs for retesting, shall be borne by the contractor and manufacturer.
3.4 INSTALLED WORK

A. Adjusting Operable Components: Adjust movable components of assembly to operate safely, smoothly, easily, and quietly, free from binding, warp, distortion, nonalignment, misplacement, disruption, or malfunction, throughout entire operational range, and without binding or damaging assembly components. Lubricate hardware and moving parts.

B. Cleaning: Clean and provide maintenance on completed construction as frequently as necessary through the remainder of the construction period.

C. Protection: Provide final protection and maintain conditions that ensure installed Work is without damage or deterioration at time of Substantial Completion.

END OF SECTION
SECTION 087100 – DOOR HARDWARE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes commercial door hardware for the following:
   1. Swinging doors.
   2. Sliding doors.
   3. Other doors to the extent indicated.

B. Door hardware includes, but is not necessarily limited to, the following:
   1. Mechanical door hardware.
   2. Electromechanical door hardware.
   3. Automatic operators.
   4. Cylinders specified for doors in other sections.

C. Related Sections:
   1. Division 08 Section “Door Hardware Schedule”.
   2. Division 08 Section “Hollow Metal Doors and Frames”.
   3. Division 08 Section “Flush Wood Doors”.
   4. Division 08 Section “Aluminum-Framed Entrances and Storefronts”.
   5. Division 28 Section “Access Control”.

D. Codes and References: Comply with the version year adopted by the Authority Having Jurisdiction.
   6. NFPA 105 - Installation of Smoke Door Assemblies.

E. Standards: All hardware specified herein shall comply with the following industry standards:
1. ANSI/BHMA Certified Product Standards - A156 Series
2. UL10C – Positive Pressure Fire Tests of Door Assemblies

1.3 SUBMITTIALS

A. Product Data: Manufacturer's product data sheets including installation details, material descriptions, dimensions of individual components and profiles, operational descriptions and finishes.

B. Door Hardware Schedule: Prepared by or under the supervision of supplier, detailing fabrication and assembly of door hardware, as well as procedures and diagrams. Coordinate the final Door Hardware Schedule with doors, frames, and related work to ensure proper size, thickness, hand, function, and finish of door hardware.

1. Format: Comply with scheduling sequence and vertical format in DHI's "Sequence and Format for the Hardware Schedule."

2. Organization: Organize the Door Hardware Schedule into door hardware sets indicating complete designations of every item required for each door or opening. Organize door hardware sets in same order as in the Door Hardware Sets at the end of Part 3. Submittals that do not follow the same format and order as the Door Hardware Sets will be rejected and subject to resubmission.

3. Content: Include the following information:
   a. Type, style, function, size, label, hand, and finish of each door hardware item.
   b. Manufacturer of each item.
   c. Fastenings and other pertinent information.
   d. Location of door hardware set, cross-referenced to Drawings, both on floor plans and in door and frame schedule.
   e. Explanation of abbreviations, symbols, and codes contained in schedule.
   f. Mounting locations for door hardware.
   g. Door and frame sizes and materials.
   h. Warranty information for each product.

4. Submittal Sequence: Submit the final Door Hardware Schedule at earliest possible date, particularly where approval of the Door Hardware Schedule must precede fabrication of other work that is critical in the Project construction schedule. Include Product Data, Samples, Shop Drawings of other work affected by door hardware, and other information essential to the coordinated review of the Door Hardware Schedule.

C. Shop Drawings: Details of electrified access control hardware indicating the following:

1. Wiring Diagrams: Upon receipt of approved schedules, submit detailed system wiring diagrams for power, signaling, monitoring, communication, and control of the access control system electrified hardware. Differentiate between manufacturer-installed and field-installed wiring. Include the following:
a. Elevation diagram of each unique access controlled opening showing location and interconnection of major system components with respect to their placement in the respective door openings.
b. Complete (risers, point-to-point) access control system block wiring diagrams.
c. Wiring instructions for each electronic component scheduled herein.

2. Electrical Coordination: Coordinate with related sections the voltages and wiring details required at electrically controlled and operated hardware openings.

D. Keying Schedule: After a keying meeting with the owner has taken place prepare a separate keying schedule detailing final instructions. Submit the keying schedule in electronic format. Include keying system explanation, door numbers, key set symbols, hardware set numbers and special instructions. Owner must approve submitted keying schedule prior to the ordering of permanent cylinders/cores.

E. Proof of Compliance: (California located Projects): Provide a list of product(s) containing chemicals known to cause cancer or reproductive toxicity as defined by the Office of Environmental Health Hazard Assessment (OEHHA) under Proposition 65 (CA Code of Regulations, Title 27, Section 27001). The list includes the specific chemical(s), if the chemical will be exposed to consumers, the means of warning, and an illustration of the label.

F. Informational Submittals:
   1. Product Test Reports: Indicating compliance with cycle testing requirements, based on evaluation of comprehensive tests performed by manufacturer and witnessed by a qualified independent testing agency.

G. Operating and Maintenance Manuals: Provide manufacturers operating and maintenance manuals for each item comprising the complete door hardware installation in quantity as required in Division 01, Closeout Procedures.

1.4 QUALITY ASSURANCE

A. Manufacturers Qualifications: Engage qualified manufacturers with a minimum 5 years of documented experience in producing hardware and equipment similar to that indicated for this Project and that have a proven record of successful in-service performance.

B. Installer Qualifications: A minimum 3 years documented experience installing both standard and electrified door hardware similar in material, design, and extent to that indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

C. Door Hardware Supplier Qualifications: Experienced commercial door hardware distributors with a minimum 5 years documented experience supplying both mechanical and electromechanical hardware installations comparable in material, design, and extent to that indicated for this Project. Supplier recognized as a factory direct distributor by the manufacturers of the primary materials with a warehousing facility in Project's vicinity. Supplier to have on staff a certified Architectural Hardware Consultant (AHC) available during
the course of the Work to consult with Contractor, Architect, and Owner concerning both standard and electromechanical door hardware and keying.

D. Door Hardware Standards and Guidelines: Prepare Door Hardware specification documents in accordance with the Owner's approved ASSA ABLOY Virtual Design Guide (VDG) standard for door opening products and applications.

E. Building Information Modeling (BIM) Qualifications: BIM software tools and processes are used to produce and support data integration of product and technical information used in specifications, submittals, project reviews, decision support, and quality assurance during all phases of Project design, construction, and facility management. Door and hardware schedules and the associated product data parameters are to be derived, updated, and fully integrated with the coordinated BIM.

1. Door Hardware BIM Software Tool: Openings Studio™ is the designated BIM software suite to be used in a coordinated effort with architects, contractors and trades to integrate Project product data and information into the coordinated Record BIMs and associated applications.

F. Source Limitations: Obtain each type and variety of door hardware specified in this section from a single source unless otherwise indicated.

1. Electrified modifications or enhancements made to a source manufacturer's product line by a secondary or third party source will not be accepted.

2. Provide electromechanical door hardware from the same manufacturer as mechanical door hardware, unless otherwise indicated.

G. Each unit to bear third party permanent label demonstrating compliance with the referenced standards.

H. Keying Conference: Conduct conference to comply with requirements in Division 01 Section "Project Meetings." Keying conference to incorporate the following criteria into the final keying schedule document:

1. Function of building, purpose of each area and degree of security required.
2. Plans for existing and future key system expansion.
3. Requirements for key control storage and software.
4. Installation of permanent keys, cylinder cores and software.
5. Address and requirements for delivery of keys.

I. Pre-Submittal Conference: Conduct coordination conference in compliance with requirements in Division 01 Section "Project Meetings" with attendance by representatives of Supplier(s), Installer(s), and Contractor(s) to review proper methods and the procedures for receiving, handling, and installing door hardware.

1. Prior to installation of door hardware, conduct a project specific training meeting to instruct the installing contractors' personnel on the proper installation and adjustment of their respective products. Product training to be attended by installers of door hardware (including electromechanical hardware) for aluminum, hollow metal and wood doors.
Training will include the use of installation manuals, hardware schedules, templates and physical product samples as required.

2. Inspect and discuss electrical roughing-in, power supply connections, and other preparatory work performed by other trades.

3. Review sequence of operation narratives for each unique access controlled opening.

4. Review and finalize construction schedule and verify availability of materials.

5. Review the required inspecting, testing, commissioning, and demonstration procedures

J. At completion of installation, provide written documentation that components were applied to manufacturer's instructions and recommendations and according to approved schedule.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Inventory door hardware on receipt and provide secure lock-up and shelving for door hardware delivered to Project site. Do not store electronic access control hardware, software or accessories at Project site without prior authorization.

B. Tag each item or package separately with identification related to the final Door Hardware Schedule, and include basic installation instructions with each item or package.

C. Deliver, as applicable, permanent keys, cylinders, cores, access control credentials, software and related accessories directly to Owner via registered mail or overnight package service. Instructions for delivery to the Owner shall be established at the "Keying Conference".

1.6 COORDINATION

A. Templates: Obtain and distribute to the parties involved templates for doors, frames, and other work specified to be factory prepared for installing standard and electrified hardware. Check Shop Drawings of other work to confirm that adequate provisions are made for locating and installing hardware to comply with indicated requirements.

B. Door Hardware and Electrical Connections: Coordinate the layout and installation of scheduled electrified door hardware and related access control equipment with required connections to source power junction boxes, low voltage power supplies, detection and monitoring hardware, and fire and detection alarm systems.

C. Door and Frame Preparation: Doors and corresponding frames are to be prepared, reinforced and pre-wired (if applicable) to receive the installation of the specified electrified, monitoring, signaling and access control system hardware without additional in-field modifications.

D. Building Information Modeling (BIM) Support: Utilize designated BIM software tools and obtain training needed to successfully participate in the Project BIM processes. All technical disciplines are responsible for the product data integration and data reliability of their Work into the coordinated BIM applications.
1.7 WARRANTY

A. General Warranty: Reference Division 01, General Requirements. Special warranties specified in this Article shall not deprive Owner of other rights Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Warranty Period: Written warranty, executed by manufacturer(s), agreeing to repair or replace components of standard and electrified door hardware that fails in materials or workmanship within specified warranty period after final acceptance by the Owner. Failures include, but are not limited to, the following:

1. Structural failures including excessive deflection, cracking, or breakage.
2. Faulty operation of the hardware.
3. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
4. Electrical component defects and failures within the systems operation.

C. Standard Warranty Period: One year from date of Substantial Completion, unless otherwise indicated.

D. Special Warranty Periods:

1. Ten years for mortise locks and latches.
2. Five years for exit hardware.
3. Twenty five years for manual surface door closer bodies.
4. Five years for motorized electric latch retraction exit devices.
5. Two years for electromechanical door hardware.

1.8 MAINTENANCE SERVICE

A. Maintenance Tools and Instructions: Furnish a complete set of specialized tools and maintenance instructions as needed for Owner's continued adjustment, maintenance, and removal and replacement of door hardware.

PART 2 - PRODUCTS

2.1 SCHEDULED DOOR HARDWARE

A. General: Provide door hardware for each door to comply with requirements in Door Hardware Sets and each referenced section that products are to be supplied under.

B. Designations: Requirements for quantity, item, size, finish or color, grade, function, and other distinctive qualities of each type of door hardware are indicated in the Door Hardware Sets at the end of Part 3. Products are identified by using door hardware designations, as follows:
1. Named Manufacturer's Products: Product designation and manufacturer are listed for each door hardware type required for the purpose of establishing requirements. Manufacturers' names are abbreviated in the Door Hardware Schedule.

C. Substitutions: Requests for substitution and product approval for inclusive mechanical and electromechanical door hardware in compliance with the specifications must be submitted in writing and in accordance with the procedures and time frames outlined in Division 01, Substitution Procedures. Approval of requests is at the discretion of the architect, owner, and their designated consultants.

2.2 HANGING DEVICES

A. Hinges: ANSI/BHMA A156.1 certified butt hinges with number of hinge knuckles and other options as specified in the Door Hardware Sets.

1. Quantity: Provide the following hinge quantity:
   a. Two Hinges: For doors with heights up to 60 inches.
   b. Three Hinges: For doors with heights 61 to 90 inches.
   c. Four Hinges: For doors with heights 91 to 120 inches.
   d. For doors with heights more than 120 inches, provide 4 hinges, plus 1 hinge for every 30 inches of door height greater than 120 inches.

2. Hinge Size: Provide the following, unless otherwise indicated, with hinge widths sized for door thickness and clearances required:
   a. Widths up to 3’0”: 4-1/2” standard or heavy weight as specified.
   b. Sizes from 3’1” to 4’0”: 5” standard or heavy weight as specified.

3. Hinge Weight and Base Material: Unless otherwise indicated, provide the following:
   a. Exterior Doors: Heavy weight, non-ferrous, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate standard weight.
   b. Interior Doors: Standard weight, steel, ball bearing or oil impregnated bearing hinges unless Hardware Sets indicate heavy weight.

4. Hinge Options: Comply with the following:
   a. Non-removable Pins: Provide set screw in hinge barrel that, when tightened into a groove in hinge pin, prevents removal of pin while door is closed; for the all out-swinging lockable doors.

5. Manufacturers:
   a. Hager Companies (HA) - CB Series.
   b. McKinney Products; ASSA ABLOY Architectural Door Accessories (MK) - MacPro Series.
   c. McKinney Products; ASSA ABLOY Architectural Door Accessories (MK) - TA Series.
d. Stanley Hardware (ST) - CB Series.

B. Continuous Geared Hinges: ANSI/BHMA A156.26 Grade 1-600 certified continuous geared hinge. with minimum 0.120-inch thick extruded 6060 T6 aluminum alloy hinge leaves and a minimum overall width of 4 inches. Hinges are non-handed, reversible and fabricated to template screw locations. Factory trim hinges to suit door height and prepare for electrical cut-outs.

1. Manufacturers:
   a. Hager Companies (HA).
   b. Pemko Products; ASSA ABLOY Architectural Door Accessories (PE).
   c. Stanley Hardware (ST).

C. Pin and Barrel Continuous Hinges: ANSI/BHMA A156.26 Grade 1-600 certified pin and barrel continuous hinges with minimum 14 gauge Type 304 stainless steel hinge leaves, concealed teflon coated stainless pin, and twin self-lubricated nylon bearings at each knuckle separation. Factory trim hinges to suit door height and prepare for electrical cut-outs.

1. Manufacturers:
   a. Hager Companies (HA).
   b. Markar Products; ASSA ABLOY Architectural Door Accessories (MR).
   c. Stanley Hardware (ST).

2.3 POWER TRANSFER DEVICES

A. Concealed Quick Connect Electric Power Transfers: Provide concealed wiring pathway housing mortised into the door and frame for low voltage electrified door hardware. Furnish with Molex™ standardized plug connectors and sufficient number of concealed wires (up to 12) to accommodate the electrified functions specified in the Door Hardware Sets. Connectors plug directly to through-door wiring harnesses for connection to electric locking devices and power supplies. Wire nut connections are not acceptable.

1. Manufacturers:
   a. Securitron (SU) - EL-CEPT Series.
   b. Von Duprin (VD) - EPT-10 Series.

2.4 DOOR OPERATING TRIM

A. Flush Bolts and Surface Bolts: ANSI/BHMA A156.3 and A156.16, Grade 1, certified.

1. Flush bolts to be furnished with top rod of sufficient length to allow bolt retraction device location approximately six feet from the floor.
2. Furnish dust proof strikes for bottom bolts.
3. Surface bolts to be minimum 8” in length and U.L. listed for labeled fire doors and U.L. listed for windstorm components where applicable.
4. Provide related accessories (mounting brackets, strikes, coordinators, etc.) as required for appropriate installation and operation.

5. Manufacturers:

   a. Burns Manufacturing (BU).
   b. Ives (IV).
   c. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

B. Coordinators: ANSI/BHMA A156.3 certified door coordinators consisting of active-leaf, hold-open lever and inactive-leaf release trigger. Model as indicated in hardware sets.

   1. Manufacturers:

      a. Burns Manufacturing (BU).
      b. Ives (IV).
      c. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

C. Door Push Plates and Pulls: ANSI/BHMA A156.6 certified door pushes and pulls of type and design specified in the Hardware Sets. Coordinate and provide proper width and height as required where conflicting hardware dictates.

   1. Push/Pull Plates: Minimum .050 inch thick, size as indicated in hardware sets, with beveled edges, secured with exposed screws unless otherwise indicated.
   2. Offset Pull Design: Size, shape, and material as indicated in the hardware sets. Minimum clearance of 2 1/2-inches from face of door and offset of 90 degrees unless otherwise indicated.
   3. Leather: Where specified English bridle and Italian Upholstery shall be 10 ounce with hand sewn saddle stitches and hand sewn end line stitches.
   4. Fasteners: Provide manufacturer's designated fastener type as indicated in Hardware Sets.

   5. Manufacturers:

      a. Burns Manufacturing (BU).
      b. Hiawatha, Inc. (HI).
      c. Ives (IV).
      d. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

2.5 CYLINDERS AND KEYING

A. General: Cylinder manufacturer to have minimum (10) years experience designing secured master key systems and have on record a published security keying system policy.

   1. Manufacturers:

      a. Stanley Best (BE).
      b. No Substitution.

B. Cylinders: Original manufacturer cylinders complying with the following:
1. Mortise Type: Threaded cylinders with rings and cams to suit hardware application.
2. Rim Type: Cylinders with back plate, flat-type vertical or horizontal tailpiece, and raised trim ring.
3. Bored-Lock Type: Cylinders with tailpieces to suit locks.
4. Mortise and rim cylinder collars to be solid and recessed to allow the cylinder face to be flush and be free spinning with matching finishes.

C. Permanent Cores: Manufacturer's standard; finish face to match lockset; complying with the following:
   1. Interchangeable Cores: Core insert, removable by use of a special key; usable with other manufacturers' cylinders.

D. Keying System: Each type of lock and cylinders to be factory keyed.
   1. Conduct specified "Keying Conference" to define and document keying system instructions and requirements.
   2. Furnish factory cut, nickel-silver large bow permanently inscribed with a visual key control number as directed by Owner.
   3. Existing System: Field verify and key locks to match Owner's existing system.

E. Key Quantity: Provide the following minimum number of keys:
   1. Change Keys per Cylinder: Three (3).
   2. Master Keys (per Master Key Level/Group): Five (5).
   4. Construction Control Keys (where required): Two (2).
   5. Permanent Control Keys (where required): Two (2).

F. Construction Keying: Provide temporary keyed construction cores.

G. Key Registration List (Bitting List):
   1. Provide keying transcript list to Owner's representative in the proper format for importing into key control software.
   2. Provide transcript list in writing or electronic file as directed by the Owner.

2.6 MECHANICAL LOCKS AND LATCHING DEVICES

A. Mortise Locksets, Grade 1 (Heavy Duty): ANSI/BHMA A156.13, Series 1000, Operational Grade 1 certified. Locksets are to be manufactured with a corrosion resistant steel case and be field-reversible for handing without disassembly of the lock body.
   1. Extended cycle test: Locks to have been cycle tested in ordinance with ANSI/BHMA 156.13 requirements to 10 million cycles.
   2. Provide status indicators with highly reflective color and wording for “locked/unlocked” or “vacant/occupied” with custom wording options if required. Indicator to be located
above the cylinder with the inside thumb-turn not blocking the visibility of the indicator status. Indicator window size to be a minimum of 2.1” x 0.6” with a curved design allowing a 180 degree viewing angle with protective covering to prevent tampering.

3. Manufacturers:

2.7 ELECTROMECHANICAL LOCKING DEVICES

A. Electromechanical Mortise Locksets, Grade 1 (Heavy Duty): Subject to same compliance standards and requirements as mechanical mortise locksets, electrified locksets to be of type and design as specified below.

1. Electrified Lock Options: Where indicated in the Hardware Sets, provide electrified options including: outside door lock/unlock trim control, latchbolt and lock/unlock status monitoring, deadbolt monitoring, and request-to-exit signaling. Support end-of-line resistors contained within the lock case. Unless otherwise indicated, provide electrified locksets standard as fail secure.

2. Energy Efficient Design: Provide lock bodies which have a holding current draw of 15mA maximum, and can operate on either 12 or 24 volts. Locks are to be field configurable for fail safe or fail secure operation.

3. Manufacturers:
   a. Corbin Russwin Hardware (RU) - ML20900 Series.

2.8 CONVENTIONAL EXIT DEVICES

A. General Requirements: All exit devices specified herein shall meet or exceed the following criteria:

1. At doors not requiring a fire rating, provide devices complying with NFPA 101 and listed and labeled for "Panic Hardware" according to UL305. Provide proper fasteners as required by manufacturer including sex nuts and bolts at openings specified in the Hardware Sets.

2. Where exit devices are required on fire rated doors, provide devices complying with NFPA 80 and with UL labeling indicating "Fire Exit Hardware". Provide devices with the proper fasteners for installation as tested and listed by UL. Consult manufacturer’s catalog and template book for specific requirements.

3. Except on fire rated doors, provide exit devices with hex key dogging device to hold the pushbar and latch in a retracted position. Provide optional keyed cylinder dogging on devices where specified in Hardware Sets.
4. Devices must fit flat against the door face with no gap that permits unauthorized dogging of the push bar. The addition of filler strips is required in any case where the door light extends behind the device as in a full glass configuration.

5. Flush End Caps: Provide flush end caps made of architectural metal in the same finish as the devices as in the Hardware Sets. Plastic end caps will not be acceptable.

6. Energy Efficient Design: Provide lock bodies which have a holding current draw of 15mA maximum, and can operate on either 12 or 24 volts. Locks are to be field configurable for fail safe or fail secure operation.

7. Electromechanical Options: Subject to same compliance standards and requirements as mechanical exit devices, electrified devices to be of type and design as specified in hardware sets. Include any specific controllers when conventional power supplies are not sufficient to provide the proper inrush current.

8. Lever Operating Trim: Where exit devices require lever trim, furnish manufacturer's heavy duty escutcheon trim with threaded studs for thru-bolts.
   a. Lock Trim Design: As indicated in Hardware Sets, provide finishes and designs to match that of the specified locksets.
   b. Where function of exit device requires a cylinder, provide a cylinder (Rim or Mortise) as specified in Hardware Sets.

9. Vertical Rod Exit Devices: Where surface or concealed vertical rod exit devices are used at interior openings, provide as less bottom rod (LBR) unless otherwise indicated. Provide dust proof strikes where thermal pins are required to project into the floor.

10. Rim Exit Devices: Exit device rails shall release with less than 5 pounds of pressure per the California Building Code.

11. Narrow Stile Applications: At doors constructed with narrow stiles, or as specified in Hardware Sets, provide devices designed for maximum 2” wide stiles.

13. Rail Sizing: Provide exit device rails factory sized for proper door width application.

14. Through Bolt Installation: For exit devices and trim as indicated in Door Hardware Sets.

B. Conventional Push Rail Exit Devices (Heavy Duty) at Exterior Doors: ANSI/BHMA A156.3, Grade 1 certified panic and fire exit hardware devices furnished in the functions specified in the Hardware Sets. Exit device latch to be stainless steel, pullman type, with deadlock feature.

   1. Manufacturers:
      a. Von Duprin (VD) - 98 Series.
      b. No Substitute.
C. Conventional Push Rail Exit Devices (Heavy Duty): ANSI/BHMA A156.3, Grade 1 certified panic and fire exit hardware devices furnished in the functions specified in the Hardware Sets. Exit device latch to be stainless steel, pullman type, with deadlock feature.

1. Manufacturers:
   a. Sargent Manufacturing (SA) - 80 Series.
   b. Von Duprin (VD) - 98 Series.

2.9 DOOR CLOSERS

A. All door closers specified herein shall meet or exceed the following criteria:

1. General: Door closers to be from one manufacturer, matching in design and style, with the same type door preparations and templates regardless of application or spring size. Closers to be non-handed with full sized covers including installation and adjusting information on inside of cover.

2. Standards: Closers to comply with UL-10C for Positive Pressure Fire Test and be U.L. listed for use of fire rated doors.

3. Cycle Testing: Provide closers which have surpassed 15 million cycles in a test witnessed and verified by UL.

4. Size of Units: Comply with manufacturer's written recommendations for sizing of door closers depending on size of door, exposure to weather, and anticipated frequency of use. Where closers are indicated for doors required to be accessible to the physically handicapped, provide units complying with ANSI ICC/A117.1.

5. Closer Arms: Provide heavy duty, forged steel closer arms unless otherwise indicated in Hardware Sets.

6. Closers shall not be installed on exterior or corridor side of doors; where possible install closers on door for optimum aesthetics.

7. Closer Accessories: Provide door closer accessories including custom templates, special mounting brackets, spacers and drop plates as required for proper installation. Provide through-bolt and security type fasteners as specified in the hardware sets.

B. Door Closers – Exterior Doors, Surface Mounted (Large Body Cast Iron): ANSI/BHMA A156.4, Grade 1 surface mounted, heavy duty door closers with complete spring power adjustment, sizes 1 thru 6; and fully operational adjustable according to door size, frequency of use, and opening force. Closers to be rack and pinion type, one piece cast iron body construction, with adjustable backcheck and separate non-critical valves for closing sweep and latch speed control.

1. Manufacturers:
   a. LCN Closers (LC) - 4040XP Series.
C. Door Closers, Surface Mounted (Heavy Duty): ANSI/BHMA A156.4, Grade 1 surface mounted, heavy duty door closers with complete spring power adjustment, sizes 1 thru 6; and fully operational adjustable according to door size, frequency of use, and opening force. Closers to be rack and pinion type, one piece cast iron or aluminum alloy body construction, with adjustable backcheck and separate non-critical valves for closing sweep and latch speed control. Provide non-handed units standard.

1. Manufacturers:
   a. Corbin Russwin Hardware (RU) - DC6000 Series.
   b. LCN Closers (LC) - 4040 Series.
   c. Norton Door Controls (NO) - 7500 Series.

2.10 ELECTROHYDRAULIC DOOR OPERATORS

A. General: Provide low energy operators of size recommended by manufacturer for door size, weight, and movement; for condition of exposure; and for compliance with UL 325. Coordinate operator mechanisms with door operation, hinges, and activation devices.

1. Fire-Rated Doors: Provide door operators for fire-rated door assemblies that comply with NFPA 80 for fire-rated door components and are listed and labeled by a qualified testing agency.

B. Standard: Certified ANSI/BHMA A156.19.

C. Performance Requirements:

1. Opening Force if Power Fails: Not more than 15 lbf required to release a latch if provided, not more than 30 lbf required to manually set door in motion, and not more than 15 lbf required to fully open door.

2. Entrapment Protection: Not more than 15 lbf required to prevent stopped door from closing or opening.

D. Configuration: Surface mounted or in-ground as required. Door operators to control single swinging and pair of swinging doors.

E. Operation: Power opening and spring closing operation capable of meeting ANSI A117.1 accessibility guideline. Provide time delay for door to remain open before initiating closing cycle as required by ANSI/BHMA A156.19. When not in automatic mode, door operator to function as manual door closer with fully adjustable opening and closing forces, with or without electrical power.

F. Features: Operator units to have full feature adjustments for door opening and closing force and speed, backcheck, motor assist acceleration from 0 to 30 seconds, time delay, vestibule interface delay, obstruction recycle, and hold open time from 0 up to 30 seconds.

G. Provide outputs and relays on board the operator to allow for coordination of exit device latch retraction, electric strikes, magnetic locks, card readers, safety and motion sensors and specified auxiliary contacts.
H. Brackets and Reinforcements: Manufacturer's standard, fabricated from aluminum with nonferrous shims for aligning system components.

I. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Dorma Products (DO) - ED800 Series.
2. LCN Closers (LC) - 4640 Series.

2.11 SURFACE MOUNTED CLOSER HOLDERS

A. Electromagnetic Door Holders: Certified ANSI A156.15 electromagnetic door holder/releases with a minimum 20 to 40 pounds holding power and single coil construction able to accommodate 12VDC, 24VAC, 24VDC and 120VAC. Coils to be independently wound, employing an integral fuse and armatures to include a positive release button.

1. Manufacturers:
   a. LCN Door Closers (LC) - SEM7800 Series.
   b. Rixson (RF) - 980/990 Series.

2.12 ARCHITECTURAL TRIM

A. Door Protective Trim

1. General: Door protective trim units to be of type and design as specified below or in the Hardware Sets.

2. Size: Fabricate protection plates (kick, armor, or mop) not more than 2" less than door width (LDW) on stop side of single doors and 1" LDW on stop side of pairs of doors, and not more than 1" less than door width on pull side. Coordinate and provide proper width and height as required where conflicting hardware dictates. Height to be as specified in the Hardware Sets.

3. Where plates are applied to fire rated doors with the top of the plate more than 16” above the bottom of the door, provide plates complying with NFPA 80. Consult manufacturer's catalog and template book for specific requirements for size and applications.

4. Protection Plates: ANSI/BHMA A156.6 certified protection plates (kick, armor, or mop), fabricated from the following:
   a. Stainless Steel: 300 grade, 050-inch thick.

5. Options and fasteners: Provide manufacturer's designated fastener type as specified in the Hardware Sets. Provide countersunk screw holes.

6. Manufacturers:
2.13 DOOR STOPS AND HOLDERS

A. General: Door stops and holders to be of type and design as specified below or in the Hardware Sets.

B. Door Stops and Bumpers: ANSI/BHMA A156.16, Grade 1 certified door stops and wall bumpers. Provide wall bumpers, either convex or concave types with anchorage as indicated, unless floor or other types of door stops are specified in Hardware Sets. Do not mount floor stops where they will impede traffic. Where floor or wall bumpers are not appropriate, provide overhead type stops and holders.

1. Manufacturers:
   a. Hager Companies (HA).
   b. Hiawatha, Inc. (HI).
   c. Ives (IV).
   d. Rockwood Products; ASSA ABLOY Architectural Door Accessories (RO).

C. Overhead Door Stops and Holders: ANSI/BHMA A156.6, Grade 1 certified overhead stops and holders to be surface or concealed types as indicated in Hardware Sets. Track, slide, arm and jamb bracket to be constructed of extruded bronze and shock absorber spring of heavy tempered steel. Provide non-handed design with mounting brackets as required for proper operation and function.

1. Manufacturers:
   a. Glynn Johnson (GJ).
   b. Rixson Door Controls (RF).

2.14 ARCHITECTURAL SEALS

A. General: Thresholds, weatherstripping, and gasket seals to be of type and design as specified below or in the Hardware Sets. Provide continuous weatherstrip gasketing on exterior doors and provide smoke, light, or sound gasketing on interior doors where indicated. At exterior applications provide non-corrosive fasteners and elsewhere where indicated.

B. Smoke Labeled Gasketing: Assemblies complying with NFPA 105 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for smoke control ratings indicated, based on testing according to UL 1784.

1. Provide smoke labeled perimeter gasketing at all smoke labeled openings.
C. Fire Labeled Gasketing: Assemblies complying with NFPA 80 that are listed and labeled by a testing and inspecting agency acceptable to authorities having jurisdiction, for fire ratings indicated, based on testing according to UL-10C.
   1. Provide intumescent seals as indicated to meet UL10C Standard for Positive Pressure Fire Tests of Door Assemblies, and NPFA 252, Standard Methods of Fire Tests of Door Assemblies.

D. Sound-Rated Gasketing: Assemblies that are listed and labeled by a testing and inspecting agency, for sound ratings indicated.

E. Replaceable Seal Strips: Provide only those units where resilient or flexible seal strips are easily replaceable and readily available from stocks maintained by manufacturer.

F. Manufacturers:
   1. Pemko Products; ASSA ABLOY Architectural Door Accessories (PE).
   2. Reese Enterprises, Inc. (RE).

2.15 ELECTRONIC ACCESSORIES

A. Door Position Switches: Door position magnetic reed contact switches specifically designed for use in commercial door applications. On recessed models the contact and magnetic housing snap-lock into a 1" diameter hole. Surface mounted models include wide gap distance design complete with armored flex cabling. Provide SPDT, N/O switches with optional Rare Earth Magnet installation on steel doors with flush top channels.
   1. Manufacturers:
      a. Sentrol.

B. Power Supplies: Provide Nationally Recognized Testing Laboratory Listed 12VDC or 24VDC (field selectable) filtered and regulated power supplies. Include battery backup option with integral battery charging capability in addition to operating the DC load in event of line voltage failure. Provide the least number of units, at the appropriate amperage level, sufficient to exceed the required total draw plus 50% for the specified electrified hardware and access control equipment.
   1. Manufacturers:
      a. Securitron (SU) - BPS Series.
      b. Von Duprin (VD) - PS.

2.16 FABRICATION

A. Fasteners: Provide door hardware manufactured to comply with published templates generally prepared for machine, wood, and sheet metal screws. Provide screws according to manufacturers recognized installation standards for application intended.
2.17 FINISHES

A. Standard: Designations used in the Hardware Sets and elsewhere indicate hardware finishes complying with ANSI/BHMA A156.18, including coordination with traditional U.S. finishes indicated by certain manufacturers for their products.

B. Provide quality of finish, including thickness of plating or coating (if any), composition, hardness, and other qualities complying with manufacturer's standards, but in no case less than specified by referenced standards for the applicable units of hardware.

C. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine scheduled openings, with Installer present, for compliance with requirements for installation tolerances, labeled fire door assembly construction, wall and floor construction, and other conditions affecting performance.

B. Notify architect of any discrepancies or conflicts between the door schedule, door types, drawings and scheduled hardware. Proceed only after such discrepancies or conflicts have been resolved in writing.

3.2 PREPARATION

A. Hollow Metal Doors and Frames: Comply with ANSI/DHI A115 series.

3.3 INSTALLATION

A. Install each item of mechanical and electromechanical hardware and access control equipment to comply with manufacturer's written instructions and according to specifications.

   1. Installers are to be trained and certified by the manufacturer on the proper installation and adjustment of fire, life safety, and security products including: hanging devices; locking devices; closing devices; and seals.

B. Mounting Heights: Mount door hardware units at heights indicated in following applicable publications, unless specifically indicated or required to comply with governing regulations:

2. Wood Doors: DHI WDHS.3, "Recommended Locations for Architectural Hardware for Wood Flush Doors."
3. Where indicated to comply with accessibility requirements, comply with ANSI A117.1 "Accessibility Guidelines for Buildings and Facilities."
4. Provide blocking in drywall partitions where wall stops or other wall mounted hardware is located.

C. Retrofitting: Install door hardware to comply with manufacturer's published templates and written instructions. Where cutting and fitting are required to install door hardware onto or into surfaces that are later to be painted or finished in another way, coordinate removal, storage, and reinstallation of surface protective trim units with finishing work specified in Division 9 Sections. Do not install surface-mounted items until finishes have been completed on substrates involved.

D. Thresholds: Set thresholds for exterior and acoustical doors in full bed of sealant complying with requirements specified in Division 7 Section "Joint Sealants."

E. Storage: Provide a secure lock up for hardware delivered to the project but not yet installed. Control the handling and installation of hardware items so that the completion of the work will not be delayed by hardware losses before and after installation.

3.4 FIELD QUALITY CONTROL

A. Field Inspection (Punch-Out Report): Reference Division 01 Section "Closeout Procedures". Final inspect installed door hardware and state in report whether work complies with or deviates from specification requirements, including whether door hardware is properly installed, operating and adjusted.

B. Fire Door Assembly Inspection: Reference Division 01 Sections "Closeout Procedures" and "Cash Allowances" for testing and inspection allowances, including cost of engaging testing agencies, performing on-site inspections, and required documentation reporting.

1. Allowance to perform the inspection and provide report documentation for an initial Fire Door Assembly Inspection upon completion of final hardware installation. A qualified fire door assembly (FDAI) inspector to certify swinging fire door openings are installed in accordance and NFPA 80 Standard for Fire Doors and Other Opening Protectives paragraph 5.2.4, regulatory compliance agencies, and local Authorities Having Jurisdiction (AHJ).

C. Opening Tags: Affix readable, QR-type label to openings with password protected link-out to Openings Studio™ BIM software suite and the installed door and hardware information.

3.5 ADJUSTING

A. Initial Adjustment: Adjust and check each operating item of door hardware and each door to ensure proper operation or function of every unit. Replace units that cannot be adjusted to operate as intended. Adjust door control devices to compensate for final operation of heating and ventilating equipment and to comply with referenced accessibility requirements.
3.6 CLEANING AND PROTECTION

A. Protect all hardware stored on construction site in a covered and dry place. Protect exposed hardware installed on doors during the construction phase. Install any and all hardware at the latest possible time frame.

B. Clean adjacent surfaces soiled by door hardware installation.

C. Clean operating items as necessary to restore proper finish. Provide final protection and maintain conditions that ensure door hardware is without damage or deterioration at time of owner occupancy.

3.7 DEMONSTRATION

A. Instruct Owner's maintenance personnel to adjust, operate, and maintain mechanical and electromechanical door hardware.

3.8 DOOR HARDWARE SETS

A. The hardware sets represent the design intent and direction of the owner and architect. They are a guideline only and should not be considered a detailed hardware schedule. Discrepancies, conflicting hardware and missing items should be brought to the attention of the architect with corrections made prior to the bidding process. Omitted items not included in a hardware set should be scheduled with the appropriate additional hardware required for proper application and functionality.

B. The supplier is responsible for handing and sizing all products and providing the correct option for the appropriate door type and material where more than one is presented in the hardware sets. Quantities listed are for each pair of doors, or for each single door.

C. MATERIALS ARE SPECIFIED IN ACCORDANCE WITH THE PREMIER/ASSA ABLOY GPO CONTRACT #PP-FA-663.

D. Manufacturer’s Abbreviations:

1. MK - McKinney
2. PE - Pemko
3. MR - Markar
4. RF - Rixson
5. RO - Rockwood
6. OT - Other
7. VD - Von Duprin
8. SA - SARGENT
9. RU - Corbin Russwin
10. BE - dormakaba Best
11. GJ - Glynn-Johnson
12. LC - LCN Closers
13. SU - Securitron

END OF SECTION 087100
SECTION 08 80 00
GLAZING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Monolithic glass (GL-1) and (GL-2)
   2. Special monolithic glass (GL-5).
   3. Laminated glass (GL-12).
   4. Insulating laminated glass (GL-21).
   5. Unframed mirrors (GL-91).

1.2 DEFINITIONS
A. Glass Manufacturers: Firms that produce primary glass, fabricated glass, or both, as defined in referenced glazing publications.
B. Glass Thicknesses: Indicated by thickness designations in millimeters according to ASTM C 1036.
C. Interspace: Space between lites of an insulating-glass unit that contains dehydrated air or a specified gas.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Shop Drawings:
   1. Review curtain wall and window shop drawings and submit acceptance of details as suitable for proposed glass products.
C. Samples: For each type of product; 12 inches square.
D. Delegated-Design Submittal: For glass indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.4 INFORMATIONAL SUBMITTALS
A. Insulating Glass Certification: Submit data verifying compliance with IGCC, Class A level.
B. Compatibility Certification: After testing and review, certify compatibility of materials in contact and in close proximity to glazing sealant materials.
C. Wind Pressure and Thermal Stress Analysis: Submit thermal stress analysis of glass where thermal stress may occur.
D. Qualification Data: For Installer.
E. Product Certificates: For glass and glazing products, from manufacturer.
F. Preconstruction adhesion and compatibility test report.
G. Sample Warranties: For special warranties.
1.5 QUALITY ASSURANCE

A. Installer Qualifications: An experienced installer who has completed glazing similar in material, design, and extent to that indicated for this Project; whose work has resulted in glass installations with a record of successful in-service performance; and who employs glass installers for this Project who are certified under the National Glass Association Glazier Certification Program as Level 2 (Senior Glaziers) or Level 3 (Master Glaziers).

B. Insulating-Glass Certification Program: Permanently marked either on spacers or on at least one component lite of units with appropriate certification label of the inspecting and testing agency, Insulating Glass Certification Council.

1.1 MOCKUPS

A. Mockups: Before glazing, build mockups for each glass product indicated below to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution. Build mockups to comply with the following requirements, using materials indicated for the completed Work:

1. Build mockups in the combination with curtain wall mockup requirements.
2. Build mockups with the glass to match glazing systems required for Project, including typical lite size, framing systems, and glazing methods:
3. Notify Architect seven days in advance of dates and times when mockups will be constructed.
5. Maintain mockups during construction in an undisturbed condition as a standard for judging the completed Work.
6. Demolish and remove mockups when directed.

1.2 PRECONSTRUCTION TESTING

A. Preconstruction Adhesion and Compatibility Testing: Test each glass product, tape sealant, gasket, glazing accessory, and glass-framing member for adhesion to and compatibility with elastomeric glazing sealants.

1. Testing is not required if data are submitted based on previous testing of current sealant products and glazing materials matching those submitted.
2. Use ASTM C 1087 to determine whether priming and other specific joint-preparation techniques are required to obtain rapid, optimum adhesion of glazing sealants to glass, tape sealants, gaskets, and glazing channel substrates.
3. Test no fewer than eight Samples of each type of material, including joint substrates, shims, sealant backings, secondary seals, and miscellaneous materials.
4. Schedule enough time for testing and analyzing results to prevent delaying the Work.
5. For materials failing tests, submit sealant manufacturer’s written instructions for corrective measures including the use of specially formulated primers.

1.3 DELIVERY, STORAGE, AND HANDLING

A. Protect glazing materials according to manufacturer's written instructions. Prevent damage to glass and glazing materials from condensation, temperature changes, direct exposure to sun, or other causes.

B. Comply with insulating-glass manufacturer's written instructions for venting and sealing units to avoid hermetic seal ruptures due to altitude change.
1.4 FIELD CONDITIONS
A. Environmental Limitations: Do not proceed with glazing when ambient and substrate temperature conditions are outside limits permitted by glazing material manufacturers and when glazing channel substrates are wet from rain, frost, condensation, or other causes.

1.5 GLASS WARRANTY
A. Warranty for Insulating Units: Warranty sealed insulating glass units for minimum period of ten (10) years, with manufacturer's replacement guarantee, covering as minimum: Defective or failure of seal; material vision obstruction as result of dust collection or film formation between panels or other similar failure and the following specific conditions:
   1. Reflective glass whose reflective coating cracks, peels or discolors shall be replaced at no charge (material only) for minimum ten (10) year period beginning on date of Substantial Completion.
   2. In addition to replacement of insulated units, provide removal and reinstallation of new units without cost to Owner during first five (5) years of guarantee.
B. Spandrel Glass Warranty: Spandrel glass whose opacifier delaminates, cracks, peels, wrinkles, discolors, or stains shall be replaced at no charge (material only) for minimum five (5) year period beginning on date of Substantial Completion.
C. Laminated Glass Warranty: Laminated glass that delaminates shall be replaced at no charge (material only) for minimum 5 years beginning on date of Substantial Completion.
D. Glazing installer shall coordinate glass and glazing installation with framing systems, and install glass and glazing in accordance with manufacturer's instructions, so that guarantee is maintained.

PART 2 PRODUCTS
2.1 PERFORMANCE REQUIREMENTS
A. General: Provide glazing systems capable of withstanding normal thermal movement and wind and impact loads (where applicable) without failure, including loss or glass breakage attributable to the following: defective manufacture, fabrication, and installation; failure of sealants or gaskets to remain watertight and airtight; deterioration of glazing materials; or other defects in construction.
B. Glass Design: Glass thicknesses indicated are minimums and are for detailing only. Confirm glass thicknesses by analyzing Project loads and in-service conditions. Provide glass lites for various size openings in nominal thicknesses indicated, but not less than thicknesses complying with ASTM E 1300 and in strengths (annealed or heat treated) required to meet or exceed the following criteria:
   1. Specified Design Wind Loads: Determine design wind loads applicable to Project from basic wind speed indicated in miles per hour at 33 feet above grade, according to ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 6.4.2, "Analytic Procedure," based on mean roof heights above grade indicated on Drawings.
   2. Specified Design Snow Loads: As indicated, but not less than snow loads applicable to Project, required by ASCE 7, "Minimum Design Loads for Buildings and Other Structures": Section 7, "Snow Loads."
   3. Probability of Breakage for Vertical Glazing: 8 lites per 1000 for lites set vertically or not more than 15 degrees off vertical and under wind action.
      a. Load Duration: 60 seconds or less.
   4. Maximum Lateral Deflection: For the following types of glass supported on all four edges, provide thickness required that limits center deflection at design wind pressure to 1/50 times the short side length or 1 inch, whichever is less.
      a. For monolithic-glass lites heat treated to resist wind loads.
b. For insulating glass.

c. For laminated-glass lites.

5. Minimum Glass Thickness for Exterior Lites: Not less than 6 mm.

6. Thickness of Tinted and Heat-Absorbing Glass: Provide the same thickness for each tint color indicated throughout Project.

C. Thermal Movements: Provide glazing that allows for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures acting on glass framing members and glazing components. Base engineering calculation on surface temperatures of materials due to both solar heat gain and nighttime-sky heat loss.

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

D. Thermal and Optical Performance Properties: Provide glass with performance properties specified based on manufacturer's published test data, as determined according to procedures indicated below:

1. For monolithic-glass lites, properties are based on units with lites 6 mm thick.

2. For laminated-glass lites, properties are based on products of construction indicated.

3. For insulating-glass units, properties are based on units with lites 6 mm thick and a nominal 1/2"-wide interspace.

4. Center-of-Glass U-Values: NFRC 100 methodology using LBL-35298 WINDOW 4.1 computer program, expressed as Btu/ sq. ft. x h x deg F.

6. Solar Optical Properties: NFRC 300

E. Safety Glazing: Where safety glazing is indicated, provide glazing that complies with 16 CFR 1201, Category II.

2.2 MANUFACTURERS

A. Single Source Responsibility: Provide materials obtained from one source for each type of insulating glass and glazing product indicated.

B. Manufacturers for Glass Substrate:

1. AGC Glass Company

2. AFG Industries.

3. ACH.

4. Ford Glass.

5. Guardian Industries Corp.

6. Pilkington North America, Inc.

7. Vitro Architectural Glass (formerly PPG).

8. Saint-Gobain.

C. Fabricators for Insulating Glass Units: Refer to Basis of Design as specified in this Section.

2.3 GLASS PRODUCTS

A. Monolithic Glass, General:

1. Specified glass thickness and thickness of individual glass plies are minimum.

2. Provide heat-strengthened as required for wind pressure or thermal stress.

3. Provide fully-tempered complying with ASTM C1048, Kind FT (fully tempered), as required to comply with safety code requirements and as indicated with “T” in the Material Identification Abbreviation.

4. Provide safety glazing labeling, as applicable.
B. Laminated Glass: ASTM C 1172, and complying with testing requirements in 16 CFR 1201 for Category II materials, and with other requirements specified. Use materials that have a proven record of no tendency to bubble, discolor, or lose physical and mechanical properties after fabrication and installation.
   1. Construction: Laminate glass with polyvinyl butyral (PVB) interlayer complying with interlayer manufacturer's written recommendations.
   2. Interlayer Thickness: Provide thickness not less than that indicated and as needed to comply with requirements.
   3. Edges ground smooth for exposed conditions.

C. Heat-Strengthened Float Glass: ASTM C1048, Kind HS (heat strengthened), Type I, Condition A (uncoated) unless otherwise indicated, Type I, Class 1 (clear) or Class 2 (tinted) as indicated, Quality-Q3

D. Ceramic-Coated Vision Glass: ASTM C1048, Condition C, Type I, Class 1 (clear) or Class 2 (tinted) as indicated, Quality-Q3; and complying with Specification No. 95-1-31 in NGA's "Engineering Standards Manual."

E. Ceramic-Coated Spandrel Glass: ASTM C1048, Type I, Condition B, Quality-Q3.

F. Insulating-Glass Units: Factory-assembled units consisting of sealed lites of glass separated by a dehydrated interspace, qualified according to ASTM E 2190, and complying with other requirements specified.
   1. Specified glass thickness are minimum.
   2. Provide heat-strengthened lites as required for wind pressure or thermal stress.
   3. Provide fully-tempered complying with ASTM C1048, Kind FT (fully tempered), as required to comply with safety code requirements. Provide safety glazing labeling, as applicable.
   4. Dual Seal: Manufacturer's standard dual sealing system with black colored silicone.
   5. Spacer: Stainless steel, painted black.
   6. Desiccant: Molecular sieve or silica gel, or blend of both.
   7. Glass type locations as indicated on drawings.

2.4 GLAZING SCHEDULE

A. (GL-1) Clear Float Glass: 1/4-inch; ASTM C1036, Type I (transparent glass, flat), Class 1 (clear), Quality-Q3 (glazing select).

B. (GL-1T) Clear Fully-Tempered Float Glass: 1/4-inch; ASTM C1036, Type I (transparent glass, flat), Class 1 (clear), Quality q3 (glazing select), and heat-treated to comply with ASTM C1048, Kind FT (fully tempered).

C. (GL-2T) Clear Fully-Tempered Float Glass: 1/2-inch; ASTM C1036, Type I (transparent glass, flat), Class 1 (clear), Quality q3 (glazing select), and heat-treated to comply with ASTM C1048, Kind FT (fully tempered).

D. (GL-5) Non-Reflective, Ultra-Clear Glass:
   1. Glass Substrate: 3/8-inch thick, ultra-clear, low-iron float glass with a visible light transmission exceeding 90 percent through a 6.0mm test sample. Inclusions shall not exceed 3 psc/kg. The glass shall be select glazing quality (q3), Type I, Class I, free of defects that affect normal viewing.
   2. Anti-Reflective Coating: On each face, providing residual reflection of less than 1 percent when viewed at a 90 degree angle.

E. (GL-12) Laminated Clear Glass: 1/2-inch unit consisting of 2 plies of 1/4-inch, heat-treated clear glass, laminated with 0.090-inch clear PVB Interlayer.
F. (GL-21) Insulating Vision Glass: 1-inch thick unit as follows:

1. Outboard Lite: 1/4 inch, clear; heat-treated; with high-performance low-emissivity coating applied to No. 2 surface.
2. Airspace: 1/2 inch, argon-filled, with black painted stainless steel spacer
3. Inboard Lite: 1/4 inch, clear; heat-treated.
4. Performance:
   b. Ultraviolet Transmission: 4 percent.
   c. Nighttime Winter U-value: 0.24
   d. Solar Heat Gain Coefficient: 0.27

1. Edge Treatment: Polished mitered edges.
2. Mounting Accessories: Brushed stainless steel (Type 302) mirror clips similar to KV277 at bottom and KV278 at top where indicated.
3. Concealed Fasteners: Mirror mastic as recommended for applicable for specific substrate and mirror configuration, unless otherwise indicated.

2.5 ACCESSORIES

A. Framing for Butt Glazing: Aluminum or stainless steel angles as indicated. Anchor to ceiling and floor substrates with appropriate fasteners in locations as indicated.

B. Setting Blocks: Neoprene, 80 to 90 shore “A” durometer hardness, chemically compatible with glazing sealant or compound, length as recommended by glass manufacturer.

C. Spacers and Shims: Neoprene, 40 to 50 shore “A” durometer hardness, chemically compatible with glazing sealant or compound, length as recommended by glass manufacturer.

D. Glazing Tape: Butyl or silicone preshimmmed tape similar to Tremco 440 Tape.

2.6 GLAZING TAPES

A. Manufacturers:
   1. Bostik.
   2. Pecora.
   3. Tremco.
   4. GE Company.

B. Back-Beding Mastic Glazing Tapes: Preformed, butyl-based, 100 percent solids elastomeric tape; nonstaining and nonmigrating in contact with nonporous surfaces; with or without spacer rod as recommended in writing by tape and glass manufacturers for application indicated; and complying with ASTM C 1281 and AAMA 800 for products indicated below:
   1. AAMA 806.3 tape, for glazing applications in which tape is subject to continuous pressure.
   2. AAMA 807.3 tape, for glazing applications in which tape is not subject to continuous pressure.

C. Expanded Cellular Glazing Tapes: Closed-cell, PVC foam tapes; factory coated with adhesive on both surfaces; and complying with AAMA 800 for the following types:
   1. AAMA 810.1, Type 1, for glazing applications in which tape acts as the primary sealant.
   2. AAMA 810.1, Type 2, for glazing applications in which tape is used in combination with a full bead of liquid sealant.
D. High-Bond Structural Glazing Tape: Pressure-sensitive, conformable acrylic closed-cell foam tape with high-performance acrylic adhesive on both faces, 2.3 mm thick, black color.
   1. Basis of Design for Product Type and Performance: B23F VHB Tape by 3M.
   2. Provide Basis of Design product or other product as recommended by tape Manufacturer for intended use.

2.7 GLAZING SEALANTS

A. Manufacturers:
   1. Dow Corning Corporation.
   2. GE Company.

B. Suitability: Comply with sealant and glass manufacturers’ written instructions for selecting glazing sealants suitable for applications indicated and for conditions existing at time of installation.
   1. Structural Sealant: Capable of withstanding tensile and shear stresses imposed by structural-sealant-glazed curtain walls without failing adhesively or cohesively. When tested for preconstruc-tion adhesion and compatibility, cohesive failure of sealant shall occur before adhesive failure.
      a. Adhesive failure occurs when sealant pulls away from substrate cleanly, leaving no sealant ma-terial behind.
      b. Cohesive failure occurs when sealant breaks or tears within itself but does not separate from each substrate because sealant-to-substrate bond strength exceeds sealant’s internal strength.

C. Adhesion Testing: Prior to application of sealants, test each application condition to ensure sealant satisfactorily adheres to substrate.
   1. Conduct test in field or by submission of representative substrate sample to manufacturer for factory test.
   2. Apply sealant to sample substrate and perform hand-pull tab test in accordance with ASTM C1193, Method A.
   3. Determine if primer is required. If so, re-test using primer.

D. Compatibility: Compatible with one another and with other materials they contact, including glass products, seals of insulating-glass units, and glazing channel substrates, under conditions of service and application, as demonstrated by sealant manufacturer based on testing and field experience.
   1. Compatibility Testing: Prior to application of sealants, test gaskets, spacers, setting blocks, and other glazing accessories being provided for project to determine compatibility with structural silicone sealants.
      a. Submit representative samples of accessories to manufacturer for factory testing.
      b. Perform testing in accordance with ASTM C1087.
      c. Incompatible accessories shall be replaced with ones recommended by and tested by manufacturer as acceptable.

E. Single-Component, Nonsag, Neutral-Curing Silicone Joint Sealant: ASTM C 920, Type S, Grade NS, Class 50, for Use NT, G, A, and O; SWRI validation.
   1. Basis of Design Product: Dow Corning Corporation, 795 Silicone Building Sealant

F. Single-Component, Nonsag, Neutral-Curing Silicone Joint Sealant: ASTM C 920, Type S, Grade NS, Class 50, for Use NT, G, and A; SWRI validation.
   1. Basis of Design Product: Dow Corning Corporation, 995 Silicone Structural Sealant
G. Single-Component, Nonsag, Acid-Curing Silicone Joint Sealant: ASTM C 920, Type S, Grade NS, Class 25, for Use NT, G, and A.

2.8 FABRICATION
A. Heat-Treated Float Glass: ASTM C 1048. Fabricate using horizontal roller heating process only. Roll wave distortion parallel to bottom edge of glass as installed. Deviation from flatness at any peak (peak to valley deviation): shall not exceed 0.003 inches in the center of a lite and shall not exceed 0.008 inches within 10.5 inches of the leading or trailing edge.

B. Fully tempered (FT) glass shall be heat soak tested to eliminate the potential of spontaneous breakage due to nickel-sulfite inclusions or other defects that can affect glass performance in place.

C. Insulating Glass Units:
   1. Fabricate using both primary and secondary seals and as otherwise required to comply with the IGCC CBA classification.
   2. Fabricate using glass from the same manufacturer throughout the Project.
   3. Seal Construction: Dual seal design with primary seal of PIB and Silicone Secondary Seal, unless specifically indicated otherwise.

D. Butt-Glazed Glass: Clean-cut or flat-grind vertical edges of butt-glazed monolithic lites to produce square edges with slight chamfers at junctions of edges and faces.

PART 3 EXECUTION

3.1 EXAMINATION
A. Verification of Conditions: Examine areas and conditions under which Work is to be performed and identify conditions detrimental to proper or timely completion.
   1. Verify glazing channels are free of burrs, irregularities, and debris.
   2. Verify glass is free of edge damage or face imperfections.
   3. Inspect door and frames to determine that frames, sash, and stops are set true and straight. Sash rabbets and stops shall be clean and dry at time of glazing.
   4. Do not proceed until unsatisfactory conditions have been corrected.

B. Beginning of installation means acceptance of substrate.

3.2 PREPARATION
A. Provide glass manufacturer’s recommended edge clearances when sizing glass.
B. Remove protective coatings from surfaces to be glazed.
C. Clean glass and glazing surfaces to remove dust, oil, and contaminants, and wipe dry.
D. Verify measurements of sash and openings at Project.
   1. Dimensions shown or indicated are given only as a guide for estimating purposes, and actual size shall be determined by measurement of the actual openings. Accurately cut glass to fit openings with proper clearances and setting block height.
E. Coordinate with and check Shop Drawings furnished by other suppliers of Work affecting this Section to avoid field installation problems.
F. Before glazing metal sash, remove oil, lacquer, or other material to which the compound will not readily adhere or which will tend to delaminate from metal and cause a leak through the glazing seal.

3.3 INSTALLATION

A. Comply with glass fabricators recommendations.

B. Except where curtain wall, window, entrance or glass manufacturer recommends otherwise, comply with Flat Glass Marketing Association (FGMA) Sealant Manual and FGMA Glazing Manual.

C. Glaze insulated units as recommended by glass and frame manufacturers.

D. Do not apply glazing materials at temperatures below manufacturer's recommendations or to damp or frosted surfaces. Apply glazing material according to the manufacturer's instructions using proper primers as required.

E. Set glass using neoprene setting blocks and spacers to insure proper edge clearance and uniform beads of compound. Clearances shall conform to FGMA Glazing Manual requirements. Center glass in glazing rabbets.
   1. Butt glazing requirements: Apply mildew resistant silicone sealant to flush depth of joint as indicated by sealant manufacturer.

F. Check openings to confirm proper clearance at perimeters and between glass and stops.
   1. Clean surfaces of rabbet (including stops) and surface of glass which will come into contact with sealant. Use solvents and methods which insure clean, dry surfaces without film or foreign material when sealant is placed.

G. Remove and replace glazing beads carefully to avoid marking or defacing any portion of frame, sash, or fastenings.
   1. Set glass in full bed of glazing tape or sealant. Clean glazing material after stops are installed. Clean excess compound, etc. from glass after setting in conformance with glass manufacturer's recommendations.
   2. If recommended prime surfaces prior to glazing.

H. Set glass with reams (waves) running horizontally. Set glass with factory attached labels in place.

I. Setting Blocks: Place setting blocks at locations recommended by glass manufacturer, generally between 1/4 points and 6 inches from corner, except at glazed doors.
   1. At glazed doors, provide one block at sill, located 3 inches up from edge of glass at hinge side; one block at hinge side jamb, located 3 inches up from lower edge of glass; one block at head, located 3 inches from edge of glass at latch side of door; and, one block at jamb at lock side of door, located 3 inches down from edge of glass at top corner.
   2. Use blocks of length required to properly support glass. Offset approximately 1 inch from shims.

J. Glass Installation in Hollow Metal Frames:
   1. Glaze frames using pre-shimmed tape on both sides. Firmly glaze in place with joints sealed, free of rattles.
   2. Set glass on setting blocks with a full bed of sealant or glazing tape.

K. Glass Installation in Aluminum Frames:
   1. Glaze aluminum frames using preformed EPDM elastomeric glazing extrusion separately or in combination with sealant and pre-shimmed glazing tape in compliance with aluminum frame supplier's recommendations.
   2. Set glass on setting blocks as recommended by manufacturer.
   3. Apply tape and/or sealant to produce uniform sight line even with frame.
4. Set glass in gaskets with corners sealed.

L. Glazing Sealant: Along entire bottom edge of light, and up at least 6 inches at each jamb, gun in continuous full bed of sealant to fill voids.
   1. Fill entire space, full width of pane, full depth of glass, with sufficient sealant to form heel along inside face and edge of glass.
   2. At other edges (top and sides) gun in continuous heel bead of sealant along edges of glass perimeter to set stop against and into, acting as fill between glass and stop.
   3. Immediately after setting glass, at entire perimeter of glass, gun in sealant between stop and glass so space above spacer is completely filled, without voids.
   4. Place sealant flush with daylight edge of stops, with slight watershed at exterior. Provide straight, smooth surface meeting at opening corners with sharp intersection.
   5. Leave no sealant on exposed surfaces of stops and glass.

M. Apply structural sealant carefully in uniform thickness pushing bead ahead of nozzle and making sure that entire cavity is filled. Air pockets or voids along edges are not acceptable.
   1. Tool joint immediately after application.
   2. Tool neatly, forcing sealant into contact with joint sides, eliminating internal voids and insuring good substrate contact.
   3. Do not tool with soap or detergent solutions.
   4. Install silicone structural butt glazing system in accordance with manufacturer’s printed instructions.

N. Mirror installation: As indicated.
   1. Adhere mirrors to substrate with mirror mastic.

3.4 CLEANING

   A. Remove surplus materials.

   B. Final cleaning of glass by Contractor.

END OF SECTION
SECTION 089100
LOUVERS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Shop-fabricated, fixed, extruded aluminum louvers and frames (LVR).
   2. Attachment hardware.
B. Related Sections:
   1. Section 055000 - Metal Fabrications: Steel support framing.
   2. Section 084400 - Aluminum Curtain Walls, Storefronts and Entrances.
   3. Division 23 - Mechanical: Attachment of ducting and blanking out unused louver area.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Shop Drawings: For louvers and accessories. Include plans, elevations, sections, details, and attachments to other work. Show frame profiles and blade profiles, angles, and spacing.
   1. Show weep paths, gaskets, flashing, sealant, and other means of preventing water intrusion. Include Details to illustrate how the louver frame interfaces and seals to the adjacent primary air and water barrier line.
      a. Locate primary seal on the louver frame to the interior of the frame.
      b. The base flashing is to be full depth with end dams to collect and weep moisture to the exterior.
C. Samples: For each type and color of exposed metal finish.

1.3 QUALITY ASSURANCE
A. Welding Qualifications: Qualify procedures and personnel according to the following:
   2. AWS D1.3, "Structural Welding Code - Sheet Steel."

1.4 FIELD CONDITIONS
A. Field Measurements: Verify actual dimensions of openings by field measurements before fabrication.

1.5 WARRANTY
A. Special Finish Warranty: Provide Manufacturer’s standard 20-year warranty against failure or excessive fading of powder coat finish.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. General: Design and fabricate exterior wall louvers in accordance with AMCA Standard 500 and comply with AMCA Certified Ratings Program.

C. Not Permitted: Vibration harmonics; wind whistles; noises caused by thermal movement; thermal movement transmitted to other building elements; loosening, weakening or fracturing of attachments or components of system.

D. Delegated Design: Design louvers, including comprehensive engineering analysis by a qualified professional engineer, using structural performance requirements and design criteria indicated.

E. Structural Performance: Louvers shall withstand the effects of gravity loads and the following loads and stresses within limits and under conditions indicated without permanent deformation of louver components, noise or metal fatigue caused by louver-blade rattle or flutter, or permanent damage to fasteners and anchors. Wind pressures shall be considered to act normal to the face of the building.
   1. Wind Loads: Determine loads based on pressures as indicated on Drawings.

F. Windborne-Debris-Impact Resistance: Louvers located within 30 feet of grade shall pass basic-protection, large-missile testing requirements in ASTM E 1996 for Wind Zone 1 when tested according to ASTM E 1886. Test specimens shall be no smaller in width and length than louvers indicated for use on Project.

G. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes.
   1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

2.2 LOUVERS

A. Source Limitations: Obtain louvers from single source from a single manufacturer where indicated to be of same type, design, or factory-applied color finish.

B. Subject to compliance with specified requirement, provide Basis of Design or provide equivalent products by one of the following:
   1. Airolite Company
   2. Construction Specialties, Inc.
   3. Greenheck Fan Corporation
   4. Industrial Louvers, Inc.
   5. Nystrom Building Products.
   6. Ruskin Company; Tomkins PLC.

   1. Free Area, Minimum: 50%.
   2. Water Penetration Velocity, Minimum: 700 fpm.
   4. Aluminum Sheet: ASTM B 209, Alloy 3003 or 5005 with temper as required for forming, or as otherwise recommended by metal producer for required finish.
   5. Color Anodic Finish: AAMA 611, AA-M12C22A42/A44, Class I, 0.018 mm or thicker.
      a. Color: Black.

2.3 FASTENERS, COMPONENTS AND ACCESSORIES

A. Provide fasteners and anchors; screening, flashing and blank-off panel components; and other installation and support accessories required for complete installed assembly.

B. Fasteners: Aluminum or 300 series stainless-steel fasteners, types and sizes to suit unit installation conditions.
C. Postinstalled Fasteners for Concrete and Masonry: Torque-controlled expansion anchors, made from stainless-steel components, with capability to sustain, without failure, a load equal to 4 times the loads imposed, for concrete, or 6 times the load imposed for masonry, as determined by testing according to ASTM E 488, conducted by a qualified independent testing agency.

D. Bird Screen: 5/8-inch flattened expanded aluminum mesh, with 0.050-inch extruded aluminum frame.

E. Sill Flashing: Formed from min. 0.050 inch aluminum, with welded side panels

F. Blank-Off Panels, Uninsulated: Metal sheet attached to back of louver.
   1. Aluminum sheet for aluminum louvers, not less than 0.050-inch nominal thickness.
   2. Panel Finish: Same finish type applied to louvers, but black color.
   3. Attach blank-off panels with fasteners as recommended by louver manufacturer.

G. Blank-Off Panels, Insulated: Laminated panels consisting of an insulating core surfaced on back and front with metal sheets and attached to back of louver.
   1. Thickness: 2 inches.
   2. Metal Facing Sheets: Aluminum sheet, not less than 0.032-inch nominal thickness.
   3. Insulating Core: Closed-cell polyisocyanurate.
   4. Edge Treatment: Trim perimeter edges of blank-off panels with louver manufacturer’s standard channel frames, with corners mitered and with same finish as panels.
   5. Seal perimeter joints between panel faces and louver frames with gaskets or sealant.
   6. Attach blank-off panels with fasteners as recommended by louver manufacturer.

H. Steel Shapes: ASTM A36.

I. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D 1187.

2.4 FABRICATION

A. Factory assemble louvers to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations. Clearly mark units for reassembly and coordinated installation.

B. Fabricate frames, including integral sills, to fit in openings of sizes indicated, with allowances made for fabrication and installation tolerances, adjoining material tolerances, and perimeter sealant joints.

C. Provide vertical mullions of type and at spacings indicated, but not more than is recommended by manufacturer.
   1. Exposed Mullions: Where indicated, provide units with exposed mullions of same width and depth as louver frame. Where length of louver exceeds fabrication and handling limitations, provide interlocking split mullions designed to permit expansion and contraction.

D. Provide subsills made of same material as louvers or extended sills for recessed louvers.

E. Join frame members to each other and to fixed louver blades with fillet welds concealed from view unless otherwise indicated or size of louver assembly makes bolted connections between frame members necessary.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates and openings, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 PREPARATION

A. Coordinate setting drawings, diagrams, templates, instructions, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. Coordinate delivery of such items to Project site.

3.3 INSTALLATION

A. Locate and place louvers level, plumb, and at indicated alignment with adjacent work.

B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.
   1. Install bird screens fixed to interior.

C. Form closely fitted joints with exposed connections accurately located and secured.

D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers, as indicated.

E. Protect unpainted galvanized and nonferrous-metal surfaces that are in contact with concrete, masonry, or dissimilar metals from corrosion and galvanic action by applying a heavy coating of bituminous paint or by separating surfaces with waterproof gaskets or nonmetallic flashing.

F. Set and tie in to flashings to ensure diversion of moisture to exterior.
   1. Locate primary seal on the louver frame to the interior of the frame.
   2. Provide full-depth base flashing with end dams to collect and weep moisture to the exterior.

G. Install concealed gaskets, flashings, joint fillers, and insulation as louver installation progresses, where weathertight louver joints are required.
   1. Comply with Section 079200 - Joint Protection for sealants applied during louver installation.

3.4 INSTALLED WORK

A. Clean exposed louver surfaces that are not protected by temporary covering, to remove fingerprints and soil during construction period. Do not let soil accumulate during construction period.

B. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to finishes. Thoroughly rinse surfaces and dry.

C. Restore louvers damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by Architect, remove damaged units and replace with new units.
   1. Touch up minor abrasions in finishes with air-dried coating that matches color and gloss of, and is compatible with, factory-applied finish coating.

END OF SECTION
SECTION 092200
NON-STRUCTURAL METAL FRAMING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Non-structural metal framing systems for interior assemblies, including:
      a. Interior partitions.
      b. Interior suspended ceiling and soffit systems.
      c. Shaft wall systems.

B. Related Sections:
   1. Section 018198 - Facility Acoustic Performance Requirements.
   2. Section 054000 - Cold-Formed Metal Framing: For interior framing members carrying a lateral (transverse) load exceeding 10 lb/ft^2, a superimposed vertical load exceeding 100 lbf/ft, or a superimposed vertical load exceeding 200 lbs; and members exceeding maximum heights, spans or spacing for non-structural framing as indicated in ASTM C 754 Tables 1-7.

1.2 ACTION SUBMITTALS
A. Product Data:
   1. Submit statement indicating that metal stud manufacturer has reviewed Project documents and that framing supplied conforms to specified requirements.
   2. Evaluation Reports: ICC-ES reports for metal studs and tracks, indicating compliance with specified requirements and building code in effect.

B. EQ Stud Submittals: Comply with the following if submitting EQ studs.
   1. Submit statement indicating that metal stud manufacturer has reviewed Project documents and that framing supplied conforms to specified requirements.
   2. Submit list of completed projects of similar project type and similar wall loading where specific product recommended has been used.
   3. Submit material test reports from a qualified testing agency indicating and interpreting test results for compliance with requirements indicated.

1.3 INFORMATIONAL SUBMITTALS
A. Shop Drawings: Submit in accordance with Section 013300, indicating light gauge framing system. Indicate by plan and elevation, stud framing (spacing, sizes, thicknesses and types), openings, bracing and blocking, fastening and anchorage, strapping, bridging, connection details and reinforcement.

1.4 QUALITY ASSURANCE
A. Perform work in accordance with applicable reference standards unless otherwise indicated.

B. Pre-Installation Conference: Convene a pre-installation meeting at the beginning of the project to review acoustically-rated construction requirements and to coordinate penetrations.
   1. Architect, Contractor, Owner's representative and each trade that may need to penetrate acoustically rated construction or will be involved in construction of acoustically rated partitions and related systems must attend.
2. Review layouts and routing for potential penetrating items, discuss reducing or eliminating penetrating items by considering alternate routing, review construction requirements, details and specifications for acoustically rated construction.
3. A follow-up meeting should be scheduled as needed.
4. This meeting can occur in conjunction with a regular construction progress meeting.
5. Publish meeting minutes highlighting topics discussed, actions items and decision made.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Design framing systems in accordance with American Iron and Steel Institute AISI Standard S220-11 North American Specification for the Design of Cold-Formed Steel Framing - NonStructural Members, except as otherwise shown or specified.

B. Fire-Test-Response Characteristics: For fire-resistance-rated assemblies that incorporate non-load-bearing metal framing, provide materials and construction identical to those tested in assembly indicated, according to ASTM E 119 by an independent testing agency.

C. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated, according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.

D. Shaft Wall Assemblies: Provide stud shaft wall system designed and tested by manufacturer to withstand lateral loading (air pressure) of 10 lbs per sq ft for maximum wall height required, and with deflection limited to 1/240 of partition height. Refer to Section 092900 - Gypsum Board for shaft wall construction.

2.2 FRAMING SYSTEMS

A. Framing Members, General: Comply with ASTM C754 for conditions indicated.
1. Provide framing type, weight, grade and finish of materials in accordance with Manufacturer's recommendations, except where otherwise required by governing regulations and applicable standards.
2. Provide clips, fasteners, ties, reinforcing, flat strap and backing plates, stiffeners, shoes, tracks, hangers, brackets, anchors, accessories, and trim as recommended by Manufacturer for application indicated.
5. Recycled Content of Steel Products: Provide products with average recycled content of steel products such that postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.

B. (MET STUD-1) Metal Studs and Runners: ASTM C645, and meeting or exceeding flexural strength, allowable bending moment, and screw pull-out of a standard 33 mil thick stud.

C. (MET STUD-2) Shaft Wall Metal Studs: ASTM C645, steel C-H, C-T or I studs hot-dipped galvanized.

D. Double-Runners: ASTM C645 slip-type head joint; inside runner with 2-inch-deep flanges, and outer runner sized to friction fit inside runner.
E. Deflection Track: Steel sheet top runner manufactured to prevent cracking of finishes applied to interior partition framing resulting from deflection of structure above; in thickness not less than indicated for studs and in width to accommodate depth of studs.

F. Firestop Track: Top runner manufactured to allow partition heads to expand and contract with movement of the structure while maintaining continuity of fire-resistance-rated assembly indicated; in thickness not less than indicated for studs and in width to accommodate depth of studs.

G. Furring and Bracing Members: Provide members with protective galvanized coating, in depths as indicated.
   1. (MET FURG-1) Hat-Shaped, Rigid Furring Channels: ASTM C645; with minimum base-metal thickness of 0.033 inch.
   2. (MET FURG-2) Z-Shaped Furring: With slotted or nonslotted web; with minimum base-metal thickness of 0.027 inch.
   3. (MET FURG-3) Cold-Rolled Steel Channels: Channel bridging, furring channels, carrying channels, steel channel stiffeners and braces; with minimum base-metal thickness of 0.054 inch.
   4. (MET FURG-4) Resilient Furring Channels: Asymmetrical steel sheet members, with face attached to single flange by a slotted leg (web), designed to reduce sound transmission.

H. Galvanized Flat Strap and Backing Plate at Interior Stud Walls: Steel sheet for blocking and bracing in length and width indicated.
   1. Minimum Base-Metal Thicknesses:
      a. Typical: 0.054 inch.
      b. For Heavy Equipment and Grab Bar Locations: 0.068 inch.
   2. Where Wood Backing and Blocking is Indicated: Refer to Section 061000 for wood requirements. Provide fire-resistant treatment.

2.3 SUSPENSION SYSTEMS

A. Components, General: Comply with ASTM C754 for conditions indicated.

B. Furring Channels: As specified above.

C. Tie Wire: ASTM A641, Class 1 zinc coating, soft temper, 0.0625 inch diameter wire, or double strand of 0.0475 inch diameter wire.

D. Hanger Attachment Anchors in Concrete: Fabricated from corrosion-resistant materials with holes or loops for attaching hanger wires and capable of sustaining, without failure, a load equal to 5 times that imposed by construction as determined by testing according to ASTM E488 by a qualified independent testing agency.
   1. Cast-in-place anchor, designed for attachment to concrete forms.
   2. Postinstalled, chemical anchor.
   3. Postinstalled, expansion anchor.

E. Wire Hangers: ASTM A641, Class 1 zinc coating, soft temper, 0.162 inch diameter.

F. Rod Hangers: ASTM A510, mild carbon steel; ASTM A153, hot-dip galvanized; 0.25 inch diameter.

G. Manufactured Suspension Grid System for Ceilings and Soffits: ASTM C 645, direct-hung system composed of main beams and cross-furring members that interlock.
   1. Products and Manufacturers:
      a. Drywall Grid Systems by Armstrong World Industries, Inc.;
      b. Drywall Grid Systems by Chicago Metallic Corporation;
      c. Drywall Suspension System by USG Corporation.
2.4 AUXILIARY MATERIALS

A. Fasteners: Galvanized steel fasteners of type, size, corrosion resistance, holding power, and other properties required to fasten steel members to substrates; and of length suitable for adequate penetration of substrate.

B. Asphalt Protection Strips: Strip of 15 lb. asphalt saturated felt at intersection of partitions and masonry walls.

C. Isolation Strip: Provide one of the following:
   1. Asphalt-Saturated Organic Felt: ASTM D 226, Type I (No. 15 asphalt felt), nonperforated.
   2. Foam Gasket: Adhesive-backed, closed-cell vinyl foam strips that allow fastener penetration without foam displacement, 1/8 inch thick, in width to suit steel stud size.

D. Acoustic Sealant: In accordance with Section 092900 - Gypsum Board.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and substrates, with Installer present, and including welded hollow-metal frames, cast-in anchors, and structural framing, for compliance with requirements and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Suspended Assemblies: Coordinate installation of suspension systems with installation of overhead structure to ensure that inserts and other provisions for anchorages to building structure have been installed to receive hangers at spacing required to support the Work and that hangers will develop their full strength.
   1. Furnish concrete inserts and other devices indicated to other trades for installation in advance of time needed for coordination and construction.

B. Coordination with Sprayed Fire-Resistive Materials:
   1. Before sprayed fire-resistive materials are applied, attach offset anchor plates or ceiling runners (tracks) to surfaces indicated to receive sprayed fire-resistive materials. Where offset anchor plates are required, provide continuous plates fastened to building structure not more than 24 inches o.c.
   2. After sprayed fire-resistive materials are applied, remove them only to extent necessary for installation of non-load-bearing steel framing. Do not reduce thickness of fire-resistive materials below that required for fire-resistance ratings indicated. Protect adjacent fire-resistive materials from damage.

3.3 INSTALLATION, GENERAL

A. Installation Standards: ASTM C 754.
   1. Gypsum Board Assemblies: Also comply with requirements in ASTM C 840 that apply to framing installation.
   2. Portland Cement Plaster Assemblies: Also comply with requirements in ASTM C 1063 that apply to framing installation.
   3. Gypsum Plaster Assemblies: Also comply with requirements in ASTM C 841 that apply to framing installation.
   4. Gypsum Veneer Plaster Assemblies: Also comply with requirements in ASTM C 844 that apply to framing installation.
B. Install supplementary framing, and blocking to support fixtures, equipment services, heavy trim, grab bars, toilet accessories, furnishings, or similar construction. Install bracing at terminations in assemblies.

C. Do not bridge building control and expansion joints with non-load-bearing steel framing members. Frame both sides of joints independently.

D. Installation Tolerance: Install each steel framing and furring member so fastening surfaces vary not more than 1/8 inch from plane formed by faces of adjacent framing.

3.4 FRAMING INSTALLATION

A. Framing Installation, General:
   1. Partition Heights: Extend partition stud system through suspended ceilings to structural support above, except where indicated to terminate at ceiling.
      a. Provide additional bracing for partitions extending above ceiling where indicated.
      b. Continue framing around ducts penetrating partitions above ceiling.
   2. Coordinate erection of studs with installation of service utilities. Align stud web openings. Coordinate installation of bucks, anchors, blocking, electrical and mechanical work which is to be placed in or behind partition framing. Allow such items to be installed after framing is complete.
   3. Isolate stud system from transfer of structural loading to system, both horizontally and vertically. Provide slip or cushioned joints to attain lateral support and avoid axial loading.
   4. Reinforce stud partitions and provide additional metal studs as indicated and required for installation of wall cabinets, wall mounted equipment, wall mounted mechanical and electrical fixtures, accessories, shelves and shelf standards. Provide thick steel plate to span minimum of 3 studs for installation of mirrors, toilet accessories or grab bars.
   5. Fire-Resistance-Rated Partitions: Install framing to comply with fire-resistance-rated assembly indicated and support closures and to make partitions continuous from floor to underside of solid structure.
   6. Sound-Rated Partitions: Install framing to comply with sound-rated assembly indicated.

B. Runners and Tracks: Secure runner tracks to floor and ceiling construction, and to structure above ceilings as recommended by manufacturer, with fastener spacing not to exceed 24 inches o.c.
   1. Runner Tracks: Provide continuous track sized to match studs. Align runner tracks accurately to partition layout at both floor and ceiling. Provide fasteners at corners and ends of runner tracks.
   2. Slip-Type Head Joints: Where framing extends to overhead structural supports, install to produce joints at tops of framing systems that prevent axial loading of finished assemblies.
   3. Firestop Track: Where indicated, install to maintain continuity of fire-resistance-rated assembly indicated.
   4. Door Openings: Screw vertical studs at jambs to jamb anchor clips on door frames; install runner track section (for cripple studs) at head and secure to jamb studs.

C. Metal Studs: Install studs vertically at 16 inches o.c., unless otherwise indicated, and not more than 2 inches from abutting construction, each side of openings, and at corners.
   1. Install metal studs in floor and ceiling runner tracks. Secure studs to runners. Anchor light gauge screw-type partition studs to runner tracks by screwing opposite flanges top and bottom, except screw end studs to both tracks at both flanges.
   2. Where studs are installed directly against exterior masonry walls or dissimilar metals at exterior walls, install isolation strip between studs and exterior wall.
   3. Provide additional studs at exterior corners and 2 inches from inside corners, terminations of partitions, and both sides of control joints.
   4. Where partitions abut other construction, provide vertical runner track securely attached to construction.
5. Use full length studs between runner tracks.

D. Door Openings:
1. Frame door openings with vertical studs attached to each jamb of door frame.
2. Provide additional studs 2 inches from jamb studs.
3. Frame head of door with horizontal section of runner track attached to jamb studs and provide vertical studs cut to fit between head and ceiling tracks and attach to tracks.
4. Provide 3/4 inch cold-rolled steel channel stiffener at 6 inches above door head extending at least 2 stud spaces beyond jamb studs, and attach to studs.
5. Fit runners under and above openings, secure intermediate studs at spacing of wall studs. Brace stud framing system and make rigid.

E. Other Framed Openings: Frame openings other than door openings the same as required for door openings, unless otherwise indicated. Install framing below sills of openings to match framing required above door heads.

F. Wall Furring Installation:
1. Erect wall furring directly attached to concrete block and concrete walls.
2. Erect furring channels horizontally or vertically as indicated. Secure in place on alternate channel flanges at maximum 24 inches on center.
3. Space furring channels maximum 24 inches on center, not more than 4 inches from floor and ceiling lines or abutting walls.
4. Erect freestanding metal stud framing by means of adjustable furring brackets in accordance with manufacturer's directions.
5. Splicing Members: Lap furring members 8 inches and runner channels 12 inches and wire-tie near each end of lap.

3.5 SHAFT WALL INSTALLATION
A. Shaft Wall Installation, General: Install gypsum board shaft wall assemblies to comply with requirements of fire-resistance-rated assemblies indicated, manufacturer's written installation instructions, and ASTM C 754 other than stud-spacing requirements.
1. Anchor components to comply with ratings and performance requirements, and with governing regulations.
2. Isolate shaft system from transfer of structural loading to system, both horizontally and vertically. Provide slip or cushioned type joints to attain lateral support and avoid axial loading.
3. Do not bridge building expansion joints with shaft wall assemblies; frame both sides of expansion joints with furring and other support.

B. Supplementary Framing: Install supplementary framing in gypsum board shaft wall assemblies around openings and as required for blocking, bracing, and support of gravity and pullout loads of fixtures, equipment, services, heavy trim, furnishings, wall-mounted door stops, and similar items that cannot be supported directly by shaft wall assembly framing.

C. Penetrations: At penetrations in shaft wall, maintain fire-resistance rating of shaft wall assembly by installing supplementary steel framing around perimeter of penetration and fire protection behind boxes containing wiring devices, elevator call buttons, elevator floor indicators, and similar items.

D. Sprayed Fire-Resistive Materials: Coordinate gypsum board shaft system work with sprayed-on fireproofing of structure, so that both remain complete and undamaged. Patch or replace sprayed-on fireproofing removed or damaged during installation of shaft framing system.

3.6 SUSPENSION SYSTEM INSTALLATION
A. Suspended Assemblies, General: ASTM C 754.
1. Install ceiling framing independent of walls, columns, and above ceiling work.
2. Do not bridge building expansion joints with support system.
3. Installation Tolerances: Install steel framing components for suspended ceilings so members for panel attachment are level to within 1/8 inch in 12 feet measured lengthwise on each member transversely between parallel members.

B. Hangers: Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structural or suspension system. Splay hangers only where required to miss obstructions and offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
1. Wire Hangers: Secure by looping and wire tying, either directly to structures or to inserts, eye screws, or other devices and fasteners that are secure and appropriate for substrate, and in a manner that will not cause hangers to deteriorate or otherwise fail.
   a. Space hanger wires 48 inches o.c. along carrying channels and within 6 inches of ends of channel run. Anchor hanger wires to supporting structure. Do not attach hangers to metal deck tabs.
2. Flat Hangers: Secure to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices and fasteners that are secure and appropriate for structure and hanger, and in a manner that will not cause hangers to deteriorate or otherwise fail.
3. Coordinate location of hangers with other work.
   a. Do not attach hangers to steel roof deck.
   b. Do not attach hangers to permanent metal forms. Furnish cast-in-place hanger inserts that extend through forms.
   c. Do not attach hangers to rolled-in hanger tabs of composite steel floor deck.
   d. Do not connect or suspend steel framing from ducts, pipes, or conduit.

C. Carrying Channels: Position channels at proper height and level, and secure with hanger wires.
1. Space main carrying channels at maximum 48 inches on center, not more than 6 inches from perimeter walls.
2. Lap splices minimum 12 inches and secure together 2 inches from each end of splice. Provide clearance between channels and abutting walls or partitions.

D. Furring Channels: Comply with Gypsum Association GA-203.
1. Place furring channels perpendicular to carrying channels at 16 inches on center not more than 6 inches from perimeter walls.
2. Lap splices minimum 8 inches and secure together one inch from each end of splice.
3. Provide clearance between furring and abutting walls or partitions. Secure furring to carrying channels with clips.
4. Frame both sides of joints with furring and other supports.
5. Fire-Resistance-Rated Assemblies: Wire tie furring channels to supports.

E. Lateral Bracing: Laterally brace entire suspension system where required. Reinforce openings in ceiling suspension system which interrupt main carrying channels or furring channels, with lateral channel bracing. Extend bracing minimum 24 inches past each end of openings.

3.7 GRID SUSPENSION SYSTEM INSTALLATION

A. Suspension Grid Systems: Install in accordance with Manufacturer’s instructions.
1. Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces.
2. Install main beams and cross tees at the on center spacing required for ceiling loading, and location of in-ceiling services.
3. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.
4. Provide additional bracing as required by code.

B. Attach perimeter wall track or angle where grid suspension systems meet vertical surfaces.

C. Mechanically join main beam and cross-furring members to each other and butt-cut to fit into wall track.

END OF SECTION
SECTION 092900
GYPSUM BOARD

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Interior gypsum board (GYP BD).
   2. Acoustic insulation (INSUL-40) and sealant.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Samples: For accessories exposed to view in final installation.
   1. Trim Accessories: Full-size Sample in 12-inch-long length for each trim accessory indicated.

1.3 QUALITY ASSURANCE
A. Pre-installation Conference: Convene a pre-installation meeting at the beginning of the project to review acoustically rated construction requirements and to coordinate penetrations.
   1. Architect, Contractor, Owner’s representative and each trade that may need to penetrate acoustically rated construction or will be involved in construction of acoustically rated partitions and related systems must attend.
   2. Review layouts and routing for potential penetrating items, discuss reducing or eliminating penetrating items by considering alternate routing, review construction requirements, details and specifications for acoustically rated construction.
   3. A follow-up meeting should be scheduled as needed.
   4. His meeting can occur in conjunction with a regular construction progress meeting.
   5. Publish meeting minutes highlighting topics discussed, actions items and decision made.
B. Mockups: Before beginning gypsum board installation scheduled to receive Level 5 Finish, install panel mockup, 48 inches wide by 96 inches tall, demonstrating at least 2 vertical and 2 horizontal joints, for Architects review of aesthetic effects workmanship.
   1. Apply or install final finish indicated, including painting, on exposed surfaces for review of mockups.
   2. Simulate finished lighting conditions for review of mockups.
   3. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 DELIVERY, STORAGE, AND HANDLING
A. Store materials inside under cover and keep them dry and protected against weather, condensation, direct sunlight, construction traffic, and other potential causes of damage.
   1. Stack panels flat and supported on risers on a flat platform to prevent sagging.

1.5 PROJECT CONDITIONS
A. Environmental Limitations: Comply with ASTM C 840 requirements and recommendations of gypsum board manufacturer, for environmental conditions before, during and after application of gypsum board.
1. Cold Weather Protection: When ambient outdoor temperatures are below 55 degrees F maintain continuous, uniform, comfortable building working temperatures of not less than 55 degrees F for minimum period of 48 hours prior to, during and following application of gypsum board and joint treatment materials or bonding of adhesives.

2. Ventilation: Ventilate building spaces as required to remove water in excess of that required for drying of joint treatment material immediately after its application. Avoid drafts during dry, hot weather to prevent too rapid drying.

B. Damaged Materials: Do not install panels that are wet, moisture damaged, and mold damaged.
   1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
   2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: For gypsum board assemblies with fire-resistance ratings, provide materials and construction identical to those tested in assembly indicated according to ASTM E119 by an independent testing and inspecting agency acceptable to authorities having jurisdiction.

B. STC-Rated Assemblies: For STC-rated assemblies, provide materials and construction identical to those tested in assembly indicated according to ASTM E 90 and classified according to ASTM E 413 by an independent testing agency.
   1. STC-Rated Assemblies: Indicated by design designations from GA-600, "Fire Resistance Design Manual."

C. Shaft Wall Assemblies: Provide gypsum board shaft wall system design and tested by manufacturer to withstand lateral loading (air pressure) of 10 lbs per sq ft for maximum wall height required, and with deflection limited to 1/240.
   1. Refer to Section 092216 - Non-Structural Metal Framing for shaft wall studs.

2.2 GYPSUM PANEL PRODUCTS

A. Gypsum Board Products, General: In accordance with ASTM C 1396, and other specified requirements, and as follows:
   1. Provide products that do not contain asbestos.
   3. Provide products in maximum lengths and widths available to minimize joints and to correspond with support system indicated.

B. Manufacturers:
   1. United States Gypsum.
   5. Temple-Inland.

C. (GYP BD-1) Fire-Rated Board: Type X, 5/8 inch thick.
D. (GYP BD-2) Moisture- and Mold-Resistant Board, Type X: With moisture- and mold-resistant paper surfaces and core. Provide mold and water-resistant gypsum board as required by local building code and as indicated
  1. Thickness: 5/8 inch.
  3. Products and Manufacturers:
     a. ProRoc M2Tech by CertainTeed.
     b. ToughRock Mold-Guard by Georgia-Pacific.
     c. Sheetrock Mold Tough Firecode by United States Gypsum (USG).

E. (GYP BD-21) Gypsum Shaft Liner: One inch thick shaft wall liner panel with moisture resistant paper facing. Square edges designed for installation into I, C-H, E, or H metal studs.
     c. G-P Gypsum Corp.: ToughRock Shaftliner.
  2. Acceptable Manufacturer, Moisture and Mold Resistant Paper Faced, ASTM D3273 score of 10:
     b. National Gypsum Company: Gold Bond Brand Fire-Shield Shaftliner XP.
     c. CertainTeed Corp.: M2Tech Shaftliner Type X.
  3. Acceptable Manufacturer, Glass Mat Faced, ASTM C1658:
     a. CertainTeed Corp.: GlasRock Shaftliner Type X.
     b. G-P Gypsum Co.: DensGlass Shaftliner.

F. (GYP BD-35) Abuse-Resistant Mold-Resistant Board: ASTM C1396, ASTM D3272 score of 10 and ASTM C1629 for abuse resistance, manufactured to produce greater resistance to surface abrasion and indentation than standard gypsum panels.
  1. Products:
     c. CertainTeed Corp.: AirRenew Extreme Abuse Gypsum Board.
  3. Core: 5/8 inch, Type X.

2.3 TILE BACKER BOARDS

A. General: Provide mold- and water-resistant tile backer boards specified.
  1. Mold Resistance Requirement: ASTM D 3273, score of 10 as rated according to ASTM D 3274.
  2. Provide cementitious tile backer boards for tile installation at showers and other high-moisture areas, and as indicated on Drawings.
  3. Contractor’s Option: Provide water-resistant gypsum backing boards in lieu of cementitious backer boards for applications other than showers or high-moisture areas, and as submitted to and accepted by Architect.

B. (GYP BD-23) Cementitious Backer Board: ANSI A118.9 and ASTM C 1325, aggregated portland cement board, reinforced with imbedded glass-fiber mesh at both faces and at long edges.
  1. Core: 1/2 inch thick.
  2. Edges: Square and smooth, reinforced.
3. Manufacturers and Products:
   a. Custom Building Products; Wonderboard.
   b. USG Corporation; DUROCK Cement Board.
   c. National Gypsum Company; PermaBase Cement Board.

C. Tile Backer Board Accessories:
   1. Fasteners: As recommended by backer board manufacturer.
   2. Tile-Setting Mortar for Joint Treatment: As specified with Section 093000 - Tiling.
   3. Joint Tape: Alkali-resistant fiberglass mesh tape, 2-inches wide, or as recommended by backer
      board manufacturer.
   4. Sealants: As specified in Section 079200 - Joint Sealants.

2.4 JOINT TREATMENT MATERIALS

A. General: Comply with ASTM C 475.

B. Corner Trim, Edge Trim, Inside Corner Trim for Abuse Resistant Gypsum Board:
   1. Provide fully bonded paper faced and joint tape backed copolymer tapered plastic trim at abuse
      resistant gypsum board.
   2. Provide corner trim as recommended by manufacturer for each condition.

C. Joint Tape:
   1. Interior Gypsum Wallboard: Paper.
   2. Tile Backing Panels: As recommended by panel manufacturer.

D. Joint Compound for Interior Gypsum Wallboard: For each coat use formulation that is compatible
   with other compounds applied on previous or for successive coats.
   1. Prefilling: At open joints, rounded or beveled panel edges, and damaged surface areas, use
      setting-type taping compound.
   2. Embedding and First Coat: For embedding tape and first coat on joints, fasteners, and trim
      flanges, use setting-type taping compound.
      a. Use setting-type compound for installing paper-faced metal trim accessories.
   3. Fill Coat: For second coat, use drying-type, all-purpose compound.
   4. Finish Coat: For third coat, use drying-type, all-purpose compound.
   5. Skim Coat: For final coat of Level 5 finish, use setting-type, sandable topping compound, or
      high-build interior coating product designed for application by airless sprayer and to be used
      instead of skim coat compound to produce Level 5 finish.

2.5 ACOUSTICAL INSULATION AND SEALANT

A. (INSUL-40) Unfaced, Mineral-Wool Blanket Insulation: ASTM C 665, Type I (blankets without
   membrane facing); consisting of fibers; with maximum flame-spread and smoke-developed indexes
   of 25 and 50, respectively, per ASTM E 84; passing ASTM E 136 for combustion characteristics.
   1. Provide at interior partitions. Glass fiber insulation is not allowed at interior partitions.
   2. Density: 2.5 pcf
   3. Thickness: Same as stud depth or as indicated.
   4. Width of Batts: Center to center dimension of metal studs and full face to face at other voids.
   5. Manufacturers:
      a. Fibrex Insulations Inc.
      b. Owens Corning; SAFB-MW
      c. Roxul Inc.; AFB
      d. USG; Thermafiber.
      e. Rockwool
B. Acoustical Sealant: Provide one of the following unless otherwise required to meet requirements of referenced STC rating. Provide low emitting sealants meeting SCQAMD rules.

1. Acoustical Sealant for Exposed and Concealed Joints: Nonsag, paintable, nonstaining, latex sealant complying with ASTM C 834 and ASTM C 919 that effectively reduces airborne sound transmission through perimeter joints and openings in building construction as demonstrated by testing representative assemblies according to ASTM E 90.
   a. Pecora AC-20 FTR Acoustical and Insulation Sealant.
   b. United States Gypsum Co. SHEETROCK Acoustical Sealant.
   c. Hilti Incorporated CP 506 Acoustical Sealant

   a. Non-hardening polyurethane type, ASTM C920, Type M, Class 25, Grade NS: Tremco Dymeric 511; or approved equal.
   b. Non-hardening polysulphide type, ASTM C920, one-part: Pecora GC-9; or approved equal.
   c. Non-hardening silicone type, ASTM C920, Type S, Class 25, Grade NS, one-part, low modulus type: GE Silpruf, Dow Corning 790, Tremco Spectrum 1, Pecora 864, or approved equal.
   d. Fire-Rated Joint Sealant: (FRJS) as specified in Section 078443 - Joint Firestopping.

3. Provide moldable putty type products acceptable to meet or exceed STC rating at service boxes.

C. Closed-Cell Tape Sponge Neoprene: Press-on Products, No. P-8200 or P-8100, or approved equal.

D. Foam Backer Rod: Closed cell polyethylene, ASTM C962: by ITP, Nomeco, or approved equal.

2.6 ACCESSORIES

A. (GYPA) Extruded Aluminum Profile Trim, Reveals, and Moldings: Alloy 6063-T5, ASTM B 221; Finish: field-painted to match adjacent wall. Provide corrosion-resistant primer compatible with joint compound and finish materials specified.

1. Manufacturers: Provide specified products or equivalent products by one of the following:
   a. Gordon Incorporated
   b. Fry Reglet Corporation
   c. Pittcon Industries

2. Profile Schedule:
   a. (GYPA-1) Z-Reveal: No. 625-25 by Fry Reglet. Finish as selected by Architect.
   b. (GYPA-2) Reveal Trims: Profiles and sizes as shown. Finish as selected by Architect.
   c. (GYPA-3) Channel Reveal: No. CH-453 by Eagle Mouldings; No. 335 Black Duranodic finish.
   d. (GYPA-4) Reveal Wall Base: No. DRMB-625-400 by Fry Reglet. Finish as selected by Architect.

B. Fasteners and Anchorages: GA 216, type and size as recommended by wallboard manufacturer.

C. Steel Drill Screws: ASTM C 1002 unless otherwise indicated.

1. Use screws complying with ASTM C 954 for fastening panels to steel members from 0.033 to 0.112 inch thick.
2. For fastening cementitious backer units, use screws of type and size recommended by panel manufacturer.

D. Trim Accessories: ASTM C 1047, galvanized or aluminum-coated steel sheet, rolled zinc, plastic, or paper-faced galvanized steel sheet.
E. Control Joints: Dietrich Zinc Control Joint No. 093

F. Joint Treatment: USG Perf-A-Tape joint system.

G. Adhesive: USG Durabond, as recommended by wallboard manufacturer for wood framing.

H. Laminating Adhesive: Joint compound or adhesive as recommended by wallboard manufacturer for laminating gypsum board face layer to gypsum board base layer.

I. Joint Sealant: As specified in Section 079000 - Joint Protection.

PART 3 EXECUTION

3.1 GYPSUM BOARD INSTALLATION

A. Install and finish gypsum board and accessories in accordance with manufacturer's printed instructions and comply with recommendations of GA 216 and ASTM C840, including appendices. Verify control joint locations at walls and ceilings with Architect.

B. Minimize butt joints by using gypsum board of maximum length possible. If cut butt joints are unavoidable, locate end butt joints as far from center of walls or ceilings as possible and stagger not less than 12 inches in alternate courses of board.

C. Do not install imperfect, damaged, damp or wet gypsum board.

D. Butt boards together for light contact at edges or ends with not more than 1/16 inch open space between boards. Do not force into place.

E. Locate edges and joints over supports or back-blocking except in horizontal applications. Position gypsum board so that both tapered edge joints and cut edges abut. Do not place tapered edges against cut edges or ends. Stagger vertical joints over different studs on opposite sides of partition/walls.
   1. Form curved surfaces by carefully bending and fastening board to smooth even curve, free of flat or distorted areas and other imperfections. Comply with manufacturer's instructions for dampening of sheets or scoring of back face, if required to form to radius shown.
   2. Hold gypsum board 1/4 inch above floor at each type of partition.

F. Install solid and semisolid drywall partitions made-up of coreboard or gypsum board studs with face courses of exposed gypsum board, laminated with both adhesive and screws.

G. Isolate gypsum surfaces with control joints or other stress relief where:
   1. Partition or furring abuts structural element (except floor) or dissimilar wall or ceiling.
   2. Ceiling abuts structural element, dissimilar wall or partition or other vertical penetration.
   3. Construction changes within plane of partition or ceiling.
   4. Partition or furring run exceeds 30 feet.
   5. Ceiling dimensions exceed 30 feet in either direction.
   6. Wings of "L", "U" and "T" shaped ceiling areas are joined.
   7. Expansion joints occur in exterior wall if expansion joints are not used.
   8. Where control joint is near a door opening, locate and align control joint with edge of door frame.
      a. Ceiling height door frames may be used as control joints.
      b. Where door frames are less than ceiling height, extend control joints to ceiling from both corners

H. Cover both faces of steel stud partition framing with gypsum panels in concealed spaces (above ceilings, etc.), except in chases braced internally.
1. Unless concealed application is indicated or required for sound, fire, air, or smoke ratings, coverage may be accomplished with scraps of not less than 8 sq. ft. in area.
2. Fit gypsum panels around ducts, pipes, and conduits.
3. Where partitions intersect open concrete coffers, concrete joists, and other structural members projecting below underside of floor/roof slabs and decks, cut gypsum panels to fit profile formed by coffers, joists, and other structural members; allow 1/4- to 3/8-inch- wide joints to install sealant.

I. Provide perimeter isolation where non-load-bearing partitions abut structural decks or ceilings, or vertical structural elements. Allow not less than 1/4 inch, or more than 1/2 inch gap between gypsum and structure. Finish edges of face layer with casing bead. Seal space between casing bead and structure with continuous acoustical sealant bead. Do not attach board directly to tracks.

J. Cutting, Fitting and Trimming: Accurately measure and precut gypsum drywall units prior to installation. Make cuts from face side by scoring and snapping away from face side or by sawing. Completely cut paper on back face; do not break paper by tearing. Maintain close tolerances for accurate fit at joints between sheets and at framed openings, and allow for covering of edges of cut-outs with plates and escutcheons. Cut edges smooth as required for neat and accurate fit.

K. Begin fastening from center portion of sheet and work toward edges and ends. Ensure contact of drywall with supports by applying pressure on surface adjacent to fastener being driven. Do not locate fasteners closer than 3/8 inch from edges and ends of gypsum drywall. Drive with shank approximately perpendicular to drywall surface.

L. Drive screws with power screwdriver recommended by drywall manufacturer. Do not hammer drive screws. Set screw heads slightly below surface of drywall, but do not break or strip paper face around screw. Stagger screws on edges and ends of adjacent sheets.

M. For fire-rated Walls: Fasten to metal framing and furring with screws. Comply with drywall manufacturer’s instructions and UL requirements for fastening, but do not exceed 8 inches on center at perimeter and 12 inches on center spacing at the field. Space fasteners not less than 1/4 inch from edges and ends of gypsum drywall.
   1. For Non-rated Walls: Fasten perimeter and field at 12 inches on center.
   2. For multilayer fire-rated walls: Comply with UL requirements.
   3. For Acoustical Walls: Comply with fire-rated wall UL requirements.

N. Multilayer Application on Partitions/Walls: Apply gypsum board indicated for base layers and face layers vertically (parallel to framing) with joints of base layers located over stud or furring member and face-layer joints offset at least one stud or furring member with base-layer joints, unless otherwise indicated or required by fire-resistance-rated assembly. Stagger joints on opposite sides of partitions.
   1. Z-Furring Members: Apply base layer vertically (parallel to framing) and face layer either vertically (parallel to framing) or horizontally (perpendicular to framing) with vertical joints offset at least one furring member. Locate edge joints of base layer over furring members.

O. Multilayer Fastening Methods: Fasten base layers and face layers separately to supports with screws.

3.2 ACOUSTICALLY RATED PARTITIONS

A. Where acoustically rated partitions are shown, provide complete air tight, acoustical rated assembly meeting or exceeding requirements of Sound Transmission Class (STC) ratings per manufacturer’s requirements and GA 600 for sound control requirements.

B. Do not penetrate acoustically rated partitions without authorization from Architect.
C. Stagger joints between layers of gypsum board and install gypsum board to be continuous between adjacent rooms.

D. Fit gypsum board tightly around structural elements.

E. Install continuous acoustical sealant at:
   1. Entire perimeter of wall on each side of top, bottom and side of walls.
   2. Intersection at change of plane and change of material.
   3. Gaps between service outlets and gypsum board
   4. Each penetration.
   5. Structural elements.
   6. All penetrations of partition, wall, and floor construction by ductwork, conduit, piping, or structure.
   7. All termination of partitions enclosing Noise Critical Spaces to abutting construction (e.g. partitions, structure, etc.)
   8. Both sides of door frames to abutting construction where doors are scheduled to have acoustical seals.
   9. Both sides of window frames to adjacent construction.
   10. Perimeter of and penetrations through sound isolating ceilings, roof systems, and floor systems.

F. Seal entire back of service boxes.

G. Seal gaps around penetrations as follows:
   1. One inch or less gap filled tightly with batt insulation and apply sealant.
   2. One inch or greater gap fill with acoustical insulation and moldable putty.

H. Backer Rod shall be used in all joints, product to be constructed of closed cell foam, or appropriate resilient material for sealant. Dimension shall be minimum 30% greater than joint width, unless otherwise indicated on details.

3.3 INSTALLATION OF TILE BACKER BOARD

A. Comply with manufacturer's written instructions for installation and finishing.
   2. Install backerboard, leaving a 1/8-inch to 3/16-inch gap at all joints and corners. Stagger board joints with those of adjacent rows.
   3. Fasten backerboard every 8-inches o.c. along framing members.
   4. Fill gaps solid with latex Portland cement mortar and embed 2-inch alkali resistant fiberglass tape.

B. Tape joints in backer board as recommended by board manufacturer. Seal ends, cut-edges and penetrations of each piece with tile setting mortar or water-resistant adhesive, and then immediately imbed tape and level joints.

C. Where tile backing panels abut other types of panels in same plane, shim surfaces to produce a uniform plane across panel surfaces.

3.4 VAPOR RETARDER INSTALLATION

A. General: Extend vapor retarder to extremities of areas to be protected from vapor transmission. Secure in place with adhesives or other anchorage system as indicated.

B. At Open Framing: Seal vertical joints in vapor retarders over framing by lapping not less than two wall studs. Fasten vapor retarders to framing at top, end, and bottom edges; at perimeter of wall openings; and at lap joints. Space fasteners 16 inches o.c.
C. Seal overlapping joints in vapor retarders with adhesives or vapor-retarder tape according to vapor-retarder manufacturer’s instructions.
   1. Seal butt joints and fastener penetrations with vapor-retarder tape.
   2. Locate all joints over framing members or other solid substrates.

D. Firmly attach vapor retarders to substrates with mechanical fasteners or adhesives as recommended by vapor-retarder manufacturer.

E. Seal end laps and terminations after each day’s work with trowelled bead of mastic. Lap sides 2-1/2 inches minimum and ends 6 inches.

F. Seal ends and edges to each other and to adjoining surfaces with uniform fillet bead of sealant. Extend vapor retarder to perimeter of windows and door frames and other items interrupting plane of membrane.
   1. Imbed vapor retarder in sealant and tape edge to window or door frame.

G. Apply heavy pressure to membrane at top and bottom terminations with back of utility knife to assure positive adhesion at edge.
   1. Roll membrane firmly and completely, immediately after each sheet is applied.

H. Lap joints on sloped substrate in direction of drainage.

I. Work out air bubbles, wrinkles, and fishmouths. Firmly press sheet into place without stretching.

J. Seal joints caused by pipes, conduits, electrical boxes, and similar items penetrating vapor retarders with vapor-retarder tape to create an airtight seal between penetrating objects and vapor retarder.

K. After installation protect membrane from damage.

L. Repair tears or punctures in vapor retarders immediately before concealment by other work. Cover with vapor-retarder tape or another layer of vapor retarder.

### 3.5 ACCESSORIES INSTALLATION

A. Acoustical Insulation: Install blankets in accordance with manufacturer’s printed instructions, with tight joints in blanket units. Use tape, adhesive or staples to hold blankets in place.
   1. Place acoustical insulation in partitions tight within spaces, around cut openings, behind and around electrical and mechanical items within or behind partitions and tight to items passing through partitions.

B. Drywall Sealant: Seal perimeter of sound-rated partitions by filling open space between drywall and floor or ceiling construction with continuous bead of sealant. Fill open spaces between drywall and fixtures, cabinets and other flush or penetrating items with continuous bead of sealant. Seal sides and back of electrical boxes to completely close up openings and joints. Seal perimeter of wallboard shaft wall where it abuts other work.
   1. Apply joint sealant in accordance with Section 079000 - Joint Protection.

C. Adhesive Application: Use adhesive recommended by manufacturer for type of substrate indicated. Prepare substrate and laminate wallboard in accordance with manufacturer’s printed instructions. Provide temporary fasteners or bracing as recommended until adhesive sets.

D. Reinforce external corners of drywall with metal corner bead. Securely fasten metal corner beads, edge trim casing beads and control joints.
3.6 SHAFT WALL INSTALLATION

A. Anchor and fasten materials and components to comply with ratings and performance requirements, and to comply with governing regulations.

B. Coordinate gypsum board shaft system work with sprayed-on fireproofing of structure, so that both remain complete and undamaged. Patch or replace sprayed-on fireproofing removed or damaged during installation of shaft system.

C. Seal perimeter of each section of gypsum board shaft work where it abuts other work. Install second bead of acoustical sealant in location and manner which will prevent dislocation by air pressure differential between shaft and external spaces. Seal joints and penetrations in work; comply with manufacturer's instructions.

3.7 FINISHING

A. Finish exposed drywall surfaces with joints, corners and exposed edges reinforced or trimmed and with joints, fastener heads, trim accessory flanges and surface defects filled with joint compound in accordance with drywall manufacturer's recommendations for smooth, flush surface. Form true, level or plumb lines, without joints, fastener heads, flanges of trim accessories or defects visible after application of field-applied decoration. Exposed metal trim (not filled) will not be acceptable.

B. Use joint tape to reinforce joints formed by tapered edges or butt ends of drywall units and at interior corners and angles. Set tape in joint compound and apply skim coat over tape in one application. Do not use topping or finishing compounds for setting of tapes.

C. At field-built demountable partitions, apply filament tape to joints prior to application of joint compound, leaving a tail of unfastened tape approximately 1/2 inch either at bottom of partition (to be concealed by base) or above finished ceiling.

D. Apply joint compound to joint. Apply joint compound to fill holes left from removal of screws at intermediate studs. Finish gypsum drywall thereafter, including sanding of final coat, in accordance with ASTM C840.

E. Where open spaces of more than 1/16 inch width occur between abutting drywall units, except at control joints, prefﬁll joints with joint compound and allow prefﬁll to dry before application of joint tape.

F. Finish Levels of Joints in Interior Gypsum Board Work:
   1. Level 0: No taping, ﬁnishing, or accessories required.
      a. Use above suspended ceilings and within other concealed spaces, unless assembly is ﬁre rated, sound rated, sound or smoke controlled, or unless space serves as air plenum.
   2. Level 1: At joints and interior angles embed tape in joint compound. Leave surface free of excess joint compound. Tool marks and ridges are acceptable.
   3. Level 2: At joints and interior angles embed tape in joint compound with one separate coat of joint compound applied over joints, angles, fastener heads, and accessories.
      a. Use for mold and water resistant gypsum board indicated for use as a substrate for ceramic tile.
      b. Use for gypsum board indicated for use as a substrate for wood paneling or acoustical panels.
      c. Use above suspended ceilings and within other concealed spaces if gypsum board assembly is fire rated, sound rated, sound or smoke controlled, or space serves as air plenum.
   4. Level 3: At joints and interior angles embed tape in joint compound with 2 separate coats of joint compound applied over joints, angles, fastener heads, and accessories. Apply joint compound smooth and free of tool marks and ridges.
      a. Use where heavy grade wall covering is ﬁnal decoration.
b. Use where gypsum board is base for acoustical ceiling tile.

5. Level 4: At joints and interior angles embed tape in joint compound with 3 separate coats of joint compound applied over joints, angles, fastener heads, and accessories. Apply joint compound smooth and free of tool marks and ridges.
   a. Use for all locations, except those indicated for other finish levels.

6. Level 5: At joints and interior angles embed tape in joint compound with 3 separate coats of joint compound applied over joints, angles, fastener heads, and accessories. Apply thin skim coat, as specified in Joint Treatment Materials Article above, to entire surface. Leave surface smooth and free of tool marks and ridges.
   a. Use where semi-gloss or gloss finish coatings are final decoration.
   b. Use for 2 story walls with direct natural day lighting (Lobbies, Entries, Rooms with large day lighting and long walls perpendicular to windows).
   c. Use at ceilings in Lobbies, assembly areas with direct natural day lighting.
   d. Use where skim coat finish is indicated.

G. Cementitious Backer Units: Finish according to manufacturer’s written instructions.

H. Glass-Mat, Water-Resistant Backing Panels: Finish according to manufacturer’s written instructions.

3.8 PROTECTION

A. Protect adjacent surfaces from drywall compound and promptly remove from floors and other non-drywall surfaces. Repair surfaces stained, marred, or otherwise damaged during drywall application.

B. Protect installed products from damage from weather, condensation, direct sunlight, construction, and other causes during remainder of the construction period.

C. Remove and replace panels that are wet, moisture damaged, and mold damaged.
   1. Indications that panels are wet or moisture damaged include, but are not limited to, discoloration, sagging, or irregular shape.
   2. Indications that panels are mold damaged include, but are not limited to, fuzzy or splotchy surface contamination and discoloration.

END OF SECTION
SECTION 093000
TILING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Tile Materials.
   4. Waterproofing and Crack Isolation Membrane
   5. Tiling Accessories.

1.2 ACTION SUBMITTALS
A. Shop Drawings: Indicate tile patterns and accessory locations; width and locations of control, isolation, contraction and expansion joints in tile surface.
B. Samples: For color selection and appearance acceptance.
   1. Full-size units of each type and size of tile and for each color and finish.
   2. Grout color samples.
   3. Full-size units of each type of ceramic tile accessory (CTA). Provide linear trim and profiles, 6 inches long.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For qualified Installer.
B. Material Test Reports: For each tile-setting and grouting products.

1.4 CLOSEOUT SUBMITTALS
A. Furnish extra materials that match and are from same production runs as products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Tile and Trim Units: Furnish quantity of full-size units equal to 3 percent of amount installed for each type, composition, color, pattern, and size indicated.

1.5 QUALITY ASSURANCE
A. Installer Qualifications: Engage installer who has minimum 5 years’ experience and who has completed tile installations similar in material, design, and extent to that indicated for this Project and with record of successful in-service performance.

1.6 DELIVERY, STORAGE, AND HANDLING
A. Deliver and store packaged materials in original containers with seals unbroken and labels intact until time of use. Comply with requirements in ANSI A137.1 for labeling tile packages.
B. Store tile and cementitious materials on elevated platforms, under cover, and in a dry location.
C. Store aggregates where grading and other required characteristics can be maintained and contamination can be avoided.
D. Store liquid materials in unopened containers and protected from freezing.
E. Handle tile that has temporary protective coating on exposed surfaces to prevent coated surfaces from contacting backs or edges of other units. If coating does contact bonding surfaces of tile, remove coating from bonding surfaces before setting tile.

1.7 PROJECT CONDITIONS
A. Provide sufficient heat and ventilation in areas where work of this section is being performed, so as to allow ceramic tile to properly set. Take precautionary measures necessary to ensure that excessive temperature changes do not occur.
B. Environmental Limitations: Do not install tile until construction in spaces is complete and ambient temperature and humidity conditions are maintained at the levels indicated in referenced standards and manufacturer's written instructions.

PART 2 PRODUCTS

2.1 TILE MATERIALS
A. Source Limitations for Tile: Obtain tile of each type and color or finish from one source or producer, and from same production run and of consistent quality in appearance and physical properties for each contiguous area.
B. ANSI Ceramic Tile Standard: Provide tile that complies with ANSI A137.1 for types, compositions, and other characteristics indicated.
C. Factory Blending: For tile exhibiting color variations within ranges, blend tile in factory and package so tile units taken from one package show same range in colors as those taken from other packages and match approved Samples.
D. Ceramic Tile: Standard Grade complying with ANSI A137.1. All-purpose porcelain type units with manufacturer's standard back-mounting.
   1. Basis of Design: Refer to Material Schedule for product selections and product information such as colors, finishes, and accessories..
      a. (CTF) Ceramic Floor Tiles.
      b. (CTW) Ceramic Wall Tiles.
      c. (CTB) Ceramic Wall Base Tiles.
   2. Tile Trim and Special Shapes: Rounded external corners and trim shapes at head, jamb and sills of openings.
   3. Slip-Resistant Units: Abrasive-surfaced tile with aluminum oxide abrasive uniformly distributed on face of tile to achieve minimum coefficient of friction of 0.60, ASTM C1028. Provide where indicated.

2.2 SETTING MATERIALS
A. Tile-Setting System Manufacturer: Provide complete tile-setting system consisting of materials by a single Manufacturer. Obtain ingredients of a uniform quality for each mortar, adhesive, and grout component from one manufacturer and each aggregate from one source or producer. Provide tile setting system by one of the following:
   1. Bostik.
   2. Custom Building Products.
   3. LATICRETE International Inc..
   4. MAPEI Corporation.
B. ANSI Standards for Tile Installation Materials: Provide materials complying with ANSI A108.02, ANSI standards referenced in other Part 2 articles, ANSI standards referenced by TCA installation methods specified in tile installation schedules, and other requirements specified.

   1. Cleavage Membrane: Asphalt felt, ASTM D 226, Type I (No. 15); or polyethylene sheeting, ASTM D 4397, 4.0 mils thick.
   2. Reinforcing Wire Fabric: Galvanized, welded wire fabric, 2 by 2 inches by 0.062-inch diameter; comply with ASTM A 185 and ASTM A 82 except for minimum wire size.
   3. Latex Additive: Manufacturer’s standard water emulsion, serving as replacement for part or all of gaging water, of type specifically recommended by latex-additive manufacturer for use with field-mixed portland cement and aggregate mortar bed.

D. Latex-Portland Cement Mortar (Thin Set): ANSI A118.4, consisting of the following:
   1. Prepackaged dry-mortar mix containing dry, redispersible, ethylene vinyl acetate additive to which only water must be added at Project site.
   2. Prepackaged dry-mortar mix combined with styrene-butadiene-rubber liquid-latex additive.
      a. For wall applications, provide nonsagging mortar that complies with Paragraph F-4.6.1 in addition to the other requirements in ANSI A118.4.
   3. Flexible Latex-Cement Mortar: Add flexible latex additive to dry mortar mix as recommended by porcelain tile manufacturer.

E. Polymer-Modified Cement Grout: ANSI A118.7. Provide Either ethylene vinyl acetate, in dry, redispersible form, prepackaged with other dry ingredients; or acrylic resin or styrene-butadiene rubber in liquid-latex form for addition to prepackaged dry-grout mix. Color as indicated.
   1. Color: As selected by Architect from manufacturer’s full range to match tile.

F. Epoxy Grout: Chemical-resistant, water-cleanable, tile setting and grouting epoxy, ANSI A118.3.
   2. Provide at quarry tile (QT) and (QTB) installations.

G. Grout Sealer: Provide grout sealer compatible with grout materials as recommended by grout manufacturer, that does not change color or appearance of grout.
   1. Provide at quarry tile (QT) and (QTB) installations.

2.3 ACCESSORIES
A. (CTA) Ceramic Tile Metal Trim and Transition Strips:

B. (CTA-10) Fluid-Applied Waterproofing and Crack Isolation Membrane System: Provide continuous and seamless waterproofing and crack isolation system, including premixed or single-component self-curing liquid-latex rubber or elastomeric-polymer membrane; complying with ANSI A118.10 for waterproofing and ANSI 118.12 for crack isolation; ASTM C627 Extra Heavy Service rating; IAPMO-approved as shower pan liner; and recommended by the manufacturer for the application indicated.
   1. Products and Manufacturers:
      a. Redgard Waterproofing and Crack Prevention Membrane by Custom Building Products
   2. Pre-treat control joints and cracks in accordance with membrane manufacturer’s instructions.
   3. Provide reinforcement and accessories as recommended by manufacturer for complete system.

C. Sealant: Provide sealants, primers, backer rods, and other sealant accessories that comply with the following requirements and with the applicable requirements in Section 079000 - Joint Sealants.
1. Use sealants that have a VOC content of 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
2. Use primers, backer rods, and sealant accessories recommended by sealant manufacturer.
3. Provide sanded elastomeric joints to match sanded grout joints.

D. Sealant and Backer Rod: As specified in Section 079000 - Joint Protection.

2.4 MIXING MORTARS AND GROUT
A. Mix mortars and grouts to comply with referenced standards and mortar and grout manufacturers’ written instructions.
B. Add materials, water, and additives in accurate proportions.
C. Obtain and use type of mixing equipment, mixer speeds, mixing containers, mixing time, and other procedures to produce mortars and grouts of uniform quality with optimum performance characteristics for installations indicated.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine substrates, areas, and conditions where tile will be installed, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of installed tile.
1. Verify that substrates for setting tile are firm, dry, clean, free of coatings that are incompatible with tile-setting materials including curing compounds and other substances that contain soap, wax, oil, or silicone; and comply with flatness tolerances required by ANSI A108.01 for installations indicated.
2. Verify that concrete substrates for tile floors comply with surface finish requirements in ANSI A108.01 for installations indicated.
   a. Verify that surfaces that received a steel trowel finish have been mechanically scarified.
   b. Verify that protrusions, bumps, and ridges have been removed by sanding or grinding.
3. Verify that installation of grounds, anchors, recessed frames, electrical and mechanical units of work, and similar items located in or behind tile has been completed.
4. Verify that joints and cracks in tile substrates are coordinated with tile joint locations; if not coordinated, adjust joint locations in consultation with Architect.
B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION
A. Prepare surfaces to receive tile as recommended by mortar or adhesive manufacturer; and in compliance with TCA's “Handbook for Ceramic Tile Installation”.
1. Roughen surfaces that are glossy or which have loose surface material by sanding or scarifying.
2. Remove surface material that is not compatible with adhesive.
3. Use primer when recommended by adhesive manufacturer.
4. Clean thoroughly to remove oil, dirt and dust.
B. Where indicated, prepare substrates to receive waterproofing by applying a reinforced mortar bed that complies with ANSI A108.1A and is sloped 1/4 inch per foot toward drains.
3.3 TILE INSTALLATION

A. Comply with TCA’s “Handbook for Ceramic Tile Installation” for TCA installation methods specified in tile installation schedules. Comply with parts of the ANSI A108 Series "Specifications for Installation of Ceramic Tile" that are referenced in TCA installation methods, specified in tile installation schedules, and apply to types of setting and grouting materials used.
   1. Achieve 100 percent bond in tile work. Back butter units 12 inch by 12 inch and larger.

B. Extend tile work into recesses and under equipment and fixtures, to form complete covering without interruptions. Terminate work neatly at obstructions, edges and corners without disruption of pattern or joint alignment.

C. Accurately form intersections and returns. Perform cutting and drilling of tile without marring visible surfaces. Grind cut edges of tile abutting trim, finish or built-in items for straight, aligned joints.
   1. Fit tile closely to electrical outlets, piping and fixtures so that plates, collars or covers overlap tile.

D. Perimeter: Provide for expansion at perimeter with non-grouted and non-sealed perimeter expansion joint.

E. Expansion Joints: Locate expansion joints and other sealant filled joints, including control, contraction and isolation joints, where indicated, or if not indicated, at spacings and locations recommended in TCA Handbook for Ceramic Tile Installation, and approved by Architect.
   1. Width of expansion joints in tile to match width of aligned joints in substrate slab.

F. Grout Jointing Pattern: Unless otherwise shown, lay ceramic tile in grid pattern. Align joints when adjoining tiles on floor, base, walls and trim are same size. Layout tile work and center tile fields both directions in each space or on each wall area.
   1. Adjust to minimize tile cutting. Provide uniform joint width.
   2. Provide 1/8 inch wide joints.

G. Apply grout sealer as recommended by sealer and grout material manufacturers.

3.4 INSTALLED WORK

A. Clean grout and setting materials from face of tile while materials are workable. Leave tile face clean and free of foreign matter.

B. Unglazed tile may be cleaned with acid solutions only when permitted by tile and grout manufacturer’s printed instructions, but not sooner than 10 days after installation.

C. Leave finished installation clean and free of cracked, chipped, broken, unbonded, or otherwise defective tile work.

D. Protect installed tile work with heavy covering during construction period to prevent damage and wear. Setting materials for large format tile require longer curing time.

END OF SECTION
SECTION 095100
ACOUSTICAL CEILINGS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Acoustical panel ceilings and exposed suspension system (ACT).

1.2 SUBMITTALS
A. Product Data: For each type of product indicated.
B. Coordination Drawings: Reflected ceiling plans drawn to scale and coordinating penetrations and ceiling-mounted items. Show the following:
   1. Ceiling suspension members.
   2. Method of attaching hangers to building structure.
   3. Ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings.
C. Samples for Verification: For each component indicated and for each exposed finish required, prepared on Samples of size indicated below.
   1. Acoustical Panel: Set of manufacturers standard size samples of each type, color, pattern, and texture.
   2. Exposed Suspension System Members, Moldings, and Trim: Set of 12 inch long samples of each type, finish, and color.

1.3 QUALITY ASSURANCE
A. Ceilings and Interior Systems Contractors Association (CISCA): Acoustical Ceilings, Use and Practice.
B. Installer's Qualifications: Firm experienced in application or installation of systems similar in complexity to those required for this Project, including specific requirements indicated.
   1. Acceptable to or licensed by manufacturer
C. Coordination of Work: Coordinate layout and installation of acoustical ceiling units and suspension system components with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system components and partition system.
D. Source Limitations for Ceiling Units and Suspension Systems: Obtain each acoustical ceiling panel and suspension system from one source with resources to provide products of consistent quality in appearance and physical properties without delaying Work.

1.4 DELIVERY, STORAGE, AND HANDLING
A. Deliver acoustical panels, suspension system components, and accessories to Project site in original, unopened packages and store them in a fully enclosed, conditioned space where they will be protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.
B. Before installing acoustical panels, permit them to reach room temperature and a stabilized moisture content.
C. Handle acoustical panels carefully to avoid chipping edges or damaging units in any way.

1.5 ENVIRONMENTAL CONDITIONS
A. Environmental Limitations: Do not install acoustical panel ceilings until spaces are enclosed and weatherproof, wet work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.
   1. Install ceiling tile after carpeting and other interior materials that off-gas has been installed and odors and VOC fumes have dissipated.
   2. Permit wet work to dry prior to commencement of installation.
B. Maintain uniform temperatures of minimum 60 degrees F and humidity as recommended by acoustical ceiling manufacturer prior to, during and after installation.

1.6 COORDINATION
A. Coordinate layout and installation of acoustical panels and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

1.7 EXTRA MATERIALS
A. Provide extra one percent of each type of acoustical ceiling unit to Owner for replacement.

PART 2 PRODUCTS

2.1 PRODUCTS AND MANUFACTURERS
A. Products and Manufacturers: Provide specified Basis of Design or approved equivalent product by one of the following:
   1. Armstrong World Industries, Inc..
   2. USG Interiors, Inc..
   3. Chicago Metallic Corporation.
B. (ACT) Basis-of-Design Acoustic Ceiling Panel and Suspension Grids: As indicated on the Material Schedule.

2.2 SUSPENSION SYSTEM
A. Metal Suspension System: Provide manufacturer's standard direct-hung metal suspension systems of types, structural classifications, and finishes indicated that comply with applicable requirements in ASTM C 635.
   1. Provide manufacturer’s standard aluminum grid system where indicated on Room Finish Schedule.
   2. High-Humidity Finish: Comply with ASTM C 635 requirements for “Coating Classification for Severe Environment Performance” where high-humidity finishes are indicated.
   3. Recycled Content: Provide products made from steel sheet with average recycled content such that postconsumer recycled content plus one-half of pre-consumer recycled content is not less than 25 percent.
   4. Double-Web, Exposed Steel Suspension System: Main and cross runners roll formed from cold-rolled steel sheet, prepainted, electrolytically zinc coated, or hot-dip galvanized according to ASTM A 653/A 653M, not less than G30 coating designation, with prefinished metal caps on flanges.
b. Face Design: Flat, flush.
c. Cap Material: Steel cold-rolled sheet.
d. Face Width: As indicated on Material Identification list.

5. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft temper, pre-stretched, with a yield stress load of at least three design load, but not less than 12 gauge.

B. Accessories: Provide stabilizer bars, furring clips, splices, edge moldings and hold down clips as required to complete and complement suspended ceiling grid system.
2. Attachment Devices: Size for five times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.
3. Edge Moldings and Trim: Provide Roll-formed sheet metal type in profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations, formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension system runners, and complying with seismic design requirements.
4. Touch-up Paint: Manufacturer’s touch-up paint for field cut tegular or other reveal edge tiles.

C. Carrying Channels and Hangers: Primed steel, size and type to suit application and to rigidly secure complete acoustic unit ceiling system, with maximum deflection of 1/360.

D. Finishes and Colors, General: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes. Provide manufacturer's standard factory-applied finish for type of system indicated.

2.3 METAL EDGE MOLDINGS AND TRIM
A. Roll-Formed, Sheet-Metal Edge Moldings and Trim: Type and profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations that comply with seismic design requirements; formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension-system runners.
1. Provide manufacturer's edge moldings that fit acoustical panel edge details and suspension systems indicated and that match width and configuration of exposed runners unless otherwise indicated.
2. For circular penetrations of ceiling, provide edge moldings fabricated to diameter required to fit penetration exactly.

2.4 ACOUSTICAL CEILING PANELS
A. Acoustical Panel Standard: Provide manufacturer’s standard panels of configuration indicated that comply with ASTM E 1264 classifications as designated by types, patterns, acoustical ratings, and light reflectance, unless otherwise indicated.
1. Recycled Content: Provide acoustical panels with recycled content such that postconsumer recycled content plus one-half of pre-consumer recycled content constitutes a minimum of 40 percent by weight.
2. Surface-Burning Characteristics: Provide acoustical panels with surface-burning characteristics complying with ASTM E 1264 for Class A materials with flame spread of 0-25, as determined by testing identical products per ASTM E 84.

B. Broad Spectrum Antimicrobial Fungicide and Bactericide Treatment: Provide acoustical panels treated with manufacturer's standard antimicrobial formulation that inhibits fungus, mold, mildew, and gram-positive and gram-negative bacteria and showing no mold, mildew, or bacterial growth when tested according to ASTM D 3273 and evaluated according to ASTM D 3274 or ASTM G 21.
PART 3 EXECUTION

3.1 EXAMINATION
A. Examine substrates and structural framing to which ceiling system attaches or abuts, with Installer present, for compliance with requirements specified in this and other sections that affect installation and anchorage of ceiling system. Do not proceed with installation until unsatisfactory conditions have been corrected.

3.2 PREPARATION
A. Measure each ceiling area and establish layout of acoustical units to balance border widths at opposite edges of each ceiling. Avoid use of less-than-half-width units at borders, and comply with reflected ceiling plans.

3.3 INSTALLATION
A. General: Install acoustical panel ceilings to comply with ASTM C636 and seismic requirements indicated, per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."
B. Suspend ceiling hangers from building's structural members and as follows:
   1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.
   2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.
   3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.
   4. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure and appropriate for substrate and that will not deteriorate or otherwise fail due to age, corrosion, or elevated temperatures.
   5. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, post-installed mechanical or adhesive anchors, or power-actuated fasteners that extend through forms into concrete.
   6. Do not attach hangers to steel deck tabs.
   7. Do not attach hangers to steel roof deck. Attach hangers to structural members.
      a. Provide alternate framing method if structural members are spaced too far apart.
   8. Space hangers not more than 48 inches o.c. along each member supported directly from hangers, unless otherwise indicated; provide hangers not more than 8 inches from ends of each member.
C. Install edge moldings and trim of type indicated at perimeter of acoustical ceiling area and where necessary to conceal edges of acoustical panels.
   1. Apply acoustical sealant in a continuous ribbon concealed on back of vertical legs of moldings before they are installed.
   2. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.
   3. Do not use exposed fasteners, including pop rivets, on moldings and trim.
D. Install suspension system runners so they are square and securely interlocked with one another. Remove and replace dented, bent, or kinked members.
E. Tolerances: Erect ceiling system level within 1/8 inch in 12'-0" in any direction.

3.4 ACoustical Panel Installation

A. Fit acoustic lay-in panels in place, free from damaged edges or other defects detrimental to appearance and function. Lay directional patterned tile one way with pattern parallel to shortest room axis.
   1. Scribe and cut panels at borders and penetrations to provide a neat, precise fit.
   2. Field recess units with tegular or reveal edge at border or ceiling edge.
   3. Paint cut edges of panel remaining exposed after installation; match color of exposed panel surfaces using coating recommended in writing for this purpose by acoustical panel manufacturer.

B. Install lay-in panels level, in uniform plane and free from twist, warp and dents with straight joints, edges in alignment, and edges and corners flush.

3.5 Adjust and Clean

A. Adjust sags or twists that develop in ceiling systems and replace part which is damaged or faulty.

B. Clean exposed surfaces of acoustical ceilings, including trim, edge moldings, and suspension members; comply with manufacturer's instructions for cleaning and touch-up of minor finish damage.
   1. Remove and replace work that cannot be successfully cleaned and repaired to permanently eliminate evidence of damage.

END OF SECTION
SECTION 095820
LINEAR METAL CEILINGS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Suspended linear metal beam and baffle ceiling systems (BMC-1)
   2. Sound insulation and accessories.
   3. Ceiling suspension system, hangers and inserts.
   4. Metal closures, filler strips, and end plugs.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Samples: For each component indicated and for each exposed finish required, prepared on Samples of size indicated below:
   1. Linear Metal Ceiling: Set of 12-inch- long Samples of each type and color and a 12-inch- long spliced section.
   2. Suspension System Members: 12-inch- long Sample of each type.
   3. Exposed Molding and Trim: Set of 12-inch- long Samples of each type, finish, and color.
C. Delegated-Design Submittal: For design of attachment devices.

1.3 INFORMATIONAL SUBMITTALS
A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Linear pattern.
   2. Staggered joint pattern.
   3. Ceiling suspension members and clips.
   4. Method of attaching hangers to building structure.
   5. Ceiling-mounted items including light fixtures, diffusers, grilles, speakers, sprinklers, and access panels.
   6. Ceiling perimeter and penetrations through ceiling; trim and moldings.
B. Evaluation Reports: For linear metal ceiling and components and anchor and fastener type.

1.4 QUALITY ASSURANCE
A. Mockups: Build mockups to verify selections made under Sample submittals and to demonstrate aesthetic effects and to set quality standards for materials and execution.
   1. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.5 DELIVERY, STORAGE, AND HANDLING
A. Deliver linear metal pans, suspension system components, and accessories to Project site in original, unopened packages and store them in a fully enclosed, conditioned space where they are protected against damage from moisture, humidity, temperature extremes, direct sunlight, surface contamination, and other causes.
B. Handle linear metal pans, suspension system components, and accessories carefully to avoid damaging units and finishes in any way.

1.6 PROJECT CONDITIONS

A. Environmental Limitations: Do not install linear metal ceilings until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Delegated Design: Engage a qualified professional engineer to design attachment devices.
   1. Attachment Devices: Size for five times the design load indicated in ASTM C 635, Table 1, Direct Hung, unless otherwise indicated.

B. Surface-Burning Characteristics: Comply with ASTM E 84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   1. Flame-Spread Index: Comply with ASTM E 1264 for Class A materials.
   2. Smoke-Developed Index: 50 or less.

2.2 SUSPENDED LINEAR BEAM AND BAFFLE CEILING

A. (BMC-1) Suspended Linear Beam and Baffle Ceiling System: ASTM E 1264, formed aluminum pans and suspension system.
   1. Basis of Design: Tavola Prime Beam and Baffle System by Hunter Douglas Architectural Products, Inc..

B. Configuration:
   1. Pan Face Width: 2 inches.
   2. Pan Depth: 8 inches.
   3. Edges: Square.
   6. Provide filler strips and end caps matching pan face finish.

2.3 CEILING SYSTEM COMPONENTS

A. Edge Moldings and Trim: Provide exposed members as indicated or required to comply with seismic requirements of authorities having jurisdiction, to conceal edges of penetrations through ceiling, to conceal ends of pans and carriers, for fixture trim and adapters, for fasciae at changes in ceiling height, and for other conditions; of metal and finish matching linear metal pans or extruded plastic unless otherwise indicated.

B. Metal Suspension System: Provide ceiling manufacturer's standard metal suspension systems of types and finishes indicated that comply with applicable ASTM C 635 requirements.
   1. Provide systems complete with carriers, splice sections, connector clips, alignment clips, leveling clips, hangers, molding, trim, retention clips, load-resisting struts, fixture adapters, and other suspension components required to support ceiling units and other ceiling-supported construction.
   2. Finish: All suspension components painted black.
3. Accessories: Provide stabilizer bars, furring clips, splices, edge moldings and hold down clips as required to complete and complement suspended ceiling grid system.

4. Wire for Hangers and Ties: ASTM A 641, Class 1 zinc coating, soft temper, pre-stretched, with a yield stress load of at least time three design load, but not less than 12 gauge.

5. Attachment Devices: Size for five times design load indicated in ASTM C 635, Table 1, Direct Hung unless otherwise indicated.

6. Edge Moldings and Trim: Provide Roll-formed sheet metal type in profile indicated or, if not indicated, manufacturer's standard moldings for edges and penetrations, formed from sheet metal of same material, finish, and color as that used for exposed flanges of suspension system runners, and complying with seismic design requirements.

7. Carrying Channels and Hangers: Primed steel, size and type to suit application and to rigidly secure complete acoustic unit ceiling system, with maximum deflection of 1/360.

C. Mechanical Fasteners and Anchors: Use material, type, size and finish required for each substrate for secure anchorage and as recommended by architectural woodwork fabricator and installer.

1. Provide concealed anchors unless otherwise indicated.

2. Provide metal expansion sleeves or expansion bolts for post-installed anchors.

3. Use nonferrous-metal or hot-dip galvanized anchors and inserts at inside face of exterior walls.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examine substrates, areas, and conditions, including structural framing and substrates to which linear metal ceilings attach or abut, with Installer present, for compliance with requirements specified in this and other Sections that affect ceiling installation and anchorage and with requirements for installation tolerances and other conditions affecting performance of linear metal ceilings.

1. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Preparation: Measure each ceiling area and establish layout of linear metal pans to balance border widths at opposite edges of each ceiling. Avoid using less-than-half-width pans at borders, and comply with layout shown on reflected ceiling plans and on Coordination Drawings.

C. Field Measurements: Take field measurements as required to fit the Work properly. Recheck measurements before installing each product.

1. Where portions of the Work are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication.

2. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

3. Verify space requirements and dimensions of items shown diagrammatically on Drawings.

3.2 INSTALLATION, GENERAL

A. Comply with ASTM C 636, per manufacturer's written instructions and CISCA's "Ceiling Systems Handbook."

B. Suspended Installation: Suspend ceiling hangers from building's structural members and as follows:

1. Install hangers plumb and free from contact with insulation or other objects within ceiling plenum that are not part of supporting structure or of ceiling suspension system.

2. Splay hangers only where required to miss obstructions; offset resulting horizontal forces by bracing, countersplaying, or other equally effective means.

3. Where width of ducts and other construction within ceiling plenum produces hanger spacings that interfere with location of hangers at spacings required to support standard suspension system members, install supplemental suspension members and hangers in form of trapezes or equivalent devices.
4. Secure wire hangers to ceiling suspension members and to supports above with a minimum of three tight turns. Connect hangers directly either to structures or to inserts, eye screws, or other devices that are secure and appropriate for substrate to which hangers are attached and for type of hanger involved.

5. Secure flat, angle, channel, and rod hangers to structure, including intermediate framing members, by attaching to inserts, eye screws, or other devices that are secure and appropriate for both structure to which hangers are attached and type of hanger involved. Install hangers in a manner that does not cause them to deteriorate or fail due to age, corrosion, or elevated temperatures.

6. Do not support ceilings directly from permanent metal forms or floor deck. Fasten hangers to cast-in-place hanger inserts, postinstalled mechanical or adhesive anchors, or power-actuated fasteners that extend through forms into concrete.

7. When steel framing does not permit installation of hanger wires at spacing required, install carrying channels or other supplemental support for attachment of hanger wires.

8. Do not attach hangers to steel deck tabs.

9. Do not attach hangers to steel roof deck. Attach hangers to structural members.

10. Space hangers not more than 48 inches o.c. along each member supported directly from hangers unless otherwise indicated; provide hangers not more than 8 inches from ends of each member.

11. Size supplemental suspension members and hangers to support ceiling loads within performance limits established by referenced standards and publications.

C. Install edge moldings and trim of type indicated at perimeter of linear metal ceiling area and where necessary to conceal edges and ends of linear metal pans.

1. Screw attach moldings to substrate at intervals not more than 16 inches o.c. and not more than 3 inches from ends, leveling with ceiling suspension system to a tolerance of 1/8 inch in 12 feet. Miter corners accurately and connect securely.

2. Do not use exposed fasteners, including pop rivets, on moldings and trim.

D. Install suspension system carriers so they are aligned and securely interlocked with one another. Remove and replace dented, bent, or kinked members.

3.3 LINEAR METAL BAFFLE CEILING INSTALLATION

A. Suspension Components:

1. Main Runners: Install 48 inches on center by direct suspension from existing structure, with not less than 12 gauge hanger wires wrapped tightly 3 full turns, spaced 48 inches on center along component length.

2. Web Covers: Installed on main runners during main runner installation.

3. Cross Tees: Installed perpendicular to main runners 48 inches on center forming 48x48 inch modules.

4. Wall Angles: Installed on vertical surfaces intersecting suspension system by appropriate method in accordance with industry accepted practice.

B. Linear Baffle Panels and Accessories: Install perpendicular or diagonally to main runner component spaced as noted on project drawings, or identical to the baffle panel depth. 6 inch maximum allowable overhang for baffle panels. Attach with suspension clips to main runners. Connect with top alignment clip and bottom alignment sleeve.

3.4 INSTALLED WORK

A. Damaged or Non-Compliant Work: Remove and replace materials that are damaged or do not comply with requirements.

1. Damaged woodwork may be repaired or refinished if resulting repair work complies with requirements and shows no evidence of repair or refinishing.
2. Remove and replace woodwork materials that are wet, moisture damaged, or mold damaged.
3. Replace, at no additional cost to Owner, materials that are damaged or that cannot be cleaned
to satisfaction of Owner.

B. Adjusting: Adjust movable components of assembly to operate safely, smoothly, easily, and quietly,
free from binding, warp, distortion, nonalignment, misplacement, disruption, or malfunction,
throughout entire operational range, and without binding or damaging assembly components. Lubri-
cate hardware and moving parts. Adjust joinery for uniform appearance.

C. Cleaning: Clean and provide maintenance on completed construction as frequently as necessary
through the remainder of the construction period.
   1. Clean interior finish carpentry on exposed and semi-exposed surfaces. Restore damaged or
soiled areas and touch up factory-applied finishes, if any.
   2. Clean cabinetwork, counters, shelves, hardware, fittings and fixtures.

D. Protection: Provide final protection and maintain conditions that ensure installed Work is without
damage or deterioration at time of Substantial Completion.
   1. Comply with specified requirements for temperature and relative humidity.
   2. Protect installed products from damage from weather, moisture, dust, dirt and other causes
during construction.

E. Demonstration and Training: Instruct Owner's personnel to operate, adjust and maintain operable
components of assemblies.

END OF SECTION
SECTION 096001
FLOORING TRANSITION STRIPS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Transition strips (TRS).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
B. Samples for Initial Selection: For each type of transition strip indicated.
C. Product Schedule & Layout: Use same designations indicated on Drawings.

1.3 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Resilient Transition Strips: Furnish not less than 10 percent of total length installed, for each profile type and color.

1.4 COORDINATION & FIELD CONDITIONS
A. Coordinate installation of floor transitions strips with installation of associated floor finishes. Install flooring after other finishing operations, including painting, have been completed. Close spaces to traffic during installation.

PART 2 PRODUCTS

2.1 FLOORING TRANSITION STRIPS

2.2 INSTALLATION MATERIALS
A. Trowelable Leveling and Patching Compounds: Latex-modified, Portland-cement-based or blended hydraulic-cement-based formulation provided or approved by flooring manufacturer for applications indicated.

B. Adhesives: Water-resistant type recommended by product manufacturers to suit flooring and substrate conditions indicated.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of resilient sheet flooring.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound; remove bumps and ridges to produce a uniform and smooth substrate.

END OF SECTION
SECTION 096400
WOOD FLOORING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   2. (WDF-2) Vinyl Sheet Flooring Over Subfloor.
   4. (WDF-20) Hardwood Strip Flooring Over Underlayment.
   5. Subfloor components.

1.2 ACTION SUBMITTALS
A. Product Data: For each material and floor system component.
B. Shop Drawings: For each type of floor assembly and accessory. Include plans, sections, and attachment details. Include expansion provisions and trim details.
C. Samples: Coordinate with Section 064000 for submittal of samples for concurrent review of materials by Architect.
   1. (WDF-2) Flooring System Cutaway Samples: Approximately 18 inches square; including all subfloor components.
   2. (WDF-20) Flooring System Cutaway Samples: Approximately 18 inches square, constructed of hardwood strips of specified type, thickness, width and finish, demonstrating the full range of expected color and texture variations; including all subfloor components.

1.3 INFORMATIONAL SUBMITTALS
A. Site Conditions Reports: Relative humidity and temperature readings taken before, during and after installation. Include readings taken in areas where woodwork is stored on site prior to installation.

1.4 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Hardwood Strips: Equal to 2 percent of amount installed for each type, color, and finish of wood flooring indicated.

1.5 QUALITY ASSURANCE
A. Installer Qualifications: An experienced Installer who has completed wood flooring installations similar in material, design, and extent to that indicated for this Project and whose work has resulted in installations with a record of successful in-service performance.
B. Mockups: Build mockups to verify selections made under Sample submittals, to demonstrate aesthetic effects, and to set quality standards for materials and execution.
   1. Approval of mockups does not constitute approval of deviations from the Contract Documents contained in mockups unless Architect specifically approves such deviations in writing.
   2. Subject to compliance with requirements, approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.
1.6 FIELD CONDITIONS

A. Delivery, Handling and Storage: Protect woodwork items from damage, dust and dirt. Do not deliver, receive, store or install woodwork materials until storage and installation areas are conditioned in accordance with requirements and recommendations of NAAWS.

B. Environmental Requirements: Use permanent HVAC system or provide temporary systems and controls to establish and maintain site conditions complying with specified requirements.
   1. Do not deliver, receive, store or install architectural woodwork until building is enclosed, wet work is complete, and temporary or permanent HVAC systems are operating in areas where woodwork is stored and installed and are maintaining temperature and relative humidity at occupancy levels and within the following ranges during the remainder of the construction phase:
      a. Temperature Range: Between 60 and 90 deg F.
      b. Relative Humidity Range: Between 45 and 55 percent.
   2. Fluctuation of Temperature and Relative Humidity Levels:
      a. Do not exceed 15 percent fluctuation over any portion of a 7-day period and not to exceed 25 percent fluctuation over any portion of a 28-day period.
      b. Maintain operation and control of heating, cooling, humidity, ventilation, temporary barriers and similar facilities continuously on a 24-hour basis to avoid rapidly fluctuating ambient levels.
   3. Site Conditions Report: Monitor temperature and relative humidity in areas where woodwork is stored and installed at Project site. Record temperature and relative humidity prior to delivery, throughout storage period and installation, and after installation until time of Substantial Completion. Report recorded values in accordance with Submittals requirements.

PART 2 PRODUCTS

2.1 WOOD FLOORING, GENERAL

A. Source Limitations: For wood flooring, obtain each species, grade, and cut of wood from one source with resources to provide materials and products of consistent quality in appearance and physical properties.

B. Hardwood Flooring: Comply with NWFA A500 for species, grade, and cut.

2.2 FLOORING SYSTEM CONFIGURATIONS

A. Floor assembly configurations as shown on Drawings and as described below:

B. (WDF-1) Hardboard Panel Flooring Over Subfloor:
   1. Tempered hardboard, 1/4-inch, 1 layer, painted finish (PT-3).
   2. T&G plywood, 3/4-inch, 1 layer.
   3. Square edge plywood, 3/4-inch, 1 layer.
   4. Wood sleepers, solid 2 by 4 lumber.
   5. Resilient isolation pads.
   6. Vapor barrier.

C. (WDF-2) Vinyl Sheet Flooring Over Subfloor:
   1. Vinyl sheet flooring, 1.2 mm.
   2. Tempered hardboard, 1/4-inch, 1 layer.
   3. T&G plywood, 3/4-inch, 1 layer.
   4. Square edge plywood, 3/4-inch, 1 layer.
   5. Wood sleepers, solid 2 by 4 lumber.
   7. Vapor barrier.
D. (WDF-3) Hardboard Panel Flooring Over Subfloor:
   1. Tempered hardboard, 1/4-inch, 1 layer, painted finish (PT-3).
   2. T&G plywood, 3/4-inch, 1 layer.
   3. Square edge plywood, 3/4-inch, 1 layer.
   4. Wood sleepers, solid 2 by 4 lumber.
   5. Resilient isolation pads.

E. (WDF-20) Hardwood Strip Flooring Over Underlayment:
   1. Solid rift sawn red oak strips, end-matched, blind-nailed.
   2. T&G plywood, 3/4-inch, 1 layer.
   3. Vapor barrier.

2.3 FLOORING SYSTEM COMPONENTS

A. Solid-Wood Hardwood: Kiln dried to 6 to 9 percent maximum moisture content, tongue and groove and end matched, and with backs channeled (kerfed) for stress relief.
   1. Species, Cut & Finish: Red Oak, rift sawn, stain and transparent finish to match WD-1 as specified in Section 064000.
   2. Edge Profile: Tongue and groove.
   3. Face Width: 2-1/4 inches.
   5. Lengths: Random-length strips complying with applicable grading rules.
   6. Finish: Stain and waterborne urethane finish system as specified below.

B. Field-Applied Transparent Finish System: Complete water-based system of compatible components that is recommended by finish manufacturer for application indicated, and matching Architect's sample.
   1. Wood Filler: Compatible with finish system components and recommended by filler and finish manufacturers for use indicated. If required to match approved Samples, provide pigmented filler.
   2. First Coat, Stain: Deep penetrating, low VOC, one-coat, UV stable stain.
      b. Color: Cinnamon.
      a. Product: Sansin Purity Floor.
      a. Product: Sansin Purity Floor.

C. Sheet Vinyl Flooring:

D. Painted Finishes: In compliance with Section 099000 - Painting, and as follows:

E. Hardboard Panel: 1/4-inch tempered S2S hardboard.

F. Plywood for Subfloor:
   1. Tongue and Groove Edge: Group 1, EXT-APA B-B, with special solid jointed core construction (B-Grade); installed with staggered joints.
   2. Square Edge: C-D EXT, thickness as indicated, installed with staggered joints.

G. Slip Sheet: Red-rosin type building paper, 3 lb/100 sq. ft. minimum weight.

I. Neoprene Waffle Pads: Natural rubber resilient pads. Isolation Pad Deflection: Provide pad spacing and durometer such that manufacturer’s recommended deflection is not exceeded under normal and maximum anticipated loads. Pad spacing shall be at least 16” o.c., but no farther than 24” o.c..
   1. Durometer: 50 as required.
   2. Size: 2 inches by 2 inches.
   3. Thickness: 3/4-inch.
   4. Basis of Design: Super W Pads by Mason Industries

J. Vapor Retarder: ASTM D4397, polyethylene sheet not less than 6.0 mils thick.

2.4 INSTALLATION ACCESSORIES

B. Fasteners: As recommended by manufacturer, but not less than that recommended in NWFA’s "Installation Guidelines: Wood Flooring."

C. Wood Flooring Adhesive: Mastic recommended by flooring and adhesive manufacturers for application indicated.
   1. Use adhesives that have a VOC content of not more than 100 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Cork Expansion Strip: Composition cork strip.

E. Solid Wood Trim, Vents and Grilles: Of same species and grade as wood flooring and in sizes indicated on Drawings.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, installation tolerances, and other conditions affecting performance of wood flooring.
   1. Slab Depression: Verify slab surface is level, maintaining a consistent slab depression of 2-3/4 inches measured from surface of adjacent terrazzo.
   2. Grind high spots and fill low spots to produce a maximum 1/8-inch deviation in any direction when checked with a 10-foot straight edge.
   3. Use trowel-applied leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, and depressions in substrates.
   4. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.

C. Broom and vacuum substrates immediately prior to product installation. After cleaning, examine substrates for moisture, alkaline salts, carbonation, or dust. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Comply with flooring manufacturer's written installation instructions, but not less than applicable recommendations in NWFA's "Installation Guidelines."

B. Vapor Barrier: Install in accordance with vapor barrier Manufacturer’s written instructions.
C. Wood Sleepers and Subfloor: Install according to requirements in Section 061000 - Rough Carpentry.

D. Solid-Wood Flooring: Blind nail or staple flooring to substrate.

E. Provide expansion space at walls and other obstructions and terminations of flooring of not less than 3/4 inch.

3.3 FIELD FINISHING

A. Machine-sand flooring to remove offsets, ridges, cups, and sanding-machine marks that are noticeable after finishing. Vacuum and tack with a clean cloth immediately before applying finish.
   1. Comply with applicable recommendations in NWFA's "Installation Guidelines."

B. Fill open-grained hardwood and repair wood flooring defects.

C. Apply floor-finish materials in number of coats recommended by finish manufacturer for application indicated, but not less than one coat of floor sealer and three finish coats.
   1. Apply stains to achieve an even color distribution matching approved Samples.
   2. For water-based finishes, use finishing methods recommended by finish manufacturer to minimize grain raise.

D. Comply with finish Manufacturer's written instructions for covering, or leaving it exposed until cured.

E. Do not cover wood flooring after finishing until finish reaches full cure, and not before seven days after applying last finish coat.

3.4 INSTALLED WORK

A. Protect installed wood flooring during remainder of construction period with covering of heavy kraft paper or other suitable material. Do not use plastic sheet or film that might cause condensation.
   1. Do not move heavy and sharp objects directly over kraft-paper-covered wood flooring. Protect flooring with plywood or hardboard panels to prevent damage from storing or moving objects over flooring.

END OF SECTION
SECTION 096500
RESILIENT FLOORING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
1. Resilient floor tile (RFT).
2. Resilient sheet flooring (RSF).
3. Resilient wall base (RB).
4. Installation accessories.
B. Related Sections:
1. Section 033000 - Cast-In-Place Concrete: Substrate preparation.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product indicated.
B. Samples: For each exposed product and for each color and texture specified, not less than 12 inches long.

1.3 INFORMATIONAL SUBMITTALS
A. Slab Moisture Content and Calcium Chloride Test Results.
B. Compatibility Certification: Submit approval documentation by both flooring manufacturer and adhesive manufacturer as compatible with substrate, flooring, project conditions, use, expected traffic, equipment loads and surface conditions including alkalinity, moisture emission levels, slab relative humidity, and other factors that may affect flooring and adhesive performance.
C. Maintenance Instructions: Submit manufacturer's written instructions for recommended maintenance practices for each type of resilient flooring.

1.4 MAINTENANCE MATERIAL SUBMITTALS
A. Furnish extra materials, from the same product run, that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. (RB-1) Resilient Base: Furnish not less than 5 percent of total linear feet installed.
2. Other Replacement Materials: Furnish not less than one percent of total project quantity of each type, size and color of material to Owner for replacement materials. Clearly identify each container of replacement materials.

1.5 QUALITY ASSURANCE
A. Installer Qualifications: A qualified installer who employs workers for this Project who are competent in techniques required by manufacturer for floor covering installation.

1.6 FIELD CONDITIONS
A. Deliver resilient flooring materials in manufacturer's protective packaging. Store and handle flooring with care to prevent damage.
B. Maintain ambient temperatures within range recommended by manufacturer, but not less than 70 deg F or more than 95 deg F, in spaces to receive floor coverings during the following time periods:
1. 72 hours before installation.
2. During installation.
3. 72 hours after installation.

C. Until Substantial Completion, maintain ambient temperatures within range recommended by manufacturer, but not less than 55 deg F or more than 95 deg F.

D. Install floor coverings after other finishing operations, including painting, have been completed.

E. Close spaces to traffic during floor covering installation and for 72 hours after floor covering installation.

F. General Contractor shall be responsible for conducting one calcium chloride test for every 1,000 square feet (minimum of 3 tests) to insure concrete moisture emissions do not exceed 5.0 lbs per 1,000 square feet within a 24-hour period.

PART 2 PRODUCTS

2.1 RESILIENT PRODUCTS

A. Single Source: Provide each type of resilient flooring produced by single manufacturer, single run.

B. Basis of Design: As indicated on Material Schedule.

C. (RFT) Linoleum Floor Tile: ASTM F 2195, Type II, linoleum floor tile with special backing.

E. (RB) Rubber Wall Base: ASTM F 1861, Type TS, Group 1, Styles A and B. Provide in 120-feet long rolls. Provide standard top-set cove base, except provide straight base at carpet.
1. ASTM E 84; Class B rating with smoke density of 150-200.

F. (RTS) Resilient Floor Finish Transition Strips:

2.2 INSTALLATION ACCESSORIES

A. Trowelable Leveling and Patching Compounds: Latex-modified, portland cement based or blended hydraulic-cement-based formulation provided or approved by manufacturer for applications indicated.

B. Skim Coat: Portland cement-based, trowel-applied skim coat intended for thin application over rough or abrasive surfaces to create a smooth prepared surface to receive resilient flooring.
1. Extent: At stair treads and landings in P1, P2 and P3.
2. Primer: As recommended by and manufactured by concrete topping Manufacturer.
3. Aggregate: Well washed, graded, fine gravel or larger aggregate as recommended by Manufacturer.

C. Adhesives: Water-resistant type recommended by manufacturer to suit resilient products and substrate conditions indicated.
1. VOC Content: Comply with the following limits when calculated according to 40 CFR 59, Subpart D (EPA Method 24):
   a. VCT Adhesives: Not more than 50 g/L.
   b. Cove Base Adhesives: Not more than 50 g/L.
   c. Rubber Floor Adhesives: Not more than 60 g/L.

D. Floor Polish: Provide protective liquid floor polish products as recommended by manufacturer.

E. Sealer and Wax: Type recommended by resilient flooring material manufacturer for material type and location.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, with Installer present, for compliance with requirements for maximum moisture content and other conditions affecting performance of the Work.
   1. Verify that finishes of substrates comply with tolerances and other requirements specified in other Sections and that substrates are free of cracks, ridges, depressions, scale, and foreign deposits that might interfere with adhesion of floor tile.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Prepare substrates according to manufacturer's written instructions to ensure adhesion of floor coverings.

B. Concrete Substrates: Prepare according to ASTM F 710.
   1. Verify that substrates are dry and free of curing compounds, sealers, and hardeners.
   2. Remove substrate coatings and other substances that are incompatible with floor covering adhesives and that contain soap, wax, oil, or silicone, using mechanical methods recommended by manufacturer. Do not use solvents.
   3. Alkalinity and Adhesion Testing: Perform tests recommended by manufacturer. Proceed with installation only after substrates pass testing.
   4. Moisture Testing: Perform tests recommended by manufacturer and as follows. Proceed with installation only after substrates pass testing.
      a. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. (1.36 kg of water/92.9 sq. m) in 24 hours.
      b. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have maximum 75 percent relative humidity level measurement.

C. Fill cracks, holes, and depressions in substrates with trowelable leveling and patching compound and remove bumps and ridges to produce a uniform and smooth substrate.

D. Do not install floor coverings until they are same temperature as space where they are to be installed.
   1. Move floor coverings and installation materials into spaces where they will be installed at least 72 hours in advance of installation.

E. Sweep and vacuum clean substrates to be covered by floor coverings immediately before installation.

3.3 FLOOR TILE INSTALLATION

A. Comply with manufacturer's written instructions for installing floor tile.

B. Lay out floor tiles from center marks established with principal walls, discounting minor offsets, so tiles at opposite edges of room are of equal width. Adjust as necessary to avoid using cut widths that equal less than one-half tile at perimeter.
C. Match floor tiles for color and pattern by selecting tiles from cartons in the same sequence as manufactured and packaged, if so numbered. Discard broken, cracked, chipped, or deformed tiles.

D. Scribe, cut, and fit floor tiles to butt neatly and tightly to vertical surfaces and permanent fixtures including built-in furniture, cabinets, pipes, outlets, and door frames.

E. Extend floor tiles into toe spaces, door reveals, closets, and similar openings. Extend floor tiles to center of door openings.

F. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on floor tiles as marked on substrates. Use chalk or other nonpermanent marking device.

G. Adhere floor tiles to flooring substrates using a full spread of adhesive applied to substrate to produce a completed installation without open cracks, voids, raising and puckering at joints, telegraphing of adhesive spreader marks, and other surface imperfections.

3.4 INSTALLED WORK

A. Comply with manufacturer’s written instructions for cleaning and protection of floor coverings.

B. Perform the following operations immediately after completing floor covering installation:
   1. Remove adhesive and other blemishes from exposed surfaces.
   2. Sweep and vacuum surfaces thoroughly.
   3. Damp-mop surfaces to remove marks and soil.

C. Protect floor coverings from mars, marks, indentations, and other damage from construction operations and placement of equipment and fixtures during remainder of construction period.

D. Floor Polish: Remove soil, visible adhesive, and surface blemishes from floor coverings before applying liquid floor polish.

END OF SECTION
SECTION 096723
RESINOUS FLOORING

PART 1 - GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Decorative quartz resinous flooring system (PTE-20).
   2. Preparation of concrete substrate to receive resinous flooring.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product specified. Include manufacturer's technical data, installation instructions, and recommendations for each resinous flooring component required
B. Samples for Initial Selection: Submit samples representing standard color range.
C. Samples: Provide samples for each resinous flooring system required, 6 inches square, applied by Installer for this Work to a rigid backing, in color, texture, and finish indicated. Where finishes involve normal color and texture variations, include sample sets showing the full range of variations expected.

1.3 QUALITY ASSURANCE
A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of flooring systems required for this Project.
   1. Engage an installer who is certified in writing by resinous flooring manufacturer as qualified to apply resinous flooring systems indicated.
B. Preinstallation Conference: Conduct conference at Project site.
C. Mockups: Apply mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Apply full-thickness mockups on 48-inch- square floor area selected by Architect.
      a. Include 48-inch length of integral cove base with inside[ and outside] corner.
   2. Simulate finished lighting conditions for Architect's review of mockups.
   3. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 DELIVERY, STORAGE, HANDLING
A. Store materials in dry, protected area with minimum temperature of 55 degrees F and away from fires or open flames.

1.5 PROJECT CONDITIONS
A. Environmental Limitations: Comply with resinous flooring manufacturer's written instructions for substrate temperature, ambient temperature, moisture, ventilation, and other conditions affecting resinous flooring installation.
B. Lighting: Provide uniform and sufficient lighting in areas of installation.
C. Close spaces to traffic during resinous flooring application and for not less than 24 hours after application, unless manufacturer recommends a longer period.
D. Ventilate area in which flooring is being applied as required.
1.6 COORDINATION

A. Concrete Curing: Coordinate curing methods with manufacturer’s requirements for substrate compatibility.

PART 2 - PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Source Limitations: Obtain primary elastomeric flooring materials including primers, resins, hardening agents, grouting coats, topcoats, finish and sealing coats from single manufacturer with not less than 3 years of successful experience in supplying principal materials for work of type described in this section.

1. Obtain secondary materials, including patching and fill material, joint sealant, and repair materials, of type and from manufacturer recommended in writing by manufacturer of primary materials.

B. Flammability: Self-extinguishing according to ASTM D 635.

C. Product shall withstand anticipated traffic and be VOC compliant product.

2.2 MANUFACTURERS

A. Subject to compliance with requirements, provide Basis of Design or equivalent flooring system by one of the following manufacturers and as approved by Architect:

1. BASF Construction Chemicals, Inc.; BASF Building Systems.
2. Crossfield Products Corp.; Dex-O-Tex.
3. DUDICK Inc.
4. International Coatings Inc.
5. Micor Company, Inc.
6. NEOGARD; Division of JONES-BLAIR.
7. PPG Industries, Inc.
9. Sherwin-Williams Company; General Polymers.
10. Stonhard, Inc.
11. Tennant Company
12. Tnemec Company, Inc.
13. Valspar Flooring.
14. Or Approved Equal.

2.3 RESINOUS FLOORING SYSTEMS

2. Configuration:
   a. Color and Pattern: As selected by Architect from manufacturer’s full range.
   b. Wearing Surface: [Textured for slip resistance] [Orange-peel texture] [Smooth] [Manufacturer’s standard wearing surface].
   c. Overall System Thickness: [1/16 inch] [1/8 inch] [3/16 inch] [1/4 inch].
3. Primer: Type recommended by manufacturer for substrate and body coats indicated.
4. **Slurry Coat and Bonding Coat**: Self-leveling epoxy resin slurry with broadcast color quartz aggregates, spread with notched trowel or rubber squeegee.
   a. **Slurry Coat**: 1/8 inch minimum thickness.

5. **Grout and Topcoat**: High-performance, high-solids two-component epoxy finish coat.
   a. **Type**: Clear.
   b. **Finish**: Non-slip quartz aggregate finish.

6. **System Physical Properties**: Provide resinous flooring system with the following minimum physical property requirements when tested according to test methods indicated:
   a. **Compressive Strength**: 12,000 psi per ASTM C579.
   b. **Tensile Strength**: 2500 psi per ASTM C307.
   c. **Flexural Modulus of Elasticity**: 4500 psi per ASTM C580.
   d. **Resistance to Elevated Temperature**: No slip or flow of more than 1/16 inch per MIL-D-3134.
   e. **Abrasion Resistance**: 70-90 maximum weight loss per ASTM D4060.
   f. **Flammability**: Self-extinguishing per ASTM D635.
   g. **Hardness**: 70/65, Shore D per ASTM D2240.
   h. **Bond Strength**: 300 psi, 100 percent concrete failure per ACI 503R.

2.4 **SUBSTRATE PREPARATION MATERIALS**

   A. **Moisture Vapor Control**: Provide Manufacturer’s moisture mitigation primer as recommended in writing by flooring system Manufacturer.

   B. **Patching and Fill Material**: Resinous product of or approved by resinous waterproof flooring manufacturer and recommended by manufacturer for application indicated.

   C. **Joint Sealant**: Provide sealant type recommended or produced by resinous flooring manufacturer for type of service and joint condition indicated, and compatible with resinous floor system.

**PART 3 - EXECUTION**

3.1 **EXAMINATION**

   A. **Ensure that subfloor is clean, dry, hard, sound, and free of oils or other substance which would affect proper bonding and curing**.

   B. **Substrate shall be above 50 degrees F, dry and free of excessive water vapor transmission with a relative humidity below 85 percent**.

   C. **Moisture Vapor Transmission**: Perform Calcium Chloride test per ASTM F1869-04 to determine moisture vapor emission levels prior to application. If results exceed 3 pounds per 1000 square feet in 24 hours, apply manufacturer’s recommended vapor control product and retest until results are within 3 pound limit. If test results exceed 15 pounds per 1000 square feet in 24 hours, consult resinous flooring manufacturer before applying vapor control products. Perform test after surface cleaning is performed. Notify Architect immediately of test results.

   D. **Verify that all floor penetrations are sealed**.

3.2 **SUBSTRATE PREPARATION**

   A. **Concrete Substrates, General**: Provide sound concrete surfaces free of laitance, glaze, efflorescence, curing compounds, form-release agents, dust, dirt, grease, oil, and other contaminants incompatible with resinous flooring.

   1. **Shot-blast surfaces with an apparatus that abrades the concrete surface, contains the dispensed shot within the apparatus, and re-circulates the shot by vacuum pickup.**
2. Repair damaged and deteriorated concrete according to resinous flooring manufacturer's written recommendations.
3. Prepare and clean substrates according to resinous flooring manufacturer's written instructions for substrate indicated.

B. Moisture Testing: Verify that concrete substrates are dry and moisture-vapor emissions are within acceptable levels according to manufacturer's written instructions.
   1. Perform anhydrous calcium chloride test, ASTM F 1869. Proceed with application of resinous flooring only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. of slab area in 24 hours.
   2. Perform plastic sheet test, ASTM D 4263. Proceed with application only after testing indicates absence of moisture in substrates.
   3. Perform relative humidity test using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.

C. Alkalinity and Adhesion Testing: Verify that concrete substrates have pH within acceptable range. Perform tests recommended by manufacturer. Proceed with application only after substrates pass testing.

D. Control Joint Treatment: Treat control joints and other nonmoving substrate cracks to prevent cracks from reflecting through resinous flooring according to manufacturer's written instructions.

E. Patching and Filling: Use patching and fill material to fill holes and depressions in substrates according to manufacturer's written instructions.

F. Keyways: Saw-cut key ways into concrete substrate in accordance with Manufacturer's written recommendations.

3.3 APPLICATION

A. General: Apply components of flooring system according to manufacturer's written instructions to produce a uniform, monolithic wearing surface of thickness indicated.
   1. Coordinate application of components to provide optimum adhesion of resinous waterproof flooring system to substrate and optimum intercoat adhesion.
   2. Cure resinous components according to manufacturer's written instructions. Prevent contamination during application and curing processes.
   3. At substrate expansion and isolation joints, provide joint in resinous flooring to comply with resinous flooring manufacturer's written recommendations.
   4. Apply system with sufficient texture to slip resistance required by local code and provide surface texture to allow ease of cleaning.

B. Primer: Apply primer over prepared substrate at manufacturer's recommended spreading rate.

C. Waterproofing: Apply waterproofing membrane, where indicated, in manufacturer's recommended thickness.
   1. Apply waterproofing membrane to integral cove base substrates.

D. Reinforcement: Apply reinforcing membrane to [substrate cracks] [entire substrate surface].

E. Coatings: Apply coatings in thickness indicated. When cured, sand to remove trowel marks and roughness.
2. **Troweled or Screeded Body Coats:** Apply troweled or screeded body coats in thickness indicated for flooring system. Hand or power trowel and grout to fill voids. When body coats are cured, remove trowel marks and roughness using method recommended by manufacturer.

3. **Grout Coat:** Apply grout coat, of type recommended by resinous flooring manufacturer, to fill voids in surface of final body coat.

4. **Topcoats:** Apply topcoats in number indicated for flooring system and at spreading rates recommended in writing by manufacturer and to produce wearing surface indicated.

F. **Aggregates:** Broadcast aggregates at rate recommended by manufacturer and, after resin is cured, remove excess aggregates to provide surface texture indicated.

G. **Integral Cove Base:** Apply cove base mix to wall surfaces before applying flooring. Apply according to manufacturer's written instructions and details including those for taping, mixing, priming, troweling, sanding, and topcoating of cove base. Round internal and external corners.

1. Integral Cove Base Height: As shown, see Drawings.

### 3.4 FIELD QUALITY CONTROL

A. **Waterproofing:** Verify waterproof integrity of waterproof system.

1. On completion of installation of membrane, dam areas in preparation for flood testing.
2. Flood area to minimum depth of one inch with clean water. After 48 hours, check for leaks.
3. If leaking is found, patch using same waterproofing materials; repeat flood-test.
4. When area is proved watertight, drain water and remove dam.

B. **Material Sampling:** Owner may at any time and any number of times during resinous flooring application require material samples for testing for compliance with requirements.

1. Owner will engage an independent testing agency to take samples of materials being used. Material samples will be taken, identified, sealed, and certified in presence of Contractor.
2. Testing agency will test samples for compliance with requirements, using applicable referenced testing procedures or, if not referenced, using testing procedures listed in manufacturer's product data.
3. If test results show applied materials do not comply with specified requirements, pay for testing, remove noncomplying materials, prepare surfaces coated with unacceptable materials, and reapply flooring materials to comply with requirements.

C. Prepare test and inspection reports.

### 3.5 INSTALLED WORK

A. **Protection:** Protect resinous flooring from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by resinous flooring manufacturer.

**END OF SECTION**
SECTION 096800
CARPETING

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Carpet tiles and sheet carpet (CPT).
   2. Installation accessories.

B. Related Sections:
   1. Section 033000 - Cast-in-Place Concrete: Finish troweling of concrete floor slabs.
   2. Section 087100 - Door Hardware: Thresholds for door openings.

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include manufacturer's written data on physical characteristics and durability.
   2. Include manufacturer's written installation recommendations for each type of substrate.

B. Shop Drawings: For carpet installation, showing the following:
   1. Columns, doorways, enclosing walls or partitions, built-in cabinets, and locations where cutouts
      are required in carpet.
   2. Carpet type, color, and dye lot.
   3. Type of subfloor.
   4. Type of installation.
   5. Pattern of installation.
   6. Pattern type, location, and direction.
   7. Pile direction.
   8. Transition details to other flooring materials.

C. Samples: For each of the following products and for each color and texture required. Label each
   Sample with manufacturer's name, material description, color, pattern, and designation indicated on
   Drawings and in schedules.
   1. Carpet: 12-inch- square Sample.
   2. Carpet Tile: Full-size Sample.
   3. Exposed Edge, Transition, and Other Accessory Stripping: 12-inch- long Samples.
   5. Carpet Seam: 6-inch Sample.

1.3 INFORMATIONAL SUBMITTALS

A. Compatibility Certification: Submit approval documentation by both flooring manufacturer and
   adhesive manufacturer as compatible with substrate, flooring, project conditions, use, expected
   traffic, equipment loads and surface conditions including alkalinity, moisture emission levels, slab
   relative humidity, and other factors that may affect flooring and adhesive performance.

1.4 CLOSEOUT SUBMITTALS

A. Maintenance Data: For carpet to include in maintenance manuals. Include the following:
   1. Methods for maintaining carpet, including cleaning and stain-removal products and procedures
      and manufacturer's recommended maintenance schedule.
2. Precautions for cleaning materials and methods that could be detrimental to finishes and performances. Including cleaning and stain-removal products and procedures.

B. Extra Materials: Furnish extra materials described below that match products installed, are packaged with protective covering for storage, and are identified with labels clearly describing contents.
   1. Carpet Tiles: Before installation begins, furnish quantity of full-size units equal to 5 percent of amount installed.

1.5 QUALITY ASSURANCE
   A. Installer Qualifications: Engage experienced Installer who is certified by Floor Covering Installation Board (FCIB) or who can demonstrate compliance with FCIB certification program requirements.

1.6 DELIVERY, STORAGE AND HANDLING
   A. Comply with the Carpet and Rug Institute’s CRI 104, Section 5: “Storage Handling.”
   B. Deliver materials to Project site in original wrappings and containers, labeled with identification of manufacturer, brand name, and lot number.
   C. Store materials on-site in original undamaged packages, inside well-ventilated area protected from weather, moisture, soilage, extreme temperatures, and humidity. Lay flat, with continuous blocking off ground.

1.7 PROJECT CONDITIONS
   A. Comply with CRI 104, Section 6: “Site Conditions.”
   B. Space Enclosures and Environmental Limitations: Do not install carpet until space is enclosed and weatherproof, wet-work in space is completed and nominally dry, work above ceilings is complete, and ambient temperature and humidity conditions are and will be continuously maintained at values near those indicated for final occupancy.
   C. Subfloor Moisture Conditions: Moisture emission rate of not more than 3 lb/1000 sq. ft/24 hours when tested by calcium chloride moisture test in compliance with CRI 104, 6.2.1, with subfloor temperature not less than 55 degrees F.
   D. Subfloor Alkalinity Conditions: pH range of 5 to 9 when subfloor is wetted with potable water and pHdrion paper is applied.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
   A. Fire-Test-Response Characteristics: Provide carpet with following fire-test-response characteristics as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction. Identify carpet with appropriate markings of applicable testing and inspecting agency.
      2. Critical Radiant Flux Classification: Class I, not less than 0.45 W/sq. cm per ASTM E648.
      3. Flame Spread: 25 or less per ASTM E84.
      4. Smoke Developed: 450 or less per ASTM E84.
2.2 **CARPETING**
A. Single-Source Responsibility: Obtain each type of carpet from one source and by single manufacturer.
B. (CPT) Basis of Design Carpet Tiles: As indicated on Material Schedule.

2.3 **INSTALLATION ACCESSORIES**
A. Trowel-Applied Leveling and Patching Compounds: Latex-modified, hydraulic-cement-based formulation provided or recommended by carpet manufacturer.
B. Concrete-Slab Primer: Non-staining type as recommended by carpet manufacturer.
C. Adhesive: Water-resistant, mildew-resistant, nonstaining type recommended and approved by flooring manufacturer to suit products and subfloor conditions indicated and to comply with flammability requirements for installed carpet as recommended by carpet manufacturer.
   1. Releasable, pressure sensitive type adhesive shall be water-based and allow for removal without damage to carpet or substrate and leave no residue.
D. Seam Adhesive: Hot-melt adhesive tape or similar product recommended by carpet manufacturer for sealing and taping seams and butting cut edges at backing to form secure seams and to prevent pile loss at seams.
   1. Adhesive Seam Sealer: (For 6 foot roll goods) As required, provide adhesive seam sealer certified in writing by the manufacturer as compatible with carpet backing. Seam sealer shall have minimum five year manufacturer’s guarantee. Sealer shall create a 100% chemical weld at the seam site to provide a monolithic installation with a moisture barrier.
E. (TRS) Transition Strips: Refer to Material Identification List and to Drawings for type and color selected. Provide in profile and with finish as indicated by specified product, of height required to protect exposed edge of carpet, and of maximum lengths to minimize running joints.

PART 3 EXECUTION

3.1 **EXAMINATION**
A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for maximum moisture content, alkalinity range, installation tolerances, and other conditions affecting carpet performance.
B. Concrete Slabs: Verify that finishes comply with requirements specified in Section 033000 - Cast-in-Place Concrete and that surfaces are free of cracks, ridges, depressions, scale, and foreign deposits.
C. Floor Substrate Criteria: Ensure concrete floors are dry and meet moisture conditions required by flooring and adhesive manufacturer’s and exhibit negative alkalinity, carbonization or dusting.
   1. Remove curing agents and other surface residue that may negatively affect adhesion or flooring installation and performance.
   2. Moisture vapor emissions do not exceed 75 percent RH when tested in accordance with ASTM F2170 unless otherwise required by finished flooring and adhesive manufacturer.
3. Moisture in concrete slab conditions up to 3lb. per 1,000 sq. ft. per 24 hours when tested with a prepackaged calcium chloride crystal kit performed in accordance with ASTM F1869 unless otherwise required by finished flooring and adhesive manufacturer.
4. Concrete slab alkalinity conditions up to a pH of 6-9 when tested in accordance with ASTM F710 with in-situ monitoring, unless otherwise required by finished flooring and adhesive manufacturer.
5. Maintain testing records and submit along with warranties for Project Record Documents.

D. Slab Moisture Testing: Perform tests so that each test area does not exceed 200 sq. ft. and perform no fewer than three tests in each installation area and with test areas evenly spaced in installation areas.
   1. Anhydrous Calcium Chloride Test: ASTM F 1869. Proceed with installation only after substrates have maximum moisture-vapor-emission rate of 3 lb of water/1000 sq. ft. in 24 hours.
   2. Relative Humidity Test: Using in situ probes, ASTM F 2170. Proceed with installation only after substrates have a maximum 75 percent relative humidity level measurement.
   3. Perform additional moisture tests recommended in writing by adhesive and carpet manufacturers.
   4. Proceed with installation only after substrates pass testing.

3.2 PREPARATION
A. General: Comply with CRI's "CRI Carpet Installation Standard" and with carpet manufacturer's written installation instructions for preparing substrates.
B. Use trowelable leveling and patching compounds, according to manufacturer's written instructions, to fill cracks, holes, depressions, and protrusions in substrates. Fill or level cracks, holes and depressions 1/8 inch wide or wider, and protrusions more than 1/32 inch, unless more stringent requirements are required by manufacturer's written instructions.
C. Concrete Substrates: Remove coatings, including curing compounds, and other substances that are incompatible with adhesives and that contain soap, wax, oil, or silicone, without using solvents. Use mechanical methods recommended in writing by adhesive and carpet manufacturers.

3.3 INSTALLATION
A. Comply with CRI's "CRI Carpet Installation Standard" and written installation instructions by carpet and adhesive manufacturers.
   1. Installation Method: Glue-down method as recommended in writing by carpet manufacturer
   2. Maintain dye-lot integrity. Do not mix dye lots in same area.
   3. Install pattern parallel to walls and borders.
B. Cut and fit carpet to butt tightly to vertical surfaces, permanent fixtures, and built-in furniture including cabinets, pipes, outlets, edgings, thresholds, and nosings. Bind or seal cut edges as recommended by carpet manufacturer.
C. Extend carpet into toe spaces, door reveals, closets, open-bottomed obstructions, removable flanges, alcoves, and similar openings.
D. Maintain reference markers, holes, and openings that are in place or marked for future cutting by repeating on carpet tile as marked on subfloor. Use nonpermanent, nonstaining marking device.

3.4 INSTALLED WORK
A. Cleaning: Perform the following operations immediately after installing carpet:
   1. Remove excess adhesive, seam sealer, and other surface blemishes using cleaner recommended by carpet manufacturer.
2. Remove yarns that protrude from carpet surface.

B. Protection: Protect installed carpet to comply with CRI's "CRI Carpet Installation Standard."

END OF SECTION
SECTION 097700
FIBERGLASS-REINFORCED PANELS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Fiberglass-reinforced plastic panels and accessories (FRP-1).

1.2 SUBMITTALS
A. Product Data: For each type of fiberglass-reinforced panel indicated,
   1. Include installation instructions, construction details, weights, individual components, profiles and finishes.
B. Samples: Two 8 inch by 10 inch samples of each type of panel, 10 inch length of each type of trim and molding, fastener.
C. Shop Drawings: Indicate and dimension locations of joints, fastener attachments.
   1. Show fabrication and installation details not shown on product data.
   2. Show profiles, thicknesses, joints, tolerances and anchorage details.
   3. Show connections to wall mounted items: cutouts for grilles.

1.3 QUALITY ASSURANCE
A. Installer Qualifications: An experienced installer who has completed fiber glass-reinforced panel installations similar in material, design, and extent to those indicated for this Project and whose work has resulted in construction with a record of successful in-service performance.

1.4 PROJECT CONDITIONS
A. During installation and for not less than 48 hours before, maintain ambient temperature and relative humidity within limits required by type of adhesive used.
B. Allow no containers of adhesive to be opened until potential sources of flame or spark have been shut down or extinguished and until warnings against their ignition during adhesive application have been posted.
C. Provide ventilation to disperse fumes during application of solvent-based adhesive.
D. Field Measurements: Where fiber glass-reinforced panels are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Coordinate fabrication schedule with construction progress to avoid delaying the Work.
   1. Established Dimensions: Where field measurements cannot be made without delaying the Work, establish dimensions and proceed with fabricating products without field measurements. Coordinate construction to ensure that actual dimensions correspond to established dimensions.

1.5 COORDINATION
A. Coordinate layout and installation of fiber glass-reinforced panels and attachment system components with other construction, including partition assemblies.
PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test Response Characteristics: Provide fiber glass-reinforced panels with the following surface-burning characteristics as determined by testing identical products per ASTM E84 by UL or another independent testing and inspecting agency acceptable to authorities having jurisdiction:
   1. Flame Spread: 25 or less.
   2. Smoke Developed: 450 or less.

2.2 FIBERGLASS-REINFORCED PLASTIC PANELS

A. Products and Manufacturers: Provide Basis of Design or equivalent product by one of the following manufacturers:
   1. Glasbord with Surfaseal by Crane Composites.
   2. Structoglas by Crane Composites.
   3. Marlite FRP by Marlite.
   4. Fiber-Lite by Nudo Products, Inc.

   1. Nominal Thickness: 0.090 inch.
   2. Panel Finish: Smooth or Embossed (Pebble Texture) as selected by Architect.

2.3 ACCESSORIES

A. Trim Accessories: Manufacturer's standard two-piece, snap-on vinyl extrusions designed to cover edges of panels. Provide division bars, inside corners, outside corners, and caps as needed to conceal edges.

B. Adhesive: As recommended by panel manufacturer for application to substrate.
   1. VOC Content: 50 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

C. Sealant: Single-component, mildew-resistant silicone sealant recommended by plastic paneling manufacturer and complying with requirements in Section 079000 - Joint Protection.
   1. VOC Content: 250 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

D. Exposed Fasteners: Non-corrosive nylon drive rivets as recommended by panel manufacturer.

E. Concealed Mounting Splines: Continuous, H-shaped aluminum extrusions designed to fit into grooves routed in edges of factory-laminated panels and to be fastened to substrate.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.
   1. Examine back-up surfaces to determine that corners are plumb and straight, surfaces are smooth, uniform, clean and free from foreign matter, nails countersunk, joints and cracks filled flush and smooth with adjoining surface.
B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 PREPARATION

A. Preparation for Adhesive Application:
   1. Remove wallpaper, vinyl wall covering, loose or soluble paint, and other materials that might interfere with adhesive bond.
   2. Prepare substrate by sanding high spots and filling low spots as needed to provide flat, even surface for panel installation.
   3. Clean substrates of substances that could impair bond of adhesive, including oil, grease, dirt, and dust.

B. Condition panels by unpacking and placing in installation space before installation according to manufacturer's written recommendations.

C. Lay out paneling before installing. Locate panel joints to provide equal panels at ends of walls not less than half the width of full panels and so that trimmed panels at corners are not less than 12 inches wide, or as shown on Drawings.
   1. Mark plumb lines on substrate at trim accessory and panel joint locations for accurate installation.
   2. Locate trim accessories and panel joints to allow clearance at panel edges according to manufacturer's written instructions.

3.3 INSTALLATION

A. Install fiberglass-reinforced paneling according to manufacturer's written instructions.

B. Install panels in a full spread of adhesive.

C. Install panels with fasteners. Layout fastener locations and mark on face of panels so that fasteners are accurately aligned.
   1. Drill oversized fastener holes in panels and center fasteners in holes.
   2. Apply sealant to fastener holes before installing fasteners.

D. Install trim accessories with [adhesive] [and] [nails].

E. Fill grooves in trim accessories with sealant before installing panels and bed inside corner trim in a bead of sealant.

F. Maintain uniform space between panels and wall fixtures. Fill space with sealant.

G. Maintain uniform space between adjacent panels and between panels and floors, ceilings, and fixtures. Fill space with sealant.

H. Remove excess sealant and smears as paneling is installed. Clean with solvent recommended by sealant manufacturer and then wipe with clean dry cloths until no residue remains.

END OF SECTION
SECTION 098000
ACOUSTIC SURFACE TREATMENTS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
1. Fabric-wrapped acoustic panels (AST-1).
2. Copolymer-faced acoustic panels (AST-2).
3. Surface-applied sound-absorbing insulation panel (AST-10).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of fabric facing, panel edge, core material, and mounting indicated.
B. Shop Drawings: Include mounting devices and details; details at panel head, base, joints, and corners; and details at ceiling, floor base, and wall intersections. Indicate panel edge and core materials.
   1. Layout include elevations showing panel sizes and direction of fabric weave and pattern matching.
C. Coordination Drawings: Elevations and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
   1. Electrical outlets, switches, and thermostats.
   2. Items penetrating or covered by sound-absorbing panels.
   3. Suspended ceiling components above ceiling units.
   4. Structural members to which suspension devices will be attached.
D. Samples:
   1. Assembled Fabric-Wrapped Panels (AST-1) and (AST-2): Submit two assembled panels for each AST type, approximately 12 by 12 inches, including panel core, edges, fabric facing and mounting hardware.
   2. Assembled Fabric-Wrapped Panels (AST-1) and (AST-2): Submit two assembled panels for each AST type, approximately 12 by 12 inches, including panel core, edges, fabric facing and mounting hardware.
   3. Direct-Applied Insulation (AST-10): Submit two samples, 12 inches by 12 inches.
   4. Wood Panel (AST-20)

2.1 INFORMATIONAL SUBMITTALS
A. Qualification Data: For Installer.
B. Field Test Reports: For Adhesion and compatibility testing.
C. Product Certificates: For each type of sound-absorbing wall unit, from manufacturer.

2.2 CLOSEOUT SUBMITTALS
A. Maintenance Data: For each product.
B. Maintenance Material Submittals: Furnish extra materials from same production run that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
1. Fabric: For each fabric, color, and pattern installed, provide length equal to 5 percent of amount installed, full width of bolt.

1.3 QUALITY ASSURANCE

A. Installer Qualifications: A firm or individual certified, licensed, or otherwise qualified by Manufacturer of acoustic treatment.

B. Mockups: Before installing acoustical wall panels, build mock-ups for each form of construction and finish required to verify selections made under sample Submittals and to demonstrate aesthetic effects and qualities of materials and execution.
   1. Build mockup of two (AST-1), minimum 48 inches by full width of space between precast concrete T’s, installed in-place as shown on Drawings.
   2. Obtain Architect’s approval of mock-ups before starting acoustical wall panel fabrication.

C. Preconstruction Adhesion and Compatibility Testing:
   1. Bond Strength: Test for cohesive and adhesive strength according to ASTM E 736.
   2. Schedule sufficient time for testing and analyzing results to prevent delaying the Work.
   3. For materials failing tests, obtain manufacturer’s written instructions for corrective measures including the use of specially formulated bonding agents or primers.

1.4 FIELD CONDITIONS

A. Delivery, Storage and Handling: Do not deliver or install acoustic treatments until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work at and above ceilings is complete, and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Site Requirements:
   1. Condition spaces and surfaces receiving insulation in accordance with Manufacturer’s written recommendations
   2. Protect absorptive acoustic treatments from exposure to airborne odors, such as tobacco smoke, and install under conditions free from odor contamination of ambient air.

C. Wood Diffusor Panels: Do not deliver, receive, store or install until building is enclosed, wet work is complete, and temporary or permanent HVAC systems are operating in areas where woodwork is stored and installed and are maintaining temperature and relative humidity at occupancy levels and within the following ranges during the remainder of the construction phase:
   1. Temperature Range: Between 60 and 90 deg F.
   2. Relative Humidity Range: Between 25 and 55 percent.
   3. Fluctuation of Temperature and Relative Humidity Levels:
      a. Do not exceed 15 percent fluctuation over any portion of a 7-day period and not to exceed 25 percent fluctuation over any portion of a 28-day period.
      b. Maintain operation and control of heating, cooling, humidity, ventilation, temporary barriers and similar facilities continuously on a 24-hour basis to avoid rapidly fluctuating ambient levels.

D. Field Measurements: Verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings.

1.5 WARRANTY

A. Special Warranty: Manufacturer’s standard form in which manufacturer agrees to repair or replace components that fail in materials or workmanship within specified warranty period.
1. Failures include, but are not limited to the following:
   b. Fabric sagging, distorting, or releasing from edges.
   c. Warping of core.

2. Warranty Period: Two years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire-Test-Response Characteristics: Provide sound-absorbing wall units meeting the following as determined by testing identical products by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:
   1. Surface-Burning Characteristics: As determined by testing per ASTM E 84.
   2. Flame-Spread Index: 25 or less.
   3. Smoke-Developed Index: 450 or less.
   4. Fire Growth Contribution: Meeting acceptance criteria of local code and authorities having jurisdiction when tested according to NFPA 265.

2.2 FABRIC-WRAPPED PANELS

A. Manufacturers: Subject to compliance with requirements, provide Basis of Design or equivalent product by one of the following manufacturers:
   1. Capaul
   2. Conwed Designscapes.
   3. Decoustics Limited.
   5. RPG Inc.
   6. Wall Technology, Inc.

B. (AST-1) Fabric-Wrapped Wall Panels: Fixed panels consisting of acoustically-transparent fabric facing stretched over sound-absorbing core panel.
   3. Fabric Facing: As indicated on Material Schedule.
   4. Core: Glass-fiber board, ASTM C 612, of type standard with manufacturer, nominal density of 6 to 7 lb/cu. ft.
   5. Attachment: Back-mounted with manufacturer's metal clips or bar hangers.

C. Fabrication: Use manufacturer's standard construction except as otherwise indicated; with facing material applied to face, edges, and back border of dimensionally stable core; and with rigid edges to reinforce panel perimeter against warpage and damage.
   1. Edge Construction: Manufacturer's standard chemically hardened core with no frame.
   2. Edge Profile: Square.
   3. Corner Detail in Elevation: Square with continuous edge profile indicated.
   4. Panel Width and Height: As indicated on Drawings.
   5. Fabric Facing: Apply fabric facing fully covering visible surfaces of unit; with material stretched straight, on the grain, tight, square, and free from puckers, ripples, wrinkles, sags, blisters, seams, adhesive, or other visible distortions or foreign matter.
      a. Square Corners: Tailor corners.
      b. Radius and Other Nonsquare Corners: Attach facing material so there are no seams or gathering of material.
c. Fabrics with Directional or Repeating Patterns or Directional Weave: Mark fabric top and attach fabric in same direction so pattern or weave matches in adjacent units.

6. Dimensional Tolerances of Finished Units: Plus or minus 1/16 inch for thickness, edge straightness, overall length and width, and squareness from corner to corner.

2.3 COPOLYMER-FACED PANELS

A. (AST-2a) and (AST-2b) Perforated Copolymer-Faced Panel: Fixed panels consisting of acoustically-transparent fabric facing heat-formed over sound-absorbing core panel.
   2. Thickness: 2-inch.
   3. Core: Glass-fiber board, ASTM C 612, of type standard with manufacturer; nominal density of 6 to 7 lb/cu. ft. unfaced, and dimensionally stable, molded rigid board; and with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively.
   4. Formed Copolymer Facing and Edges: 1/16 inch thick copolymer perforated with 3/32 inch holes on 5/32 inch staggered centers; single sheet heat formed to cover panel face and edges.
      a. Color: As selected from panel manufacturer's range of standard colors.

2.4 SURFACE-APPLIED ACOUSTIC INSULATION

A. (AST-10) Black Glass-Fiber Board Insulation: ASTM C 612, Type IA; faced on one side with black glass-fiber mat or black polymer finish; maximum flame-spread and smoke-developed indexes of 25 and 50, respectively, per ASTM E 84.
   1. Products and Manufacturers:
      a. Permacote Linacoustic R-300 by Johns Manville;
      b. SelectSound Black Acoustic Board by Owens Corning;
   2. Acoustical Performance: Sound absorption NRC of 0.95 to 1.00 according to ASTM C 423 for Type A mounting according to ASTM E 795.
   4. Thickness: 2 inches.
   5. Finish: Matte black, unstamped.
   6. Mounting: Mechanical or Adhesive, as shown.
   7. Mechanical Fasteners:
      a. Gemco Type 0912 Insulation hanger with perforated base and S-250 self locking washer (black) and black dome cap from Goodloe E. Moore, Danville, IL
      b. Eckoustic-Klip from Eckel Industries, Cambridge, MA
      c. INC Stick-Pin from Industrial Noise Control, Addison, IL
   8. Adhesives: Use only adhesives that have a VOC content of 70 g/L or less when calculated according to 40 CFR 59, Subpart D (EPA Method 24).

2.5 SOUND-DIFFUSING WOOD PANELS

A. (AST-24) Sound-Diffusing Wood Panels: Acoustically-engineered manufactured panels, 2-inch deep, matching WD-1. Provide Edge moulding shall provide a suitable divider allowing a fractal mounting and also provide an end termination. Edge mouldings shall be of the same wood species and finish or as specified by the architect.
   1. Products and Manufacturer:
      b. GuD Panel Geometric Uniform Diffuser by Real Acoustix.
PART 3 EXECUTION

3.1 EXAMINATION
A. Examine fabric, fabricated units, substrates, areas, and conditions for compliance with requirements, installation tolerances, and other conditions affecting performance of sound-absorbing ceiling units.
B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION OF PANELS
A. Install acoustical panels and accessories in accordance with reviewed shop drawings and manufacturer's printed instructions.
B. Install units in locations indicated with vertical surfaces and edges plumb, top edges level and in alignment with other units, faces flush, and scribed to fit adjoining work accurately at borders and at penetrations.
C. Comply with sound-absorbing wall unit manufacturer's written instructions for installation of units using type of mounting devices indicated. Mount units securely to supporting substrate.
D. Comply with manufacturer's written instructions for installation of units using type of mounting devices indicated. Mount units securely to supporting substrate.
E. Provide for shimming and adjustments as required to maintain consistent alignment of joints and of finished panel faces.
F. Coordinate installation of panel suspension system with work of other trades.
G. Align fabric pattern and grain with adjacent units.
H. Installation Tolerances:
   1. Variation from Alignment with Surfaces: Plus or minus 1/16 inch.
   2. Variation from Level or Slope: Plus or minus 1/16 inch.
   3. Variation of Panel Butt Joints from Hairline: Not more than 1/16 inch wide.

3.3 INSTALLATION OF DIRECTLY ATTACHED ACOUSTICAL INSULATION
A. Adhesive Installation: Install acoustical insulation by bonding or stapling to substrate, using method recommended in writing by Manufacturer for Project conditions.
B. Maintain tight butt joints, aligned in both directions and coordinated with ceiling fixtures.

3.4 INSTALLED WORK
A. Cleaning: Remove dust and other foreign materials according to manufacturer's written instructions.
B. Protection: Protect surfaces from damage and soiling until project substantial completion.
C. Replacement: At no additional cost, replace damaged materials and materials that cannot be cleaned to satisfaction of Owner.

END OF SECTION
SECTION 09 90 00
PAINTING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Painting and finishing of new and existing materials (PT)
   2. Preparation of surfaces for painting and finishing.
   3. Repainting and refinishing of existing surfaces as indicated and as specified in Section 017329
      - Cutting and Patching. Preparation of existing surfaces for repainting and refinishing.

1.2 ACTION SUBMITTALS
A. Product Data: For each paint system specified, all coats, including block fillers and primers.
   1. Submit Manufacturer's certifications that products comply with specified requirements and with
      local regulations for VOC content.
B. Samples: Submit three 4 inch by 6 inch samples of each specified finish to be reviewed for color
   and sheen. Architect reserves right to select color or finish from any manufacturer, herein specified,
   as necessary to achieve desired color or finish.
C. Product Schedule: Cross-reference to paint system and locations of application areas. Use same
   designations indicated on Drawings and in schedules. Include color designations.

1.3 CLOSEOUT SUBMITTALS
A. Maintenance Materials (Attic Stock): Furnish extra paint materials from the same production run as
   the materials applied and in the quantities described below. Package with protective covering for
   storage and identify with labels describing contents. Deliver extra materials to Owner.
   1. Quantity: Furnish Owner with extra paint materials in quantities indicated below:
      a. Interior, Paint: 3 gal. of each color applied.
      b. Exterior, Paint: 3 gal. of each color applied.

1.4 QUALITY ASSURANCE
A. Single-Source Responsibility: Provide primers and undercoat paint produced by same
   manufacturer as finish coats.
B. Coordination of Work: Review other sections in which primers are provided to ensure compatibility
   of total systems for various substrates. On request, furnish information on characteristics of finish
   materials to ensure use of compatible primers.
C. Applicator Qualifications: Engage experienced applicator who has completed painting system
   applications similar in material and extent to that indicated for this Project with record of successful
   in-service performance.
D. Mockups: Make sample application of each paint type (PT) on project surfaces to the extent as
   directed by Architect.
   1. Obtain acceptance of sample field application before making additional applications.
   2. Accomplish work to equal or exceed standards established by approved samples. Protect and
      maintain approved field samples through completion of project.
   3. For PT-13, demonstrating 2 different paint options for final selection. Mockup shall include
      mockup of lighting conditions.
1.5 DELIVERY, STORAGE AND HANDLING

A. Deliver paint materials in sealed original labeled containers, bearing manufacturer's name, type of paint, brand name, color designation and instructions for mixing or reducing.

B. Provide adequate storage facilities. Store paint materials at minimum ambient temperature of 45 degrees F in well ventilated area. Restrict storage to paint materials and related equipment.

C. Take precautionary measures to prevent fire hazards and spontaneous combustion. Comply with health and fire regulations.

1.6 PROJECT CONDITIONS

A. Environmental Requirements: Comply with manufacturer's recommendations as to environmental conditions under which painting and finishing can be applied. Do not apply finish in areas where dust is being generated.

B. Measure moisture content of surfaces using electronic moisture meter. Do not apply finishes unless moisture contents of surfaces are below following maximums:
   1. Gypsum Wallboard: 12 percent.
   2. Masonry, Concrete and Concrete Block: 12 percent.
   3. Interior Wood: 15 percent.

C. Ensure surface temperature and surrounding air temperature is above 40 degrees F before applying finishes. Minimum application temperature for latex paints for interior work shall be 45 degrees F and 50 degrees F for exterior work. Minimum application temperature for transparent finish shall be 65 degrees F, or surface and air temperature shall be 5 degrees above dew point.

D. Provide adequate continuous ventilation and sufficient heating facilities to maintain temperatures above 45 degrees F for 24 hours before, during and 48 hours after application of finishes.

E. Provide minimum 25 foot candles of lighting on surfaces to be finished.

PART 2 PRODUCTS

2.1 PRODUCT REQUIREMENTS

A. Manufacturers:
   1. Benjamin Moore Paints.
   2. ICI Dulux (AkzoNobel).
   3. Pratt & Lambert.
   4. PPG Architectural Finishes.
   5. Sherwin-Williams.

B. Compatibility: Provide block fillers, primers, and finish-coat materials that are compatible with one another and with the substrates indicated under conditions of service and application, as demonstrated by manufacturer based on testing and field experience.

C. Single-Source Responsibility: Provide primers and undercoat coating produced by same manufacturer as finish coats.

D. Material Quality: Provide manufacturer's best-quality paint material of the various coating types specified that are factory formulated and recommended by manufacturer for application indicated. Paint-material containers not displaying manufacturer's product identification will not be acceptable.
E. VOC Content of Field-Applied Interior Paints and Coatings: Provide products that comply with the following limits for VOC content, exclusive of colorants added to a tint base, when calculated according to 40 CFR 59, Subpart D (EPA Method 24); these requirements do not apply to paints and coatings that are applied in a fabrication or finishing shop:

1. Flat Paints and Coatings: 50 g/L.
2. Nonflat Paints and Coatings: 150 g/L.
3. Dry-Fog Coatings: 400 g/L.
4. Primers, Sealers, and Undercoaters: 200 g/L.
5. Anticorrosive and Antirust Paints Applied to Ferrous Metals: 250 g/L.
7. Pretreatment Wash Primers: 420 g/L.
8. Floor Coatings: 100 g/L.
9. Shellacs, Clear: 730 g/L.
10. Shellacs, Pigmented: 550 g/L.

F. Painting and Finishing Schedules: Refer to Painting and Finishing Schedules in Part 3 of this Section.

1. Proprietary Names: Use of manufacturer's proprietary product names to designate colors or materials is not intended to imply that products named are required to be used to the exclusion of equivalent products of other manufacturers. Furnish manufacturer's material data and certificates of performance for proposed substitutions.

2. Sheen: When one of following terms is used to denote specific sheen for coating listed, following index shall apply:
   a. Flat: Less than 15 units based on 85 degrees of sheen.
   b. Eggshell: 5 to 20 units based on 60 degrees of sheen.
   c. Satin/Low Lustre: 15 to 35 units based on 60 degrees of sheen.
   d. Semi-gloss: 30 to 65 units based on 60 degrees of sheen.
   e. Gloss: Above 65 units based on 60 degrees of sheen.

G. (PT) Paint Colors: Provide specified color as indicated on Material Schedule, in paint type as scheduled in this Section.

2.2 MIXING AND TINTING

A. Deliver paints ready-mixed to job site.

B. Job mixing and job tinting is not acceptable.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine surfaces to receive paint and transparent finishes for conditions that would adversely affect execution, permanence or quality of work and which cannot be put into acceptable condition through preparatory work. Do not proceed with surface preparation or coating application until conditions are suitable.

3.2 PREPARATION OF SURFACES

A. Perform preparation and cleaning procedures in accordance with paint manufacturer's instructions and as specified, for each particular substrate condition.

1. Remove mildew, by scrubbing with solution of detergent, bleach and warm water. Rinse with clean water and allow surface to dry completely.
2. Provide barrier coats over incompatible primers or remove and reprime as required. Notify Architect in writing of anticipated problems in using specified coating systems with substrate primed by others.

B. Remove hardware, hardware accessories, plates, lighting fixtures, and similar items in-place and not to be finish painted, or provide surface-applied protection prior to surface preparation and painting operations. Remove, if necessary, for complete painting of items and adjacent surfaces. Following completion of painting of each space or area, reinstall removed items by workmen skilled in trades involved.

C. Clean surfaces to be painted before applying paint or surface treatment. Remove oil and grease with clean cloths and cleaning solvents prior to mechanical cleaning. Program cleaning and painting so that dust and other contaminants from cleaning process will not fall in wet, newly painted surfaces.
   1. Remove dirt, grease and oil from canvas and cotton insulated coverings.

D. Cementitious Materials: Prepare cementitious surfaces of concrete, concrete block and cement plaster to be painted by removing efflorescence, chalk, dust, dirt, grease, oils, and by roughening as required to remove glaze. Determine alkalinity and moisture content of surfaces to be painted by performing appropriate tests. If surfaces are found to be sufficiently alkaline to cause blistering and burning of finish paint, correct this condition before application of paint.
   1. Remove contamination, acid etch and rinse new concrete floors with clear water. Ensure required acid alkali balance is achieved. Allow to thoroughly dry. Repeat procedure if necessary to achieve a medium sandpaper-like profile.
   2. Remove dirt, loose mortar, scale, powder and other foreign matter from concrete and concrete block surfaces which are to be painted or to receive clear seal. Remove oil and grease with solution of trisodium phosphate, rinse well and allow to thoroughly dry.
   3. Remove stains from concrete and concrete block surfaces caused by weathering of corroding metals with solution of sodium metasilicate after being thoroughly wetted with water. Allow to thoroughly dry.

E. Gypsum Wallboard: Remove contamination from gypsum wallboard surfaces and prime to show defects, if any. Paint after defects have been remedied.

F. Plaster Surfaces: Fill hairline cracks, small holes and imperfections on plaster surfaces with patching plaster. Smooth off to match adjacent surfaces. Wash and neutralize high alkali surfaces where they occur.

G. Galvanized Surfaces: Clean free of oil and surface contaminates with acceptable non-petroleum based solvent.

H. Ferrous Metals: Clean non-galvanized, ferrous surfaces that have not been shop-coated of oil, grease, dirt, loose mill scale and other foreign substances by solvent or mechanical cleaning, complying with Steel Structures Painting Council (SSPC)-SP3.
   1. Touch-up shop-applied prime coats which have damaged or bare areas. Wire-brush, solvent-clean, and touch-up with same primer as shop coat.
   2. Clean unprimed steel surfaces by washing with solvent. Apply treatment of phosphoric acid solution, ensuring weld joints, bolts and nuts are similarly cleaned. Prime surfaces to indicate defects, if any. Paint after defects have been remedied.

I. Wood: Clean wood surfaces to be painted of dirt, oil, or other foreign substances with scrapers, mineral spirits, and sandpaper, as required. Sandpaper smooth those finished surfaces exposed to view, and dust off.
1. Prime or seal wood required to be job painted immediately upon delivery to job. Prime edges, ends, faces, undersides, and backsides of such wood.

2. After priming, fill holes and imperfections in finish surfaces with putty or plastic wood-filler. Sandpaper smooth when dried.

J. Existing Surfaces to be Repainted or Refinished: Wash surfaces to remove grease, oil, soil or other matter which will interfere with proper bond of new materials. Scrape and wire brush loose or flaking paint. Fill cracks, voids or other defects.

3.3 MATERIALS PREPARATION
A. Mix and prepare painting materials and transparent finish materials in accordance with manufacturer's directions.

B. Store materials not in actual use in tightly covered containers. Maintain containers used in storage, mixing, and application of paint in clean condition, free of foreign materials and residue.

C. Stir materials before application to produce mixture of uniform density, and as required during application of materials. Do not stir any film that may form on surface into material. Remove film and, if necessary, strain material before using.

3.4 APPLICATION
A. Application Procedures: Apply paints and coatings by spray, or other applicators according to manufacturer's written instructions.

1. Brushes: Use brushes best suited for type of material applied. Use brush of appropriate size for surface or item being painted.

2. Rollers: Use rollers of carpet, velvet-back, or high-pile sheep's wool as recommended by manufacturer for material and texture required.

3. Spray Equipment: Use airless spray equipment with orifice size as recommended by manufacturer for material and texture required.

4. Apply each coat at proper consistency.

5. Each coat of paint shall be slightly darker than preceding coat unless otherwise approved by Architect.

6. Provide finish coats which are compatible with prime paints used.

B. Do not apply succeeding coats until previous coat has completely dried. Sand between each enamel or varnish coat application with fine sandpaper, or rub surfaces with pumice stone where required to produce even, smooth surface in accordance with coating manufacturer's directions.

1. Allow each coat of finish to dry before following coat is applied, unless directed otherwise by manufacturer.

C. Apply additional coats when undercoats, stains, or other conditions show through final coat of paint, until paint film is of uniform finish, color and appearance. Give special attention to insure that surfaces, including edges, corners, crevices, welds, and exposed fasteners receive film thickness equivalent to that of flat surfaces.

D. Finish doors on tops, bottoms, and side edges same as exterior faces, unless otherwise indicated.

E. Film Thickness: Apply materials in accordance to paint manufacturer's recommendations and spreading rates to provide total dry film thickness as recommended.

1. Apply paint materials no thinner than manufacturer's recommended spreading rate to achieve dry film thickness indicated

2. Use precision instruments designed for measuring and evaluation wet and dry films of paints and coatings.

3. Results measuring less than recommended thickness will require additional material application.
4. Use of poor hiding colors may require application of additional coats in order to achieve proper coverage and hiding.

F. Apply first-coat material to surfaces that have been cleaned, pre-treated or otherwise prepared for painting as soon as practicable after preparation and before subsequent surface deterioration.

G. Allow sufficient time between successive coatings to permit proper drying. Do not recoat until paint has dried to where it feels firm, does not deform or feel sticky under moderate thumb pressure, and application of another coat of paint does not cause lifting or loss of adhesion of undercoat.

H. Prime Coats: Recoat primed and sealed walls and ceilings where there is evidence of suction spots or unsealed areas in first coat, to assure finish coat with no burn-through or other defects due to insufficient sealing.

I. Stipple Enamel Finish: Roll and redistribute paint to even and fine texture. Leave no evidence of rolling such as laps, irregularities in texture, skid marks, or other surface imperfections.

J. Transparent Finish: On exposed portions, use multiple coats to produce glass-smooth surface film continuity of even luster. Provide finish free of laps, cloudiness, color irregularity, runs, brush marks, orange peel, nail holes, or other surface imperfections. Provide satin finish for final coats, unless otherwise indicated.

K. Repainting of Existing Surfaces: Where repainting of existing surfaces is required, repaint wall and ceiling surfaces in their entirety, patch or spot painting is not acceptable.

L. Paint surfaces behind movable equipment or furniture same as similar exposed surfaces. Paint surfaces behind permanently-fixed equipment or furniture with prime coat only.

M. Completed Work: Match approved samples for color, texture, and coverage. Remove, refinish, or repaint work not complying with requirements.

3.5 MECHANICAL AND ELECTRICAL EQUIPMENT

A. Refer to mechanical and electrical documents with respect to field painting and finishing requirements. Painting of mechanical and electrical work is not required in pipe chases, tunnels, and mechanical rooms with unpainted walls.

B. Remove grilles, covers and access panels for mechanical and electrical systems from location and paint separately.

C. Finish paint primed equipment to color selected.

D. Prime and paint insulated and bare pipes, conduits, boxes, insulated and bare ducts, hangers, brackets, collars and supports, except where items are plated or covered with prefinished coating, or where they are not in finished space or room.

E. Paint interior surfaces of air ducts, convectors and baseboard heating cabinets that are visible through grilles and louvers before installation of equipment with 1 coat of flat black paint, to limit of sight line. Paint dampers exposed immediately behind louvers, grilles, convectors and baseboard cabinets to match face panels.

F. Paint exposed piping, insulated piping and conduit occurring in finished areas. Color and texture to match adjacent surfaces.

G. Paint both sides and edges of plywood backboards for electrical equipment before installing backboards and mounting equipment on them.

3.6 CLEANING

A. As work proceeds and upon completion, promptly remove paint where spilled, splashed or spattered. Touch up and restore damaged or defaced painted areas.
B. During progress of work keep premises free from unnecessary accumulation of tools, equipment, surplus materials and debris. Remove at end of each workday.

C. Upon completion of work clean window glass and other paint-spattered surfaces and leave premises neat and clean, to satisfaction of Architect.

3.7 PROTECTION

A. Adequately cover or otherwise protect finished work of other trades and other surfaces from paint and damage. Repair damage as result of inadequate or unsuitable protection as acceptable to Architect.

1. Furnish sufficient drop cloths, shields and protective equipment to prevent spray or droppings from fouling surfaces not being painted and in particular, surfaces within storage and preparation area.

B. Place cotton waste, cloths and material which may constitute fire hazard in closed metal containers and remove daily from site.

C. Remove electrical plates, surface hardware, fittings and fastenings, prior to painting operations. These items shall be carefully stored, cleaned and replaced on completion of work in each area. Do not use solvent to clean hardware that may remove permanent lacquer finish.

D. Provide "Wet Paint" signs as required to protect newly painted finishes. Remove temporary protective wrappings provided by others for protection of their work after completion of painting operations.

3.8 EXTERIOR PAINTING AND FINISHING SCHEDULE

A. Non-Ferrous Metal Surfaces (Galvanized):

1. Surfaces Included:
   a. Steel lintels, lintel plates, relieving angles.
   b. Hollow metal doors and frames.

   a. Primer: 1 coat Direct to Metal Primer and Flat Finish (or 1 coat touch-up if preprimed).

B. Ferrous Metal Surfaces (Steel, Iron):

1. Surfaces Included:
   a. Roof ventilators, roof vents.
   b. Metal roof stacks.
   c. Metal roof hatches.
   d. Exterior ferrous metal.

   a. Primer: 1 coat Direct to Metal Primer and Flat Finish (or 1 coat touch-up if preprimed).

C. Concrete Masonry Surfaces:

1. Surfaces Included: Walls.

2. Water Based System (Low VOC): 100 percent Acrylic Latex Finish over Heavy Duty Acrylic Block Filler.
   a. Block Filler: 1 coat Heavy Duty Acrylic Block Filler.
3.9 INTERIOR PAINTING AND FINISHING SCHEDULE

A. Concrete Unit Masonry Surfaces:
   1. Surfaces Included: Walls.
   2. Waterborne Low VOC, Low Odor System: Low VOC, Low Odor Acrylic Finish over Latex Block Filler, not less than 35 percent solids, ammonia free coating.
      a. Block Filler: 1 coat Heavy Duty Acrylic Block /Filler.
      b. Finish: 2 coats Interior Eggshell Enamel.

B. Ferrous and Non-Ferrous Metal Surfaces:
   1. Surfaces Included:
      a. Hollow metal doors and frames.
      b. Steel stairs, ladders and railings.
      c. Pre-painted surfaces.
      d. Prime painted hardware.
      e. Radiator, convector and other heating unit covers.
      f. Uninsulated piping and ductwork.
      g. Metal access panels.
      h. Metal louvers and grilles.
      i. Electric panels (over factory finish).
      j. Fire horns.
      k. Metal supports for counters, benches and shelves.
      l. Exposed and miscellaneous metals.
      m. Other exposed to view interior ferrous metals not factory finished.
      a. Primer: 1 coat Direct to Metal Primer & Flat Finish.
      b. Finish: 2 coats Benjamin Moore Natura Eggshell #513.

C. Gypsum Wallboard Surfaces:
   1. Surfaces Included:
      a. Gypsum wallboard, including over skim coat of joint compound.
      b. Apply additional coat of primer under deep tone finish paint.
      c. Sheens - General: Unless noted otherwise on Room Finish Schedule.
         1) Walls: Eggshell
         2) Ceilings and Soffits: Flat
         3) Walls where indicated on Room Finish Schedule: Semi-gloss.
         4) microbial growth resistant finish #16-551 Series - (2.0 - 3.0 mils dry thick).
      a. Primer: 1 coat Benjamin Moore Natura Primer #511.
      b. Finish: 2 coats Benjamin Moore Natura Eggshell #513, Flat #512 and Semi-Gloss *514.

D. Gypsum Wallboard Surfaces for A/V Projection:
   1. Surface Prep: Provide GA Level 5 finish.
   2. Paint Basis of Design: PT-8, as Screen Goo Projection Screen Coatings (PT-8). Apply in accordance with Manufacturer’s instructions and recommendations.

E. Wood Surfaces Painted:
   1. Surfaces Included:
      a. Wood for paint finish.
      b. Concealed surfaces of wood items to be back-primed
      a. Primer: 1 coat Interior Water-Based Primer.
      b. Finish: 2 coats Interior Eggshell Enamel.

F. Insulated items in rooms with painted walls:
1. Surfaces Included:
   a. Piping, ducts, tanks, and equipment.
2. Waterborne System: Premium Quality Acrylic Latex finish over Vapor Barrier Primer.
   a. Primer: 1 coat Vapor Barrier Primer Sealer.
   b. Finish:
      1) 2 coats Interior Latex Eggshell.
      2) 2 coats Latex Flat Finish.

G. Black Enamel Finish:
1. Surfaces Included:
   a. Duct throats for visible distance but not less than approximately 24 inches behind supply or return air grilles, registers, louvers.
   b. Wood blocking exposed at reveals.
   a. Finish: 1 coat Interior Latex Flat Black Finish.

H. Metal Ceilings:
1. Coordinate with Division 05 for shop-applied primer.
2. Surfaces Included:
   a. Bar joist, decking and supports.
   b. Galvanized ductwork.
   c. Other overhead metal surfaces.
3. Dry Fall Spray-Applied Waterborne Systems: Waterborne Dryfall over Waterborne Metal Primer
   a. Primer (touch-up if pre-primed): 1 coat.
   b. Finish: 1 coat S-W Waterborne Acrylic Dry Fall.

I. Insulation-Wrapped Piping and Equipment:
1. Surfaces Included: Piping, ducts, tanks, and equipment.
   a. Primer: 1 coat.
   b. Finish: 2 coats.

3.10 REPAINTING OF EXISTING SURFACES

A. Existing Surfaces:
1. Surfaces Included:
   a. Existing surfaces where indicated to be repainted.
   b. Existing metal lockers (casework) (metal toilet compartments) where indicated to be repainted.
2. Low-VOC Latex System:
   a. Primer/Finish: 2 coats paint similar to type listed above.
3. Electrostatic System:
   a. Primer/Finish: 2 coats electrostatic paint finish.

END OF SECTION
SECTION 09 96 00
HIGH-PERFORMANCE COATINGS

PART 1 - GENERAL

1.1 SUMMARY
   A. Section Includes:
      1. High-performance coatings (HPC) for metal surfaces.
      2. Surface preparation.

1.2 ACTION SUBMITTALS
   A. Product Data: For each coating system specified, all coats, including fillers and primers.
      1. Submit Manufacturer's certifications that products comply with specified requirements and with
         local regulations for VOC content.
   B. Samples: Submit three 4 inch by 6 inch samples of each specified finish to be reviewed for color
      and sheen. Architect reserves right to select color or finish from any manufacturer, herein specified,
      as necessary to achieve desired color or finish.
   C. Product Schedule: Cross-reference to coating system and locations of application areas. Use same
      designations indicated on Drawings and in schedules. Include color designations.

1.3 MAINTENANCE MATERIAL SUBMITTALS
   A. Furnish extra materials, from the same product run, that match products installed and that are
      packaged with protective covering for storage and identified with labels describing contents.
   B. Leave on premises, where directed by Architect, not less than 1 unopened gallon of each color
      used.
   C. Tightly seal containers and clearly label for identification.

1.4 QUALITY ASSURANCE
   A. Coordination of Work: Review other sections in which primers are provided to ensure compatibility
      of total systems for various substrates.
      1. On request, furnish information on characteristics of finish materials to ensure use of
         compatible primers.
   B. Approved Applicator: Applicator shall have not less than 3 years of successful experience in
      installation of similar coating systems and shall be certified in writing as manufacturer's licensed or
      approved applicator.
   C. Owner reserves the right to have testing agency test materials used as often as deemed necessary
      during period when coatings are being applied to ensure that product materials being used comply
      with specified requirements.

1.5 DELIVERY, STORAGE AND HANDLING
   A. Deliver coating materials in sealed original labeled containers, bearing manufacturer's name, type
      of coating, brand name, color designation and instructions for mixing or reducing.
   B. Provide adequate storage facilities. Store coating materials at minimum ambient temperature of 45
      degrees F. in well ventilated area. Restrict storage to coating materials and related equipment.
C. Take precautionary measures to prevent fire hazards and spontaneous combustion. Comply with health and fire regulations.

1.6 PROJECT CONDITIONS

A. Environmental Requirements: Comply with manufacturer’s recommendations for environmental conditions under which coating and finishing can be applied.
   1. Do not apply finish in areas where dust is being generated.

B. Ensure surface temperature or surrounding air temperature is between 50 degrees F. and 90 degrees F. before applying finishes.
   1. Minimum application temperature for exterior work is 50 degrees F.

C. Provide adequate continuous ventilation and sufficient heating facilities to maintain temperatures above 45 degrees F. for 24 hours before, during and 48 hours after application of finishes.

D. Provide minimum 25 foot candles of lighting on surfaces to be finished.

PART 2 - PRODUCTS

2.1 PRODUCT REQUIREMENTS

A. Acceptable Manufacturers:
   1. Tnemec Company, Inc.,
   2. Sherwin Williams,
   3. ICI/Dulux,
   4. Pittsburg Paints,

B. Compatibility: Provide materials that are compatible with one another and substrates indicated under conditions of service and application, as demonstrated by manufacturer of coating system based on testing and field experience.

C. Single-Source Responsibility: Provide primers and undercoat coating produced by same manufacturer as finish coats.

D. VOC Content: Products shall comply with VOC limits of authorities having jurisdiction, and, for interior coatings applied at project site, the following VOC limits, exclusive of colorants added to a tint base, when calculated according to 40 CFR 59, Subpart D (EPA Method 24)]:
   1. Flat Paints and Coatings: 50 g/L.
   2. Nonflat Paints and Coatings: 150 g/L.
   3. Primers, Sealers, and Undercoaters: 200 g/L.
   4. Anti-Corrosive and Anti-Rust Paints Applied to Ferrous Metals: 250 g/L.
   6. Pre-Treatment Wash Primers: 420 g/L.
   7. Floor Coatings: 100 g/L.
   8. Shellacs, Clear: 730 g/L.
   9. Shellacs, Pigmented: 550 g/L.

E. (HPC) Colors: Provide high-performance coating type as specified in this Section, in color as indicated on the Material Identification List and matching corresponding paint color (PT).

2.2 COATINGS SCHEDULE

A. Interior Ferrous Steel: Interior ferrous metal surfaces including stairs and railings, metal fabrications.
1. Surface Preparation: Solvent cleaning and sweep blast cleaning as recommended by system Manufacturer and as specified in Part 3 of this Section. Touch-up non-galvanized steel surfaces with high-zinc coating.

   a. Primer: Series 27WB Typoxy by Tnemec.
      1) Application: 4.0 to 6.0 dry mils.
   b. Intermediate: Series 27WB Typoxy by Tnemec.
      1) Application: 4.0 to 6.0 dry mils.
   c. Finish: Series 1080 Endura-Shield by Tnemec.
      1) Application: 2.0 to 3.0 dry mils.
      2) Sheen: Eggshell.
   d. System Total Dry Film Thickness: 10 to 15 dry mils.

B. Interior and Exterior Galvanized Steel: Including railings, metal fabrications, exposed steel angles and lintels, bollards.

1. Surface Preparation: Solvent cleaning and sweep blast cleaning as recommended by system Manufacturer and as specified in Part 3 of this Section. Touch-up non-galvanized steel surfaces with high-zinc coating.

      1) Application: 2.5 to 3.5 dry mils.
   b. Intermediate: Series 27WB Typoxy by Tnemec.
      1) Application: 4.0 to 6.0 dry mils.
   c. Finish: Series 1095 Endura-Shield by Tnemec.
      1) Application: 2.0 to 3.0 dry mils.
      2) Sheen: Gloss.
   d. System Total Dry Film Thickness: 8.5 to 12.5 dry mils.

2.3 MIXING AND TINTING

A. Deliver coatings and enamel ready-mixed to job site. Accomplish job mixing and job tinting only as approved by Manufacturer. Use tinting materials recommended by Manufacturer for specified system and application.

PART 3 - EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examine surfaces to receive high performance coatings for conditions that would adversely affect execution, permanence or quality of work and which cannot be put into acceptable condition through preparatory work.
   1. Do not proceed with surface preparation or coating application until conditions are suitable.

B. Adequately cover or otherwise protect finished work of other trades and other surfaces from coating and damage.

C. Remove surface hardware, fittings and fastenings, prior to coating operations. These items shall be carefully stored, cleaned and replaced on completion of work in each area.

3.2 PREPARATION OF SURFACES

A. Perform preparation and cleaning procedures in accordance with coating manufacturer’s instructions and as specified, for each particular substrate condition.
   1. Remove mildew, by scrubbing with solution of detergent, bleach and warm water.
a. Rinse with clean water and allow surface to dry completely.

2. Remove surface contamination from aluminum surfaces requiring finish by steam, high pressure water or solvent washing.
   a. Apply etching primer or acid etch.
   b. Apply coating immediately if acid etching.

3. Provide barrier coats over incompatible primers or remove and reprime as required.
   a. Notify Architect in writing of anticipated problems in using specified coating systems with substrate primed by others.

B. Finishes for steel labeled Architecturally Exposed Steel shall comply with these additional requirements: smooth exposed surface and edges, including welds, by grinding and fill depressions, voids and holes with weld material and/or auto body filler, sand smooth, prime and coat.

C. Clean surfaces to be coated before applying coating or surface treatment. Remove oil and grease with clean cloths and cleaning solvents prior to mechanical cleaning.
   1. Program cleaning and coating so that dust and other contaminants from cleaning process will not fall in wet, newly coated surfaces.
      a. Apply compatible sealer or primer.

D. Equipment used for blast cleaning shall be of type that has proper oil and water filters and traps on compressors and/or tanks so that sandblasting material is not being re-contaminated by oil and water in the air blast.

E. Ferrous Metals: Clean non-galvanized, ferrous surfaces that have not been shop-coated of oil, grease, loose mill scale and other foreign substances by solvent or mechanical cleaning, complying with Steel Structures Painting Council (SSPC)-SP6.
   1. Touch-up shop-applied prime coats which have damaged or bare areas. Wire-brush, solvent clean, and touch-up with same primer as shop coat.
      a. Clean unprimed steel surfaces by washing with solvent. Apply treatment of phosphoric acid solution, ensuring weld joints, bolts and nuts are similarly cleaned.
      b. Prime surfaces to indicate defects. Coat after defects have been remedied.
      c. Sand and scrape shop primed steel surfaces to remove loose primer and rust. Feather out edges to make touch-up patches inconspicuous.
      d. Clean surfaces with solvent. Prime bare steel surfaces. (Prime steel including shop primed steels.)

F. Strictly adhere to all finish manufacturers recommendations for preparation of each specific type of substrate.

G. Remove finish hardware, fixture covers, and accessories and store.

H. Protect adjacent surfaces and materials not receiving coating from spatter and overspray; mask if necessary to provide adequate protection. Repair damage.

3.3 MATERIALS PREPARATION

A. Mix and prepare coating materials and transparent finish materials in accordance with manufacturer's directions.

B. Store materials not in actual use in tightly covered containers.
   1. Maintain containers used in storage, mixing, and application of coating in clean condition, free of foreign materials and residue.

C. Stir materials before application to produce mixture of uniform density, and as required during application of materials.
   1. Do not stir film which may form on surface into material.
2. Remove film and, if necessary, strain material before using.

3.4 APPLICATION

A. Schedule Coatings: Apply first coat to surfaces that have been cleaned, pre-treated or otherwise prepared for coating as soon as practicable after preparation and before subsequent surface deterioration.
   1. Number of coats and film thickness required is the same regardless of application method employed.

B. Apply high performance coating with brush, roller, spray, or other acceptable practice in accordance with manufacturer's directions.
   1. Use brushes best suited for type of material being applied. Use rollers of carpet, velvet back, or high pile sheep wool recommended by coating manufacturer for material and texture required.
      a. Apply each coat at proper consistency.
      b. Each coat shall be slightly darker than preceding coat unless otherwise approved by Architect.
      c. Provide finish coats which are compatible with prime coatings used.

C. Do not apply succeeding coats until previous coat has completely dried, unless directed otherwise by manufacturer.
   1. Sand between each enamel or varnish coat application with fine sandpaper, or rub surfaces with pumice stone where required to produce even, smooth surface in accordance with coating manufacturer's directions.

D. Apply additional coats when undercoats, or other conditions show through final coat, until coating film is of uniform finish, color and appearance.
   1. Give special attention to insure that surfaces, including edges, corners, crevices, welds, and exposed fasteners receive film thickness equivalent to that of flat surfaces.
      a. Apply each material at not less than manufacturer's recommended spreading rate, to provide total dry film thickness as recommended.
      b. Apply first-coat material to surfaces that have been cleaned, pre-treated or otherwise prepared for coating as soon as practicable after preparation and before subsequent surface deterioration.

E. Allow sufficient time between successive coatings to permit proper drying.
   1. Do not recoat until coat has dried to where it feels firm, does not deform or feel sticky under moderate thumb pressure, and application of another coat does not cause lifting or loss of adhesion of undercoat.

F. Prime Coats: Recoat primed and sealed areas where there is evidence of suction spots or unsealed areas in first coat, to assure finish coat with no burn-through or other defects due to insufficient sealing.

G. Stipple Enamel Finish: Roll and redistribute coating to even and fine texture. Leave no evidence of rolling such as laps, irregularities in texture, skid marks, or other surface imperfections.

H. Brush Application: Brush-out and work brush coats onto surfaces in even film.
   1. Cloudiness, spotting, holidays, laps, brush marks, runs, sags, ropeyness, or other surface imperfections will not be acceptable.
   2. Neatly draw glass and color break lines.

3.5 INSTALLED WORK

A. Cleaning: As work proceeds, promptly remove coating where over-sprayed, splashed, spattered or spilled.
B. Repair: Touch-up and restore damaged.

C. Provide "Wet Paint" signs as required to protect newly coated finishes. Remove temporary protective wrappings provided by others for protection of their work after completion of coating operations.

END OF SECTION
SECTION 10 11 00
VISUAL DISPLAY BOARDS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Markerboards (MKBD).
   2. Tackboards (TKBD).

1.2 ACTION SUBMITTALS
A. Product Data: For each display board specified.
B. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
   1. Show location of panel joints.
   2. Show location of special-purpose graphics for visual display surfaces.
   3. Include sections of typical trim members.
C. Samples: For each type of visual display surface indicated and as follows:
   1. Visual Display Surface: Not less than 8-1/2 by 11 inches, mounted on substrate indicated for final Work. Include one panel for each type, color, and texture required.
   2. Trim: 6-inch- long sections of each trim profile.
   3. Accessories: Full-size Sample of each type of accessory.

1.3 QUALITY ASSURANCE
A. Installer Qualifications: An authorized representative of motor-operated, sliding visual display unit manufacturer for installation and maintenance of units required for this Project.
B. Mockups: Construct mockups to verify selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for materials and execution.
   1. Approved mockups may become part of the completed Work if undisturbed at time of Substantial Completion.

1.4 WARRANTY
A. Warranty Period: Lifetime, unlimited warranty.
B. Special Warranty for Porcelain-Enamel Face Sheets: Manufacturer's standard form in which manufacturer agrees to repair or replace porcelain-enamel face sheets that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Surfaces lose original writing and erasing qualities.
      b. Surfaces become slick or shiny.
      c. Surfaces exhibit crazing, cracking, or flaking.
   2. Warranty Period: 50 years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 MANUFACTURERS
A. Manufacturers:
1. Carolina Chalkboard.
2. Claridge Products.
4. ADP Lemco Incorporated.

2.2 MARKERBOARDS

A. (MKBD-1) Porcelain-Enamel Marker Boards: Balanced, high-pressure, factory-laminated marker board assembly of three-ply construction consisting of backing sheet, core material, and porcelain-enamel face sheet.
   1. Porcelain-Enamel Face Sheet: Manufacturer's standard steel sheet with porcelain-enamel coating fused to steel; uncoated thickness indicated.
      a. Matte Finish: Low reflective; marker wipes clean with dry cloth or standard eraser.
      b. Color: Custom color as selected by Architect.
   2. Manufacturer's Standard Core: Minimum 1/4 inch thick, with manufacturer's standard moisture-barrier backing.
   3. Laminating Adhesive: Manufacturer's standard, moisture-resistant thermoplastic type.
   4. Extruded Aluminum: ASTM B 221, Alloy 6063; clear anodic finish, AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

2.3 TACKBOARDS

A. (TKBD-1) Plastic-Impregnated-Cork Sheet: 1/4-inch seamless, homogeneous, self-sealing sheet consisting of granulated cork, linseed oil, resin binders, and dry pigments that are mixed and calendared onto fabric backing; with washable vinyl finish and integral color throughout.
   1. Flame Spread Rating: Class A Fire Rating per ASTM E84 Complying with ASTM E84, with flame spread rating of 25.
   2. Color: See Material Identification List.
B. Extruded Aluminum J-Trim: ASTM B 221, Alloy 6063; clear anodic finish, AAMA 611, AA-M12C22A31, Class II, 0.010 mm or thicker.

2.4 INSTALLATION ACCESSORIES

A. Mechanical Fasteners: Stainless steel standoffs, 2-inches diameter, 1/2-inch standoff, resilient gasket.
B. Adhesive: Install using adhesive as recommended by marker board Manufacturer, or as follows:
   1. GE Silglaze II.
   2. GE Silpruf.
   3. Dow Corning 795.
   4. Dow Corning 995, concealed metal mounting hardware.

2.5 FABRICATION

A. Porcelain-Enamel Visual Display Assemblies: Laminate porcelain-enamel face sheet and backing sheet to core material under heat and pressure with manufacturer's standard flexible, waterproof adhesive.
B. Make joints only where total length exceeds maximum manufactured length. Fabricate with minimum number of joints, balanced around center of board.
C. Aluminum Frames and Trim: Fabricate units straight and of single lengths, keeping joints to a minimum. Miter corners to a neat, hairline closure.
1. Where factory-applied trim is indicated, trim shall be assembled and attached to visual display units at manufacturer's factory before shipment.

2.6 GENERAL FINISH REQUIREMENTS

A. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

B. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.

C. Appearance of Finished Work: Noticeable variations in same piece are not acceptable. Variations in appearance of adjoining components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which visual display boards are to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install visual display boards in accordance with reviewed shop drawings and manufacturer's printed instructions. Keep perimeter lines straight, plumb and level.

B. Provide grounds, clips, backing, brackets, anchors, trim and accessories. Use splines at joints to maintain surface alignment and smooth joints.

C. Clean units in accordance with manufacturer's instructions.
SECTION 101414
CUSTOM ILLUMINATED SIGNAGE

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Custom-fabricated, illuminated exterior signage (ACR-1).

1.2 ACTION SUBMITTALS
A. Shop Drawings: Indicate overall construction of unit, with accommodations for attachment to building, electrical service, and access for maintenance.
   1. Show attachment to existing building.
   2. Show adjacent metal panels.
   3. Show locations of electrical service connections.
   4. Include diagrams for power, signal, and control wiring.
B. Samples: For each exposed material and finish.
C. Fabrication Sample: For each type of sign assembly showing all components and with the required finishes, in manufacturer’s standard size unless otherwise indicated and as follows:
   2. Variable Component Materials: Full-size sample of each base material, character (letter, number, and graphic element) in each exposed color and finish not included in Samples above.
   3. Exposed Accessories: Full-size sample of each accessory type.
   4. Full-size Samples, if approved, will be returned to Contractor for use in Project.

1.3 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Manuals.

1.4 QUALITY ASSURANCE
A. Fabricator Qualifications: Shop that employs skilled workers who custom-fabricate products similar to those required for this Project and whose products have a record of successful in-service performance.
B. Installer Qualifications: Fabricator of products.

1.5 PROJECT CONDITIONS
A. Field Measurements: Verify recess openings by field measurements before fabrication and indicate measurements on Shop Drawings.

1.6 DELIVERY, STORAGE AND HANDLING
A. Deliver letters in manufacturer’s protective packaging. Handle finished surfaces with care to prevent damage.
B. Deliver and handle system components to prevent damage to finished surfaces.
C. Store and protect system components in accordance with manufacturer’s recommendations.
D. Provide wrapping or strippable coating to protect prefinished aluminum surfaces. Do not use adhesive papers or sprayed coatings which bond when exposed to sunlight or weather.

1.7 COORDINATION
A. Coordinate placement of anchorage devices for installing signs.

1.8 WARRANTY
A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 ILLUMINATED SIGNAGE
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. (ACR-1) Illuminated Signage: Custom, shop-fabricated assembly constructed of aluminum channel frame and translucent acrylic faces, in configuration as shown; to be back-lit for light box effect.

C. Frames:
   1. Aluminum Sheet and Plate: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with at least the strength and durability properties of Alloy 5005-H32.
   2. Aluminum Extrusions: ASTM B 221, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with at least the strength and durability properties of Alloy 6063-T5.

D. Translucent Acrylic Sheet: 0.236 inch thick, ASTM D 4802, Category A-1 or B-1, Finish 1 (smooth or polished), Type UVF (UV filtering), Combustibility Class CC2, white color.
   1. Manufacturers and Products:
      a. Altuglas International, Division of Arkema Inc.; Plexiglas G.
      b. Cyro Industries, a subsidiary of Degussa Corporation; Acrylite GP.
      c. Altuglas International, Division of Arkema Inc.; Plexiglas MC.
      d. Cyro Industries, a subsidiary of Degussa Corporation; Acrylite FF.
      e. Lucite International; Lucite CP.
      f. Plaskolite, Inc.; Optix.

E. Illumination: Backlighted construction with LED lighting including transformers, insulators, and other accessories for operability, with provision for servicing and concealing connections to building electrical system. Use tight or sealed joint construction to prevent unintentional light leakage. Space lamps apart from each other and away from character surfaces as needed to illuminate evenly.
   1. Power: As indicated on electrical Drawings. Provide electrical components, devices, and accessories that are listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Power: As indicated on electrical Drawings.
   3. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2.2 INSTALLATION ACCESSORIES

A. Anchors and Inserts: Provide stainless steel anchors and inserts.

B. Soft Compression Gaskets: Extruded or molded, closed-cell, integral-skinned [EPDM] [or] [silicone] gaskets complying with ASTM C 509, Type II, black; and of profile and hardness required to maintain watertight seal.

C. Glazing Sealants: Silicone glazing sealant complying with ASTM C 920, Type S, Grade NS, Use NT. Comply with sealant and glass manufacturers’ written instructions for selecting glazing sealants suitable for applications indicated and for conditions existing at time of installation.
   1. VOC Content: For sealants used inside the weatherproofing system, not more than 250 g/L when calculated according to 40 CFR 59, Subpart D (EPA Method 24).
   2. Colors of Exposed Glazing Sealants: [As indicated by manufacturer's designations] [Match Architect's samples] [As selected by Architect from manufacturer's full range].

D. Fasteners and Accessories: Manufacturer’s standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.
   1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
   2. Reinforce members as required to receive fastener threads.
   3. Use exposed fasteners with countersunk Phillips screw heads, fabricated from Series 300 stainless steel.

2.3 FABRICATION

A. Preassemble in the shop to greatest extent possible. Disassemble only as necessary for shipping and handling limitations.

B. Fabricate to allow access for servicing lighting fixtures and for cleaning and maintaining plastic panels.

C. Provide for drainage of incidental water.

D. Fabricate corners and connections to achieve seamless and monolithic appearance. Conceal all fasteners and anchors.

E. Conceal fasteners if possible; otherwise, locate fasteners where they will be inconspicuous.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Examine supporting members to ensure that surfaces are at elevations indicated or required to comply with authorities having jurisdiction and are free from dirt and other deleterious matter.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

D. Verify that electrical service is correctly sized and located to accommodate signs.
3.2 INSTALLATION

A. General: Install signs in accordance with reviewed shop drawings and manufacturer's printed instructions. Set letters plumb, level and true to line, and securely attach to adjacent construction.
   1. Locate signs and accessories where indicated, using mounting methods as indicated.
   2. Install signs level, plumb, and at heights indicated, with sign surfaces free of distortion and other defects in appearance.
   3. Do not install damaged components.
   4. Fit joints to produce hairline joints free of burrs and distortion.
   5. Rigidly secure nonmoving joints.
   6. Install anchors with separators and isolators to prevent metal corrosion, electrolytic deterioration, and impediments to movement of joints.
   7. Weld components in concealed locations to minimize distortion or discoloration of finish.
      Protect glazing surfaces from welding.
   8. Seal joints watertight unless otherwise indicated.

B. Metal Protection:
   1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer, applying sealant or tape, or installing nonconductive spacers as recommended by manufacturer for this purpose.
   2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

3.3 ERECTION TOLERANCES

A. Erection Tolerances: Install to comply with the following non-accumulating maximum tolerances:
   1. Plumb: 1/8 inch in 10 feet.
   2. Level: 1/8 inch in 20 feet.
   3. Alignment:
      a. Where surfaces are in line or are separated by reveal or protruding element up to 1/2 inch wide, limit offset from true alignment to 1/16 inch.
      b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch wide, limit offset from true alignment to 1/8 inch.
      c. Where surfaces are separated by reveal or protruding element of 1 inch wide or more, limit offset from true alignment to 1/4 inch.

3.4 CLEANING AND PROTECTION

A. Protection and Repair:
   1. Protect surrounding Work as necessary to prevent damage during installation.
   2. Fabricator/Installer is responsible for general clean-up of site area but is not responsible for extensive landscaping or restoration of architectural elements due to damage or sun bleaching by previous signs.

B. After installation, clean soiled sign surfaces as recommended by signage fabricator/installer. Protect signs from damage until acceptance by Owner.

C. At completion of installation, clean exposed sign surfaces in accordance with the manufacturer’s instructions. Signs shall be free of glue, fingerprints, dirt, grease, or any other imperfections.

END OF SECTION
SECTION 101419
DIMENSIONAL LETTER SIGNAGE

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Interior and exterior dimension letter signage (ORN MET-7).

1.2 COORDINATION
A. Coordinate placement of anchorage devices for installing signs.

1.3 ACTION SUBMITTALS
A. Shop Drawings: Indicate overall construction of unit, with accommodations for attachment to building, electrical service, and access for maintenance.
   1. Provide graphic elements and layout for each sign.
   2. Illuminated Signage:
      a. Show locations of electrical service connections.
      b. Include diagrams for power, signal, and control wiring.

B. Samples: For each size and font, submit 1 full scale letter sample using specified materials and finishes.

1.4 CLOSEOUT SUBMITTALS
A. Maintenance Data: For signs to include in maintenance manuals.

1.5 QUALITY ASSURANCE
A. Installer Qualifications: Fabricator of products.

B. Fabricator Qualifications: Shop that employs skilled workers who custom-fabricate products similar to those required for this Project and whose products have a record of successful in-service performance.

1.6 WARRANTY
A. Special Warranty: Manufacturer’s standard form in which manufacturer agrees to repair or replace components of signs that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2.2 DIMENSION LETTER IDENTIFICATION

A. Cutout Characters: Characters with uniform faces; smooth, square edges; precisely formed lines and profiles.
   1. Configuration: Typeface, Height, and Text as indicated on Drawings.

B. Fabricated Channel Characters: Form exposed faces and sides of characters to produce surfaces free from warp and distortion. Include internal bracing for stability and attachment of mounting accessories.
   1. Configuration: Typeface, Height, and Text as indicated on Drawings.
   2. Provide manufacturer's hardware for projection mounting of channel characters at.
   3. Provide wall stand-off mounting accessories as recommended by Fabricator.
   4. For steel exposed to view on completion, provide materials having flat, smooth surfaces without blemishes. Do not use materials whose surfaces exhibit pitting, seam marks, roller marks, rolled trade names, or roughness.

C. Illuminated Characters: Backlighted character construction with LED lighting including transformers, insulators, and other accessories for operability, with provision for servicing and concealing connections to building electrical system. Use tight or sealed joint construction to prevent unintentional light leakage. Space lamps apart from each other and away from character surfaces as needed to illuminate evenly.
   1. Power: As indicated on electrical Drawings.
   2. Weeps: Provide weep holes to drain water at lowest part of exterior characters. Equip weeps with permanent baffles to block light leakage without inhibiting drainage.

2.3 MATERIALS

A. Aluminum:
   1. Aluminum Sheet: Not less than 0.090 inch thick.
   2. Aluminum Castings: ASTM B 26/B 26M, of alloy and temper recommended by sign manufacturer for casting process used and for use and finish indicated.
   3. Aluminum Sheet and Plate: ASTM B 209, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with at least the strength and durability properties of Alloy 5005-H32.
   4. Aluminum Extrusions: ASTM B 221, alloy and temper recommended by aluminum producer and finisher for type of use and finish indicated, and with at least the strength and durability properties of Alloy 6063-T5.

B. Stainless Steel:
   1. Stainless-Steel Sheet: Not less than 0.050 inch thick for face and 0.031 inch thick for returns.
      a. Finish: No. 4.
   2. Stainless-Steel Sheet: ASTM A 240 or ASTM A 666, Type 316, stretcher-leveled standard of flatness.

C. Fasteners and Accessories: Manufacturer's standard corrosion-resistant, nonstaining, nonbleeding fasteners and accessories compatible with adjacent materials.
   1. Use self-locking devices where fasteners are subject to loosening or turning out from thermal and structural movements, wind loads, or vibration.
   2. Reinforce members as required to receive fastener threads.
   3. Use exposed fasteners with countersunk Phillips screw heads, fabricated from Series 300 stainless steel.
2.4 FABRICATION

A. General: Provide manufacturer's standard signs of configurations indicated.
   1. Welded Connections: Comply with AWS standards for recommended practices in shop welding. Provide welds behind finished surfaces without distortion or discoloration of exposed side. Clean exposed welded surfaces of welding flux and dress exposed and contact surfaces.
   2. Mill joints to tight, hairline fit. Form joints exposed to weather to exclude water penetration.
   3. Preassemble signs in the shop to greatest extent possible. Disassemble signs only as necessary for shipping and handling limitations. Clearly mark units for reassembly and installation, in location not exposed to view after final assembly.
   4. Conceal fasteners if possible; otherwise, locate fasteners where they will be inconspicuous.

B. Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
   1. Protect mechanical finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
   2. Appearance of Finished Work: Variations in appearance of abutting or adjacent pieces are acceptable if they are within one-half of the range of approved Samples. Noticeable variations in the same piece are not acceptable. Variations in appearance of other components are acceptable if they are within the range of approved Samples and are assembled or installed to minimize contrast.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of work.

B. Examine supporting members to ensure that surfaces are at elevations indicated or required to comply with authorities having jurisdiction and are free from dirt and other deleterious matter.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install signs in accordance with reviewed shop drawings and manufacturer's printed instructions. Set letters plumb, level and true to line, and securely attach to adjacent construction.
   1. Locate signs and accessories where indicated, using mounting methods as indicated.
   2. Install signs level, plumb, and at heights indicated, with sign surfaces free of distortion and other defects in appearance.
   3. Do not install damaged components.
   4. Fit joints to produce hairline joints free of burrs and distortion.
   5. Rigidly secure nonmoving joints.
   6. Install anchors with separators and isolators to prevent metal corrosion, electrolytic deterioration, and impediments to movement of joints.
   7. Weld components in concealed locations to minimize distortion or discoloration of finish. Protect glazing surfaces from welding.
   8. Seal joints watertight unless otherwise indicated.

B. Metal Protection:
1. Where aluminum will contact dissimilar metals, protect against galvanic action by painting contact surfaces with primer, applying sealant or tape, or installing nonconductive spacers as recommended by manufacturer for this purpose.

2. Where aluminum will contact concrete or masonry, protect against corrosion by painting contact surfaces with bituminous paint.

3.3 ERECTION TOLERANCES

A. Erection Tolerances: Install to comply with the following non-accumulating maximum tolerances:
   1. Plumb: 1/8 inch in 10 feet.
   2. Level: 1/8 inch in 20 feet.
   3. Alignment:
      a. Where surfaces abut in line or are separated by reveal or protruding element up to 1/2 inch wide, limit offset from true alignment to 1/16 inch.
      b. Where surfaces are separated by reveal or protruding element from 1/2 to 1 inch wide, limit offset from true alignment to 1/8 inch.
      c. Where surfaces are separated by reveal or protruding element of 1 inch wide or more, limit offset from true alignment to 1/4 inch.

3.4 INSTALLED WORK

A. After installation, clean soiled sign surfaces as recommended by signage fabricator/installer. Protect signs from damage until acceptance by Owner.

B. At completion of installation, clean exposed sign surfaces in accordance with the manufacturer’s instructions. Signs shall be free of glue, fingerprints, dirt, grease, or any other imperfections.

SECTION 101443
PHOTOLUMINESCENT EGRESS PATH MARKINGS

GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Photoluminescent egress path markings (PEPM-1).

1.2 REFERENCES

1.3 SUBMITTALS
A. Product Data: Include product description, materials, finishes, and performance characteristics.
B. Shop Drawings: Indicate sign locations, content, mounting heights, and attachments.
C. Samples:
   1. Marking film/strip samples: 12 inches long.
   2. Perimeter demarcation strip samples: 12 inches long.
   3. Landing identification samples: 12 inches long.
   4. Door hardware marking samples: 4 x 4 inches.

1.4 DELIVERY, STORAGE AND HANDLING
A. Store markings in cool, dry location until installed.

PART 2 PRODUCTS

2.1 PRODUCTS AND MANUFACTURERS
A. Products and Manufacturers:
   1. Glo Brite Egress Path Markings by Jessup Manufacturing Company
   2. Safe-T-First Photo Luminescent Egress Path Marking System by Johnsonite.
B. Description:
   1. Photo luminescent material absorbing and storing energy from ambient fluorescent light, not requiring external power supply.
   2. Non-toxic, non-radioactive.
   3. High-visibility illumination.
C. Perimeter Demarcation Strips: Conformable photo luminescent film, 1-inch wide.
D. Stripe Film/Strip: 1-inch wide, black diagonal stripes, self-adhering with release-paper facing.
E. Fire Safety Signs: (by signage contract)
   1. Provide signs with indicated characters and graphic depictions.
   2. STANDPIPE: 8.75 inches wide x 12 inches high.
   3. PUSH TO EXIT: 11.25 inches wide x 5 inches high.
   4. PUSH UNTIL ALARM SOUNDS - DOOR CAN BE OPENED IN 15 SECONDS: 11.25 inches wide x 10 inches high.
   5. Running man - right: 8 x 8 inches.
   6. Running man - left: 8 x 8 inches.
F. Floor Identification Signs:
1. Size: 12 inches wide x 18 inches high.
2. Content:
   a. Stair or ramp identification.
   b. Floor level.
   c. Braille floor indicator.
   d. Exit enclosure top and bottom terminus.
   e. Roof access availability.
   f. Exit discharge direction.

G. Door and Hardware Markings: Self-adhering with release-paper facing.
1. Exit door markings: 4 x 4 inches.
2. Door hardware markings:
   a. Door handles: 4 x 4 inches.
   b. Panic bars: 1-inch high x full width of bar.

PART 3 EXECUTION

3.1 PREPARATION
A. Clean substrate surfaces of dirt, oil, grease, and loose matter that could impair adhesion.

3.2 INSTALLATION
A. Install markings in accordance with Manufacturer’s instructions and approved Shop Drawings.
B. Locate markings in accordance with Building Code.
C. Install markings straight and true to line.

SECTION 102100
TOILET COMPARTMENTS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Solid plastic toilet compartments and urinal screens (T COMP-1) and (T COMP-2).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for toilet compartments.
B. Shop Drawings: For toilet compartments.
   1. Include plans, elevations, sections, details, and attachment details.
   2. Show locations of cutouts for compartment-mounted toilet accessories.
   3. Show locations of centerlines of toilet fixtures.
   4. Show locations of floor drains.
   5. Show overhead support or bracing locations.
C. Samples: For each type of toilet compartment material indicated. Each type of material, color, and finish required for toilet compartments, prepared on 6-inch-square Samples of same thickness and material indicated for Work.

1.3 CLOSEOUT SUBMITTALS
A. Maintenance Data: For toilet compartments to include in maintenance manuals.

1.4 PROJECT CONDITIONS
A. Field Measurements: Verify actual locations of toilet fixtures, walls, columns, ceilings, and other construction contiguous with toilet compartments by field measurements before fabrication.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS
A. Regulatory Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines for Buildings and Facilities for toilet compartments designated as accessible.

2.2 MANUFACTURERS
A. Products and Manufacturers: Subject to compliance with specified requirements, provide Basis of Design or equivalent product, approved by Architect, by one of the following Manufacturers:
   1. Metpar Steel Products.
   2. Accurate Partitions.
   4. Scranton Products.
2.3 SOLID-PLASTIC TOILET COMPARTMENTS

A. (T COMP-1) and (T COMP-2): Floor-mounted, overhead-braced solid plastic toilet enclosures and wall-hung urinal screens.

B. Door, Panel, Screen, and Pilaster Construction: Constructed of two sheets of 1/8 inch thick high density polyethylene (HDPE), thermoformed with touch points into single engineered panel, with structural inserts on top and middle rails. Waterproof and nonabsorbent, with self-lubricating surface, resistant to marks by pens, pencils, markers, and other writing instruments.
   1. Integral Hinges: Configure doors and pilasters to receive integral hinges.
   2. Finish: "Orange Peel".
   3. (T COMP-1) Color: "Stainless".
   4. (T COMP-2) Color: "Linen". Engraved Traditional 2600.

C. Headrail: Heavy-duty extruded aluminum, anti-grip design, integrated curtain track, clear anodized finish, fastened to headrail bracket with stainless steel tamper resistant Torx head bolt and at top of pilaster with stainless steel tamper resistant Torx head screws.
   1. Headrail Brackets: 20 gage stainless steel, satin finish, secured to wall with stainless steel tamper resistant Torx head screws.

2.4 HARDWARE AND ACCESSORIES

A. Hardware and Accessories: Manufacturer’s heavy-duty operating hardware and accessories.

B. Hinges: Manufacturer’s minimum 0.062-inch-thick stainless-steel continuous, cam type that swings to a closed or partially open position allowing emergency access by lifting door. Mount with through-bolts.

C. Latch and Keeper: Manufacturer’s heavy-duty surface-mounted cast-stainless-steel latch unit designed to resist damage due to slamming, with combination rubber-faced door strike and keeper, and with provision for emergency access. Provide units that comply with regulatory requirements for accessibility at compartments designated as accessible. Mount with through-bolts.

D. Coat Hook: Manufacturer’s heavy-duty combination cast-stainless-steel hook and rubber-tipped bumper, sized to prevent in-swinging door from hitting compartment-mounted accessories. Mount with through-bolts.
   1. Provide coat hook at inside of stall doors.

E. Door Bumper: Manufacturer’s heavy-duty rubber-tipped cast-stainless-steel bumper at out-swinging doors. Mount with through-bolts.

F. Door Pull: Manufacturer’s heavy-duty cast-stainless-steel pull at out-swinging doors that complies with regulatory requirements for accessibility. Provide units on both sides of doors at compartments designated as accessible. Mount with through-bolts.

G. Anchorages and Fasteners: Manufacturer’s standard exposed fasteners of stainless steel, finished to match the items they are securing, with theft-resistant-type heads. Provide sex-type bolts for through-bolt applications. For concealed anchors, use stainless-steel, hot-dip galvanized-steel, or other rust-resistant, protective-coated steel compatible with related materials.

2.5 FABRICATION

A. Fabrication, General: Fabricate toilet compartment components to sizes indicated. Coordinate requirements and provide cutouts for through-partition toilet accessories where required for attachment of toilet accessories.
1. Provide formed and closed edges for doors, panels and pilasters. Miter and weld corners and grind smooth.
2. Provide internal reinforcement in areas of attached hardware and fittings. Mark locations of reinforcement for partition mounted toilet accessories.

B. Overhead-Braced Units: Provide manufacturer's standard corrosion-resistant supports, leveling mechanism, and anchors at pilasters to suit floor conditions. Provide shoes at pilasters to conceal supports and leveling mechanism.

C. Floor-Anchored Units: Provide manufacturer's standard corrosion-resistant anchoring assemblies with leveling adjustment nuts at pilasters for structural connection to floor. Provide shoes at pilasters to conceal anchorage.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine areas and conditions, with Installer present, for compliance with requirements for fastening, support, alignment, operating clearances, and other conditions affecting performance of the Work.
   1. Confirm location and adequacy of blocking and supports required for installation.
   2. Proceed with installation only after unsatisfactory conditions have been corrected.
B. Examine site conditions to which work is to be applied. Do not proceed with work until unsatisfactory conditions have been corrected.
   1. Take site dimensions affecting this work.
   2. Ensure correct spacing of plumbing fixtures.
   3. Ensure correct location of built-in framing, anchorage, and bracing, where required.

3.2 INSTALLATION
A. General: Comply with manufacturer's written installation instructions. Install units rigid, straight, level, and plumb. Secure units in position with manufacturer's recommended anchoring devices.
   1. Maximum Clearances:
      a. Pilasters and Panels: 1/2 inch.
      b. Panels and Walls: 1 inch.
   2. Install partitions secure, plumb, level, and square.
   4. Full-Height Brackets: Secure panels to walls and to pilasters with intermittent brackets.
      a. Locate bracket fasteners so holes for wall anchors occur in masonry or tile joints.
      b. Align brackets at pilasters with brackets at walls.
B. Ceiling-Hung Units: Secure pilasters to supporting structure and level, plumb, and tighten. Hang doors and adjust so bottoms of doors are level with bottoms of pilasters when doors are in closed position.
C. Overhead-Braced Units: Secure pilasters to floor and level, plumb, and tighten. Set pilasters with anchors penetrating not less than 1-3/4 inches into structural floor unless otherwise indicated in manufacturer's written instructions. Secure continuous head rail to each pilaster with no fewer than two fasteners. Hang doors to align tops of doors with tops of panels, and adjust so tops of doors are parallel with overhead brace when doors are in closed position.
D. Floor-Anchored Units: Set pilasters with anchors penetrating not less than 2 inches into structural floor unless otherwise indicated in manufacturer's written instructions. Level, plumb, and tighten pilasters. Hang doors and adjust so tops of doors are level with tops of pilasters when doors are in closed position.

E. Urinal Screens: Attach with anchoring devices to suit supporting structure. Set units level and plumb, rigid, and secured to resist lateral impact.

F. Hardware:
   1. Equip each door with hinges; one door latch, or at accessible stalls, one accessible use door latch and one door pull; and one coat hook and bumper.
   2. Install door strike keeper with door bumper on each pilaster in alignment with door latch.
   3. Hardware Adjustment: Adjust and lubricate hardware according to hardware manufacturer's written instructions for proper operation. Set hinges on in-swinging doors to hold doors open approximately 30 degrees from closed position when unlatched. Set hinges on out-swinging doors to return doors to fully closed position.

3.3 CLEANING

A. Field touch-up of scratches or defaced enamel finish will not be permitted. Damaged, scratched or marred defective materials will be rejected, and shall be replaced with new materials.

B. Remove protective maskings. Clean surfaces free of oil and imperfections.

END OF SECTION
SECTION 102600
WALL & DOOR PROTECTION

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Wall corner guards (WCG-1).
   2. Chair rails (CHR-1).

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product. Include construction details, material descriptions, impact strength, dimensions of individual components and profiles, and finishes.
B. Shop Drawings: For each type of wall and door protection showing locations and extent.
C. Samples: For each type of impact-resistant wall-protection unit indicated, in each color and texture specified. Include Samples of accent strips and accessories to verify color selection.

1.3 DELIVERY, STORAGE AND HANDLING
A. Deliver wall and corner guards in manufacturer's protective covering. Handle finished surfaces with care to prevent damage.

PART 2 PRODUCTS

2.1 MANUFACTURERS
A. Manufacturers:
   1. IPC Door and Wall Protection Systems.
   2. Koroguard.
   4. MM Systems Corp.
   5. K.J.Miller Corp.
   6. Stylmark
   7. C/S Group.

2.2 METAL WALL CORNER GUARDS
A. (WCG-1) Surface-Mounted, Metal Corner Guards: Fabricated as one piece from formed or extruded metal with formed edges; with 90- or 135-degree turn to match wall condition.
   1. Basis of Design: Inpro
   2. Material: Stainless-steel sheet, Type 430.
   3. Thickness: 16 ga...
   4. Finish: Directional satin, No. 4.
   5. Wing Size: Nominal 2 by 2 inches.
   7. Mounting: Flat-head, countersunk screws through factory-drilled mounting holes.
2.3 CHAIR RAILS
   A. (CHR-1) Chair Rail: Snap on cover of .070" thickness extruded polyvinyl chloride on Continuous aluminum retainer of .060" thickness shall be fabricated from 6063-T5 aluminum, with a mill finish.
   1. Basis of Design: 2500 Chair Rail by IPC.
      a. Color: Designer White 0101
   2. Sizes: 2 inches high, 1 inch depth.
   3. End caps, outside corners and inside corners made of injection molded thermoplastics.

2.4 INSTALLATION ACCESSORIES
   A. Attachment Hardware: As recommended by manufacturer for wall construction type.
   C. Fasteners: Non-corrosive and compatible with aluminum retainers, supplied by wall protection manufacturer.
   D. Trim and Accessories: Edge and corner trim as required for a complete finished installation as approved by Architect.
   E. Adhesive: Type recommended by manufacturer for use with material being adhered to substrate indicated.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine areas and conditions in which wall surface protection components and wall protection systems will be installed.
   B. Wall surfaces to receive impact-resistant wall covering materials shall be dry and free from dirt, grease, loose paint and scale.
   C. Do not proceed with installations until unsatisfactory conditions have been corrected.

3.2 PREPARATION
   A. Prior to installation, clean substrate to remove dust, debris, and loose particles.

3.3 INSTALLATION
   A. Install wall protection and corner guards and accessories in accordance with reviewed shop drawings and manufacturer's printed instructions.
   B. Install true, plumb and level, securely and rigidly anchored to substrate.
   C. Do not install damaged materials with chips, cracks, voids, or stains left exposed to view.
   D. Provide mounting hardware, splices, anchors and other accessories for complete system.

3.4 CLEANING
   A. Immediately upon completion of installation, clean plastic covers and accessories using standard ammonia based household cleaning agent. Clean metal components in accordance with manufacturer's recommendations.
   B. Remove excess adhesive using methods and materials recommended by manufacturer.
C. Remove surplus materials, rubbish and debris resulting from installation upon completion of work and leave areas of installation in neat, clean condition.

END OF SECTION
SECTION 10 28 13
TOILET ACCESSORIES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Washroom accessories.
   2. Hand dryers.
   3. Custodial accessories.
   4. Installation of Owner-furnished accessories (OFCI).
B. Related Sections:
   1. Section 088000 - Glazing: Glass mirrors.
   2. Section 092216 - Non-Structural Metal Stud Framing: Metal anchor reinforcement in walls.

1.2 COORDINATION
A. Coordinate accessory locations with other work to prevent interference with clearances required for access by people with disabilities, and for proper installation, adjustment, operation, cleaning, and servicing of accessories.
B. Deliver inserts and anchoring devices set into concrete or masonry as required to prevent delaying the Work.

1.3 SUBMITTALS
A. Product Data: For each type of product indicated. Include the following:
   1. Construction details and dimensions.
   2. Anchoring and mounting requirements, including requirements for cutouts in other work and substrate preparation.
   3. Material and finish descriptions.
   4. Features that will be included for Project.
   5. Manufacturer's warranty.
   6. Installation Templates: Provide setting drawings where cutouts are required in other work, including templates, substrate preparation instructions, and directions for preparing cutouts and installing anchorage devices.
B. Samples:
   1. Finish Samples: Submit samples of each exposed finish type.
   2. Unit Samples: Full size, for each accessory item to verify design, operation, and finish requirements. Approved full-size Samples will be returned and may be used in the Work.
C. Product Schedule: Indicating types, quantities, sizes, and installation locations by room of each accessory required.
   1. Identify locations using room designations indicated.
   2. Identify products using designations indicated.
D. Maintenance Data: For toilet and bath accessories to include in maintenance manuals.

1.4 DELIVERY, STORAGE AND HANDLING
A. Do not deliver accessories to site until rooms in which they are to be installed are ready to receive them.
B. Pack accessories individually in manner to protect accessory and its finish.

1.5 WARRANTY

A. General Warranty: Special warranty specified in this Article shall not deprive Owner of other rights. Owner may have under other provisions of the Contract Documents and shall be in addition to, and run concurrent with, other warranties made by Contractor under requirements of the Contract Documents.

B. Special Mirror Warranty: Manufacturer's standard form in which manufacturer agrees to replace mirrors that develop visible silver spoilage defects and that fail in materials or workmanship within specified warranty period.
   1. Warranty Period: 15 years from date of Substantial Completion.

PART 2 PRODUCTS

C. Product Requirements

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

E. Source Limitations: For products listed together in the same Part 2 articles, obtain products from single source from single manufacturer.
   1. Owner Approved Supplier: Allied Eagle Supply Co.

2.1 SCHEDULE OF CUSTODIAL AND TOILET ACCESSORIES

A. Schedule: Subject to compliance with specified requirements, provide Basis of Design products as indicated or equivalent products as approved by Architect.

B. General Building Accessories:
   1. (BA-1) Mop and Broom Holder with Shelf: Stainless steel shelf, 24 inches long, _ inches deep, with 3 mop & broom holders.
      a. Bobrick B-223.
   2. (BA-2) Mop and Broom Holder with Shelf: Stainless steel shelf, 36 inches long
      a. Bobrick B-224.

C. Coat Hooks:
   1. (CH-1) Single Hook: Stainless steel, satin finish.
      a. Bobrick B-76717.
      b. Bradley 9114 Bradex.
   2. (CH-2) Double Hook: Stainless steel, satin finish.
      a. Bobrick B-76727.
      b. Bradley 9124 Bradex.
   3. (CH-3) Hat and Coat Hook: Stainless steel, satin finish.
      a. Bobrick B-6827.
      b. Bradley 9134 Bradex.

D. (DRY-1) Electric Hand Dryers: Surface mounted, electric with automatic operation, polycarbonate-ABS casing, 1400 watts, voltage 110-127V.
   1. Basis of Design: Dyson Airblade dB.

E. (DRY-2) Hand Dryers: Surface-mounted, electric with automatic operation, vitreous enamel paint finish over cast iron, 1900 to 2300 watts.
   2. Operation: Electronic-sensor activated with timed power cut-off switch.
3. Motor: 60 Hz. Capacitor-initiated; brushless, for longer life and quiet operation; 1/10 HP, 3,400 RPM; self-lubricating bearings; self-resetting thermal switch.

F. (GB) Grab Bars: In accordance with ADA guidelines, capable of withstanding downward load of 250 lbf when tested according to ASTM F 446.
   1. Basis of Design:
      a. Bobrick B-6806 Series.
      b. Bradley 812 Series
   2. Material and Finish: Type 304 stainless steel pipe, 18 ga., 1-1/2” outer diameter, with satin finish on ends and slip-resistant texture in grip area.
   3. Mounting: Flanges with concealed fasteners and gasketed stainless steel escutcheon.
   4. Configurations: As indicated on Drawings. Refer to grab bar schedule in Drawings.

G. Infant Changing Station: Unit that opens by folding down from stored position by pneumatic shock-absorbing mechanism, engineered to support a minimum of 250-lb static load when opened, with child-protection strap and built-in tissue liner dispenser; in compliance with ASTM F 2285 - Standard Safety Performance Specification for Diaper Changing Tables for Commercial Use.
   1. (ICS-1) Stainless Steel, Recess-Mounted, Horizontal Orientation: Type 304 stainless steel station with HDPE formed liner.
      a. KB110-SSRE by Koala Kare Products, a division of Bobrick.

H. (MIR-1) Framed Mirrors Without Shelf: sizes as indicated.

I. (PTC-1) Dual Paper Towel Roll Dispensers: Surface-mounted, ABS plastic, translucent black; one roll in reserve.
   2. Supplier: Allied-Eagle.

J. (SDISP-1) Soap Dispenser: Wall-mounted, manual foaming soap dispenser, vertical design, translucent black plastic.
   2. Supplier: Allied-Eagle.

K. (SDISP-2) Soap Dispenser: Lavatory-mounted, manually-operated foaming soap dispenser, 4-inch spout, reservoir.
   1. Basis of Design: Lite’n Foamy Counter Mount Dispenser #967700

   2. Supplier: Allied-Eagle.

2.2 SHOWER ACCESSORIES

A. (SHCR-1) Shower Curtain Rod:

B. (SHC-1) Shower Curtain and Hooks:
1. Bobrick B-2041 hooks
2. Bobrick B-2042 curtain

C. (SHFS-4) Shower Folding Seat:
   1. Bobrick, B-5193 Folding Shower Seat, solid phenolic

### 2.3 MATERIALS

A. Stainless Steel: ASTM A 666, Type 304, with No. 4 finish (satin), in 0.0312-inch minimum nominal thickness, unless otherwise indicated.

B. Steel Sheet: ASTM A 1008, Designation CS (cold rolled, commercial steel), 0.036-inch minimum nominal thickness.

C. Sheet Steel: ASTM A 366, cold rolled, commercial quality, 0.0359-inch minimum nominal thickness; surface preparation and metal pretreatment as required for applied finish.

D. Galvanized Steel Sheet: ASTM A 653, G60.

E. Chrome Plating: ASTM B 456, Service Condition Number SC 2 (moderate service).

G. Mirror Glass: ASTM C 1036, Type I, Class 1, Quality q2, nominal 6.0 mm thick, with silvering, electroplated copper coating, and protective organic coating complying with FS DD-M-411.
   1. Mirrors: ASTM C 1503, Mirror Glazing Quality, clear-glass mirrors, nominal 6.0 mm thick.

H. Fasteners and Mounting Devices: Provide concealed fasteners where possible.
   1. Where fasteners remain exposed to view, provide tamper-resistant and theft-resistant fasteners, of material and finish to match accessory unit.
   2. Screws, bolts, and other devices of same material as unit and tamper-and-theft resistant where exposed, and of galvanized steel where concealed.

I. Fasteners, Screws, and Bolts: Hot dip galvanized.

J. Expansion Shields: Fiber, lead or rubber as recommended by accessory manufacturer for component and substrate. Provide exposed fasteners with finish to match accessories.

K. Adhesive: Epoxy type contact cement.

### 2.4 FABRICATION

A. General:
   1. Fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with full-length, continuous hinges. Equip units for concealed anchorage and with corrosion-resistant backing plates.
   2. Shop assemble components and package complete with anchors and fittings.
   3. Keys: Provide universal keys for internal access to accessories for servicing and resupplying.

B. General: Names or labels are not permitted on exposed faces of accessories. On interior surface not exposed to view or on back surface of each accessory, provide printed, waterproof label or stamped nameplate indicating manufacturer’s name and product model number.

C. Surface-Mounted Toilet Accessories: Unless otherwise indicated, fabricate units with tight seams and joints, and exposed edges rolled. Hang doors and access panels with continuous stainless-steel hinge. Provide concealed anchorage where possible.
D. Recessed Toilet Accessories: Unless otherwise indicated, fabricate units of all-welded construction, without mitered corners. Hang doors and access panels with full-length, stainless-steel hinge. Provide anchorage that is fully concealed when unit is closed.

E. Framed Glass-Mirror Units: Fabricate frames for glass-mirror units to accommodate glass edge protection material. Provide mirror backing and support system that permits rigid, tamper-resistant glass installation and prevents moisture accumulation.

F. Provide galvanized steel backing sheet, not less than 0.034 inch and full mirror size, with non-absorptive filler material. Corrugated cardboard is not an acceptable filler material.

G. Mirror-Unit Hangers: Provide mirror-unit mounting system that permits rigid, tamper- and theft-resistant installation, as follows:
   1. One-piece, galvanized steel, wall-hanger device with spring-action locking mechanism to hold mirror unit in position with no exposed screws or bolts.

H. Keys: Provide universal keys for internal access to accessories for servicing and resupplying. Provide minimum of six keys to Owner’s representative.

PART 3 EXECUTION

3.1 PREPARATION
A. Deliver inserts and rough-in frames to jobsite at appropriate time for building-in. Provide templates and rough-in measurements as required.

B. Before starting work notify Architect in writing of conflicts detrimental to installation or operation of units.

C. Verify exact location of accessories with Architect. Verify blocking is in place prior to gypsum board installation.

D. Accessory Locations: Coordinate accessory locations with other work to avoid interference and to assure proper operation and servicing of accessory units.

3.2 INSTALLATION
A. Locate toilet accessories in accordance with requirements of Texas Accessibility Standards (TAS).

B. Install fixtures, accessories and items in accordance with manufacturer’s printed instructions.

C. Install true, plumb and level, securely and rigidly anchored to substrate and sealed to protect structural elements of wall from moisture.

D. Use tamper proof (security) type fasteners.

3.3 INSTALLED WORK
A. Adjust toilet accessories for proper operation and verify that mechanisms function smoothly. Replace damaged or defective items.

B. Clean and polish exposed surfaces in accordance with manufacturer’s recommendations after removing labels and protective coatings.

END OF SECTION
SECTION 10 44 00
FIRE PROTECTION SPECIALTIES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Fire extinguishers (FE).
   2. Fire extinguisher cabinets (FEC).
   3. Fire department key box (FDKB).
   4. Wall brackets and other accessories.
B. Related Sections:
   1. Section 099000 - Painting.
   2. Division 21 - Fire Suppression: Fire protection system.

1.2 ACTION SUBMITTALS
A. Product Data:
   1. Fire Extinguishers: Include rating and classification, material descriptions, dimensions of individual components and profiles, and finishes for fire extinguisher.
   2. Fire-Protection Cabinets: Include roughing-in dimensions, details showing mounting methods, relationships of box and trim to surrounding construction, door hardware, cabinet type, trim style, and panel style.
B. Shop Drawings: For fire-protection cabinets. Include plans, elevations, sections, details, and attachments to other work.

1.3 DELIVERY, STORAGE AND HANDLING
A. Deliver firefighting devices in manufacturer’s protective packaging as required by project sequencing for installation. Fill and service extinguishers as required before installation.
B. Store and handle with care to prevent damage.

1.4 COORDINATION
A. Coordinate size of fire-protection cabinets to ensure that type and capacity of fire extinguishers indicated are accommodated.
B. Coordinate with Divisions 21, 26 and 28 as needed for connection of key box to building emergency alarm system.
C. Fire Department Key Box Coordination:
   1. Coordinate with local emergency departments for master keying.
   2. Coordinate with building alarm system.
   3. Coordinate with Section 087100 - Door Hardware.

1.5 WARRANTY
A. Special Warranty: Manufacturer’s standard form in which manufacturer agrees to repair or replace components of portable fire extinguishers that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
a. Failure of hydrostatic test according to NFPA 10.
b. Faulty operation of valves or release levers.
2. Warranty Period: 5 years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Fire Extinguishers: Listed and labeled for type, rating, and classification by an independent testing agency acceptable to authorities having jurisdiction.
   1. NFPA Compliance: Fabricate and label fire extinguishers to comply with NFPA 10, "Portable Fire Extinguishers."
   2. UL-Listed Products: Provide fire extinguishers which are UL-listed and bear UL "Listing Mark" for type, rating, and classification of extinguisher indicated.
   3. FM-Listed Products: Provide fire extinguishers which are approved by Factory Mutual Research for type, rating and classification of extinguisher indicated, carrying appropriate FM marking.
B. Cabinets in Fire-Rated Walls: Provide Manufacturer’s fire-rated cabinets, listed and labeled to comply with requirements of ASTM E 814 for fire-resistance rating of walls where they are installed.

2.2 PRODUCTS AND MANUFACTURERS

A. Basis of Design: The design for each fire extinguisher is based on the product named. Other products subject to compliance with the requirements in this Section, and as approved by Architect.
   1. Amerex Corporation.
   2. Ansul.
   3. JL Industries.
   4. Larsen's Manufacturing.
   5. Potter Roemer, Div. of Smith Industries, Inc.

2.3 FIRE EXTINGUISHERS

A. Multipurpose Dry-Chemical Type in Steel Container: Monoammonium phosphate-based dry chemical in enameled-steel container; for Class A, B C fires; charged and bearing inspection tag with charge date; and as follows:
   1. (FE-2) 5 lb. Extinguisher: UL-rated 3-A:40-B:C.
B. Mounting Brackets: Manufacturer's standard galvanized steel, designed to secure fire extinguisher to wall or structure, of sizes required for types and capacities of fire extinguishers indicated, with plated or baked-enamel finish.

2.4 FIRE EXTINGUISHER CABINETS

A. (FEC-1) Recessed Steel Cabinet with Flat Trim:
   2. Door Style and Material: Full glass.
   3. Glass Type: Clear, tempered glass
   4. Latch: Magnetic catch.
   5. Finish: Baked enamel finish in color as selected by Architect. Door Hardware: Manufacturer's standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
      a. Provide manufacturer's standard.
b. Provide continuous hinge, of same material and finish as trim, permitting door to open 180 degrees.

6. Identification: Horizontal die-cut lettering complying with authorities having jurisdiction for letter style, size, spacing, and location.

B. (FEC-2) Surface-Mounted Steel Cabinet:
   2. Door Style and Material: Full glass.
   3. Glass Type: Clear, tempered glass
   4. Latch: Magnetic catch.
   5. Finish: Baked enamel finish in color as selected by Architect. Door Hardware: Manufacturer’s standard door-operating hardware of proper type for cabinet type, trim style, and door material and style indicated.
      a. Provide manufacturer’s standard.
      b. Provide continuous hinge, of same material and finish as trim, permitting door to open 180 degrees.
   6. Identification: Horizontal die-cut lettering complying with authorities having jurisdiction for letter style, size, spacing, and location.

2.5 EMERGENCY KEY BOX
A. (FDKB-1) Surface-Mounted Emergency Key Box: Surface-mounted box with gasketed weather-resistant hinged door.
   1. Basis of Design: Knox-Box 3275 by Knox Company
   2. Finish: Manufacturer’s standard finish in black color as selected by Architect.

2.6 FABRICATION
A. Fire-Protection Cabinets: Provide manufacturer’s standard box (tub), with trim, frame, door, and hardware to suit cabinet type, trim style, and door style indicated.
   1. Weld joints and grind smooth.
   2. Provide factory-drilled mounting holes.
   3. Prepare doors and frames to receive locks.
   4. Install door locks at factory.
B. Fire-Rated Cabinets: Construct fire-rated cabinets with double walls fabricated from 0.0428-inch-thick, cold-rolled steel sheet lined with minimum 5/8-inch-thick, fire-barrier material. Provide factory-drilled mounting holes.
C. Cabinet Doors: Fabricate doors according to manufacturer’s standards, from materials indicated and coordinated with cabinet types and trim styles selected.
   1. Fabricate door frames with tubular stiles and rails and hollow-metal design, minimum 1/2 inch thick.
   2. Miter and weld perimeter door frames.
D. Cabinet Trim: Fabricate cabinet trim in one piece with corners mitered, welded, and ground smooth.

PART 3 EXECUTION
3.1 EXAMINATION
A. Examine roughing-in for hose valves and cabinets to verify actual locations of piping connections before cabinet installation.
B. Examine walls and partitions for suitable framing depth and blocking where recessed and semi-recessed cabinets will be installed.

C. Examine fire extinguishers for proper charging and tagging.
   1. Remove and replace damaged, defective, or undercharged units.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install fire protection specialties and accessories according to reviewed shop drawings and manufacturer instructions.

B. Fire-Protection Cabinets: Fasten fire-protection cabinets to structure, square and plumb.
   1. Provide inside latch and lock for break-glass panels.
   2. Fasten mounting brackets to inside surface of fire-protection cabinets, square and plumb.
      1. Install cabinet with not more than 1/16-inch tolerance between pipe OD and knockout OD. Center pipe within knockout.
      2. Seal through penetrations with firestopping sealant as specified in Section 078440 - Firestopping.

C. Mounting Brackets: Fasten mounting brackets to surfaces, square and plumb, at locations indicated.

D. Install in locations and at mounting heights indicated or, if not indicated, at heights to comply with applicable regulations of governing authorities.

E. Prepare recesses in walls for cabinets as required by type and size of cabinet and style of trim and to comply with manufacturer’s instructions.

3.3 ADJUSTING AND CLEANING

A. Remove temporary protective coverings and strippable films, if any, as fire-protection specialties are installed, unless otherwise indicated in manufacturer’s written installation instructions.

B. Adjust fire-protection cabinet doors to operate easily without binding. Verify that integral locking devices operate properly.

C. On completion of fire-protection cabinet installation, clean interior and exterior surfaces as recommended by manufacturer.

D. Touch up marred finishes, or replace fire-protection cabinets that cannot be restored to factory-finished appearance. Use only materials and procedures recommended or furnished by fire-protection cabinet manufacturer.

E. Replace fire-protection cabinets that have been damaged or have deteriorated beyond successful repair by finish touchup or similar minor repair procedures.

END OF SECTION
SECTION 107113
EXTERIOR SUN CONTROL DEVICES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 051200 Structural Steel Framing

1.2 SUMMARY

A. This section includes the following:

1. Fixed, extruded-aluminum sunshades.

1.3 DEFINITIONS

A. For fenestration industry standard terminology and definitions refer to American Architectural Manufacturers Association (AAMA) AAMA Glossary (AAMA AG).

1.4 PERFORMANCE REQUIREMENTS

A. Structural Performance: Combined load on sunshade configurations to be determined in accordance with ASCE 7 or applicable code requirements. Combined load consists of wind, snow and ice loads. Design sunshade configurations to withstand stresses due to combined load. Stresses resulting from thermal expansion/contraction, shall not cause permanent deformation of sunshade assemblies or disengagement from the wall system.

B. Blade deflection shall not exceed L/120 of span length.

B. Shading Performance: Design of standard configurations will allow for negligible direct sunlight to show through the blades based on project location, latitude, altitude, building orientation, surrounding conditions, and aesthetic requirements, except for round, diamond and square sunshade styles.

C. Thermal Movements: Allow for thermal movements resulting from the following maximum change (range) in ambient and surface temperatures:

1. Temperature Change (Range): 120 deg F, ambient; 180 deg F, material surfaces.

1.5 SUBMITTALS

A. Product Data: For each type of product specified.

B. Shop Drawings: For sunshade units and accessories. Include plans, elevations, sections, and details showing profiles, angles, and spacing of sunshade blades. Show unit dimensions related to wall openings and construction and profiles of frames at jamb, heads and sills, and anchorage details and locations.

1. For installed sunshades indicated to comply with design loadings, include structural analysis data signed and sealed by a qualified professional engineer responsible for their preparation.
C. Samples for Initial Section: American Warming & Ventilating’s color charts showing the full range of colors available for units with factory applied color finishes unless custom colors are called for in Paragraph 2.5.

D. Samples for Verifications: Of each type of metal finish required, prepared on samples of same thickness and material indicated for final work. Where finishes involve normal color and texture variations, include sample sets showing the full range of variations expected.

E. Product Certificates: Signed by American Warming and Ventilating certifying that the finished products comply with requirements and are licensed to bear the AMCA seal based on tests made according to AMCA 500 and complying with AMCA's Certified Ratings Program.

F. Product Test Reports: Indicate compliance of products with requirements based on comprehensive testing of current products.

G. Qualification Data: For firms and persons specified in "Quality Assurance" article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of architects and owners, and other information specified.

1.6 QUALITY ASSURANCE

A. Professional Engineer Qualifications: A professional engineer who is legally qualified and who is experienced in providing engineering service of kind indicated. Engineering services are defined as those performed for installations of sunshades that are similar to those indicated for this project in material, design, and extent.

B. Source Limitations: Obtain sunshades and vents from a single source manufacturer where alike in one or more respects regarding type, design, and factory applied color finish.

D. Delegated Design: Sun shade to be designed and verified by supplier to meet all applicable codes, including mounting and connections.

1.7 PROJECT CONDITIONS

A. Field Measurements: Verify sunshade openings by field measurements before fabrication and indicate measurements on shop drawings. Coordinate fabrication schedule with construction progress to avoid delaying the work.

1. Establishing Dimensions: Where field measurements cannot be made without delaying the work, the general contractor shall establish opening dimensions allowing the manufacturer to proceed with fabricating sunshades without field measurements. Coordinate construction to ensure that actual opening dimensions correspond to established dimensions.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Manufacturers Basis of Design: Subject to compliance with requirements, provide products manufactured by the following:

1. American Warming and Ventilating, Inc., 7301 International Dr. Holland, OH 43528 USA, Phone: 419-865-5000, Fax: 419-865-1375
2. Other manufacturers are acceptable and will be evaluated on ability to comply with design, performance and project requirements.

2.2 MATERIALS

A. Aluminum Extrusions: ASTM B 221, alloy 6063-T5.

B. Fasteners: Of same basic metal and alloy as fastened metal unless otherwise indicated. Do not use metals that are corrosive or incompatible with materials joined.
   1. Use types, gauges, lengths to suit unit installation conditions.
   2. Use hex-head screws for exposed fasteners unless otherwise indicated.

C. Anchors and Inserts: Of type, size and material required for type of loading and installation indicated. Use nonferrous metal or hot-dip galvanized anchors and inserts for exterior installations and elsewhere as required for corrosion resistance. Use toothed steel or expansion bolt devices for drilled-in-place anchors.

2.3 FABRICATION, GENERAL

A. Assemble sunshades in factory to minimize field splicing and assembly. Disassemble units as necessary for shipping and handling limitations.

B. Weld fixed sunshade blades to outrigger frame unless otherwise indicated or size of sunshade assembly makes bolted connections between frame members necessary.

2.4 FIXED, EXTRUDED-ALUMINUM SUNSHADES CONSTRUCTION

A. Manufacture: Provide fixed-blade sunshades by American Warming and Ventilating model SC8T.

B. Horizontal Sunshade Blades: Rectangular tube blade type complying per the following:
   1. Blade width: 8 inches x 2 inches.
   2. Blade Thickness: Minimum 0.25 inch thick Extruded Aluminum 6063-T5 or T6 alloy

C. Outriggers: Minimum 1/4” Thick aluminum alloy complying per the following:
   1. Depth: 8 inches (203 mm) by length indicated on project drawings.

2.5 ALUMINUM FINISHES

A. Finish designations prefixed by AA comply with system established by the Aluminum Association for designating aluminum finishes.

   1. Fluoropolymer Two Coat System: Manufacturer's standard thermocured system consisting of specially
formulated inhibitive primer and fluoropolymer color topcoat containing not less than 70 percent polyvinylidene fluoride resin by weight, complying with AAMA 2605. (20) year warranty.
   a. Custom color to match MP-1 (Evening Shade ENC-1605) or to match architects sample.

PART 3 EXECUTION

3.1 PREPARATION

   A. General Contractor to coordinate setting drawings, diagrams, templates, instruction, and directions for installation of anchorages that are to be embedded in concrete or masonry construction. General Contractor to coordinate delivery of such items to project site.

3.2 INSTALLATION

   A. Locate and place sunshade units level, plumb, and at indicated alignment with adjacent work.

   B. Use concealed anchorages where possible. Provide brass or lead washers fitted to screws where required to protect metal surfaces and to make a weathertight connection.

   C. Form closely fitted joints with exposed connections accurately located and secured.

   D. Provide perimeter reveals and openings of uniform width for sealants and joint fillers as indicated.

   E. Repair finishes damaged by cutting, welding, soldering, and grinding. Restore finishes so no evidence remains of corrective work. Return items that cannot be refinished in the field to the factory, make required alterations, and refinish entire unit or provide new units.

   F. Protect galvanized and nonferrous metal surfaces from corrosion or galvanic action by applying a heavy coating of bituminous paint on surfaces that will be in contact with concrete, masonry, or dissimilar metals.

   G. Install concealed gaskets, flashings, joint fillers, and insulation, as sunshade installation progresses, where weathertight sunshade joints and required. Comply with Division 7 Section "Joint Sealants" for sealants applied during sunshade installation.

3.3 ADJUSTING, PROTECTING, AND CLEANING

   A. Protect sunshades and vents from damage during construction. Use temporary protective coverings where needed and approved by sunshade manufacturer (AWV). Remove protective coverings at the time of Substantial Completion.

   B. Restore sunshades damaged during installation and construction so no evidence remains of corrective work. If results of restoration are unsuccessful, as determined by the architect, remove damaged units and replace with new units.

      1. Clean and touch up minor abrasions in finishes with air-dried coating that matches color and gloss, and is compatible with, factory-applied finish coating.

      C. Periodically clean exposed surfaces of sunshades and vents that are not protected by temporary covering to remove fingerprints and soil accumulated during construction. Do not let soil accumulate until final cleaning.

      D. Before final inspection, clean exposed surfaces with water and a mild soap or detergent not harmful to
finishes. Thoroughly rinse surfaces and dry.
SECTION 107313
AWNINGS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes: Fixed awning with custom graphics (AWN-1).

1.2 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include styles, material descriptions, construction details, fabrication details, dimensions of individual components and profiles, hardware, fittings, mounting accessories, features, and finishes for awnings.

B. Shop Drawings:
   1. Include plans, elevations, sections, mounting heights, and attachment details.
   2. Detail fabrication and assembly of awnings, including seam layout, spacing, and orientation of awning fabric.
   3. Show locations for blocking, reinforcement, and supplementary structural support.
   4. Graphics: Show text message, font, character sizes, and other graphic forms; character, word, and line spacing; margin widths; position of copy; and other information related to graphic design.

C. Samples for Initial Selection: For each type of exposed finish.
   1. Include Samples of graphics on fabric and accessories involving color or finish selection.

D. Samples for Verification: For the following:
   1. Awning Fabric: 12-inch- square section of fabric from dye lot to be used for the Work, with specified treatments applied. Mark face of fabric.
   2. Graphics: Not less than 12-inch- square section showing graphics application method.
   3. Seam, Edge, and Corner Condition: Not less than 12-inch- long section showing seam, edge, and corner treatment.
   4. Frame Finish: Not less than 6-inch lengths.

1.3 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For awnings to include in operation and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Fabricator Qualifications: Shop that employs skilled workers who custom fabricate products similar to those required for this Project and whose products have a record of successful in-service performance.

B. Installer Qualifications: Fabricator of products.

C. Welding Qualifications: Qualify procedures and personnel according to the following:
   1. AWS D1.1/D1.1M, "Structural Welding Code - Steel."
   2. AWS D1.2/D1.2M, "Structural Welding Code - Aluminum."
1.5 WARRANTY

A. Special Warranty: Manufacturer and fabricator agree to repair or replace components of awnings that fail in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Structural failures including framework.
      b. Deterioration of fabric including seam failure.
      c. Deterioration of metals, metal finishes, and other materials beyond normal weathering.
      d. Faulty operation of operator.
   2. Awning Warranty Period: Five years from date of Substantial Completion.
   3. Fabric Warranty Period: Five years from date of Substantial Completion.
   4. Thread Warranty Period: Five years from date of Substantial Completion.
   5. Graphics Warranty Period: Outdoor durability not less than Five years from date of Substantial Completion.

PART 2 PRODUCTS

2.1 FABRIC

A. Fabric:
   1. Fiber Content: [Vinyl-laminated or -coated polyester mesh] [Vinyl-laminated or -coated polyester] [Acrylic-coated polyester] [Resin-coated polyester] [Vinyl-coated polyester/cotton blend] [Acrylic-coated polyester/cotton blend] [Resin-coated polyester/cotton blend] [Solution-dyed acrylic] [Solution-dyed modacrylic] [Expanded PTFE] <Insert description>.
   2. Weight: .
   4. Shrinkage: Not greater than \([0.1] [0.5] [1] <\text{Insert number}>\) percent according to ASTM D1204.
   5. Stretch Factor: Not less than \([0.4] [1] [4] <\text{Insert number}>\) percent according to ASTM D4851.
   6. Applied Treatment: [Stain resistant] [Mildew resistant] [Polymer, flame resistant] [Water repellent] [Lamination] <Insert description>.
   7. Pattern and Color: [Match Architect's samples] [As selected by Architect from manufacturer's full range] [As indicated in an awning schedule] <Insert color>.

B. Seam Thread: [100 percent expanded PTFE] [100 percent bonded polyester], UV-light, mildew, and rot resistant.

C. Decorative Trims: [Borders] [Braid and bindings] [Cords] [Fringe] [Patterned edge; scalloped] [Patterned edge; V-shaped] [Streamers] [Tassels] [Welting] <Insert description>.
   1. Colors: [As indicated by manufacturer's designations] [Match Architect's samples] [Matching or coordinating with awning fabric color] [As selected by Architect from manufacturer's full range] [As indicated in an awning schedule] <Insert colors>.

D. Fringe: [As indicated by manufacturer's designation for style and color] [As indicated in awning schedule] <Insert description>.

2.2 AWNING FRAME AND ACCESSORY MATERIALS

A. Steel:
   1. Steel Plates, Shapes, and Bars: ASTM A36/A36M.
   2. Steel Tubing: ASTM A500/A500M.
   3. Galvanized Steel Tubing: ASTM A787/A787M.
B. Aluminum: Alloy and temper recommended by awning manufacturer for type of use and finish indicated and with not less than the strength and durability properties of alloy and temper required by structural loads.
   1. Aluminum Plate and Sheet: ASTM B209.

C. Anchors, Fasteners, Fittings, Hardware, and Installation Accessories: Complying with performance requirements indicated and suitable for exposure conditions, supporting structure, anchoring substrates, and installation methods indicated. Corrosion-resistant or noncorrodible units; weather-resistant, compatible, nonstaining materials. Provide as required for awning assembly, mounting, and secure attachment. Number as needed to comply with performance requirements and to maintain uniform appearance; evenly spaced. Where exposed to view, provide finish and color as selected by Architect from manufacturer’s full range.
   2. Lag Bolts: ASME B18.2.1.
   3. Zinc-Coated High-Strength Bolts, Nuts, and Washers: ASTM F3125/F3125M, Grade A325, Type 1, heavy-hex steel structural bolts; ASTM A563, Grade DH, heavy-hex carbon-steel nuts; and ASTM F436/F436M, Type 1, hardened carbon-steel washers, zinc coated.
   4. Expansion Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry assemblies and equal to four times the load imposed when installed in concrete as determined by testing according to ASTM E488 conducted by a qualified independent testing and inspecting agency.
      a. Material: Stainless steel with bolts and nuts complying with ASTM F593 and ASTM F594, Alloy Group 1 or 2.
   5. Adhesive-Bonded Anchors: Anchor bolt and sleeve assembly with capability to sustain, without failure, a load equal to six times the load imposed when installed in unit masonry assemblies and equal to four times the load imposed when installed in concrete as determined by testing according to ASTM E1512 conducted by a qualified independent testing and inspecting agency.
      a. Material: Stainless steel with bolts and nuts complying with ASTM F593 and ASTM F594, Alloy Group 1 or 2.
   6. Grommets: [Zinc-coated brass, No. 2] [Stainless steel, No. 2] <Insert description>.
   7. Lacing: [100 percent polyester, braided No. 4] <Insert description>.

E. Bituminous Paint: Cold-applied asphalt emulsion complying with ASTM D1187.

2.3 AWNING FABRIC FABRICATION

A. Fabrication: Reinforce wear points and hardware attachment points with [nonwoven] [mesh] [polypropylene mesh] <Insert description> webbing. Seam fabrics [in locations indicated on the Drawings and] as follows:
   2. Fabric Edges and Seams: Hot cut and sealed.
   5. Fabric Edges and Seams: Manufacturer’s standard hemming and seaming methods.
   6. Fabric Attachment: [Manufacturer’s standard.] [Hem pockets.] [Screws.] [Staples.]
   7. Fabric Attachment: Grommets.
A. Grommet Spacing: [6 inches o.c.] <Insert spacing>.

B. Fabric Insets: [Heat-sealed] [Sewn-in] process.

C. Graphic Application: [Hand painting] [Silk-screen printing] [Heat color transfer] [Vinyl film with pressure-sensitive adhesive backing] [PVDF film with pressure-sensitive adhesive backing] [PVF film with pressure-sensitive adhesive backing] [Radio-frequency, heat-sealed vinyl film] [Eradication] [Cut-out lettering] <Insert description>.
1. Graphic Image: [As indicated on Drawings] [As indicated in awning schedule].
2. Text Message: [As indicated on Drawings] [As indicated in an awning schedule] <Insert text>.
   a. Text Font: [Helvetica] <Insert style>.
   b. Character Size: Minimum [1-inch] [1-foot] <Insert dimension> high characters.
   c. Character Colors: <Insert colors>.
3. Vinyl Film: [Calendered-vinyl film, not less than 3 mils thick, with pressure-sensitive adhesive backing] [Cast-vinyl film, not less than 2 mils thick, with pressure-sensitive adhesive backing] [Cast-vinyl reflective film, not less than 2 mils thick, with pressure-sensitive adhesive backing] <Insert description>.

2.4 FIXED AWNING FABRICATION

A. Frame Fabrication: Fabricate awning frames from [steel] [aluminum]. Preassemble in shop to greatest extent possible. Disassemble units only as necessary for shipping and handling limitations. Use connections that maintain structural value of joined pieces. Clearly mark units for reassembly and coordinated installation. Form bent-metal corners to smallest radius possible without causing grain separation or otherwise impairing work.

B. Form exposed work true to line and level with accurate angles and surfaces and straight edges.

C. Form exposed connections with hairline joints, flush and smooth, using concealed fasteners where possible. Fabricate slip-fit connections exposed to weather in a manner to exclude water. Provide weep holes where water may accumulate.

D. Weld corners and connections continuously. Obtain fusion without undercut or overlap. Remove welding flux immediately. At exposed corners and connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

E. Provide for anchorages of type indicated; coordinate with supporting structure. Space anchoring devices to secure awnings in place and to properly transfer loads.

F. Steel Finish: [Galvanized mill finish; apply galvanizing repair paint to welds.] [Manufacturer's standard primed and top-coated decorative] [Baked-enamel or powder-coat] <Insert finish> finish complying with finish manufacturer's written instructions for surface preparation including pretreatment, application, baking, and minimum dry film thickness.
   1. Color: [As indicated by manufacturer's designations] [Match Architect's sample] [As selected by Architect from manufacturer's full range] <Insert color and gloss>.

G. Aluminum Finish: [Mill] [Manufacturer's standard primed and top-coated decorative] [Baked-enamel or powder-coat] <Insert finish> finish complying with finish manufacturer's written instructions for surface preparation including pretreatment, application, baking, and minimum dry film thickness.
   1. Color: [As indicated by manufacturer's designations] [Match Architect's sample] [As selected by Architect from manufacturer's full range] <Insert color and gloss>.
PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for supporting members, blocking, inserts, installation tolerances, [operational clearances, accurate locations of connections to building electrical system,][lighting,] and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. General: Install awnings[ and motor controls] at locations and in position indicated, securely connected to supports, free of rack, and in proper relation to adjacent construction. Use mounting methods of types described and in compliance with Shop Drawings and fabricator's written instructions.

B. Install awnings after other finishing operations, including joint sealing and painting, have been completed.

C. Slip fit frame connections accurately together to form hairline joints, and tighten to secure.

D. Weld frame connections that are not to be left as exposed joints but cannot be shop welded because of shipping size limitations.
   1. Field Welding: Comply with the following requirements:
      a. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
      b. Obtain fusion without undercut or overlap.
      c. Remove welding flux immediately.
      d. At exposed connections, finish exposed welds and surfaces smooth and blended so no roughness shows after finishing and contour of welded surface matches that of adjacent surface.

E. Anchoring to In-Place Construction: Use anchors, fasteners, fittings, hardware, and installation accessories where necessary for securing awnings to structural support and for properly transferring load to in-place construction.

F. Corrosion Protection: Coat concealed surfaces of aluminum that come in contact with grout, concrete, masonry, wood, or dissimilar metals with a heavy coat of bituminous paint.

G. Coordinate awning installation with flashing and joint-sealant installation so these materials are installed in sequence and in a manner that prevents exterior moisture from passing through completed exterior wall and roof assemblies.

3.3 INSTALLED WORK

A. Adjust hardware and moving parts to function smoothly, and lubricate as recommended by retractable-awning manufacturer.

B. Touch up factory-applied finishes to restore damaged or soiled areas.

C. Galvanized Surfaces: Clean field welds, connections, and abraded areas and repair galvanizing to comply with ASTM A780.
END OF SECTION
SECTION 112326
COMMERCIAL WASHERS AND EXTRACTORS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Laundry Appliances
   1. Clothes washer (VOC EQ-11).
   2. Clothes dryer (VOC EQ-12).

1.2 SUBMITTALS
A. Product Data: Manufacturer's data sheets on each product to be used, including:
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
B. Coordination Drawings: Indicate locations of laundry equipment and connections to utilities, and clearance requirements for equipment access and maintenance.
C. Operation and Maintenance Data: For laundry equipment to include in emergency, operation, and maintenance manuals. Include a schedule with the following:
   1. Designation indicated on Drawings.
   2. Manufacturer's name and model number.
   3. List of factory-authorized service agencies including their addresses and telephone numbers.

1.3 QUALITY ASSURANCE
A. Manufacturer Qualifications: Maintains a service center capable of providing training, parts, and emergency maintenance repairs.
B. Installer Qualifications: An employer of workers trained and approved by manufacturer for installation and maintenance of units required for this Project.

1.4 DELIVERY AND STORAGE
A. Deliver appliances to Project site in manufacturer's undamaged protective packaging.
B. Delay delivery of appliances until utility rough-in is complete and construction in spaces to receive appliances is substantially complete and ready for installation.

1.5 WARRANTIES
A. Submit written warranties executed by manufacturer of each appliance specified agreeing to repair or replace units or components that fail in materials or workmanship within specified warranty period.
B. Washer Extractor Parts Only: Manufacturer's standard form in which manufacturer agrees to repair or replace any part of the equipment assembly that fails within specified warranty period.
   1. Warranty Period: Three years from date of Substantial Completion.
C. Dryer Tumbler Parts Only: Manufacturer's standard form in which manufacturer agrees to repair or replace any part of the equipment assembly that fails within specified warranty period.
   1. Warranty Period: Three years from date of Substantial Completion.
PART 2 PRODUCTS

2.1 REGULATORY REQUIREMENTS
   A. Regulatory Requirements: Comply with the following:
      1. NFPA: Provide electrical appliances listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
      2. ANSI: Provide gas-burning appliances that comply with ANSI Z21 Series standards.
      3. UL Certification: Provide electric equipment and components that are evaluated by UL for fire, and electric shock according to applicable safety standards and that are UL certified for compliance and labeled for intended use.
      5. NFPA 70 - National Electrical Code.
      7. Clothes Dryer: UL Listed.

2.2 PRODUCTS AND MANUFACTURERS
   A. Basis-of-Design Products: Subject to compliance with requirements, provide product indicated or comparable product by one of the following:
      1. Alliance Laundry Systems.
      2. Dexter Laundry.
      4. Huebsch.
      5. Maytag.
      6. Speed Queen.
      7. Unimac.
      8. Whirlpool.
   B. (VOC EQ-11) Washer:
   C. (VOC EQ-12) Dryer/Extractor:

2.3 SOUND ISOLATION
   A. Isolate appliances from rigid contact with floor with Mason Type W neoprene pad mounts under feet.

PART 3 EXECUTION

3.1 EXAMINATION
   A. Examine substrates and conditions, with Installer present, for compliance with requirements for installation tolerances, power connections, and other conditions affecting installation and performance of residential appliances.
   B. Examine roughing-in for piping systems to verify actual locations of piping connections before appliance installation.
   C. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the Work.
   D. Proceed with installation only after unsatisfactory conditions have been corrected.
3.2 INSTALLATION, GENERAL
   A. General: Comply with manufacturer's written instructions.
   B. Freestanding Equipment: Place units in final locations after finishes have been completed in each area. Verify that clearances are adequate to properly operate equipment.
   C. Utilities: See Divisions 22 and 26 for plumbing and electrical requirements.

3.3 FIELD QUALITY CONTROL
   A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect components, assemblies, and equipment installations, including connections, and to assist in testing.
   B. Tests and Inspections:
      1. Perform visual, mechanical, and electrical inspection and testing for each appliance according to manufacturers' written recommendations. Certify compliance with each manufacturer's appliance-performance parameters.
      2. Leak Test: After installation, test for leaks. Repair leaks and retest until no leaks exist.
      3. Operational Test: After installation, start units to confirm proper operation.
      4. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and components.
   C. An appliance will be considered defective if it does not pass tests and inspections.
   D. Prepare test and inspection reports.

3.4 DEMONSTRATION
   A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain residential appliances.

END OF SECTION
SECTION 115700
VOCATIONAL SHOP EQUIPMENT

PART 1 - GENERAL

1.1 SUMMARY
A. Section Includes:
   1. VOC EQ-1: Dust curtain.
   3. VOC EQ-3: Metal Dust Collector.
   4. VOC EQ-4: Metal Dust Collector Stand for Bench Grinder.
   7. VOC EQ-7: Wood Dust Collector, Portable.
   8. VOC EQ-8: Dye Vat.

B. Related Sections:
   1. Divisions 22, 23 & 26 specifications for equipment venting, gas and utility connections, power and controls.
   2. Division 26: For power and connections.

1.2 ACTION SUBMITTALS
A. Product Data: Manufacturer’s specifications and technical data including performance, construction and fabrication information.
B. Equipment Options and Accessories: Submit to Owner for approval prior to purchase of equipment.
C. Shop Drawings: Indicate dimensions, description of materials and finishes, general construction, specific modifications, component connections, anchorage methods, hardware, and installation procedures, including specific requirements indicated.
D. Dust Collector Product Data: Include rated capacities, furnished specialties, and accessories for each type of product indicated and include the following:
   1. Motor ratings and electrical characteristics, plus motor and electrical accessories.
   2. Material gages and finishes, including color charts.
   3. Filter media. Type and area.

1.3 QUALITY ASSURANCE
A. Installer’s Qualifications: Firm with not less than 5 years experiences in installation of systems similar in complexity to those required for this Project, including specific requirements indicated.
   1. Acceptable to or licensed by manufacturer.
   2. Successfully completed not less than 5 comparable scale projects using this system.

1.4 DELIVERY, STORAGE, AND HANDLING
A. Packing and Shipping: Deliver products in original unopened packaging with legible manufacturer’s identification.
B. Storage and Protection: Comply with manufacturer’s recommendations.
C. Protect from damage by the elements and construction procedures.
1.5 **WARRANTY**

A. Manufacturer shall warrant installed system for a period of 5 years from Date of Substantial Completion.

B. Prior to purchase of specified equipment, coordinate equipment options and accessories with Owner.

1.6 **SERVICE CONTRACT**

A. Service Contract: Submit service contract to Owner in writing including separate cost of service contract and for 1 year service covering installed systems, which would commence immediately after expiration of warranty period, with separate costs for "on-call" service for in-house and in-shop work.

**PART 2 - PRODUCTS**

2.1 **EQUIPMENT REQUIREMENTS**

A. Electrical Equipment: Provide equipment suitable for use with electrical system indicated on drawings. Provide electrical components including motor, disconnect switches, motor controllers, motor control devices, electrical circuits, and connections which conform to requirements of NAPA 70, whether or not electrical items are furnished as part of the equipment components assemblies. Provide electrical wiring, conduit and electrical devices necessary for installation and operation of systems and equipment furnished.

B. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

C. NEMA Compliance: Motors and electrical accessories shall comply with NEMA standards.

D. Manufactured Products: Manufacturer of equipment assemblies, which include components made by others, shall assume complete responsibility for the final assembled unit.
   1. Components of assembled unit need not be products of single manufacturer.
   2. Constituent parts that are alike shall be products of single manufacturer.
   3. Components shall be compatible with each other and with total assembly for intended service.

E. Safety Devices: Fully enclose and guard exposed belts, chains, pulleys, couplings, shafts, gears, and other moving parts in accordance with ANSI pamphlet B15-1 irrespective of height above floor. Guards shall be of cast iron, sheet metal or wire mesh. Rigidly and suitable secure parts of guard so as to be readily removable without disassembling pipes and fittings on equipment.

2.2 **DUST CURTAIN**

A. Performance Requirements: NFPA fire-retardant, CFM fire-retardant.

B. (VOC EQ-1) Dust Curtain: Manually-operated.
   1. Basis of Design: Welding Curtain Walls by AKON, LLC.
   2. Layout: Straight.
      a. Total Height: 12 feet 0 inches.
      b. Bottom 48-inches opaque, middle 48-inches transparent, top 48-inches opaque.
      c. Chain-weighted bottom hem.
      d. Other Options: [Floor sweep] [Magnet seal] [Velcro seal] [Floor anchor straps]

C. Track: Manufacturer's suspended ceiling track, with threaded rod mounting.
2.3 SPRAY HOOD
   A. National Fire Protection Association (NFPA), Standard Number 33.
   C. (VOC EQ-2) Walk-in Spray Hood: Air is drawn in through the open face at the front of the spray booth; air flows through the booth's working area, into the exhaust plenum at the rear of the booth and then flows out to the atmosphere via the exhaust stacks. This booth is provided complete, with all necessary hardware.
      2. Interior Working Dimensions: 6'-0" wide X 7'-0" tall X 5'-0" long.
      3. Overall Dimensions: 6'-4" wide X 7'-2" tall X 7'-8" long.
      4. Panels: 18-gauge quality galvanized steel, flanged and precision punched on 6" centers for maximum rigidity. Panels are fastened together with 5/16" bolts and are to be sealed with the provided caulk following assembly.
      5. Integrated LED lighting: 4000 Lm; Fixtures are Maintenance-Free rated for Class I Division II Groups A, B, C, D; Class II Division II Groups F & G. Fixtures are ETL listed and approved for their intended use and placement. Lighting is provided by innovative LED technologies consisting of multiple high efficiency flux boards paired with high efficiency drivers. Fixtures are designed to accept either 120VAC or 277VAC power.
      6. Air Solenoid Valve: Interlocked to the exhaust fan and air supply for the spray application equipment
      7. NEMA 12 enclosure control panel that will house the disconnects, light switch, and fan control; single point connection.
   D. Spray Booth Fan: Aerovent No.BTABD.
      1. Volumetric Flow: 5250 CFM, at 0.5" Static Pressure.
      3. Horsepower: 1.0.

2.4 METAL DUST COLLECTORS
   A. (VOC EQ-3) Metal Dust Collector:
   B. (VOC EQ-4) Metal Dust Collector Stand for Bench Grinder:

2.5 WELDING FUME HOODS
   A. (VOC EQ-5) Wall-Mounted Welding Fume Hood:
      1. Basis of Design: Model SS-400-SKY by Sentry Air Systems, Inc..
   B. (VOC EQ-6) Portable Welding Fume Hood:

2.6 WOOD DUST COLLECTORS
   A. (VOC EQ-7) Portable Wood Dust Collectors:
      1. Basis of Design:
2.7 DYE VATS

A. (VOC EQ-8) Dye Vat: Self-contained, stainless steel, steam jacketed unit; electrical heated steam source within unit.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with manufacturer's recommendations.

3.2 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections. Report results in writing.

3.3 INSTALLED WORK

A. Adjust: Make necessary adjustments of equipment to ensure smooth and accurate operation.

B. Demonstration: Engage a factory service representative to train Owner's maintenance personnel to adjust, operate, and maintain equipment.
   1. Train Owner's maintenance personnel on procedures and schedules for starting and stopping, troubleshooting, servicing, and maintaining equipment and schedules.
   2. Review data in maintenance manuals. Refer to Division 1 Section "Closeout Procedures."

END OF SECTION 116133 - APPENDIX A
SECTION 116133
THEATRICAL RIGGING

PART 1 - GENERAL

1.1 SUMMARY

A. The work in this section includes Theatrical Rigging (TR) systems and equipment within the following spaces and associated support areas:
   1. Proscenium Theatre
   2. Black Box Theatre
   3. Valade Jazz Center

B. Section Includes
   1. Major Systems and Equipment: furnish and install the following major elements and associated accessories:
      a. Counterweight Rigging System
      b. Proscenium safety curtain with lineshaft winch
      c. Stage Traveler Track assemblies
      d. Rope rigging for multi-cable management
      e. Zero fleet hoist
      f. Rigging Control System
      g. Capstan winch
      h. Walk-Draw Drapery Track
      i. Houselight Rigging and cable management
      j. Tension wire grid
      k. Miscellaneous rigging equipment and accessories
      l. Main Drape and Valance
      m. Walk-draw acoustic draperies
      n. Drapery storage bags/hampers
      o. Fabric remnants from the manufacture of the theatrical draperies
      p. Site survey of existing conditions - Valade Jazz Center

2. Work Results:
   a. The equipment installed as part of this Section shall result in a complete and working theatrical rigging system.
   b. Provide fully coordinated and engineered equipment, installation, supervision and commissioning for systems and associated accessories as required for each space.
   c. Provide supervision of Theatrical Rigging Systems low voltage signal cable pulling, termination and testing by the Division 26 Electrical Contractor.
   d. Provide coordination of conduit, backboxes and AC power wiring provided by the Division 26 Electrical Contractor.
   e. Provide all material, components, accessories and services required to provide the work as specified herein, elsewhere in the Contract Documents and/or as shown on related drawings.
   f. Consult and coordinate with other affected work and contractors throughout the course of the work contained herein.

3. Delegated Design:
   a. Provide design for the means of fastening, suspension and support of the work of this Section.
b. Provide all material, components, accessories and services required to provide the work as specified herein, elsewhere in the Contract Documents and/or as shown on related Drawings.

C. Products Supplied But Not Installed Under This Section
   1. The following equipment supplied under this Section shall be installed and/or terminated under Division 26:
      a. Stage Level LED index strip light
      b. Motor Control Centers (MCC)
      c. Motion Control Racks (MCR)
      d. Rigging control system devices including but not limited to control panels, limit switches, detection and safety devices
      e. Low Voltage/Control Wireways for automated hoists
      f. Line Voltage Wireways for automated hoists
   2. Termination of control system conductors shall be made by Division 26 under the direct onsite supervision of the Contractor.
   3. If not internal to the equipment, controls, safety and limit switch devices are installed under this Section. Final terminations to the devices are made under Division 26.

D. Related Requirements
   1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specifications apply to this Section.
   2. Examine Contract Documents for requirements that directly affect or are affected by work of this Section. A list of those Documents and Sections includes, but is not limited to the following:
      a. Division 01 – General Requirements
      b. Division 03 – Concrete
      c. Division 04 – Masonry
      d. Division 05 – Metals
      e. Division 09 – Finishes
      f. Division 11 – Equipment
         1) Section 116135 – Stage Extension Orchestra Pit Lift System
         2) Section 116163 – Theatrical Lighting Dimming and Control
      g. Division 21 – Fire Suppression
      h. Division 22 – Plumbing
      i. Division 23 – Heating, Ventilating and Air Conditioning
      j. Division 26 – Electrical
         1) Section 265561 – Theatrical Systems Electrical Requirements
         2) General requirements for all Electrical work, including installation of system cable trays, terminal cabinets, empty conduit, junction/pull boxes and back boxes for system devices and panels (Division 26).
         3) Electrical terminations (AC power and grounding only) to all equipment racks and AC power receptacles (Division 26).
         4) Provision and installation of all conduit and back boxes (Division 26).
         5) Electrical services and main circuit protection (Division 26).
         6) Distribution system equipment (Division 26).
         7) Conduit, wire, pull boxes, junction boxes and miscellaneous hardware and components as required for a complete electrical installation.
         8) Terminations and testing of system continuity.
      k. Division 27 – Communications
         1) Structured cabling systems
         2) At common facility panels, coordinate receptacles for building standard communications systems.
      l. Division 28 – Electronic Safety and Security
1.2 PRICE AND PAYMENT PROCEDURES

A. Refer to Division 01 – General Requirements for information regarding price and payment procedures.

B. Unit Prices
   1. Provide price to Owner for five year maintenance agreement on winches. Price to include emergency site service (post warranty period), one one-day session of additional operator training per year, and replacement of parts due to failure under normal usage.

C. Alternates
   1. Provide separate price information to deduct the material and labor associated with the following equipment and systems from the price of the full and complete systems as otherwise specified in this document:
      a. Alternate #9 - Valade Jazz Center – Delete Cyclorama motorized batten and related infrastructure

1.3 REFERENCES

A. Abbreviations:
   1. The following abbreviations and acronyms are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
      a. ETCP – Entertainment Technician Certification Program.
      b. MCC – Motor Control Center
      c. MCR – Motion Control Rack
      d. SWL – Safe Working Load

B. Definitions:
   1. The following definitions are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
      a. In all cases where a device or a part of equipment is referred to in a singular manner within the contract documents, it is intended that such a reference shall include all devices required to complete the installation in accordance with the project documents.
      b. “Architect”: All references to the “Architect”, Hamilton Anderson Associates, will refer to the process by which the indicated action or decision regarding the work in this section will be administered. All such actions shall be initiated with or by the Architect, who will disseminate all pertinent information and documents to, as well as coordinate all efforts and site visits with, the Theatre Consultant and all other project consultants who may have design responsibility relating to the work in this section.
      c. “Theatre Consultant”: Auerbach + Associates, Inc. (d.b.a. Auerbach Pollock Friedlander). The Theatre Consultant will be party to all actions and decisions regarding the work in this section.
      d. “Other Project Consultants”: Acoustical Consultant, Electrical Engineer, Structural Engineer, or Mechanical Engineer as is applicable to a particular issue.
      e. “Contractor”: Manufacturer / Installer responsible for the fabrication and installation of the work contained in this section.
      f. Contractors involved with other work shall be indicated with a specific trade preceding the word “Contractor” (i.e. General, Electrical, etc.).
      g. “Owner”: Authorized personnel representing Wayne State University.
      h. “Furnish”: Purchase and/or fabricate and deliver to project site.
      i. “Install”: Physically install the items in their proper location(s) on the project site.
      j. “Provide”: Furnish and install.
2. Definitions of Technical Terms:
   a. “Safe Working Load”: The load that can be applied to the system by the end user.
   b. “System Load”: Sum of the Safe Working Load and the weight of the load carrying
device. The maximum load which can be safely handled by the machinery
installation under normal operating conditions, not taking dynamic forces into
consideration.
   c. “Dynamic Force”: Forces exerted on the structure or machine that are the result of
   the movement patterns of the load and system component parts.
   d. “Design Load”: Sum of the System Load and the loads due to dynamic forces.
   e. “Category 0 Stop”: An uncontrolled stop resulting from loss of power to the machine
   actuators at any time during its movement.
   f. “Category 1 Stop”: A controlled stop that allows power to the machine actuators to
   achieve a safe stop, and then removes power from the machine actuators when the
   stop is achieved.
   g. “Category 2 Stop”: A controlled stop that leaves power left available to the machine
   actuators.
   h. “Initial Limit”: The mechanical limit switch connected to the electrical system in such
   a manner as to prevent further movement in the over travel direction. It shall be a
   Category 2 stop and allow the user to operate the system in the opposite direction.
   i. “Ultimate Limit”: The mechanical limit switch is a positive break mechanical limit
   switch, which executes a Category 1 stop. NOTE: The Ultimate Limit switch shall
   be located in such a manner that, should the Initial Limit fail to operate, if the
   machinery strikes the Ultimate Limit at maximum speed all components of the
   machine shall come to a complete stop before the over travel results in mechanical
damage.
   j. “Fleet Angle”: The angle formed between the wire rope and the centerline of a
   sheave or drum as the wire rope traverses to another sheave or fixed point.
   k. “Zero Fleet Winch”: A hoist in which the line pays off the drum at the exact same
   location at all times, thereby maintaining a fleet angle of zero (0) degrees.

C. Reference Standards:
   1. Reference Division 01 for general project references and standards.
   2. References to codes, standards, specifications and recommendations of technical
   societies, trade organizations and governmental agencies will refer to the latest edition
   of such publications adopted and published prior to submittal of the bid. All such codes
   and standards will be considered a part of this specification as if they were fully included
   herein.
   3. If an applicable code or standard permits work of lesser quality or extent than this
   specification, then this specification and the related drawings will govern.
   4. Comply with national, state and local codes.
   5. Comply with national, state and local labor regulations and requirements.
   6. The following standards apply to the work of this Section. It remains the Contractor’s
   responsibility to confirm and comply with all industry standards that are applicable to the
   work of this Section.
   a. ASTM International
      1) ASTM A36 for structural steel shapes
      2) ASTM A47 for malleable iron casting
      3) ASTM A48 for gray iron casting
      4) ASTM A1011 for side plates
   b. American National Standards Institute (ANSI):
      1) ANSI B18.2.1&2 for square and hex bolts and nuts
      2) ANSI-Z535 – System load and safety signage
      3) ANSI E1.6-1 Entertainment Technology – Powered Hoist Systems
      4) ANSI E1.4-1 Entertainment Technology – Manual Counterweight Rigging
       Systems
5) ANSI E1.22 Entertainment Technology – Fire Safety Curtain Systems
   c. American Iron and Steel Institute (AISI):
      1) AISI 1045 for steel shafts
   d. National Fire Protection Association (NFPA)
      1) NFPA 70 - National Electrical Code
      2) NFPA 80 – Standard for Fire Doors and Other Opening Protectives
   e. National Electrical Manufacturers Association (NEMA)
      1) NEMA WC 63.1 (2005) Twisted Pair Premise Voice and Data Communications Cables
      2) NEMA WC 66 (2001;Errata 2003) Category 6 and Category 7 100 Ohm Shielded and Unshielded Twisted Pairs
   f. Underwriters Laboratories Incorporated (UL)
      1) UL/IEC 61508A Functional Safety of Electrical/Electronic/Programmable Electronic Safety-related Systems
      2) UL 1666 (2000; Rev thru Jul 2002) Test for Flame Propagation Height of Electrical and Optical-Fiber Cables Installed Vertically in Shafts

1.4 ADMINISTRATIVE REQUIREMENTS
   A. Coordination:
      1. The Contractor is required through drawings, memos and meetings to properly coordinate the work with the other sections as necessary to complete the work of this section.
   B. Pre-installation Meeting:
      1. Refer to Division 01 - General Requirements for information regarding pre-installation meeting with the General Contractor.
   C. Sequencing
      1. The installation of the equipment in this section shall be coordinated with other work which may be in conflict with or which must be completed before the work in this section may be installed, including:
         a. Principal foundation work (see Architectural Drawings)
         b. Installation of associated electrical work (see Electrical Drawings)
         c. Installation of HVAC work in ceilings (see Mechanical Drawings)
         d. Painting
         e. Finishing of floors and finishes
         f. Electromechanical and electronic equipment installation shall proceed after environmental site conditions are met. Refer to paragraph 1.10-B for class requirements.

1.5 ACTION SUBMITTALS
   A. All submittals shall be submitted in accordance with Division 01.
   B. All submittals shall be submitted in a timely manner, allowing sufficient time for adequate review and possible resubmittals without jeopardizing project schedule.
   C. Submittals will be reviewed, accepted and field dimension verified prior to proceeding with the fabrication of the work in this section.
D. All submittals shall leave space available for review stamps and comments.

E. The Architect and Theatre Consultant shall only mark one set of drawings per submittal with comments. Any additional sets of drawings or product data shall be returned unmarked.

F. Provide insurance against loss or damage during shipment. Furnish certifications of such coverage to the General Contractor not less than 60 calendar days prior to the shipment of any equipment.

G. Review all pertinent project Contract Documents. Following this review, provide to the Architect and General Contractor any additional information required to make a fully functioning system. In addition, the Manufacturer shall indicate maximum accepted wire size as it relates to termination points on their equipment.

H. Verify wire type, count, and routing for all required data wiring between all components to allow for proper conduit sizing and routing by Division 26. Verify and coordinate all line voltage power input required by systems components that shall be provided under Division 26.

I. Prior to fabrication, it shall be the responsibility of the contractor to provide a complete submittal for approval within 90 days of award of contract.

J. Product Data
   1. Where standard manufacturer parts are used, submit current product literature describing component, manufacturer’s recommended applications, load ratings, safety factors and dimensions. The data shall include all information which indicates compliance with the specifications herein.
   2. Clearly indicate specific component and applicable options.

K. Shop Drawings
   1. Provide shop drawings on D size minimum (24” x 36”) sheets.
   2. Include a cover sheet with a drawing index including sheet number and title for each sheet in the set.
   3. Provide ½” = 1'-0” plans of all locations which contain equipment in this contract. Show all equipment properly located, dimensioned and labeled. Note all work by others in the vicinity which may affect work of this Section.
   4. Provide complete, fully dimensioned, large scale detailed fabrication drawings of all major components.
   5. Provide requisite schematics, plans and sections indicating assembly and installation of components.
   6. Provide indications by arrow and boxed caption of all variations from contract drawings and specifications, except where variation is indicated as acceptable.
   7. Indicate all elements with appropriate safety factors and/or safety equipment.
   8. Indicate recommended load limits for each element in the system with loading requirements.
   9. Indicate Safe Working Load for each element in the system with loading requirements.
   10. Provide power requirements, one-line riser diagrams and installation circuit diagrams for electrical equipment. Show all required wire sizes and counts between all components. These shall be provided within 30 days of Contract Award.
   11. Provide a full Bill of Materials to be supplied, including quantities, manufacturer’s part number, reference to applicable drawings, etc.
   12. Provide an inventory of all draperies to be supplied, indicating fabric type, fullness, edge finish, color and size.

L. Samples
   1. Submit sample items including, but not limited to:
a. Submit 24” x 24” Tension Wire Grid module as a full scale mock-up of all components including:
   1) Perimeter channel painted to display finished painted surfaces
   2) Cable with typical connection hardware.
   3) Finished cable holes
b. Full bolt-width (54”) by 36-inch “quality” samples and color line swatches for all fabrics to be selected “by Architect”. These samples will be approved and all colors selected prior to shop drawings submittals.
c. Samples of standard hooks, swivels, ties and hardware.
d. Samples of drapery tracks and associated hardware.
e. Control switches and panel materials.
2. Additional samples must be submitted within 14 days of Architect’s written request.

M. Certificates
1. Provide a Certificate of Training for each participant at the conclusion of Owner instruction sessions.
2. Provide manufacturer’s certificates stating drapery materials meet fire performance characteristics as specified herein.
3. Provide manufacturer’s certificates stating prosenium safety curtain materials meet fire performance characteristics as specified herein.

N. Delegated Design Submittals
1. Provide drawings and calculations meeting the review requirements of the authorities having jurisdiction, stamped and wet signed by a Professional Engineer licensed in the project jurisdiction for work of the specific type performed.
2. Engineered drawings shall be provided to the Architect and Theatre Consultant for review of coordination and compliance to this Section.
3. Engineered drawings shall be provided to the Structural Engineer of record for this project. The engineer of record will review the loads imposed on the structure by this equipment and compare those loads to allowable structural loading.
4. Engineered drawings shall be provided to the Authority Having Jurisdiction for this facility. The AHJ will review the drawings for compliance with local codes. In all cases code compliance is the responsibility of the Contractor.

O. Test and Evaluation Reports
1. Test Procedures
   a. Provide test procedures for all custom motor drive assemblies.
   b. The test procedures shall describe in detail all of the necessary operations to perform verification through a test. A test procedure shall be produced for every verification test required and shall contain the following information:
      1) Scope of the test: the test shall be described and the intended result shall be listed.
      2) Application Documents: all the documents referred to in the test procedure shall be listed.
      3) Test conditions: all applicable requirements needed to correctly perform the test shall be listed and detailed (for example: special environmental conditions, dedicated tools, test rigs, special requirements on the tested items, calibration requirements, etc.)
      4) Test procedure: all operations required to perform the test shall be detailed.
      5) Test results presentation: the procedures to process the raw data for final presentation of the test results shall be described.
2. Test Reports
   a. Winches: Provide a load testing report for every winch and component part installed in the automated system based on Safe Working Load.
      1) Static loading of primary brake to 1.25 x SWL for a minimum of 10 minutes
2) Static loading of secondary brake to 1.25 x SWL for a minimum of 10 minutes
3) Dynamic test of primary brake to 1.0 x SWL (drop test)
4) Dynamic test of secondary brake to 1.0 x SWL (drop test)
5) Full speed E-Stop test with 1.0 x SWL
6) Test all limits at full speed with 1.0 x SWL

P. Source Quality Control Submittals
   1. The Contractor shall supply as part of the submittal process the following Source Quality
      Control documents which must contain, at minimum:
      a. Serial number of hoist
      b. Motor drive serial number
      c. Batch number of major components
      d. Name of person conducting the QC test
      e. Date the test was conducted
      f. List of mechanical tests conducted
      g. List of electrical tests conducted

Q. Special Procedure Submittals
   1. Installation/Erection Plan
      a. The Contractor shall supply as part of the submittal process the following
         Installation/Erection Plan documents which must contain, at minimum:
         1) Required path to site of work, including maximum loads applied to floor in that
            path
         2) Maximum size and weight of pieces to be moved along the path
         3) Required erection machinery, including lifts, hoists, etc., including the
            maximum loads applied to the floor and lift points in the erection area
         4) Erection Plan: the plan shall outline the construction methods, erection
            sequence, erection bracing, temporary bracing if required, equipment
            required and other engineering details necessary for shipping, erecting and
            maintaining stability of the equipment detailed in this section
   2. Training
      a. To ensure proper training of the user group, the Contractor shall supply as part of
         the submittal process the following training documentation:
         1) Training syllabus
         2) Training guide (bound hard copy)
         3) Training guide (hands on system training)
         4) Testing document for confirmation of understanding
         5) DVD/ MPG video training file
      b. These shall be provided two (2) months prior to completion.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents:
   1. Submit documents in accordance with Division 01 – General Requirements
   2. At the time of acceptance testing, submit three (3) copies of parts lists and maintenance
      instruction sheets.
   3. Within 60 days of acceptance testing, submit one (1) set of reproducible “as built and
      approved” drawings showing all equipment as installed. These drawings shall include
      all adjustments made during the checkout process.
   4. Submit operation and maintenance manuals with the “as built and approved” drawings.
      Each manual shall be bound in an individual binder with the project name on the front
      cover and system identification on the spine. The manuals shall include:
      a. Complete parts list for all equipment and telephone numbers for the authorized parts
         and service distributors.
b. Instructions as to the safe operation for all equipment.
c. Recommended maintenance schedule for component parts that may need periodic replacement or maintenance.
d. Recommendations for cleaning, maintaining and touch-up of all finished surfaces.
e. Provide specific recommendations for cleaning drapery fabric, including precautions against materials and methods which could damage drapery fabric.
f. Deliver all copies of approved Operations Manual to Owner during instruction session, and review it as part of that session.

5. Where specific elements do not require manuals, instruction sheets as to care and handling shall be provided.

6. Certificates of flame resistance as required herein.

7. Warranties as required herein.

B. Maintenance Contract
   1. Refer to 3.10 – Maintenance.
   2. Submit maintenance contract proposal for Owner and Theatre Consultant review no later than one month prior to substantial completion.

C. Submit verification that all punch list items have been rectified. Such written verification will be required for project closeout and initiation of the warranty period.

D. The record documents shall be reviewed by the Architect and all modifications to the documents stemming from this review shall be made as required.

E. Above submissions are required as a condition for final approval of the work.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Spare Parts
   1. Furnish the following user-serviceable components as spare parts for major electronics assemblies:
      a. Furnish 3 spare fuses of each type in the system
      b. Furnish 1 spare breaker of each type in the system
      c. Furnish 4 spare keys of each type in the system
      d. Furnish 1 spare sets of winch control connection cables
      e. Furnish 1 spare e-stop master controller card
      f. Furnish 1 spare winch drive motion controller card
   2. Motors and complete motor drives shall not be provided but shall be available within 24-hours of notice to manufacturer.

B. Extra Stock Materials:
   1. Deliver stock of maintenance material to Owner. Furnish the following to match those installed and taken from the same production run, packaged with protective covering for storage and identified with appropriate labels:
      a. Furnish 12 compression sleeves of each type in the system.
      b. Furnish 4 shackles of each type in the system.
      c. Furnish 12 thimbles of each type in the system.
      d. Furnish 12 bolts and nylock nuts of each type in the system.
      e. Furnish 12 lockwashers of each type in the system.
      f. Furnish 4 turnbuckles of each type in the system.
      g. Furnish 1 master track carrier of each type in the system.
      h. Furnish 4 other track carriers of each type in the system.
   2. Deliver all fabric remnants from the manufacture of the theatrical draperies to the Owner.
1.8 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Refer to Division 01 – General Requirements.

B. Qualifications
   1. All equipment and installation to be the responsibility of a single Contractor, who shall own and operate their own manufacturing facility for the fabrication, assembly and integration of theatrical rigging equipment, and be regularly engaged in the fabrication of such equipment. Fabrication of such equipment shall comprise no less than 90% of the Contractor’s business.
   2. The Contractor’s Project Manager shall be qualified and have experience in projects of similar size and scope. The Project Manager shall have binding authority to represent and act for the Contractor. The Project Manager shall be the primary conduit for all information between the supplier of this equipment and the General Contractor. All information given to the Project Manager shall be considered as given to the Contractor.
   3. The Contractor shall have been continuously engaged in the fabrication, integration and installation of theatrical rigging systems for no less than five years.
   4. The Contractor shall have, at the time of bid, a current Contractor’s License and shall know, understand, and have the required documentation to work in the State of Michigan. This license shall be maintained throughout the course of work of this contract.
   5. Contractor is responsible for proper installation, operation and safety of all component equipment.
      a. Equipment must be procured as specified. Non-specified items may be procured from any nationally recognized manufacturer.
      b. Metalworking may be done by others. Responsibility in all respects shall be that of the Contractor.
   6. The Contractor shall verify all system design loads.
   7. Errors and omissions within the Contract Documents shall not relieve the Contractor and the General Contractor of the responsibility for providing a properly functioning installation of the system as described herein.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage and handling shall be coordinated with the General Contractor and shall meet all requirements described in Division 01.

B. Packing, Shipping, Handling and Unloading
   1. All equipment shall be appropriately and substantially packed for shipment.
   2. All equipment containers shall clearly indicate the equipment contained, “front”, “top”, “fragile”, the project name, and theatre site allocation. Include packing and shipping lists for each container.
   3. All drapery shall be boxed in solid plywood crates and shipped on pallets. In no case shall the drapery itself contact any slatted surfaces during shipping.
      a. All required weights and bottom pipe to be shipped separately from draperies and installed on the job site.
   4. All shipping costs to the job site are the responsibility of the Contractor. The shipping method/company is at the total discretion of the Contractor in order to meet the published project schedules.

C. Acceptance at Site
   1. Coordinate responsibility for acceptance of material and equipment at job site with the General Contractor.
2. The Contractor shall be responsible for acceptance of the Theatrical Rigging System components at the job site, confirming that all quantities and counts are correct and for keeping accurate logs and records of such information.

D. Storage and Protection
1. Upon delivery, the materials shall be stored under cover in a clean and dry location, off the ground. Delivered materials which are damaged or otherwise not suitable for installation shall be removed from the job site and replaced with acceptable materials.
2. Replace, at no additional expense to the Owner, all equipment and materials which are damaged during storage or handling.

1.10 SITE CONDITIONS
A. Existing Conditions
1. Verify all conditions at job site. Promptly report variations and obstructions to the Architect. All additions and/or corrections are to be requested prior to fabrication.

B. Environmental Requirements
1. Equipment is classified according to its susceptibility to construction conditions that may affect its operation. Classes shall be defined by the following paragraphs:
   a. Class 1:
      1) Cable and distribution apparatus, structural elements, electrical back boxes, face plates, terminal boxes, and empty equipment rack frames may be stored in weather protected spaces under "normal" construction site conditions provided that no electronic components are contained within devices, storage boxes are sturdy and well-sealed, and equipment is protected with imperforate inner plastic sheeting.
      2) Contractor may install this class of equipment in weather-protected spaces under "normal" construction site conditions provided that equipment is protected from dust and moisture by sturdy imperforate plastic sheeting and completely covered with corrugated cardboard held securely in place by duct tape. Cardboard covers shall not be removed until area is broom cleaned. Under no circumstances shall equipment remain uncovered overnight during installation or while work which causes high dust or moisture levels in area of placement is taking place.
   b. Class 2:
      1) Control panels, spare parts, test and other equipment (except as listed under Class 3) not subject to damage by concrete dust or dirt shall be stored and protected per Class 1 devices.
      2) Contractor shall not install equipment in this class until area of installation is broom cleaned, "blown" clean with pressurized air, mopped, air conditioned and secure. Contractor may install control panels with electronic components under Class 1 conditions, but electronic components must be removed and not installed until area of installation meets Class 2 conditions.
   c. Class 3:
      1) Control consoles, filled equipment racks and other electronic equipment shall not be shipped to site until the rack and control rooms are finished, air conditioned, dust free, broom and mop cleaned, secure, and in all respects complete and ready for occupation.
      2) This class of equipment shall not be unpacked until the system is complete in all other respects. Under no circumstances may any equipment in this class be removed from the rack and control rooms into or through spaces which are not cleaned, air conditioned, and complete.
C. Field Measurements
   1. Field measurements shall be taken prior to preparation of final shop drawings and prior to fabrication to ensure proper fitting of work. Allow for adjustments during installation whenever taking field measurements.
   2. Should field measurement of site conditions alter the design or installation of system elements from the approved shop drawings, revised shop drawings shall be reissued for review.

1.11 WARRANTY

A. Comply with the warranty requirements of Division 01 and the following.

B. The Contractor shall warrant materials and workmanship of systems and equipment installed as free of defects. The Contractor shall guarantee in writing the repair or replacement within 14 days of any item found defective during a period of one (1) year following date of final acceptance. Ordinary wear and defects due to improper usage are excepted.

C. The Contractor shall warrant the workmanship of the installation services provided under this Section for a period of one (1) year following the date of final acceptance. Ordinary wear and damage due to improper usage are excepted.

D. During the warranty period, all emergency conditions where systems failures may be hazardous or may cause severe hardship or cancellation of performances shall be responded to within 24 hours. Immediate action shall be undertaken to ensure the safety of the audience and the performers.

E. During the Warranty Period, for each product that uses software, furnish manufacturer’s software updates to the Owner for installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. To establish comparative standards of quality, the Contractor may install elements as manufactured by the following, or an approved equal:
   1. Counterweight Rigging Systems
      a. H & H Specialties Inc.
      b. J.R. Clancy, Inc.
      c. Thern Stage Equipment
      d. Texas Scenic Company
   2. Track Systems
      a. H & H Specialties Inc.
      b. Automatic Devices Company (ADC)
      c. Gerriets
      d. Triple E
   3. Motorized Zero-Fleet Hoist
      a. J.R. Clancy, Inc.
      b. ETC Rigging
   4. Motorized Rigging Control Systems
      a. J.R. Clancy, Inc.
      b. ETC Rigging
5. Draperies
   b. iWeiss
   c. Rose Brand
   d. Stage Decoration and Supplies

B. Manufacturers shall provide the Warranty and Maintenance services specified herein as applicable to their products.

C. Manufacturers shall engineer, design, produce shop drawings and fabricate all custom equipment required in this section.

2.2 SYSTEMS DESCRIPTION

A. The following performance spaces shall contain the following major system components listed below and as shown on the TR-series drawings:

1. Proscenium Theatre
   a. Counterweight System:
      1) Structural performance for this entire system must be fully documented under the direct supervision of a Structural Engineer registered in the State of Michigan. The Contractor’s engineer shall design and/or select all elements and their connections to meet or exceed the International Building Code.
      2) The rigging system shall include provisions for basic hanging, shifting and storing of scenery, stage draperies, masking and elements of the stage lighting systems.
      3) The rigging system is highly integrated with the structural steel of the fly tower. See structural Drawings and Specifications for details.
      4) The counterweight system shall be a single purchase, “tee” bar guide as detailed in the drawings. See drawings for layout. Operation of the counterweight system shall be from locking rail on the stage floor. The battens shall travel as indicated on the drawings.
      5) The technical galleries at stage left and right shall permit the random use of rope line rigging to be spotted on the gridiron at any point above the stage. The loading gallery shall provide access to the counterweight arbors when a batten is being loaded.
   
   b. Proscenium Safety Curtain
      1) Straight lift proscenium safety curtain with lineshaft winch, smoke pocket, pull station, rate of rise detector, fusible links, and associated hardware.
      2) Provide push-button controls for non-emergency operation.
   
   c. Cable Management systems
      1) Cable cradles, manual hemp lines, and floor mounted hemp blocks will be included for management of electrical multi-cables.
   
   d. Portable Capstan Winch
   
   e. Stage Traveler Track assemblies
      1) Main Drape traveler track shall be furnished for manual, bi-parting, back-packing curtains.
   
   f. Main Drape and Valance
   
   g. Acoustic Drapery Track
      1) Walk-draw track assembly
   
   h. Walk-draw acoustic drapery
   
   i. House Light Rigging

2. Black Box Theatre
   a. Tension Wire Grid
   b. Demountable dead hung drapery pipe battens
3. Valade Jazz Center
   a. Site survey of existing conditions
   b. Zero Fleet Motorized Batten System
   c. Rigging Control System
   d. Acoustic Traveler Track assemblies
      1) Acoustic backdrop drape traveler track shall be furnished for manual, bi-
         parting, back-packing curtains.
   e. Acoustic bi-part drapery

B. State of the Art Development
   1. The Contractor shall furnish only the manufacturer’s latest developed appropriate
      products. In cases where product development from a specified manufacturer surpasses
      the criteria of this specification, the Contractor shall inform the Architect and make the
      newer product available to the Owner for acceptance. In no case shall discontinued or
      obsolete equipment be acceptable. Should a newer product be suggested as a
      substitution for a discontinued product, or for a product that is in process of being phased
      out of production, that newer product shall be offered to the Owner at no additional cost.
   2. Should product recall by the Manufacturer require temporary or permanent replacement
      of a product specified under this section, the Contractor shall notify the Owner at the
      earliest reasonable time and shall arrange to replace the product in question at the
      earliest possible time.
   3. Equipment found defective or subject to recall prior to scheduled installation shall not
      be delivered to the job site.
   4. Equipment defect or intended recall shall not relieve the Contractor from his contractual
      obligation with regard to delivery schedule of product. In this circumstance, notification
      shall be made to the Architect by express carrier. Arrangement for alternate product
      shall be made at this time.

C. Substitutions
   1. All requests for variations from the specified materials and products will be reviewed by
      the Architect according to the procedures outlined in Division 01.
   2. All requests for substitutions must be submitted in a timely manner, so as not to
      adversely impact the project schedule.
   3. Substitutions will only be accepted if, in the opinion of the Architect, the product is an
      equal to the specified product. No substitutions may be made without written acceptance
      from the Architect. All substitutions made prior to this acceptance are at the sole risk of
      the Contractor.
   4. A substitution must be a product of equal design, construction and performance. The
      Contractor must submit all pertinent information required to substantiate that the product
      is equal. The Contractor must submit all additional information, including test data, which
      may be requested in order for the Architect to fully evaluate the substitution. The burden
      of proof is solely on the Contractor.
   5. All additional expenses of any kind with respect to substitution(s) shall be borne by the
      Contractor. This shall include, but not be limited to, all fees and expenses incurred by
      the Architect and other related Consultants for evaluation of the substitution and
      subsequent integration into the project should the substitution be taken and/or additional
      costs of other contractors related to the substitution(s).

2.3 MATERIALS

A. General
   1. All equipment and components shall be new and complete. No used or reconditioned
      equipment shall be acceptable unless otherwise noted.
   2. All equipment to have pertinent labels.
B. Materials shall conform to the following minimum standard specifications:
   1. AISI 1045 for steel shafts
   2. ASTM A36 for structural steel shapes
   3. ASTM A47 for malleable iron casting
   4. ASTM A48 for gray iron casting
   5. ASTM A1011 for side plates
   6. ANSI B18.2.1&2 for square and hex bolts and nuts

C. Hardware
   1. All mounting hardware to be included.
   2. All bolts and fasteners must be Grade 5 or better.
   3. All bolted attachments to have lock washers or other self-locking fasteners.

D. Electrical
   1. All internal wiring shall be factory completed and clearly marked. All field connections
      shall be by compression connector, terminal strip or other device specified herein. All
      terminal strip connections shall be clearly labeled as to terminal designation. Insulated
      wire ferrules are to be used whenever possible for wire termination. Wire nut splices not
      permitted.
   2. All wire sizes and insulation to comply with Underwriters Laboratory and all applicable
      standards and local codes.
   3. All wiring to be harnessed and bound. No loose or randomly routed wires shall be
      permitted.

E. Design Factors
   1. Overhead rigging elements to be designed with a mechanical safety factor of their
      minimum breaking strength.
      a. Wire rope: 8:1
      b. Terminating hardware: 5:1
      c. Batten clamps: 5:1
   2. All drive components shall be designed with a safety factor 3X.
   3. Bearings shall be designed with a 2X rating, full speed / 2000 hours.

2.4 COUNTERWEIGHT RIGGING SYSTEM

A. Tee Bar Guide Tracks
   1. Provide “tee” bar guide tracks installed on the tee bar wall from the stage floor to the
      underside of the headblock beam, as indicated on the Drawings. The center-to-center
      dimension (in plan) between each tee bar varies, refer to the Drawings. The tee bar
      must form a true vertical plane and be so certified by the Contractor. All splice joints
      shall be free of burrs and irregularities and in exact alignment.
   2. Provide tee bars of 2" x 2" x ¼" steel tee, held in place by spreader "U" plates bolted to
      continuous horizontal steel angle wall battens fastened to continuous horizontal Unistrut,
      Superstrut, or equal on 5'-0" maximum vertical centers over the entire length and height
      of the system, and held in place by 2-3/8" x 5/16" bent steel plate wall knees. Finish flat
      black. See Structural Drawings and coordinate for exact locations of wall attachment.
   3. 
   4. Provide continuous floor batten and continuous top and bottom stop batten of 2" x 2" x
      ¼" steel angle, (see TR series drawings). Continuous bumper strips of 2" x 2" hardwood
      with neoprene pads bolted to the stop battens. Neoprene bumpers shall be flat head
      screwed with ferrules to hardwood at 4” o.c. Stop battens bolted to each tee with one
      3/8” diameter bolt.
   5. All mounting holes in tee bars, "U" plates and wall knees to be slotted to facilitate proper
      alignment vertically and horizontally. Lock washers at all joints.
B. Arbors

1. Size and weight capacity per schedule on Drawings.
2. Arbor top and bottom to be either steel plate formed channel with forged eyes for each lift line and for hand lines, approved steel forgings with integral eyelets, or approved welded assembly. Bottom plates threaded for connecting tension rods.
3. Arbor top and bottom joined on tee bar side by not less than 3" x ½" cold rolled steel (CRS) vertical flat bar fastened top and bottom by 2 3/8" bolts and tack welded.
4. Provide tee bar guide shoes mounted top and bottom of tie bar. Each to be 2 pieces of 5/16" UHMW separated by 5/16" UHMW spacer (or as required to properly fit the existing tee bar). Full width 3/16" steel reinforcing plate on front and back. Arbors over 15'-0" in length shall have an intermediate guide shoe attached to the steel back bar. Delrin shoes required for aluminum tees.
5. Provide two 3/4" high tensile strength threaded connecting rods between top and bottom spaced to fit counterweight slots. Fastened with 2 nuts and 1 lock washer each side of top and bottom.
6. Provide 12 gauge, 2" x 12" spreader plates to slip on connecting rods. Top spreader plate with spring keeper on front rod and locking stop collar on back rod. Provide 1 spreader plate for each 3'-0" of arbor height plus top spreader.
7. Provide forged eye as shown on the Drawings for utilization of capstan winch.
8. Provide metal angle iron "counterweight spacers" on any arbor where, after the pipe weight is installed, the counterweight is not level with the loading gallery. In all cases, on each arbor, the pipe weight must be level with the loading gallery.

C. Counterweights

1. Provide standard "U" slotted smooth flame-cut steel weights. All counterweight to fit all arbors (as set to set clearances allow) unless otherwise noted. Weights to be ground free of burrs or any sharp edges or protrusions. Weight to have diagonal cut at opposite corners. Provide the following sized weights:
   a. 6" wide counterweight:
      1) 11 pound weights 1/2" thick by 6" wide by nominally 14" long
         a) Provide 5%
      2) 22 pound weights 1" thick by 6" wide by nominally 14" long
         a) Provide 95%
   b. Pipe weight for general purpose linesets
   c. Main Drape and Valance
   d. 60% of total system working load limit capacity
      1) Approximately 52,000 lbs.
   e. All weights to be painted with shop coat of flat grey alkyd primer, Benjamin Moore Corotech Alkyd Shop Coat Primer or equal.
   f. All pipe weight to be completely painted bright yellow.
   g. After painting the counterweight shall be distributed:
      a. 90% at the loading gallery
      b. 10% at the stage floor
   h. Provide necessary thinner sheet steel weights for fine trimming of Main Drape.
   i. Batten balance and other permanent weights for all linesets to be permanently held in arbor by 2 bands standard mechanically locked steel strapping. Paint strapped weights bright yellow for identification.

D. Lift Lines:

1. Oil-free, zinc coated, 1/4", 7x19 aircraft cable. 7,000 lbs. minimum breaking strength for general linesets.
2. Pipe batten connection by:
   a. Pipe clamp
b. Rated hot dip galvanized jaw/jaw (cotter pin type) turnbuckle with 6" of take-up, lock nuts, lock washers and safety wire mouse (after adjustment).

c. Wire rope thimble

d. Copper compression sleeve installed as per manufacturer’s recommendation.

e. Dress cable ends using black heat shrink tubing.

3. Arbor connections by:

a. Thimble

b. Rated galvanized shackle, cotter pin type with cotters on inward side.

c. Copper compression sleeve installed as per manufacturer’s recommendation.

d. Dress cable ends using black heat shrink tubing.

e. Adjust lengths of lift lines to trim batten parallel to stage floor at low trim height as indicated on the Drawings.

E. Pipe Battens

1. Provide pipe battens complete with sleeves, connectors and fittings as indicated on the Drawings. Pipe to be of 1½" nominal Schedule 40 black iron pipe as per standard industry practice.

2. Batten joints to be secured with 18" close fitted internal sleeve by (2) 3/8” dia. bolts with lock nuts perpendicular to floor on each side of joint.

3. Batten ends to be covered with yellow vinyl caps to protect individuals from contact with cut pipe ends.

4. Battens to be painted with flat black enamel.

5. Battens to be marked with a 1" wide white stripe on centerline only, full circumference around pipe. Battens to be marked with 1'-0" measured increments from end to end. All markings to be in yellow enamel paint.

F. Operating (Hand) Lines

2. Dead tie with bowline at top, use 2 tight fitting half hitches after passing through eye at bottom of arbor, tape ends, or dress top with 2 removable nylon tie wraps.

3. Adjust length for proper tension block takeup after initial line stretch. Bottom of floor block to be approximately 9" above counterweight pit slab at time at final checkout.

G. Counterweight Locking Rails

1. Continuous 4" x 6" x ¼" steel tube locking rail, running the full length of the tee bar system. Drill for rope locks on required centers to match all tee bar spacing. Drill tube at 4'-0" centers to accept standard belaying pins. Provide 3" square steel engaging tube for capstan winch.

2. Provide (1) complete locking rail at the stage floor level. Refer to Drawings.

3. Rail stanchions of 3" square tube, not more than 5'-0" on center. Anchor to stage floor to withstand upward force of 350 lbs. per foot on rail.

4. Continuous white acrylic index strip as indicated on the Drawings.

5. Provide neoprene handle bumper on rail or integrated with rope lock (see below).

6. Provide lineset labeling on the onstage face of the locking rail.

H. Rope Locks

2. Cast iron bodies acceptable (#30 gray iron).

4. Slip ring to hold lever in locked position.

5. Provide 3/8" bolts to locking rail positioning lock on axis of arbor.

6. Operating handle and slip ring to be plastic covered.
7. All internal parts to operate silently. Provide internal neoprene pads and nylon cam shims.
8. Provide one rope lock per lineset as indicated in the Drawings for each tee bar space.
9. Provide one high quality, all keyed alike, padlock per each rope lock.

I. Tension Blocks
1. Provide 10" diameter cast #30 gray iron sheave, turned and grooved for 3/4" hand line, press-fitted with precision ball bearings.
2. Provide 5/8" minimum steel shafts held by self-locking hex nuts.
3. Steel housing or cast iron weighing, with sheave, not less than 30 pounds to maintain hand line tension.
4. Two UHMW and neoprene guide assemblies with ¼" steel full width backing plates on both sides of shoes, as for arbors, for free riding attachment to tee bar tracks.

J. Head Blocks
1. Heavy-duty machined cast ductile iron or #30 gray iron sheave turned and grooved for ¼" steel cable lift lines and for 3/4" operating line. Pitch diameter to be matched for steel cable and rope. Grooves to have 1/64" tolerance.
2. See schedule on Drawings for the number of grooves in each head block.
3. Sheaves to have 4" machine faced hubs bored for 2 press-fitted Timken 7204-B cup and 07100 preloaded cone roller, or equal. Alternates require specific approval.
4. Shafts of 1" diameter steel, locked to side plate, with adjustment nut factory tightened to manufacturer's torque specifications and locked to shaft by cotter pin or self-locking nut.
5. Sides not less than 3/16" CRS plate, welded and riveted to 1½" x 2" x ¼" steel base angles with 1½" legs horizontal, turned in and cut to clear vertical lines on 6-line+ sets. Base angle legs shall be turned out for 4-line sets. Side plates to span past edges of head block beam flanges by at least 1½". Side plates to span base angle cut and head block beam flanges by at least 1½".
6. Sides joined into rigid assembly by at least five 3/8" bolts with spacer pipes located where appropriate to retain cables in sheave grooves.
7. Head block sheave to be 12" in diameter, typical, unless otherwise noted on the Drawings.
8. Head blocks attached to the head block beam by double steel clips with forged offset or space plate for thickness of beam flange. Clips bolted to block by minimum (2) ½" dia. grade 5 bolts with nuts and lockwashers.

K. Loft Blocks:
1. Machined, cast ductile iron or #30 gray iron sheaves, 8" diameter, turned and grooved for one ¼" steel cable. 1/64" groove tolerance.
2. Shafts bored and press-fitted with double sealed precision ball bearing assemblies. SKF 60 Series 2 RS or equal.
3. Shafts of 5/8" diameter steel locked to side plate, with adjustment nut factory set for proper shaft and bearing adjustment and locked in place.
4. Side plates not less than 10 gauge CRS plate.
5. Base angles shall be 1½" x 1½" x ¼", with legs turned out.
6. Sides joined by five 5/16" bolts with pipe spacers same as head blocks located where appropriate to retain cables in sheave grooves and fully enclose sheave.
7. Idler sheaves (4" minimum diameter) may be of high strength nylon grooved for ¼" steel cable. Precision ball bearings. Provide spacers as required to locate sheaves ½" on center, sheave to sheave. Each loft block shall have one idler for each cable which passes it. Use of sag bars are not permitted.
8. Short line loft blocks to be multigroove sheaves with 1 groove for each pickup cable in set. Construction shall be similar to that indicated for the head block above, without the groove for the operating line.
9. Loft blocks attached to the beam by double steel clips with forged offset or space plate for thickness of beam flange. Clips bolted to block by minimum (2) 3/8” dia. grade 5 bolts with nuts and lockwashers.

L. Index Strip Light
1. Provide LED index strip light with 2 alternating circuits (white and blue). Fixtures will be dimmable LED, alternating white frosted and blue frosted. Index strip to be full length of locking rail. Suspend from outrigger batten as indicated in the Drawings. Mount the strip lights prior to connection by Division 26.
2. Provide local dimmers of appropriate voltage and capacity for each of the two circuits. Installation by Division 26.

M. Outrigger Battens:
1. Provide bracket support for index strip lights at the locking rail as indicated above and as shown on Drawings.
2. Outrigger batten and index strip light support brackets may not be fastened to the tee bar guide tracks.

N. Counterweight System Labeling
1. The linesets shall be labeled with the designations indicated on the Drawings in the following locations:
   a. The onstage face of the locking rail.
   b. The onstage flange of the counterweight head block well buck beam.
   c. The upper offstage railing of the loading gallery.
   d. Pipe ends
2. Labels shall be painted with enamel paint on structure using stencils or by a professional sign painter.

O. System Signage:
1. Provide signage indicating system load data for each of the following locations:
   a. Stage Level
   b. Technical Gallery
   c. Loading Gallery
2. System data shall include:
   a. “When Working on Galleries: Fall Protection Required When Loading/Unloading Counterweights from Arbors”
   b. Working Load Limit and total load capacity of general purpose sets
   c. Weight per each size of counterweight
3. Signage shall be made of 1/8” aluminum, painted finish.
   a. Block lettering of 1/4” high minimum letters.

2.5 PROSCENIUM SAFETY CURTAIN

A. General:
1. Proscenium Safety Curtain shall comply with the following:
   a. International Building Code Section 410.3.5 “Proscenium Curtain”
   c. NFPA 80, Chapter 20, “Fabric Fire Safety Curtains”
   d. Additional requirements of this specification where those requirements exceed the Code.
2. The safety curtain shall be a single non-asbestos fabric panel, motor operated, with fusible link and break-glass release emergency operation.
3. The curtain shall be made of noncombustible materials constructed and mounted so as to intercept hot gases, flames and smoke and to prevent glow from a severe fire on the stage showing on the auditorium side within a period of 20 minutes.

4. The curtain shall be so constructed as to withstand horizontal movement or bowing of no more than 2’ when subjected to lateral load of 2 lbs. per square foot over the entire area of the curtain.

5. The closing of the curtain shall have an average closing speed of not less then 6” / sec and not more then 24” / sec. The last 8’-0” of travel shall require not less than 5 second.

B. Safety Curtain

1. The safety curtain shall be fabricated from a non-asbestos coated curtain fabric made of 100% glass yarns. The weight of the material shall be approximately 40 oz. per square yard and approximately .08” thick. The material shall withstand continuous high temperatures to 1500 degrees Fahrenheit. The strength of the finished cloth in tension shall not be less than 260 lbs per inch warp width and 290 lbs per inch of filling width. The material shall not be affected by bleaches or mildew. The material shall be “Zetex Plus A-1210” as manufactured by Newtex Industries or equal.

2. All strips of fabric to be run vertically for the full height of the curtain; horizontal seams not permitted. Lap seams not less than 1” and sewn with 2 lines of stitching. The fire characteristics of the thread must not compromise the assembly.

3. Fabric at the sides to be turned back and sewn with a 6” flat hem reinforced with 16 gauge painted steel sheet metal on each side of hem.

4. Steel strap curtain guides, with ball bearing trolleys bolted in 3 places each to the side of the curtain, 1’-6” on center.

5. The top and bottom of the curtain shall have a 6-inch flat single-thickness pocket to hold the pipe batten.

6. Yield pad as shown on Drawings. Yield pad of noncombustible material not less than 3” thick to form a seal against the floor.

7. Finished curtain to overlap proscenium rated opening per code at top and sides. Curtain must extend into smoke pockets per code.

C. Pipe Battens

1. Provide pipe battens complete with sleeves, connectors and fittings as indicated on the Drawings. Pipe to be of 2” nominal Schedule 40 black iron pipe as per standard industry practice.

2. Batten joints to be secured with 18” close fitted internal sleeve by (2) 3/8” dia. bolts with lock nuts perpendicular to floor on each side of joint.

3. Battens to be painted with flat black enamel.

D. Smoke Stop and Smoke Pockets

1. The top of the curtain shall have a smoke stop fitted to make it as smoke tight as practicable.

2. The smoke pockets at the sides of the curtain shall be of structural steel shapes and plates not less than ¼” thick. Construction to be bolted, no welding permitted.

3. The smoke pockets shall be not less than 11” deep and 6” wide. The smoke pockets shall be set back from the face of the proscenium arch by at least 6”. The smoke pockets shall extend from the stage floor level to a point 3’-0” above the top of the raised curtain and shall be securely bolted to the proscenium wall. Coordinate attachment backing.

4. Details of construction and anchorage to be approved by local building and fire authorities and the Architect prior to fabrication.

E. Curtain Guide Track

1. Provide curtain guide channel track as shown on the Drawings.

2. Track to be not less than 14 gauge steel track with adjustable mountings for attachment to the smoke pocket assemblies.
Gateway Theater Complex
HAA Project No. 2016034.00
WSU Project No. 189-178578

THEATRICAL RIGGING
11 61 33 - 21

F. Lift Lines
   1. Oil-free, zinc coated, 1/4", 7x19 aircraft cable. 7,000 lbs. minimum breaking strength.
   2. Pipe batten connection by:
      a. Pipe clamp
      b. Rated hot dip galvanized jaw/jaw (cotter pin type) turnbuckle with 6" of take-up, lock
         nuts, lock washers and safety wire mouse (after adjustment).
      c. Wire rope thimble
      d. Compression sleeve installed as per manufacturer's recommendation.

G. Hoist Components
   1. Hoist motor shall be properly sized to carry the weight of the safety curtain. The motor
      shall have a minimum NEMA service factor of 1.25 for continuous operation. The motor
      shall be totally enclosed and fan cooled. Motor shall be C flange type mount. It shall
      operate on 3 phase, 208 VAC (confirm voltage with electrical contractor). Brakes shall
      be an integral part of the motor. Brakes shall be normally closed, direct acting, spring
      loaded, electrically released, and equipped with a manual release as well. Brakes must
      stop and hold 200% of the full load torque.
   2. Release of the safety curtain by any of the emergency release devices shall cause a
      hydraulic governor to control the decent of the safety curtain as outlined in 2.5.A.5 above.
      The hydraulic governor can be used as the primary brake but at no time shall the brake
      require electricity to hold the curtain in the up position or shall electricity be required to
      allow the safety curtain to be released and complete its travel. The hydraulic governor
      shall be an integrated unit - no hoses shall be required.
   3. Hoist gearboxes shall have combination helical-worm reducers, directly mounted by a
      flange to the motor. Gear reducers shall be selected to safely transmit the required
      power, torque and impact. All gear reducers shall have a minimum service factor of 1.50
      and an AGMA load classification of 1. The gear reducer case shall be high-tensile nickel
      cast iron. The helical gear shall be centrifugally cast bronze, mounted on a cast iron
      hub. The input and output shafts shall each be supported by two tapered roller bearings.
      The gears shall run in an oil bath. The shaft bearings shall be provided with double-lip
      oil seals to prevent leakage. There shall be a drip pan provided under the gearbox.

H. Limit Switches
   1. The primary limit control shall be a rotary limit switch connected to output shaft of
      gearbox. The limit switch shall be driven from the drive train by means of a roller chain
      or toothed belt transmission. All shaft connections shall be pinned or keyed.
      Connections using set screws shall not be acceptable.

I. Electronic Controls
   1. The electronic controls, mounted in the Production Control Panel as shown in the
      drawings, shall allow the curtain to go up, down or stop anywhere in its travel. This
      movement is independent of an “emergency release” situation. At no time shall the
      electronic controls inhibit the movement of the safety curtain during an “emergency
      release” situation.
   2. It shall be possible to reposition the safety curtain at any location in its travel using the
      constant contact (hold-to-run) UP and DOWN buttons located on the panel.
   3. The EMERGENCY STOP button, mounted on the same panel as the UP and DOWN,
      buttons, shall be the large “mushroom” type and shall be a true power interrupting
      disconnect.
   4. When using the electronic controls to operate the safety curtain, the time to fully open
      the curtain shall not exceed 60 seconds.

J. Motor Control Cabinet
   1. Provide wall mounted NEMA enclosure mounted at the gridiron level as shown on the
      drawings.
2. Panel shall utilize forward/reversing motor starter technology.
   a. Starters shall be specifically manufactured as a reversing starter with overload protection and mechanically interlocked to prevent simultaneous forward and reverse activation.
   b. Provide panels with current and thermal overload protection.
3. Provide Emergency Stop “mushroom” button mounted on the face of the enclosure.
4. Provide momentary key switches for local UP and DOWN control of the hoist on the face of the enclosure.
5. The enclosure must fit into the space provided. Field verify all site conditions

K. Cable Drums
1. Cable drums shall be designed to properly support the required loads without crushing or deformation. Drums shall have integral hubs, which will accept properly sized drum shafts for the transmission of loads and torque from the drive mechanism to the cable drums. Outboard ends of shafts shall be supported by self-aligning pillow block bearings. Drum shafts shall be continuous passing through both hubs and both bearing mounts. The drum hub shall be keyed to the drum shaft with keys, which are properly sized for the shaft diameter, and set-screwed through the hub. The length of the hubs and keys shall be sized for the torsional load on the drum.
2. Drums shall be grooved for the wire rope to be spiral wound. The pitch diameter of the drum groove shall be in accordance with recommendations of the wire rope manufacturer. The groove shall be machined to accept a minimum of 3/8 the rope depth, with 15 degree sloping sides, and spaced for a minimum clearance of 1/32” between cables.
3. There shall be a minimum of three dead wraps. Drums shall carry only a single layer of cable. An angled hole shall be drilled from the root of the cable groove through the drum wall for each cable. The axis of the hole shall be a 45-degree angle to a radial line through the center of the hole. The hole shall be chamfered, free of burrs and of correct size to retain a Nicopress cable retainer as manufactured by the National Telephone Supply Company or other approved connection.
4. All drums shall be machined to at least 63 RMS finish with concentricity to a rotational angle + 1/16”.
5. All stepped-down shaft corners and shoulders shall have proper fleet radius.

L. Cross Groove Detection:
1. Each cable drum shall be provided with a ground bar or limit switch which initiate an E-stop if any of the lift lines leave their established rope drum groove either due to slack line or cross groove condition.

M. Emergency Release Line (safety line)
1. Provide wire rope safety line with 165°F fusible links. Fusible links to conform to local and state codes.
2. Provide diverter sheaves where safety line changes directions as indicated on the drawings.
3. Provide diverter sheaves with bolted steel side plates and safety line keepers. Keepers must prevent a slack release line from coming out of the sheave groove.
4. Provide secondary mounting steel and hardware for attaching sheaves to structure.
   a. Safety line shall extend across the top of the stage within 12” of the roof support structure.

N. Electro-Mechanical Release Station
1. Provide an electro-mechanical safety line release activated by rate of rise heat detectors and by release of tension in the safety line.
2. Provide switch mounted in the release mechanism enclosure for testing system operation. Activation of release mechanism shall release tension in the safety line and close the safety curtain.

3. The release unit shall incorporate three pulleys to permit its attachment to the safety line at any point and to help prevent accidental release.

4. The release shall contain an integral battery and charger to provide emergency power during power interruptions. The release shall operate from a 120 VAC power source.

5. The electrical safety line release shall be UL Listed.

O. Emergency Release Station

1. Sheet metal enclosure, finished with red enamel paint. Stencil legend “IN CASE OF FIRE BREAK GLASS PULL RED PIN TO LOWER SAFETY CURTAIN” with white paint as indicated on the Drawings.

2. Mounting hardware as is appropriate for secure attachment of release station to proscenium wall. Metal enclosure shall be removable from the proscenium wall without releasing the safety curtain release line.

3. Emergency release line securely attached to steel release plate. Form line over thimble and secure line appropriately.

4. Provide 1/8” thick tempered glass window to cover steel release pull pin. Provide a steel mallet chained to the side of the pull pin box to break glass. Glass to be held in place with screws and clips for ease of replacement. Provide 2 spare panes of glass for replacement.

P. Safety Chains

1. Provide 3/8” welded proof coil chain rated not less than 3,700 lbs proof test or 1,800 pounds safe working load.

2. Anchor to gridiron channels with 3/8” forged eye bolt and shackle.

3. Attach to safety curtain top batten with ring batten clamp and shackle.

4. Adjust length to hold curtain upright at low trim.

Q. Safety Curtain Signage

1. On each side of proscenium, adjacent to the safety line, mount a sign panel not less than 9” high by 12” wide reading “IN CASE OF FIRE BREAK GLASS PULL RED PIN TO RELEASE SAFETY CURTAIN”.

R. Approvals Required

1. Provide the Architect with detailed plans and shop drawings for submission to local and State Fire Marshall. Shop drawings will not be released for fabrication until so approved.

2. Completed installation must be operated twice, and adjusted as necessary, for approval of the Architect, Theatre Consultant and local authorities.

2.6 STAGE TRAVELER TRACK ASSEMBLIES

A. Provide tracks for the traveler curtains and side masking draperies as indicated on Drawings and schedules. Complete with all necessary accessories (CWANA).

B. Track:

1. Track to be heavy-duty channel type, approximately 3” x 3”, 14 gauge steel or extruded aluminum formed to provide parallel double tracks for carrier wheels and totally enclosed except for bottom carrier slot.

2. Traveler tracks for bi-part drapes to be in two sections, with 2’-0” combined center overlap, fitted for manual line operation.

3. Each traveler track section to be a single piece, free of burrs, dents or irregularities. Sections for bi-part track assemblies clamped together by at least 3 lap clamps.
4. Hanger fittings and clamps for attachment spaced at 4'-0" on center maximum.

C. Carriers:
1. Provide one master carrier for each single-section line-operated traveler track.
2. Provide two master carriers for each double-section traveler track.
3. Master carriers to each have 4 paired neoprene wheels with ball bearings.
4. Master carriers to have 2 clamps for attachment of operating line and 2 plated swivels with 6" of usable trim chains for curtain attachment.
5. Single carriers to have 2 neoprene wheels with ball bearing with "hollow center" design to bypass the operating line.
6. Each single carrier to have single plated swivels with 6" of usable trim chain.
7. One single carrier for each 1'-0" of track length.
8. Provide end stacking (rear fold, back pack) devices to stack drapery only at offstage track ends. Provide rubber washers to packing tabs.

D. Traveler Track Pulley Blocks:
1. End pulley blocks heavy-duty type with 8" sheaves turned and grooved for 1/2" operating line. Double vertical sheaves on the live end of the tracks; a single horizontal sheave on the dead end. Housings firmly bolted to the track.
   a. Flying Traveler Tracks: Provide a single 45 degree slanted sheave on the dead end.
2. Floor pulley blocks to have 8" sheaves with sealed ball bearings. Sheaves mounted to slide vertically and clamp in a steel frame with full side plates of sufficient height to permit 9" tension and adjustment of operating line. Base drilled for 2 improved stage screws for floor mounting. Supply 2 improved stage screws and plugs.
3. All blocks to provide for positive retention of operating cords in grooves of sheaves.

E. Traveler Operating Hand Lines:
1. Each hand line to be a single length, first quality, 1/2" diameter, fiberglass center, braided cotton cord.
2. Rig for curtain operation from the live end of the track.
3. Length of hand line to be adjusted for tension with traveler curtains mounted and trimmed.

F. Products:
1. ADC #283-R
2. H&H #400
3. Or equal

2.7 PORTABLE CAPSTAN WINCH

A. Provide one side block capstan motorized bull winch.

B. Winch to have "gate block" for rope line.

C. Gear motor to be worm drive 180:1 reduction with 1750 RPM, 1½ HP, 208 VAC motor.

D. Gearmotor and idler block mounted in castered frame for portable use. Fabricate from steel tube with tab angle to secure to counterweight locking rail. Mount motor controls, pushbuttons, and snatch cleat to frame.

E. Provide with 50'-0" extension cord with twistlock male connector. Provide female receptacle with faceplate for installation under Division 26 Electrical work.
F. Provide 150'-0", 5/8" diameter, 14,500 lbs. minimum breaking strength, uni-directional, 100% polyester rope for use with the capstan winch with forged hook to attach to forged eye at bottom of arbor.

1. Provide "Sta-Set X" as manufactured by New England Rope or equal.

2.8 MOTORIZED ZERO-FLEET HOIST BATTENS – VALADE CENTER

A. Winch Architecture

1. Zero Fleet:
   a. Provide a system of compact vertically mounted “zero fleet” fixed speed winches to be located and mounted as shown on the drawings. Zero fleet is defined as the angle at which the wire rope leaves a grooved winch drum perpendicular to the groove; this angle must remain 0 degrees at all times.
   b. Winch system shall utilize motor drives local to each individual winch. Winch cables shall be connectorized for connection to wireways.
   c. The winches shall be mounted on a chassis bolted to structure as shown on the drawings.
      1) All mounting hardware is under this contract.
   d. Total width of winches shall not exceed dimensions as shown in the drawings.
   e. The motor carriage with drum or assembly of diverter sheaves shall move horizontally as the drum rotates to allow the pick-up lines to pass internal diverter sheaves maintaining a zero fleet angle.
   f. If required due to the hoist orientation, diverter sheaves allow the cable to exit the drum and immediately turn 90 degrees to exit the end of the winch parallel to drum axis.

2. Hoisting Capacity
   a. The safe working load (SWL) of the hoist shall be as listed in the Lineset Schedule.
   b. During the commissioning and Compliance Testing phase, this hoist shall be capable of lifting 25% more than the SWL without substitution of any components. See “System Start up, Owners Instruction and Commissioning” above.

3. Speed
   a. The speed of the hoist shall be as listed in the Lineset Schedule.

4. Lift lines:
   a. The number of wire ropes that will be attached to the hoist drum shall be as listed in the Lineset Schedule. The drum must be sized to accommodate the full travel, plus three dead (safety) wraps and space for two unused wraps for each lift line. The termination of each wire rope shall be by compression stop sleeve installed as per manufacturer’s recommendation to hold the wire rope firmly to the drum.
      b. Note: the total length of each lift line is a function of the travel distance and the distance from the hoist to the attachment point for the batten.

5. Travel Distance:
   a. The travel distance shall be as listed herein or as detailed in the drawings.

6. Limits:
   a. The hoist shall be capable of being stopped at any point between its initial up and initial down limits. The exact stopping point shall be determined by the information provided by an absolute encoder which is part of the hoist design.
   b. The hoist shall have the following hard struck limit switches:
      1) “Ultimate up” hard struck limit
      2) “Initial up” hard struck limit
      3) “Initial down” hard struck limit
      4) “Ultimate down” hard struck limit
   c. The initial hard limits, both up and down, stop the hoist from traveling but allow the operator to drive off the initial limit. The ultimate hard limits, both up and down,
initiate an E-stop in which power is removed from the motor drive after a fast deceleration.

d. In all cases, proper over travel must be provided in the hoist design to accommodate a failure of the control system. The hoist must come to a complete stop after striking an “initial up” or “initial down” limit without striking an “ultimate” limit. If the “initial limits” fail to function, the striking of an “ultimate” limit must bring the hoist to a complete stop before striking an immovable object.

7. Telemetry:
   a. The telemetry, i.e. position, of the moving element connected to the hoist shall be determined by the feedback of, at minimum, a single absolute encoder. This encoder shall be capable of accurately positioning the moving element. This encoder shall be mounted to the electric motor and shall not be belt driven.

8. Brake:
   a. Each hoist shall have a primary motor brake and a secondary brake. Each brake shall be cable of stopping and holding 200% of the hoisting capacity. Each brake shall be spring applied, fail safe, electromagnetically released.
   1) Secondary brake shall be on load side of hoist drive-train. Secondary brake shall be mechanically coupled to wire rope drum with as few connections as possible. Secondary brake located at the motor’s high RPM/low torque output shaft shall not be accepted

9. Load Detection:
   a. The hoist shall be provided with a load cell device which is capable of determining the load which has been added or removed from the system. This device shall be integrated into the control system and each hoist shall be able to “learn” its load, as a safeguard against unintentionally overloading or under-loading the hoist.
   b. The control system must initiate a stop if the system load changes by more than ±6%. This threshold shall be user adjustable.
   c. In no case shall the software system allow movement if the SWL is exceeded.

10. Cross Groove Detection:
    a. The hoist shall be provided with a ground bar or limit switches, one per each lift line, which initiate an E-stop if any of the lift lines leave their established rope drum groove either due to slack line or cross groove condition.

11. Drum rollers:
    a. Provide pinch rollers to ensure lift lines are held in their groove at the tangential point at which the lift line exits the drum.
    b. Rollers shall rotate on sealed ball bearings. Plain bushings shall not be accepted.
    c. Rollers shall be machined to match the profile of the lift lines. Machined rollers shall include at least one profile to ride in an empty drum groove and at least one groove for exiting lift line.

12. Power and Control Distribution
    a. Each hoist shall be connected to electrical power via an 8’-0” long cable extending from the rear of the hoist to the source outlet in the Power and Control Distribution box. (coordinate with Electrical Contractor).
    b. The control circuit shall be attached to the hoist via a separate control wire that is also 8’-0” long and shall be connected at the hoist and at the Power and Control Distribution box.
    c. The receptacles shall be installed in a sheet metal junction box and shall include a power and control outlet.
    d. The distribution box shall include a 3 phase motor rated breaker sized for the operating horsepower of the motor.
    e. The wiring and connectors shall be barriered between high and low voltage.
    f. The Power and Control Distribution box shall be UL listed.
    g. Control wiring terminations shall be made via an IDC style connector.
    h. Hoists shall connect to the control panel via a single CAT-5e style cable.
i. The Control Panel shall operate on low voltage power supplied via the control cable that connects the control circuit to the power and control distribution box.

j. A centralized contactor cabinet with individual multiple wire connecting to each hoist shall not be acceptable for this installation

13. The hoist shall be:
   a. Prodigy EXO P900G Hoist by ETC Rigging
   b. or approval equal

B. Lift Lines:
   1. Oil-free, zinc coated, 3/16” 7x19 aircraft cable. 4,200 lbs minimum breaking strength.
   2. Pipe batten connection by:
      a. Pipe clamp
      b. Rated hot dip galvanized jaw/jaw (cotter pin type) turnbuckle with 6” of take-up, lock nuts, lock washers and safety wire mouse (after adjustment).
      c. Wire rope thimble
      d. Compression sleeve installed as per manufacturer’s recommendation.
      e. Dress cable ends by black heat shrink tubing.
   3. Adjust lengths of lift lines to trim batten parallel to stage floor at low trim height as indicated on the Drawings.

C. Pipe Battens
   1. Provide segmented battens complete with sleeves, connectors and fittings as indicated on the Drawings. Pipe to be of 1½” nominal Schedule 40 black steel pipe as per standard industry practice.
   2. Batten joints to be secured with 18” close fitted internal sleeve by (2) 3/8” dia. bolts with lock nuts perpendicular to floor on each side of joint.
   3. Batten ends to be covered with yellow vinyl caps to protect individuals from contact with cut pipe ends.
   4. Battens to be painted with flat black enamel.
   5. Battens to be marked with a 1” wide white stripe on centerline only, full circumference around pipe. Battens to be marked with 1’-0” measured increments from end to end. All markings to be in yellow enamel paint.

D. Loft Blocks:
   1. Machined, cast ductile iron or #30 gray iron sheaves, turned and grooved for one 3/16” steel cable. 1/64” groove tolerance. Wire rope to sheave D to d to be 26 times minimum.
   2. Sheaves bored and press-fitted with double sealed precision ball bearing assemblies. SKF 6000 Series 2RS or equal.
   3. Shafts of 5/8” diameter steel locked to side plate, with adjustment nut factory set for proper shaft and bearing adjustment and locked in place.
   4. Side plates not less than 10 gauge CRS plate.
   5. Base angles shall be 1½” x 1½” x ¼”, with legs turned out.
   6. Sides joined by five 5/16” bolts with pipe spacers located where appropriate to retain cables in sheave grooves and fully enclose sheave.
   7. Custom UHMW idler block as shown on drawings.
   8. Loft blocks attached to the beam by double steel clips with forged offset or space plate for thickness of beam flange. Clips bolted to block by minimum (2) 3/8” dia. grade 5 bolts with nuts and lockwashers.

E. Mule Blocks
   1. Individual cast ductile or #30 gray iron sheaves, 8” in diameter, turned and grooved number of 3/16” steel cables muled. Bearings and tolerances as for loft blocks indicated above.
   2. See Drawings for number of grooves required per unit.
3. Shafts of 3/4" diameter steel locked to side plate, with adjustment nut factory set for proper shaft and bearing adjustment and locked in place.
4. Side plates to be 10 gauge CRS plate.
5. Mounting to be by steel clip and channels, minimum (4) ½” dia. grade 5 bolts and lockwashers, as required to assure positive alignment. Shims and spacers as required.
6. Provide as required for clearance of field conditions

F. Upright Idler
   1. Idler assembly machined in 2 halves to accommodate 3/16” wire rope as shown in drawings.
   2. Mounting to be by steel clip and channels, minimum (4) ½” dia. grade 5 bolts and lockwashers, as required to assure positive alignment. Shims and spacers as required.
   3. Provide as required for clearance of field conditions

2.9 RIGGING CONTROL SYSTEM (RCS) – VALADE CENTER

A. The control system shall be designed for the control of theatrical rigging, specifically the automated hoists, provided in this section.

B. The system shall be easy to understand and operate that result in accurate position of all motorized rigging in the system.
   1. Controller shall be wall mounted as shown on the drawings.

C. Controller shall display the position of batten’s bottom pipe in feet and inches above the finished stage floor.

D. System shall detect weight imbalance as little as 6% variance over or under predefined load shall cause the axis to stop. Only motion in the opposite direction shall be allowed to correct the fault.

E. Provide all necessary contactors, relays, protective devices, motor starters, motor drives etc. in NEMA enclosures for installation by Division 26.

F. Functions:
   1. Provide digital two-way communication between the controller and hoist units. This communication must include feedback loop information, E-Stop information, position information, error information as well as all other vital system statistics.
   2. System must continually monitor and control all safety functions including but not limit to, E-stop, slack line, over current, over temp, limits and over speed, etc.
   3. System shall be programed to run no more than 2 hoists simultaneously.

G. Display Functions:
   1. Provide LCD display with feedback and operating information.
   2. Display window shall include position, axis name and number, weight of load, preset position, and status indicators for e-stop and the nature of any faults.

H. System Computer:
   1. The computer architecture and all central processing for the control system shall be a specifically designed for controlling stage movement machinery. The computer shall utilize multi-processing architecture and interact with the remote control elements described herein.
   2. Provide necessary signal and information storage devices to provide back-up.
   3. Computer shall be configured to allow performance upgrades and “fixes” via software, without replacement of non-defective hardware.
4. Backup:
   a. All input and recorded data shall be stored in a timed backup on non-volatile flash memory.
   b. Provide USB port and flash drive or appropriate removable storage media, for archival recording of all functions.

5. The computer shall issue control commands to the hoist electronic motor drive modules via an industry standard control protocol i.e. Ethernet – Cat 5 UTP, SIMOLINK or Profinet by way of a cable plant established for this sole purpose.

6. Provide an uninterruptible power supply rated to power control equipment for 30 minutes

I. Event Log:
   1. All user functions including log-in and logout, failed attempts, user operations, keystrokes, system errors, axis faults, limit strikes, slack line faults, load sensing, hardware faults, over temperature and the like shall be recorded with time and date of action and operator identity.
   2. A separate event log shall be created for analysis and reporting purposes.
   3. Access to the event log shall be defined by the System Administrator.

J. Trims:
   1. Provide at least one preset trim (predetermined trim positions) per axis.
   2. The programmable trims shall be independent of programmed top and bottom limits stops.

K. Monitor of Limit Functions:
   1. There shall be hard struck ultimate over travel limits in both directions acting directly on motor drive and will stop the movement completely. Resetting these limits shall require investigation of the condition and physical bypass of the limits to reset the system. (See Fault Diagnosis below)
   2. There shall be hard struck initial over travel limits in both directions, these limits, when struck, will stop the movement completely, however the control system can be operated to “drive off” the limits to correct the fault. (See Fault Diagnosis below)
   3. In addition to the four hard struck limits, the control system shall have user assignable soft ultimate limits.

L. Fault Diagnosis:
   1. Immediately upon a fault on any axis the system shall display an error message on all active displays.
   2. The error message shall be specific with regard to the fault, such as overload, slack line, limits, E-stop, position error, etc.
   3. The exact axis, number, location, and type of fault shall be displayed. In addition, the check requirement, such as “reset”, check limits, etc., shall be indicated on the display.
   4. E-stop trip location shall be displayed in the event of a manual local trip. All faults shall be logged in the event log.

M. Emergency Stop:
   1. Provide low voltage logic signal called “E-STOP”. E-stop function shall enable redundant safety line contactor disconnecting power to motor drive. No motor element shall function unless “E-STOP” is deactivated. However, it is a priority that one single component failure shall not render entire system unusable.
   2. The E-stop and ultimate over travel limit switches shall be a part of a circuit which is separate from and redundant to the normal end of travel limit switches. This circuit shall not depend on the software or electronic logic. Operation of an E-stop or ultimate over travel limit switch directly disconnect power from the winch(es) using a UL580E type 2, non-welding positive break contactor. An override mechanism to allow resetting of the over travel limits shall be included.
3. E-Stop on individual decentralized motor drive cabinets shall initiate a global E-Stop.
4. Provide additional “E-STOP” stations as shown on drawings.

N. Acceptable Products:
   1. QuickTouch 4-channel and Remote Control by ETC Rigging

2.10 TENSION WIRE GRID

A. Design Criteria:
   1. The following design criteria are intended to establish minimum safety requirements. 
      Where Federal, State and Local legislation address these topics, the more stringent 
      requirement shall take precedence. Factors listed below in no way relieve the contractor 
      from the sole responsibility for furnishing a safe and properly engineered system.
   2. Cables, fittings, load bearing components: Minimum safety factor of 8x.
   3. Maximum woven cable surface deflection at mid-span: Not greater than L/80 under a 
      150# load on a 12” x 12” area.
   4. Maximum frame compression on any member: 5000#.
   5. Design live load on grid: 20# p.s.f. over a panel.

B. Tension Grid Frame Assembly
   1. Tension wire grid frames to be welded assemblies of structural steel, sized appropriately 
      for this application. Overall dimensions of the frames as per the Drawings and as verified 
      by field survey of structural support grid.
   2. Frame assembly to be drilled, de-burred and chamfered for attachment of woven wire 
      rope grid. Live end (swaged fitting) holes and dead end (compression sleeve) holes to 
      be 9/32” diameter.
   3. Frame assembly to be finished with flat black enamel.

C. Tension Grid Woven Wire Rope Grid
   1. The walking surface of the tension wire grid shall be made of 1/8” wire rope woven at 2” 
      on center in two directions. Connections to channel frame assembly by swaged fittings 
      and compression sleeves as per Drawings and indicated herein.
   2. Where members having sloping flange faces, bolted connections shall be provided with 
      appropriate beveled washers to afford square seating of heads and nuts. Alternate 
      method: weld pipe section in place to accommodate a bend in the wire rope.
   3. Wire rope lengths shall be continuous lines from the same spool, free of knots, splices 
      or mechanical fasteners along their length unless specifically required in the Contract 
      Documents.
   4. Wire rope shall be oil free, preformed 1/8” diameter 7x19 galvanized and blackened 
      cable. Blacken by means of electro-statically applied powder coat. Cable shall be rated 
      at not less than 2,000 pounds. Damaged or deformed cables shall not be used.
   5. Blackened wire rope shall be the product of:
      a. Fehr Brothers (no known equal).

D. Tension Grid Swaged Fittings
   1. Swaged fittings shall be Type 303 selenium bearing, corrosion resistant stainless steel. 
      Stud fittings shall be sized for 1/8” wire rope and be threaded as required to meet the 
      criteria established herein and on the Drawings.
   2. Swaged fitting shall be secured in place with 1 washer and 2 nuts.

E. Tension Grid Compression Sleeves
   1. Compression sleeves shall be sized appropriately for the cable construction and 
      diameter of the cable with which they are employed. Sleeves shall be cylindrical for stop
sleeves. Sleeves shall be copper. After application, sleeves shall meet or exceed the latest requirements of Military Specification MIL-W-83420.

F. Compression sleeves and tools shall be the product of:
   1. National Telephone Supply Company, Locoloc, or equal.

G. Temporary Compression Struts
   1. If required to prevent deformation during fabrication, provide temporary compression struts. Struts to remain in place until modules are welded down, and tension tabs and perimeter gussets are welded in place.
   2. Struts to be completely removed after welding is complete. No remnants or finish variations permitted.

H. Tension Tabs And Perimeter Gussets
   1. Tension tabs and perimeter gussets shall be installed in order to prevent the deformation of the module channel frame.
   2. After placement and weld-down of tension grid modules and prior to the removal of the temporary shipping struts, weld 1” x 6” steel strap between adjacent modules, top and bottom. Provide tension tabs at third points on all side. Alternate on either side of centerline across a row to permit future access to wire rope fittings. Center tabs between holes.
   3. For the perimeter conditions, after placement and weld-down of tension grid modules and prior to the removal of the temporary shipping struts, weld 4” leg 45 degree triangle steel gusset between module channel and understructure. Provide gussets at third points of module. Locate centered between holes.

I. Tension Grid Signage
   1. Signage shall be legible both in construction and grammar. A diagram depicting the system layout and maximum load limitations (drawn not less than 1/2” = 1'-0”) shall be wall-mounted in a protective transparent faced frame on the wall near the entrance to the grid as to be plainly visible, and as not to interfere with the operation of systems.
   2. Provide verbiage in English as listed below:

   **WARNINGS FOR TENSION GRID:**

   MAXIMUM LOAD - 4 PERSONS PER MODULE (20 lbs./sq.ft.)
   DO NOT BOUNCE ON SURFACE
   SECURE LOOSE ITEMS
   MAINTAIN CABLE WEAVE AT 2” SQ.

2.11 DRAPERY TRACK

A. Walk-Draw Track
   1. Furnish and install walk-draw traveler tracks for surround masking draperies as indicated on Drawings and schedules, complete with all necessary accessories (CWANA).
   2. Track:
      a. Track to be heavy-duty extruded aluminum type, approximately 3-1/4” high x 1-5/8” wide I-beam, 7 gauge. Extruded shape shall provide parallel tracks for carrier.
      b. Tracks to be single pieces, free of burrs, dents or irregularities.
      c. Provide straight track and radius track sections as per contract drawings.
      d. Splice sections as required for continuous installation as per contract drawings.
      e. Finish Black.
      f. Provide attachment to pipes and walls to properly support track along its entire path.
Gateway Theater Complex
HAA Project No. 2016034.00
WSU Project No. 189-178578

THEATRICAL RIGGING

2.12 REMOVABLE DEAD HUNG DRAPERY BATTENS

A. Furnish and install dead hung pipe battens for support of masking drapery and tracks.

2.13 HAND WINCH HOUSELIGHT PIPES

A. Provide batten, connection, cable, loft blocks, head blocks, and (2) house light battens. The house light battens shall be driven by manually operated winches that are mounted house right. It shall be able to raise and lower the house light batten as indicated on the drawings.

B. Provide required steel to mount assemblies to the building structure.

C. Pipe battens
   1. Specifications as per Section 116133 – Theatrical Rigging, paragraph 2.4E – Pipe Battens.

D. Pipe batten connection by:
   1. Pipe clamp
   2. Rated hot dip galvanized jaw/jaw (cotter pin type) turnbuckle with 6" of take-up, lock nuts, lock washers and safety wire mouse (after adjustment).
   3. Wire rope thimble
   4. Compression sleeve installed as per manufacturer's recommendation.
   5. Dress cable ends by clear heat shrink tubing

E. Hand Pile Wind Winch
   1. The winch shall be a six lift line pile-on (yo-yo) type drum winch.
   2. Winch shall be a hand cranked, oil bath, geared reduction unit with a 1200-pound lifting capacity. The winch shall be fully enclosed and supplied with a sturdy metal handle.
   3. The hand crank shall operate from front side of the winch and be removable for storage. The hand crank shall be located at the proper height for easy operation. The enclosure shall have signs warning that the handle must be removed when not in use.
   4. The cable drum shall be of welded steel construction and carry 24 feet of 3/16" diameter galvanized aircraft cable. Minimum 4 dead wraps.
   5. The winch shall be locked in position by a caliper disk brake capable of holding 200% of the rated load.
   6. Wall mount with support assembly.
7. Hand Winch system shall be:
   a. Thern: PW11-M Series
   b. Or approved equal

F. Lift Lines:
   1. Oil-free, zinc coated, 3/16", 7x19 aircraft cable. 4,200 lbs minimum breaking strength

G. Head Blocks:
   1. Machined, cast ductile iron, #30 gray iron, or high strength filled nylon sheaves, 8" diameter, turned and grooved for six 3/16" steel cables. 1/64" groove tolerance.
   2. Sheaves bored and press-fitted with double sealed precision ball bearing assemblies. SKF 60 Series 2 RS or equal.
   3. Shafts of 5/8" diameter steel locked to side plate, with adjustment nut factory set for proper shaft and bearing adjustment and locked in place.
   4. Side plates not less than 12 gauge CRS plate and bolted to base angles. Side plate shall fully enclose the sheave.
   5. Base angles shall be 1½" x 1½" x ¼", with legs turned out.
   6. Sides joined by five 5/16" bolts with pipe spacers located where appropriate to retain cables in sheave grooves and fully enclose sheave.
   7. Head blocks attached to the beam by double steel clips with forged offset or space plate for thickness of beam flange. Clips bolted to block by minimum (2) ½" dia. grade 5 bolts with nuts and lockwashers.

H. Loft Blocks:
   1. Machined, cast ductile iron, #30 gray iron, or high strength filled nylon sheaves, 8" diameter, turned and grooved for one 3/16" steel cable. 1/64" groove tolerance.
   2. Sheaves bored and press-fitted with double sealed precision ball bearing assemblies. SKF 60 Series 2 RS or equal.
   3. Shafts of 5/8" diameter steel locked to side plate, with adjustment nut factory set for proper shaft and bearing adjustment and locked in place.
   4. Side plates not less than 12 gauge CRS plate and bolted to base angles. Side plate shall fully enclose the sheave.
   5. Base angles shall be 1½" x 1½" x ¼", with legs turned out.
   6. Sides joined by five 5/16" bolts with pipe spacers located where appropriate to retain cables in sheave grooves and fully enclose sheave.
   7. Idler sheaves (4" minimum diameter) may be of high strength nylon grooved for 3/16" steel cable. Precision ball bearings. Each loft block shall have one idler for each cable which passes it. Use of sag bars are not permitted.
   8. Loft blocks attached to the beam by double steel clips with forged offset or space plate for thickness of beam flange. Clips bolted to block by minimum (2) 3/8" dia. grade 5 bolts with nuts and lockwashers.

2.14 CABLE REELS AND ASSOCIATED CABLE

A. Furnish cable reels for the architectural lighting pendant fixtures as indicated in the TR series drawings.

B. Furnish each reel with hybrid power/data cabling for the following:
   1. One 120vac 20amp switched circuit
   2. One DMX lighting control cable.
   3. All cables shall be heavy duty, flexible, and suited for installation into energy chain.
   4. All cable must be installed in each reel prior to delivery to site.
C. Reels shall be spring-driven. Size spring units for lift application with travel as indicated in the TR series drawings

D. Furnish Kellem's® mesh type cable grips and mounting hardware at connection to pendant fixture junction box per TR series drawings. Coordinate straight or 90 degree elbow type with architectural lighting manufacturer and Division 26.

E. Furnish reel terminal box with voltage separation for incoming power and data conductors

F. Provide all required components for reel mounting
   1. Provide strut and hardware as required.
   2. Provide bracing as required to stabilize reels while in operation.

G. Furnish:
   1. E-spool reel with 1 twistband by Igus
   2. or approved equal

2.15 MISCELLANEOUS RIGGING EQUIPMENT AND ACCESSORIES

A. Provide loose rigging equipment and accessories as indicated in the Appendix.

2.16 MAIN DRAPE AND VALANCE

A. The face material of the Main Drape and Valance shall meet or exceed the following criteria:
   1. 100% Inherently Flame Retardant (IFR) polyester velour
   2. Acceptable products:
      a. Rose Brand 25 oz. “Prestige”
      b. Dazian 25 oz. “Angelo”
      c. or approved equal
   3. The color shall be selected by the Architect from the manufacturer’s standard color choices.

B. Line with black IFR lining fabric. Tack lining to face material by sewing cording between each face material seam and the lining material at 4'-0” on center vertically. Tack lining to face material hems every 4'-0” on center horizontally in a similar fashion.
   1. Acceptable Products
      a. Rose Brand “Avora Lining”
      b. Rose Brand “Poly Chintz”
      c. Or equal IFR lining fabric

C. Main Drape Construction:
   1. Two panels for bi-part action, with continuous border as indicated on drawings. Each panel finished with 75% fullness, box pleated and sewn down.
   2. Sew with nylon thread. Color to match face material. Thread shall have no apparent sheen with relationship to the velour.
   3. All finish webbing to be black heavyweight polypropylene, unless otherwise indicated.
   4. The center edges of each panel faced back with a full width of fabric plus 1'-0” (minimum) and hand-tacked entire height with continuous catch stitching spaced 4” apart, seizing lining and facing material.
   5. Offstage edges faced back 1'-0”.
6. Provide pocket for storage of floor block at the offstage edge of the live end of the Main Drape.
7. Provide a paging handle for the upstage panel of each bi-parting curtain set. The paging handle shall be located on the back face of the onstage side of the panel with the point of attachment located 48" above the bottom of the curtain.
   a. Each handle to be fabricated of a 12" loop of velour face material which is sewn around a core of heavy-duty 2" black polypropylene webbing.
   b. Each handle to be stitched to the back of the center edge of the panel and seized in the stitching where the face material is turned back. Sewing for the attachment of the handle shall not be visible on the face of the curtain panel.
8. Box pleats at top of panels 1'-0" O.C. reinforced with heavyweight 3½" polypropylene webbing. Vertical seams to be located so as to be hidden behind pleats.
9. At center of each pleat on main drape, provide 1" cadmium plated rigid eye snap hook attached by nylon webbing strap sewn and riveted through curtain and polypropylene webbing with two rivets. This assembly shall be centered on the webbing. Provide double layer of polypropylene webbing (3½" square) at snap hook locations.
10. 6" double-turned bottom hems with 0.75 lb per foot weighted tape in a separate pocket inside hem. Continuous chain of equal weight, sewn in, acceptable. Weight pocket to be 1" short of finished hem for main drape, equal to finished hem for valance. Ends of weight pockets to be secured with 1½" wide black hook-and-loop fastener for the full height of the pocket opening.
   a. Weights shall be shipped separately from draperies and installed in weight pockets in the field.
   b. A pull-line or tape shall be placed within each weight pocket prior to shipping. The pull line shall be provided to facilitate installation of weights in the field.
11. Size and quantity as indicated in the Drapery Schedules.

D. Valance Construction:
1. Entire drapery shall be continuous, finished with 75% fullness, box pleated and sewn down.
2. Sew with nylon thread. Color to match face material. Thread shall have no apparent sheen with relationship to the velour.
3. All finish webbing to be black heavyweight polypropylene, unless otherwise indicated.
4. Offstage edges faced back 1'-0".
5. Box pleats at top of panels 1'-0" O.C. reinforced with heavy weight 3½" polypropylene webbing. Vertical seams to be located so as to be hidden behind pleats.
6. At center of each pleat on valance, provide #2 black oxide finish brass grommets, double grommets at both ends. Center grommets on webbing. Provide double layer of webbing (3½" square) at each grommet.
7. Mark with centerline designation on heavy-duty muslin with permanent markings, sewn securely to webbing. 2" high letters minimum.
8. Provide one 2'-0" black #4 cotton braided tie line at each grommet. Center tie line to be white. Finish ends of tie lines to prevent unraveling.
9. 6" double-turned bottom hems with 0.75 lb per foot weighted tape in a separate pocket inside hem. Continuous chain of equal weight, sewn in, acceptable. Weight pocket to be equal to finished hem for valance. Ends of weight pockets to be secured with 1½" wide black hook-and-loop fastener for the full height of the pocket opening.
   a. Weights shall be shipped separately from draperies and installed in weight pockets in the field.
   b. A pull-line or tape shall be placed within each weight pocket prior to shipping. The pull line shall be provided to facilitate installation of weights in the field.
10. Size and quantity as indicated in the Drapery Schedules.

2.17 ACOUSTIC DRAPERIES

A. The face material shall meet or exceed the following criteria:
1. 100% Inherently Flame Retardant (IFR) polyester velour

B. The color of all acoustic draperies shall be black.
C. Drapery operation as indicated in the schedules. Each panel finished with fullness as indicated in the schedules, box pleated and sewn down.
D. Sew with nylon thread or cotton thread. Color to match face material. Thread shall have no apparent sheen with relationship to the velour.
E. All finish webbing to be black heavyweight polypropylene, unless otherwise indicated.
F. Edges of masking panels are to be faced back with at least 3" hems. Hand-tack entire height with continuous catch stitching spaced 4" apart.
G. Tops reinforced with 3½” polypropylene webbing with #2 black oxide finish brass grommets, 12” O.C.; double grommets at both ends. Center grommets on webbing. Provide double layer of webbing (3½” square) at each grommet.
H. Bottoms to have 6” double-turned hems with #8 zinc coated chain in separate pocket inside hem. Weight pocket to be 1” short of finished hem. Ends of weight pockets to be secured with 1½” wide black hook-and-loop fastener for the full height of the pocket opening.

1. Weights shall be shipped separately from draperies and installed in weight pockets in the field.
2. A pull-line or tape shall be placed within each weight pocket prior to shipping. The pull line shall be provided to facilitate installation of weights in the field.

I. Provide all attachment hardware to mount drapery to curtain track carriers.
1. Sizes and quantities as indicated in the Drapery Schedules

2.18 SOURCE QUALITY CONTROL

A. All equipment and components to be factory tested prior to shipping.

2.19 FABRICATION

A. Fabricate all work in this section in accordance with the Architect’s direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.

B. Machine-finish all operating parts to standard trade tolerance, fits and finishes.

C. Carry out shop welding in full accordance with the appropriate sections of the “Specification for the Design, Fabrication and Erection of Structural Steel for Buildings” of the American Institute of Steel Construction (AISC).

D. Draperies
1. Each drapery to have identification tag sewn to the webbing at the upper offstage corner of the goods. Identification tag should contain the following information:
   a. Manufacturer’s Name
   b. Date of manufacture
   c. Finished size of goods
   d. Recommended cleaning instructions
2. Fabric runs to be full height without joints or intermediate seams.
3. In no case shall a seam between fabric runs fall directly at the finished end of a piece of goods. Provide 1'-0" minimum from end of goods to a seam, either on the front or back face.
4. Nap of velour sewn down unless otherwise specified.

5. Ends of chain and pipe pockets to be closed with 1½” wide hook and loop fasteners minimum.

6. Hang-out and Straightening
   a. All draperies shall be pre-hung for stretch and final length and trim prior to delivery. This shall be done at the scenic studio or at the job site given clean conditions.

PART 3 - EXECUTION

3.1 INSTALLERS

A. The systems, equipment and services described herein shall be provided by a Theatrical Engineering and Rigging Contractor who will be responsible for all the work of this Section, including but not limited to coordination and supervision of the engineering, shop drawings, fabrication and provision for all systems specified herein and shown in the drawings.

B. To establish comparative standards of quality, the provision of the equipment and services of this section shall be by one of the following contractors:

   Beck Studios, Inc
   1001 Tech Drive
   Milford, OH 45150
   Tel: (513) 831-6650

   Gopher Stage Lighting
   4141 Cedar Avenue
   Minneapolis, MN 55407
   Tel: (612) 871-0138

   J.R. Clancy Incorporated
   7041 Interstate Island Road
   Syracuse, NY 13209-9713
   Tel: (800) 836-1885

   Stagecraft Industries
   5051 North Lagoon Avenue
   Portland, OR 97217
   Tel: (503) 286-1600

   Texas Scenic Co.
   8053 Potranco Road
   San Antonio, TX 78251
   Tel: (210) 684-0091

C. Substitution Limitations

   1. Any contractor who wishes to be listed and has not been pre-approved must submit qualification information to the Architect. Proposal shall include all of the information listed below:

      a. Statements of financial responsibility for the past five fiscal years showing assets and liabilities.
      b. List of principal officers and design and service engineers in an organizational structure flow chart.
c. List of not less than 5 projects of similar size and scope completed within the five years on which contractor has provided full services: product engineering, shop drawings, manufacture, installation and commissioning. In each instance, indicate specifics of scope of fabrication and installation. Include a contact list: name, address and phone numbers of person(s) directly responsible for operation and maintenance of equipment in each facility.

d. List of current projects and approximate contract value and completion dates. Include list of names, phone numbers and addresses of owner, owner's representatives and architect.

e. For each above described project, list of names of persons who supervised preparation of shop drawings, manufacture of components, and installation of equipment.

f. List of names of persons who would do project management, product engineering, supervision of shop drawing, and supervision of installation should this contract be awarded.

g. Contract Bond Company information indicating that contractor has bonding capacity for full duration of project. Include list of other bonded projects coinciding with this project.

h. Evidence of ability to undertake custom product engineering to meet specific requirements of project specifications. Provide sample project engineering drawings for custom products and contact information for facility operators where those products have been installed.

2. Standards of Acceptance:

a. Refer to Paragraph 1.8B - Quality Assurance/Qualifications.

3.2 EXAMINATION

A. Verification of Conditions: Contractor must examine areas and conditions under which the equipment is to be installed and must notify the General Contractor in writing of conditions detrimental to proper and timely completion of work. Work will not proceed until unsatisfactory conditions have been corrected in a manner acceptable to the Contractor.

3.3 INSTALLATION

A. Install all work in this section in accordance with the Architect's direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.

B. Provide site supervision during the installation of electrical work associated with the Theatrical Rigging system elements.

C. Install all work securely, complete with all bolts, nuts, washers, clips, fittings, supports, and other items required for proper installation and operation.

D. Position all items accurately as indicated on drawings and true to plumb, line and level. Maintain maximum headroom and clearances at all points.

E. Coordinate work with all other trades to avoid causing delays in construction schedule.

F. All field welding requires prior approval of the Architect and Contractor's Structural Engineer.
G. Carry out approved field welding in full accordance with the appropriate sections of “Specification for the Design, Fabrication and Erection of Structural Steel Buildings” of the American Institute of Steel Construction (AISC).

H. Do all cutting, drilling, tapping and approved welding required to properly install work. Obtain Architect’s prior approval for cutting and drilling of existing structural work.

I. Clean structural steel and fabricated steelwork of rust, scale and foreign matter by grinding; prime with 1 coat of primer; finish with 1 coat of first quality machinery enamel free of skips, runs and saps. Touch up all field connections, welds and abraded places with primer and enamel.

3.4 FIELD QUALITY CONTROL

A. The installation of the equipment indicated in this Section shall be supervised by qualified personnel who are regularly employed by the Contractor for supervision of equipment installation similar to that indicated herein.

1. Installation supervisor shall be an ETCP Certified Rigger for Theater.

B. Installers must be appropriately skilled and experienced for the type and quality of work.

C. Arrange for all tests and inspections required by the General Requirements.

3.5 SYSTEM STARTUP AND COMMISSIONING

A. Commissioning

1. Upon completion of installation work required by the work of this Section, the Contractor shall perform all required tests and inspections, including but not limited to the Compliance Testing Procedures specified herein.

2. Contractor shall supply all equipment required for the commissioning process including access equipment (personnel lifts, ladders and appropriate protective equipment), test instruments and communications equipment.

3. Contractor shall provide staff to assist in the commissioning process.

4. Compliance Testing Procedures (CTP)

a. The Compliance Testing Procedures are designed to verify that all system motor drive elements function as specified. The following represents a sample of the types of testing that will be conducted:
   1) Validation of E-Stop and limit switches
   2) Validation of operational speeds
   3) Validation of travel limits
   4) Validation of target achievement & repeatability
   5) Observe motion during E-Stop Activation
   6) Observe motion during instantaneous loss of power (bang stop)

b. Contractor shall coordinate the site so as to ensure testing can be done in a well-lit, clean, safe environment, including barricades to ensure unauthorized persons are not able to interfere with the testing. No temporary wiring or transformers will be allowed during the CTP.

c. Contractor shall provide test weights delivered, manipulated for testing, and removed from site. Provide floor protection as required during CTP.

1) Provide sufficient quantities of weights to test each motor drive element to 125% of capacity.

d. All costs associated with the CTP are the responsibility of the Contractor; this includes items such as equipment necessary to access the hoists to ensure limits and brakes can be tested.
3.6 ADJUSTING

A. Adjust all equipment and components for operation in accordance with the specifications, approved shop drawings and pertinent Contract Drawings prior to the demonstration indicated herein.

B. Upon installation and in accordance with the Owner’s schedule, all draperies shall be given an adequate “hang-out” period prior to final acceptance. Steam-out of wrinkles and creases will only be permitted with prior approval.

3.7 CLEANING

A. Touch up minor abrasions and imperfections as required.

B. Remove from the premises all debris caused by this work. All unnecessary equipment and materials shall be removed from the area(s) of this work upon completion, removed from the job site and disposed of legally at no additional cost to the Owner.

3.8 CLOSEOUT ACTIVITIES

A. Demonstration
   1. Upon completion of Commissioning, the Contractor will notify the Theatre Consultant that the system is complete, conforms to specification and is ready for Demonstration.
   2. Installed equipment to be operated for approval and inspected for quality by the Theatre Consultant, the Architect and the Owner.
   3. The Theatre Consultant will observe the CTP on each hoist unit during the equipment Demonstration.
   4. Adjustments or modifications shall be made as directed by the Architect and the Theatre Consultant.
   5. Costs of re-inspection and additional testing by the Architect and Theatre Consultant, if required, due to lack of completion and/or errors and omissions shall be paid by the Contractor. This work will be conducted on a time and materials basis, including the Architect’s and Theatre Consultant’s standard hourly rates, and shall be scheduled and approved in writing prior to the re-inspection/testing session.

B. Training
   1. Following the equipment demonstration, inspection and final adjustments, provide instruction to the Owner’s staff or representatives on the safe operation, care and maintenance of all items.
      a. Instruction must match information provided at the time of submittals and shall include, but not be limited to, proper general maintenance of the system, replacement procedures for user replaceable parts, and operating procedure to obtain maximum usage of system.
      b. Deliver all copies of approved Operations Manual to Owner prior to first instruction session, and review it as part of that session.
   2. Motorized Rigging Instruction:
      a. Provide in-depth instruction to Owner or Owner’s designated staff on the detailed operation of motorized hoists, control elements and associated devices. This training shall take place in two separate sessions.
   3. Timing for all sessions shall be scheduled by the Owner at their convenience.
   4. Instruction must be by qualified expert operators who have actual experience with systems in performance conditions.
5. At the conclusion of the training the Contractor shall conduct a written and hands-on test of the participants that shall demonstrate to the Contractor that the participants have reached a level of understanding that will result in safe use of the equipment.
   a. Provide Certificates of Training for each participant. Log the names of those who successfully completed the training process. Submit as the first page of the bound material.

6. All training shall be videotaped, by the Contractor, for the training of future employees and students.

3.9 PROTECTION

A. Provide full protection from damage, construction dirt and debris for all equipment from the point of installation to testing and commissioning.

B. Remove all equipment protection and clean components thoroughly prior to the demonstration session.

3.10 MAINTENANCE

A. Maintenance Services
   1. One month prior to the end of the first year following the date of final systems acceptance, a factory engineer shall be provided to examine, adjust and repair the equipment included in this section as required. This service shall not cover adjustments, repairs or replacement of parts due to negligence, misuse, abuse or accidents caused by persons other than the Contractor. All labor and materials which are required to perform this service shall meet or exceed these specifications and shall not compromise the performance of the equipment in any way.

   2. Following this inspection and maintenance service, the Contractor shall provide the Owner and Theatre Consultant with a written report itemizing the results of the inspections and the warranty work that was conducted. The Contractor shall also include in this written report recommendations for any corrective actions which the Contractor feels should be taken with respect to the equipment included in this section but are outside the scope of the warranty agreement.

   a. The report of the one year inspection shall be furnished within fifteen days of the inspection. It shall indicate the findings, recommendations, revised maintenance procedures, etc.

B. System Programming Updates
   1. Contractor shall review system operation and control system programming with the Owner’s representatives. Any required adjustments and changes to the control system programming requested by the Owner shall be performed and completed during the time of the corrective service site visit. All control system programming changes shall be documented by the Contractor.

C. Maintenance Contract
   1. Provide to the Owner an executed yearly maintenance agreement for a total of 5 years. This agreement must include, but not be limited to:

      a. Visual inspection of each hoist and all associated loft blocks, idlers, mule blocks, wire rope, connections, etc.
      b. Upgrade, if available, to the latest release of the software compatible with the existing control system.
      c. Network data distribution inspection.
d. Re-training of existing personnel and new training of new personnel. This training is to be at the same level or better than the original training.

e. All material, components, accessories and services required to provide the work as specified herein.

3.11 ATTACHMENTS

A. Refer to Appendix A of this section for quantities and accessories.

END OF SECTION 11 61 33
SECTION 116135

STAGE EXTENSION – ORCHESTRA PIT LIFT SYSTEM

PART 1 - GENERAL

1.1 SUMMARY

A. The work in this section includes Stage Extension - Orchestra Pit Lift systems and equipment within the following space:
   1. Proscenium Theatre

B. Section Includes
   1. Major Systems and Equipment: furnish and install the following major elements and associated accessories:
      a. Motorized orchestra pit lift
         1) Cable Management
         2) Rigid skirt with safety net
      b. Orchestra lift controls
      c. Safety devices
         1) Removable safety railing frames and sockets with interlock switch
         2) Astragal safety tape switches
         3) Access hatch
         4) Door interlocks
         5) Edge of audience infill assembly
      d. Storage carts for removable safety railings
      e. Training
   2. Work Results:
      a. The equipment installed as part of this Section shall result in a complete and working orchestra pit lift system in each space.
      b. Provide fully coordinated and engineered equipment, installation, supervision and commissioning for the systems and associated accessories as required for each space.
      c. Provide supervision of orchestra pit lift system low voltage signal cable pulling, termination and testing by the Division 26 Electrical Contractor.
      d. Provide coordination of conduit, backboxes and AC power wiring provided by the Division 26 Electrical Contractor.
      e. Provide all material, components, accessories and services required to provide the work as specified herein, elsewhere in the Contract Documents and/or as shown on related drawings.
      f. Consult and coordinate with other affected work and Contractors throughout the course of the work contained herein.
   3. Delegated Design:
      a. Provide design for the means of fastening, suspension and support of the work of this Section.
      b. Provide all material, components, accessories and services required to provide the work as specified herein, elsewhere in the Contract Documents and/or as shown on related Drawings.

C. Products Supplied But Not Installed Under This Section
   1. The following equipment supplied under this Section shall be installed and/or terminated under Division 26:
a. Motors
b. Motor disconnect switches
c. Motor Control Center (MCC)
d. Terminal boxes and flexible cable from machinery pit to orchestra lift platform.
e. Lift control system devices including but not limited to control panels, E-stop stations, and control connection stations.

2. Termination of control system conductors shall be made by Division 26 under the direct onsite supervision of the Contractor.

3. Controls, limit switches, safety interlock system devices (including rocker arm limit switches, astragal tape switches, door interlocks, removable rail interlocks, etc.) are installed under this Section. Final terminations to the devices are made under Division 26.

D. Related Requirements
1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specifications apply to this Section.
2. Examine Contract Documents for requirements that directly affect or are affected by Work of this Section. A list of those Documents and Sections includes, but is not limited to the following:
   a. Division 01 – General Requirements
   b. Division 03 – Concrete
      1) Fastener requirements
   c. Division 04 – Masonry
      1) Fastener requirements
   d. Division 05 – Metals
      1) Structural steel supporting the work of this section.
   e. Division 09 – Finishes
      1) Flooring
         a) Finished floor and any additional framing on top of lift superstructure required for floor support (see Architectural Documents).
      2) Millwork
         a) Removable railings finish surface (see Architectural Documents).
         b) Lift fascia (see Architectural Drawings)
   f. Division 11 – Equipment
      1) Section 116133 – Theatrical Rigging
      2) Section 116163 – Theatrical Lighting Dimming and Control
   g. Division 12 – Furnishings
      1) Section 127100 – Portable Audience Seating
   h. Division 26 – Electrical, including but not limited to:
      1) Section 265561 – Theatrical Systems Electrical Requirements
      2) General requirements for all Electrical work, including installation of system cable trays, terminal cabinets, empty conduit, junction/pull boxes and back boxes for system devices and panels (Division 26).
      3) Electrical terminations (AC power and grounding only) to all equipment racks and AC power receptacles (Division 26).
      4) Provision and installation of all conduit and back boxes (Division 26).
      5) Electrical services and main circuit protection (Division 26).
      6) Distribution system equipment (Division 26).
      7) Conduit, wire, pull boxes, junction boxes and miscellaneous hardware and components as required for a complete electrical installation.
      8) Terminations and testing of system continuity.
1.2 PRICE AND PAYMENT PROCEDURES

A. Refer to Division 01 – General Requirements for information regarding price and payment procedures.

B. Unit Prices
   1. Provide price to Owner for five year maintenance agreement on motor drive elements. Price to include emergency site service (post warranty period), one one-day session of additional operator training per year, and replacement of parts due to failure under normal usage.

1.3 REFERENCES

A. Definitions
   1. The following definitions are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
      a. In all cases where a device or a part of equipment is referred to in a singular manner within the contract documents, it is intended that such a reference shall include all devices required to complete the installation in accordance with the project documents.
      b. "Architect": All references to the "Architect", Hamilton Anderson Associates, will refer to the process by which the indicated action or decision regarding the work in this section will be administered. All such actions shall be initiated with or by the Project Architect, who will disseminate all pertinent information and documents to, as well as coordinate all efforts and site visits with, the Theatre Consultant and all other project consultants who may have design responsibility relating to the work in this section.
      c. "Theatre Consultant": Auerbach + Associates, Inc. (d.b.a. Auerbach Pollock Friedlander). The Theatre Consultant will be party to all actions and decisions regarding the work in this section.
      d. "Other Project Consultants": Acoustical Consultant, Electrical Engineer, Structural Engineer or Mechanical Engineer as is applicable to a particular issue.
      e. "Contractor": Manufacturer/Installer responsible for the fabrication and installation of the work contained in this section.
         1) Contractors involved with other portions of the work shall be indicated with a specific trade preceding the word "Contractor" (i.e. General, Electrical, etc.).
      f. "Owner": Authorized personnel representing Wayne State University.
      g. "Furnish": Purchase and/or fabricate and deliver to project site.
      h. "Install": Physically install the items in their proper location(s) on the project site.
      i. "Provide": Furnish and install unless otherwise indicated.

B. Reference Standards:
   1. Reference Division 01 for general project references and standards.
   2. References to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies will refer to the latest edition of such publications adopted and published prior to submittal of the bid. All such codes and standards will be considered a part of this specification as if they were fully included herein.
   3. If an applicable code or standard permits work of lesser quality or extent than this specification, then this specification and the related drawings will govern.
   4. Comply with national, state and local codes.
   5. Comply with national, state and local labor regulations and requirements.
   6. The following standards apply to the work of this Section. It remains the Contractor's responsibility to confirm and comply with all industry standards that are applicable to the work of this Section.
STAGE EXTENSION ORCHESTRA PIT LIFT SYSTEM

Gateway Theater Complex
HAA Project No. 2016034.00
WSU Project No. 189-178578

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
1. The Contractor is required through drawings, memos and meetings to properly coordinate the work with the other sections as necessary to complete the work of this section.

B. Pre-installation Meeting:
1. Refer to Division 01 - General Requirements for information regarding pre-installation meeting with the General Contractor.

C. Sequencing
1. The installation of the equipment in this section shall be coordinated with other work which may be in conflict with or which must be completed before the work in this section may be installed, including:
   a. Principal foundation work (see Structural Drawings)
   b. Installation of associated electrical work (see Electrical Drawings)
   c. Installation of HVAC work in ceilings (see Mechanical Drawings)
   d. Painting
   e. Finishing of floors and finishes
   f. Electromechanical and electronic equipment installation shall proceed after environmental site conditions are met. Refer to paragraph 1.10-B for class requirements.

D. Scheduling
1. The Contractor shall submit a project schedule (critical path) at the time of contract negotiation, which shall indicate coordinated functions with other trades and project requirements.

1.5 ACTION SUBMITTALS

A. All submittals shall be submitted in accordance with Division 01.

B. All submittals shall be submitted in a timely manner, allowing sufficient time for adequate review and possible resubmittals without jeopardizing project schedule.

C. Submittals will be reviewed, accepted and field dimension verified prior to proceeding with the fabrication of the work in this section.

D. All submittals shall leave space available for review stamps and comments.

E. The Architect and Theatre Consultant shall only mark one set of drawings per submittal with comments. Any additional sets of drawings or product data shall be returned unmarked.

F. Provide insurance against loss or damage during shipment. Furnish certifications of such coverage to the General Contractor not less than 60 calendar days prior to the shipment of any equipment.

G. Review all pertinent project Contract Documents. Following this review, provide to the Architect and General Contractor any additional information required to make a fully functioning system. In addition, the Manufacturer shall indicate maximum accepted wire size as it relates to termination points on their equipment.

H. Verify wire type, count, and routing for all required data wiring between all components to allow for proper conduit sizing and routing by Division 26. Verify and coordinate all line voltage power input required by systems components that shall be provided under Division 26.

I. Prior to fabrication, it shall be the responsibility of the contractor to provide a complete submittal for approval within 90 days of award of contract.

J. Product Data
   1. Where standard manufacturer parts are used, submit current product literature describing component, manufacturer’s recommended applications, load ratings, safety factors and dimensions. The data shall include all information which indicates compliance with the specifications herein.
   2. Clearly indicate specific component and applicable options.

K. Shop Drawings
   1. Provide shop drawings on D size minimum (24” x 36”) sheets.
   2. Include a cover sheet with a drawing index including the sheet number and title for each sheet in the set.
   3. Provide \( \frac{\pi}{4} = 1’-0” \) plans of all locations which contain equipment in this contract. Show all equipment properly located, dimensioned and labeled. Note all work by others in the vicinity, which may affect work in this Section.
   4. Provide complete, fully dimensioned, large scale detailed fabrication drawings of all major components.
   5. Provide requisite schematics, plans and sections indicating assembly and installation of components.
6. Provide indications by arrow and boxed caption of all variations from contract drawings and specifications, except where variation is indicated as acceptable.
7. Indicate all elements with appropriate safety factors and/or safety equipment.
8. Indicate recommended load limits for each element in the system with loading requirements.
9. Provide power requirements, one-line riser diagrams and installation circuit diagrams for electrical equipment. Show all required wire sizes and counts between all components. These shall be provided within 30 days of Contract Award.
10. Provide a full Bill of Materials to be supplied, including quantities, manufacturer’s part number, reference to applicable drawings, etc.

L. Samples
1. Submit sample items including, but not limited to:
   a. Control switches and panel materials
   b. Astragal tape switches
   c. Lift guide rail and block
   d. Interlock switches/sensors
   e.
2. Additional samples must be submitted within 14 days Architect’s written request.

M. Delegated Design Submittals
1. Provide drawings and calculations meeting the review requirements of the authorities having jurisdiction, stamped and wet signed by a Professional Engineer licensed in the project jurisdiction for work of the specific type performed.
2. Where standard components are used, manufacturer’s engineering data shall be provided to supplement engineered calculations.
3. Engineered drawings shall be provided to the Architect and Theatre Consultant for review of coordination and compliance to this Section.
4. Engineered drawings shall be provided to the Structural Engineer of record for this project. The engineer of record will review the loads imposed on the structure by this equipment and compare those loads to allowable structural loading.
5. Engineered drawings shall be provided to the Authority Having Jurisdiction for this facility. The AHJ will review the drawings for compliance with local codes. In all cases code compliance is the responsibility of the Contractor.

N. Manufacturer’s Instructions
1. Installation Instructions:
   a. Supply installation instructions for all items furnished in this section, as reviewed and approved with shop drawings, to Electrical Contractor and General Contractor. Such instructions shall be fully coordinated with trades doing adjoining work and with site conditions. Instructions shall include inter-equipment connection diagrams with terminal designations.

O. Manufacturer’s Reports
1. Installation Inspection Reports:
   a. Supply reports confirming that all elements of installation by Division 26 conform to requirements of the Orchestra Pit Lift System as engineered and specified herein. Submit these reports to the Architect at times required by the Schedule of Submittals.
   b. If conditions exist that are contrary to proper installation of the Orchestra Pit Lift System, directly inform Contractor, Architect, and Theatre Consultant of discrepancies. Failure to inform the Contractor shall constitute acceptance of installation and place responsibility for any revisions or additions necessary to properly install work of this section, with the Manufacturer.
2. Provide periodic video recordings of production of material to demonstrate progress of work. Video schedule shall be indicated in the Contractor's critical path.

P. Source Quality Control Submittals
1. The Contractor shall supply as part of the submittal process the following Source Quality Control documents which must contain, at minimum:
   a. Serial number of motor(s)
   b. Serial number of lifting column(s)
   c. Motor drive serial number
   d. Batch number of major components
   e. Name of person conducting the QC test
   f. Date the test was conducted
   g. List of mechanical tests conducted
   h. List of electrical tests conducted

1.6 CLOSEOUT SUBMITTALS
A. Project Record Documents:
   1. Submit documents in accordance with Division 01 – General Requirements.
   2. At the time of acceptance testing, submit three (3) copies of parts lists and maintenance instruction sheets.
   3. Within 60 days of the acceptance testing, submit one (1) set of reproducible "as built and approved" drawings showing all equipment as installed. These drawings shall include all adjustments made during the checkout process.
   4. Submit operation and maintenance manuals with the “as built and approved” drawings. Each manual shall be bound in an individual binder with the project name on the front cover and system identification on the spine. The manuals shall include:
      a. Complete parts list for all equipment and telephone numbers for the authorized parts and service distributors.
      b. Instructions as to the safe operation for all equipment.
      c. Recommended maintenance schedule for component parts that may need periodic replacement or maintenance.
      d. Recommendations for cleaning, maintaining and touch-up of all finished surfaces.
      e. Deliver all copies of approved Operations Manual to Owner during instruction session, and review it as part of that session.
   5. Where specific elements do not require manuals, instruction sheets as to care and handling shall be provided.
   6. Warranties as required herein.

B. Submit verification that all punch list items have been rectified. Such written verification will be required for project closeout and initiation of the warranty period.

C. The record documents shall be reviewed by the Architect and all modifications to the documents stemming from this review shall be made as required.

D. Above submissions are required as a condition for final approval of the work.

1.7 MAINTENANCE MATERIAL SUBMITTALS
A. Spare Parts:
   1. Deliver stock of maintenance material to Owner. Furnish the following to match those installed and taken from the same production run, packaged with protective covering for storage and identified with appropriate labels:
a. (2) Spare fuses of each type used in the system
b. (6) Indicator lamps of each type used in the system
c. (2) Relays of each type used in the system
d. Machinery lubricant

1.8 QUALITY ASSURANCE

A. Regulatory Requirements:
1. Refer to Division 01 – General Requirements.

B. Qualifications
1. All equipment and installation to be the responsibility of a single Contractor, who shall own and operate their own manufacturing facility for the fabrication, assembly and integration of theatrical lift equipment, and be regularly engaged in the fabrication of such equipment. Fabrication of such equipment shall comprise no less than 90% of the Contractor’s business.
2. The Contractor’s Project Manager shall be qualified and have experience in projects of similar size and scope. The Project Manager shall have binding authority to represent and act for the Contractor. The Project Manager shall be the primary conduit for all information between the supplier of this equipment and the General Contractor. All information given to the Project Manager shall be considered as given to the Contractor.
3. The Contractor shall have been continuously engaged in the fabrication, integration and installation of theatrical lift equipment for no less than ten years.
4. The Contractor shall have, at the time of bid, a current Contractor’s license and shall know, understand, and have the required documentation to work in the State of Michigan. This license shall be maintained throughout the course of the work of this contract.
5. Contractor shall be responsible for proper installation, operation and safety of all component equipment.
   a. Equipment must be procured as specified. Non-specified items may be procured from any nationally recognized manufacturer.
   b. Metalworking may be done by others. Responsibility in all respects shall be that of the Contractor.
6. The Contractor shall verify all system design loads.
7. Errors and omission within the Contract Documents shall not relieve the Contractor and the General Contractor of the responsibility of providing a properly functioning installation of the system as described herein.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage and handling shall be coordinated with the General Contractor and shall meet all requirements described in Division 01.

B. Packing, Shipping, Handling and Unloading
1. All equipment shall be appropriately and substantially packed for shipment.
2. All equipment containers shall clearly indicate the equipment contained, “front”, “top”, “fragile”, the project name, and theatre site allocation. Include packing and shipping lists for each container.
3. All shipping costs to the job site are the responsibility of the Contractor. The shipping method/company is at the total discretion of the Contractor in order to meet the published project schedules.

C. Acceptance at Site
1. Coordinate responsibility for acceptance of material and equipment at job site with the General Contractor.

2. The Contractor shall be responsible for acceptance of the Theatrical Lift System components at the job site, confirming that all quantities and counts are correct and for keeping accurate logs and records of such information.

D. Storage and Protection

1. Upon delivery, the materials shall be stored under cover in a dry and clean location, off the ground. Delivered materials which are damaged or otherwise not suitable for installation shall be removed from the job site and replaced with acceptable materials.

2. Replace, at no expense to the Owner, all equipment and materials which are damaged during storage or handling.

1.10 SITE CONDITIONS

A. Existing Conditions

1. Verify all conditions at job site. Promptly report variations and obstructions to the Architect. All additions and or corrections are to be requested prior to fabrication.

B. Environmental Requirements

1. Equipment is classified according to its susceptibility to construction conditions that may affect its operation. Classes shall be defined by the following paragraphs:

   a. Class 1:
      1) Cable and distribution apparatus, structural elements, electrical back boxes, face plates, terminal boxes, and empty equipment rack frames may be stored in weather protected spaces under "normal" construction site conditions provided that no electronic components are contained within devices, storage boxes are sturdy and well-sealed, and equipment is protected with imperforate inner plastic sheeting.
      2) Contractor may install this class of equipment in weather-protected spaces under "normal" construction site conditions provided that equipment is protected from dust and moisture by sturdy imperforate plastic sheeting and completely covered with corrugated cardboard held securely in place by duct tape. Cardboard covers shall not be removed until area is broom cleaned. Under no circumstances shall equipment remain uncovered overnight during installation or while work which causes high dust or moisture levels in area of placement is taking place.

2. Class 2:

   1) Control panels, spare parts, test and other equipment (except as listed under Class 3) not subject to damage by concrete dust or dirt shall be stored and protected per Class 1 devices.

   2) Contractor shall not install equipment in this class until area of installation is broom cleaned, "blown" clean with pressurized air, mopped, air conditioned and secure. Contractor may install control panels with electronic components under Class 1 conditions, but electronic components must be removed and not installed until area of installation meets Class 2 conditions.

3. Class 3:

   1) Control consoles, filled equipment racks and other electronic equipment shall not be shipped to site until the rack and control rooms are finished, air conditioned, dust free, broom and mop cleaned, secure, and in all respects complete and ready for occupation.

   2) This class of equipment shall not be unpacked until the system is complete in all other respects. Under no circumstances may any equipment in this class
be removed from the rack and control rooms into or through spaces which are not cleaned, air conditioned, and complete.

C. Field Measurements
   1. Field measurements shall be taken prior to preparation of shop drawings and prior to fabrication to ensure proper fitting of work. Allow for adjustments during installation whenever taking field measurements.
   2. Should field measurement of site conditions alter the design or installation of system elements from the approved shop drawings, revised shop drawings shall be reissued for review.

1.11 WARRANTY

A. Comply with the warranty requirements of Division 01 and following.

B. The Contractor shall warrant materials and workmanship of systems and equipment installed as free of defects. The Contractor shall guarantee in writing the repair or replacement within 14 days of any item found defective during a period of one (1) year following date of final acceptance. Ordinary wear and defects due to improper usage are excepted.

C. The Contractor shall warrant the workmanship of the installation services provided under this Section for a period of one (1) year following the date of final acceptance. Ordinary wear and damage due to improper usage are excepted.

D. During the warranty period, all emergency conditions where systems failures may be hazardous or may cause severe hardship or cancellation of performances shall be responded to within 24 hours. Immediate action shall be undertaken to ensure the safety of the audience and the performers.

E. During the Warranty Period, for each product that uses software, furnish manufacturer’s software updates to the Owner for installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. To establish comparative standards of quality, the equipment and installation indicated herein shall be by one of the following manufacturers:

   Gala Systems Inc.
   3185 First Street
   St-Hubert, QC J3Y 8Y6
   Canada
   Tel: (450) 678-7226

   Serapid USA Inc.
   34100 Mound Rd
   Sterling Heights, MI 48310
   Tel: (586) 274-0774

B. Substitution Limitations
1. Any contractor who wishes to be listed and has not been pre-approved must submit qualification information to the Architect. Proposal shall include all of the information listed below:
   a. Statements of financial responsibility for the past five fiscal years showing assets and liabilities.
   b. List of principal officers and design and service engineers in an organizational structure flow chart.
   c. List of not less than 5 projects of similar size and scope completed within the five years on which contractor has provided full services: product engineering, shop drawings, manufacture, installation and commissioning. In each instance, indicate specifics of scope of fabrication and installation. Include a contact list: name, address and phone numbers of person(s) directly responsible for operation and maintenance of equipment in each facility.
   d. List of current projects and approximate contract value and completion dates. Include list of names, phone numbers and addresses of owner, owner's representatives and architect.
   e. For each above described project, list of names of persons who supervised preparation of shop drawings, manufacture of components, and installation of equipment.
   f. List of names of persons who would do project management, product engineering, supervision of shop drawing, supervision of installation should this contract be awarded.
   g. Contract Bond Company information indicating that Contractor has bonding capacity for full duration of project. Include list of other bonded projects coinciding with this project.
   h. Evidence of ability to undertake custom product engineering to meet specific requirements of project specifications. Provide sample project engineering drawings for custom products and contact information for facility operators where those products have been installed.

2. Standards of Acceptance:
   a. Refer to Paragraph 1.8B - Quality Assurance/Qualifications.

2.2 SYSTEMS DESCRIPTION

A. The following performance spaces shall contain the following major systems components listed below and as shown on the TE-series drawings:
1. Orchestra Pit Lift
   a. The orchestra pit lift shall be built as a continuation of the stage floor, with predetermined stops to serve as a show deck, stage extension, an audience seating area with removable seats, and an orchestra pit. The finished floor shall be by Flooring Contractor. Coordinate adequate steel framing and subfloor support for the floor detail shown on the Architectural drawings with the Flooring Contractor.
   b. Cable management shall be provided for any flexible cabling between the machine pit and the orchestra lift platform.
   c. The underside of the lift shall have a rigid skirt with safety net on upstage side.
2. Controls
   a. Lift controls shall be located as indicated in the drawings. Controller shall be a handheld pendant on an umbilicus, which shall plug into a receptacle located at the Production Control Panel (PCP) or at orchestra pit level.
3. Safety Devices
   a. The orchestra pit lift shall be provided with removable, socketed safety railings as shown in the drawings. Coordinate railing frame fabrication with details in Architectural drawings. Provide rolling steel tube storage carts.
b. Shear edge protection and interlocks at doors, railings, and access hatches to be provided as indicated in the drawings.

B. State of the Art Development
1. The Contractor shall furnish only the manufacturer’s latest developed appropriate products. In cases where product development from a specified manufacturer surpasses the criteria of this specification, the Contractor shall inform the Architect and make the newer product available to the Owner for acceptance. In no case shall discontinued or obsolete equipment be acceptable. Should a newer product be suggested as a substitution for a discontinued product, or for a product that is in process of being phased out of production, that newer product shall be offered to the Owner at no additional cost.
2. Should product recall by the Manufacturer require temporary or permanent replacement of a product specified under this section, the Contractor shall notify the Owner at the earliest reasonable time and shall arrange to replace the product in question at the earliest possible time.
3. Equipment found defective or subject to recall prior to scheduled installation shall not be delivered to the job site.
4. Equipment defect or intended recall shall not relieve the Contractor from his contractual obligation with regard to delivery schedule of product. In this circumstance, notification shall be made to the Architect by express carrier. Arrangement for alternate product shall be made at this time.

C. Substitutions
1. All requests for variations from the specified materials and products will be reviewed by the Architect and Theatre Consultant according to the procedures outlined in Division 01.
2. All requests for substitutions must be submitted in a timely manner, so as not to adversely impact the project schedule.
3. Substitutions will only be accepted if, in the opinion of the Architect, the product is an equal to the specified product. No substitutions may be made without written acceptance from the Architect. All substitutions made prior to this acceptance are at the sole risk of the Contractor.
4. A substitution must be a product of equal design, construction and performance. The Contractor must submit all pertinent information required to substantiate that the product is equal. The Contractor must submit all additional information, including test data, which may be requested in order for the Architect to fully evaluate the substitution. The burden of proof is solely on the Contractor.
5. All additional expenses of any kind with respect to substitution(s) shall be borne by the Contractor. This shall include, but not be limited to, all fees and expenses incurred by the Architect and other related Consultants for evaluation of the substitution and subsequent integration into the project should the substitution be taken and/or additional costs of other contractors related to the substitution(s).

2.3 MATERIALS
A. General
1. All equipment and components shall be new and complete. No used or reconditioned equipment shall be acceptable unless otherwise noted.
2. All equipment to have pertinent labels.

B. Materials shall conform to the following minimum standard specifications:
1. AISI 1045 for steel shafts
2. ASTM A36 for structural steel shapes
3. ASTM A47 for malleable iron casting
4. ASTM A48 for gray iron casting
5. ASTM A1011 for side plates
6. ANSI B18.2.1&2 for square and hex bolts and nuts

C. Hardware
1. All mounting hardware to be included.
2. All bolts and fasteners must be Grade 5 or better.
3. All bolted attachments to have lock washers or other self-locking fasteners.

D. Electrical
1. All internal wiring shall be factory completed and clearly marked. All field connections shall be by compression connector, terminal strip or other device specified herein. All terminal strip connections shall be clearly labeled as to terminal designation. Insulated wire ferrules are to be used whenever possible for wire termination. Wire nut splices not permitted.
2. All wire sizes and insulation to comply with Underwriters Laboratory and all applicable standards and local codes.
3. All wiring to be harnessed and bound. No loose or randomly routed wires shall be permitted.

E. Design Factors
1. Contributing static loads x 7.0 for structure and all supporting and mechanical components; x 3.0 for drive components.
2. Static deflection of structural spans shall adhere to a criteria of L/720.
3. All drive components shall be designed with a safety factor 3X.
4. Bearings shall be designed with a 2X rating, full speed / 2000 hours.

F. Finishes
1. Machine-finish all operating parts to standard trade tolerance, fits and finishes.

G. Electronics
1. All microprocessor controls shall utilize a non-volatile memory. System configuration, operating parameters, presets, etc. shall be protected against system power failure indefinitely.

2.4 ORCHESTRA LIFT

A. Operating Criteria
1. Electro-mechanical Lifting Mechanism (Option 1):
   a. Spirailift by Gala
2. Electro-mechanical Lifting Mechanism (Option 2):
   a. Linklift rigid push chain columns by Serapid
3. Travel Speed: 8 feet per minute
4. Sustaining Capacity: 150 PSF live load
5. Lifting Capacity: 50 PSF live load
6. “Point Load” Capacity: 750 lbs. castered wheel load
7. Vertical Drift: 0 under full load
8. Programmed Stops:
   a. Show Deck Level (+6” above Stage Level)
   b. Stage Level
   c. Alternate Stage Level
   d. Audience Level
   e. Orchestra Pit Level
   f. Basement Level
9. Total Travel
   a. 12’-6”
10. Over-travel
   a. Proper over-travel is required to ensure a safe stop can be achieved.
      1) The lift shall not strike the initial limit if all system components are operating normally.
      2) The lift shall not strike the ultimate limit if a deceleration stop was initiated by striking the initial limit.
      3) The lift shall not strike any hard surface (building or lift structure) if a deceleration stop was initiated by striking the ultimate limit.

11. Power Supply: 208VAC, 3-Phase, 60Hz (confirm with electrical contractor)

B. Structural Framing
   1. The superstructure of the lift shall be provided as indicated in the drawings.
   2. All framing and structural support members shall be of steel construction, sandblasted, primed with rust inhibitor, and painted with two coats of black enamel.
   3. Static deflection of structural spans shall adhere to a criteria of L/720.
   4. Steel tube stringers on superstructure to accept finished stage floor by others. Coordinate with General Contractor.
   5. Provide steel angle perimeter frame support to accept finished fascia by others. Coordinate with General Contractor.
   6. Coordinate lift structure and fascia with General Contractor to ensure that finished edges of lift have no more than 3/16" clearance to adjacent surfaces. See Drawings for details.

C. Audience Edge Infill
   1. Provide infill framing and cover at edge of audience slab as shown on the drawings. It is the design intent that the manufacturer of the orchestra pit lift will control the intersection point between the audience edge and the lift.
   2. The infill floor shall incorporate sockets and interlock switches for removable safety railing.
   3. The infill floor shall include removable cover sections to allow access to interlock switches for inspection and maintenance.

D. Drive System
   1. General
      a. The mechanical system shall consist of electro-mechanically driven lifting columns mounted to the machine room floor as indicated in the drawings. There shall be two motors and floor-mounted miter gearboxes. Provide intermediate shaft supports as necessary.
      b. Provide enclosure to protect and house the lifting elements from entry of foreign materials and prevent the collection of debris in the machinery.
      c. Vertical drift under full static and live load shall be zero.
   2. Electro-mechanical Lifting Mechanism
      a. Spiralift Columns (Option 1)
         1) Provide Spiralift columns as indicated in the Drawings.
         2) Top of Spiralift attachment with reaction plate bolted to the lift superstructure.
         3) Provide pressure plate with compression load sensor at top of Spiralift to ensure constant compressive loading on all columns. Compression load sensors shall disable power to the system before the compression load is completely relieved in order to prevent a catastrophic failure of the column.
         4) Provide base plate with mounting angles for attachment to the machine room floor.
         5) Spiralift worm gear:
         6) The column shall be driven by a worm gear that is engineered to resist the loads with the appropriate safety factors as described herein.
         7) Provide Spiralift columns by Gala Systems, sized as required to meet operating criteria as indicated above and in drawings
      b. Rigid Chain Columns (Option 2)
1) Provide rigid push chain lifting columns as indicated in the Drawings.
2) Drive mechanism shall be inherently self-locking regardless of the elevation or load imposed.
3) Provide rigid chain storage magazine cover.
4) Front of chain attachment with reaction plate bolted to the lift superstructure.
5) 90 degree reaction base plate with mounting angles for attachment to the machine room floor.
6) The columns shall have flexible dust / debris cover at the top chain input port.
7) Linklift Chain gearbox
   a) The chain shall be driven by a planetary gear box that is sized to resist the loads with appropriate safety factors as described herein.
8) Provide Linklift columns by Serapid, sized as required to meet operating criteria as indicated above and in drawings.

3. Drive Mechanism:
   a. Gearboxes
      1) Power shall be transmitted to lifting columns via drive shafts and right angle bevel gearboxes via drive shafts.
      2) A 90 degree miter gearbox shall be provided at right angle transitions in the drive train.
      3) Pedestals and support for gearbox and drive shafts are under the work in this Section.
      4) All stepped-down shaft corners and shoulders shall have proper corner radius.
      5) The gears shall run in an oil bath.
      6) The shaft bearings shall be provided with double-lip oil seals to prevent leakage.
      7) The gear box shall be sized to resist the loads with the appropriate safety factors as described herein.
      8) Provide spiral-bevel type gearbox by Andantex or pre-approved equal (Hubcity shall not be accepted)
   b. Shaft Couplings:
      1) Flexible couplings, shaft and bearing blocks shall be provided as required.
      2) All shaft connections shall be flexible spline/gear type. Chain couplings are not acceptable.
      3) Shafts shall be supported by an intermittent pillow block support assembly as required.
      4) The shaft couplings shall be sized to resist the loads with the appropriate safety factors as described herein.
   c. Shaft
      1) Connecting shafts shall be sized to limit twist to 0.001 degree per foot at maximum torque over full length of shafting. All shafting, keys and keyways shall be in accordance with ANSI "Code of Design of Transmission Shafting" to safely transmit all applied loads, torques and their combinations, with proper allowance for impact loading and to satisfy critical speed and torsional deflection requirements.
   d. Pillow Blocks
      1) Shafts shall be supported by heavy duty spherical roller bearing pillow blocks, with sealed ball bearings.
      2) Pillow blocks bolted to support frame with bolts, nuts and lock washers.

4. Lift Motor:
   a. Size and capacity as described herein.
   b. Operating speed of the lift shall be consistent whether the lift is fully loaded or unladen.
   c. The motor shall be NEMA class D designed for three-phase operation with soft start and high starting torque characteristics.
d. Service factor of 1.25 for continuous operation and an AGMA load classification of 1. All motors shall be totally enclosed and fan cooled. Motors shall have ramp start and stop.

e. Motor shall have flux vector type drive.

f. Motor brakes shall be normally closed, direct acting, spring loaded, electrically released, and equipped with a manual release. Brakes must stop and hold 200% of the full load torque on the motor shaft.

g. Shafts to be keyed and fixed with double set screws and positioned with locking collars.

h. Exposed shafting and couplings shall be properly supported with bearing blocks to provide quiet operation. Speed shall not exceed 25 rpm.

i. Motor support to be rectangular tube frame bolted to pit slab as indicated in Drawings.

j. Verify and coordinate power requirements with Electrical Engineer.

k. Provide Conedrive, SEW Eurodrive or equal.

E. Guides

1. The lift shall be provided with guides to control lateral movement in all directions at all levels.

2. Guides shall be Thomson linear motion shaft bearings as shown on the drawings. Elevator "tee" guides are not acceptable. Precision guides shall be hardened steel.

3. Lateral movement shall be nil and controlled so as to allow no more than 3/16" gap between the lift and adjacent structure.

4. Provide a flexible but positive closure over all guide slots in order to conceal slots from view and prevent physical access from personnel on the lift. Closure shall be neoprene strip split to allow guide arm to travel freely.

5. Guide rails to be mounted to support plates with threaded bolt assembly that allows for vertical/ horizontal field adjustment.

F. Positioning

1. Position feedback will be by absolute encoder.

G. Limit Switches

1. Provide lever operated hatchway type limit switches for a minimum of up and down, initial and ultimate limits. Mount limit switches at guide arm.

H. Cable Management

1. Provide cable management system and associated flexible cable for the orchestra lift.

2. Furnish terminal box mounted to floor of the machine pit, for installation by the Electrical Contractor.

3. Provide terminal box mounted to the orchestra lift platform.

4. The Contractor must provide all cable management between the terminal boxes on the machine pit floor and on the orchestra lift platform.

2.5 CONTROLS

A. Lift controls shall be by a handheld touchscreen control pendant on a 50'-0" umbilicus with constant contact "UP" and "DOWN" pushbuttons and an "Emergency Stop" mushroom button. The emergency stop shall remove power to the motor drives. Reset shall be possible at the handheld controller.

B. The lift shall be capable of being stopped at any point between its extreme upper and lower limits by releasing the travel control button.
C. In no case shall the lift operate past its upper or lower limits.

D. Locate the lift control receptacles as per the drawings.
   1. Provide a finished rack-mount control receptacle panel in the Production Control Panel:
      a. Panel faceplate constructed of sheet metal, finished flat black.
      b. Labels to be engraved and white filled.
      c. Prewire the panel at the factory, insofar as possible.
      d. Provide terminal strips for field wiring terminations.
      e. Panel to contain the following controls:
         1) Emergency “STOP” latching mushroom-type pushbutton
         2) Multi-pin receptacle for handheld controller
   2. Provided a finished wall mount control receptacle station at the Orchestra Pit Level
      a. Station back box and faceplate constructed of sheet metal, finished flat black.
         Provide requisite mounting holes, conduit knockouts, etc.
      b. Labels to be engraved and white filled.
      c. Internally wired at the factory prior to shipping.
      d. Provide internal terminal strips for field wiring terminations.
      e. Station to contain the following controls:
         1) Emergency “STOP” latching mushroom-type pushbutton
         2) Multi-pin receptacle for handheld controller

E. The operation of the lifts to be as follows:
   1. The operator must plug the control pendant into the receptacle at the Production Control
      Panel or at Orchestra Pit Level. The appropriate direction pushbutton must then be pushed
      and held. The lift shall operate as long as the pushbutton is held or until it reaches the next
      predetermined stop (or upper or lower limit), whichever comes first. To continue operation,
      the pushbutton must be released and pushed again.

F. Motor Control Center (MCC):
   1. Provide Motor Control Center (MCC) in location as indicated in the drawings
   2. Provide MCC with current and thermal overload protection as required for components
      within.
   3. MCC cabinet must fit into the space provided and pass through the door provided. Field
      verify all site conditions.
   4. Provide motor drives by:
      a. Siemens
      b. Mitsubishi
      c. Or approved equal
   5. Logic systems to be solid state. Use of relays requires prior approval.
   6. Provide Emergency “STOP” latching mushroom-type pushbutton mounted on the face of
      the enclosure.
   7. MCC cabinet will be Areta modular cabinet system or approved equal.

G. Handheld Console
   1. Self-contained console that shall contain all requisite control processors with redundant
      elements necessary for complete operation.
      a. All necessary switches, back light pushbuttons, display screens, etc to perform all
         functions called for herein from this single console.
   2. Connection via a single control/power cable to the lift control receptacle.
      a. Provide 50’ of cable length
   3. Console shall include the following:
      a. A case made of impact resistant injection molded resin or equal.
      b. Independent Emergency Stop (as part of separate E-Stop system).
      c. Hold to run switch on console.
      d. Security access via PIN.
e. Menu selection keys.
f. Touchscreen panel display.
g. Emergency control in event of graphic failure.
h. Alarm signal of vital functions.
i. Auto selection and monitoring of line input power.
j. Auto fault detection of power supply inputs.

H. E-stop Enable Network
1. There shall be a low voltage VDC logic signal network called "e-stop-enable". This system shall run independently of the Lift Control System. Failure of the Lift Control System shall not disable this E-Stop network.
2. The e-stop enable network is continually active. In the event of an E-stop activation this network shall discontinue the operation of the Lift.
   a. Failure in this network shall cause the electronic motor control modules to cease operation. No motor element shall function unless the E-stop enable network is active.
   b. An individual E-stop device shall have dual /redundant contacts and have a high mean time before failure rate.

I. E-stop device
1. Provide wall mount e-stop device that shall have on the front an “E-Stop” mushroom push button which shall activate the E-Stop system.

2.6 SAFETY DEVICES

A. Removable Safety Railings
1. Provide steel tube frame railings to accept finished surface by others. Coordinate with General Contractor.
2. Each railing frame shall include two round locating pegs.
3. Railing frames shall be primed with rust inhibitor and painted with two coats of black enamel paint.
4. Provide sufficient tube steel rolling storage carts to store railings when not in use.
   a. Carts to be finished black

B. Safety Net
1. Provide a safety netting attached between underside of the upstage edge of the lift and the machine pit floor to create a visual indicator when the lift is not at Orchestra Pit level.
2. Provide sheet metal guards at machine pit floor to ensure safety netting does not interfere with lift columns when stored.
3. Provide full width, 1” diameter weight bar at 24” on center weaved through netting.
4. Provide ANSI compliant crush hazard warning sign at 48” on center along width of the netting.

C. Interlocks
1. Provide an interlock system utilizing proper placement or condition of railings, access doors, tape switches etc., as shown on the drawings. Lift shall be inoperative unless devices are properly activated.
   a. Design the system logic and provide triggering components (e.g. magnetic door locks, railing interlocks, etc.) under work of this Section.
2. Railing Interlocks
   a. Provide a reliable sensing system with railing detection devices for installation at the removable rail sections as shown on the drawings. When the integral circuits are activated, the detector shall indicate that the railing is in place and thereby deactivate restricted travel for the lift.
b. Audience Edge
   1) The audience edge interlocks shall restrict the lift from traveling below audience elevation unless the rail interlocks are detected.

c. Stage Side Edge
   1) The stage side edge interlock shall restrict the lift from traveling below audience elevation unless the rail interlocks are detected.

3. Door Interlocks
   a. Orchestra Pit
      1) Orchestra pit doors shall be locked when lift is not at Orchestra Pit level. A key override switch shall be provided at the entry to the orchestra pit for emergency access.
         a) Provide yellow mushroom-type momentary contact pushbutton for escape from the orchestra pit. The pushbutton will override door lock to allow exit from the orchestra pit.

   b. Trap Room
      1) The Trap Room door to the orchestra pit shall be locked when pit lift is not at Basement level. A key override switch shall be provided at the entry to the orchestra pit for emergency access.
         a) Provide yellow mushroom-type momentary contact pushbutton for escape from the orchestra pit. The pushbutton will override door lock to allow exit from the orchestra pit.

   c. Access Hatch
      1) The Machine Pit access hatch shall be locked when lift is in motion.

D. Shear Edge Protection
   1. Provide fail-safe pressure sensitive safety edges as required to protect against shear hazards in both directions of travel. Field verify and identify shear hazards.
   2. All overhanging surfaces and shear edges shall be equipped with a continuous pressure tape switch (astragal) fitted to a yield pad. Upon contact, the lift shall stop within the safe stopping dimension of the yield pad.

E. Motor controls will be sized to disengage or shunt at a value no greater than the capacity of the motor.

F. A visual flashing and audible “beeping” indicator, mounted on top of the Production Control Panel at Stage Level, will be activated whenever the lift is in motion.

G. Exposed rotary and transmission components must be guarded to prevent injury.

2.7 SOURCE QUALITY CONTROL

A. All equipment and components to be factory tested prior to shipping.

2.8 FABRICATION

A. Fabricate all work in this section in accordance with the Architect's direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.

B. Machine finish all operating parts to standard trade tolerance, fits and finishes.
C. Carry out shop welding in full accordance with the appropriate sections of “Specification for the Design, Fabrication and Erection of Structural Steel for Buildings” of the American Institute of Steel Construction (AISC).

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Contractor must examine areas and conditions under which the equipment is to be installed and must notify the General Contractor in writing of conditions detrimental to proper and timely completion of work. Work will not proceed until unsatisfactory conditions have been corrected in a manner acceptable to the Contractor.

3.2 INSTALLATION

A. Install all work in this section in accordance with the Architect's direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.

B. Provide site supervision during the installation of electrical work associated with the Theatrical Lift system elements.

C. Install all work securely, complete with all bolts, nuts, washers, clips, fittings, supports, and other items required for proper installation and operation.

D. Position all items accurately as indicated on drawings and true to plumb, line and level. Maintain maximum headroom and clearances at all points.

E. Coordinate all work with all other trades to avoid causing delays in construction schedule.

F. All field welding requires prior approval of the Architect and Contractor's Structural Engineer.

G. Carry out approved field welding in full accordance with the appropriate sections of "Specifications for the Design, Fabrication and Erection of Structural Steel Buildings" of the American Institute of Steel Construction (AISC).

H. Do all cutting, drilling, tapping and approved welding required to properly install work. Obtain Architect's prior approval for cutting and drilling of existing structural work.

I. Clean structural steel and fabricated steelwork of rust, scale and foreign matter by grinding; prime with 1 coat of first quality primer; finish with 1 coat of first quality machinery enamel free of skips, runs and saps. Touch up all field connections, welds and abraded places with primer and enamel.

3.3 FIELD QUALITY CONTROL

A. The installation of the equipment indicated in this Section shall be supervised by qualified personnel who are regularly employed by the Contractor for supervision of equipment installation similar to that indicated herein.

B. Installers must be appropriately skilled and experienced for the type and quality of work.
C. Arrange for all tests and inspections required by the General Requirements.
   1. If any work is to be specially tested or approved, whether by the General Contractor's instructions or by any laws, ordinance or any public authority, the Contractor shall give the General Contractor and Architect timely notice of its readiness for inspections, and of dates of inspections to be made by appropriate authorities.

3.4 SYSTEM STARTUP AND COMMISSIONING

A. Commissioning
   1. Upon completion of installation work required by the work of this Section, the Contractor shall perform all required tests and inspections, including but not limited to the Compliance Testing Procedures specified herein.
   2. Contractor shall supply all equipment required for the commissioning process including access equipment (personnel lifts, ladders and appropriate protective equipment), test instruments and communications equipment.
   3. Contractor shall provide staff to assist in the commissioning process.
   4. Compliance Testing Procedures (CTP)
      a. Full load test at sustaining (static) and lifting (dynamic) capacity. Lifts to run under full dynamic load in up and down directions to all predetermined stops in each direction. Demonstrate all emergency stop circuitry under full load.
      b. Contractor to provide test weight, delivered, manipulated for testing, and removed from site. Provide floor protection during test.
      c. Provide means to momentarily bypass travel limits for testing/commissioning purposes. Temporary removal of the physical limit/actuator/striker shall not be acceptable.

3.5 ADJUSTING

A. Adjust all equipment and components for operation in accordance with the specifications, approved shop drawings and pertinent Contract Drawings prior to the demonstration indicated herein.

3.6 CLEANING

A. Touch-up minor abrasions and imperfections as required.

B. Remove from the premises all debris caused by this work. All unnecessary equipment and materials shall be removed from the area(s) of this work upon completion, removed from the job site and disposed of legally at no additional cost to the Owner.

3.7 CLOSEOUT ACTIVITIES

A. Demonstration
   1. Upon completion of Commissioning, the Contractor will notify the Theatre Consultant that the system is complete, conforms to specification and is ready for Demonstration.
   2. Installed equipment to be operated for approval and inspected for quality by the Theatre Consultant, the Architect and the Owner.
   3. Adjustments or modifications shall be made as directed by the Architect and the Theatre Consultant.
4. Costs of re-inspection and additional testing by the Architect and Theatre Consultant, if required, due to lack of completion and/or errors and omissions shall be paid by the Contractor. This work will be conducted on a time and materials basis, including the Architect's and Theatre Consultant's standard hourly rates, and shall be scheduled and approved in writing prior to the re-inspection/testing session.

B. Training
1. Following the equipment demonstration, inspection and final adjustments, provide an instruction session to the Owner’s staff or representatives on the safe operation, care and maintenance of all items.
   a. Instruction shall include, but not be limited to, proper general maintenance of the system, replacement procedures for user replaceable parts, and operating procedure to obtain maximum usage of system.
   b. Provide one (1) half-day of staff training on operation of motor drive elements. This shall include basic safety in the use of the system as well as the handling of mechanical elements. Attendance shall be limited to ten (10) personnel.
   c. Deliver all copies of approved Operations Manual to Owner prior to first instruction session, and review it as part of that session.
2. Timing for all sessions shall be scheduled by the Owner at their convenience.
3. All training shall be by technical staff of the Contractor.

3.8 PROTECTION
A. Provide full protection from damage, construction dirt and debris for all equipment from the point of installation to testing and commissioning.
B. Remove all equipment protection and clean all components thoroughly prior to the demonstration session.

3.9 MAINTENANCE
A. Maintenance Services:
   1. One month prior to the end of the first year following the date of final systems acceptance, a factory engineer shall be provided to examine, adjust and repair the equipment included in this section as required. This service shall not cover adjustments, repairs or replacement of parts due to negligence, misuse, abuse or accidents caused by persons other than the Contractor. All labor and materials which are required to perform this service shall meet or exceed these specifications and shall not compromise the performance of the equipment in any way.
   2. Following this inspection and maintenance service, the Contractor shall provide the Owner and Theatre Consultant with a written report itemizing the results of the inspections and the warranty work that was conducted. The Contractor shall also include in this written report recommendations for any corrective actions which the Contractor feels should be taken with respect to the equipment included in this section but are outside the scope of the warranty agreement.
      a. The report of the one year inspection shall be furnished within fifteen days of the inspection. It shall indicate the findings, recommendations, revised maintenance procedures, etc.
B. System Programming Updates
   1. Contractor shall review system operation and control system programming with the Owner's representatives. Any required adjustments and changes to the control system programming requested by the Owner shall be performed and completed during the time
of the corrective service site visit. All control system programming changes shall be
documented by the Contractor.

C. Maintenance Contract
   1. Provide to the Owner an executed yearly maintenance agreement for a total of 5 years.
      This agreement must include, but not be limited to:
         a. Visual inspection of each lift system and all associated hardware.
         b. Upgrade, if available, to the latest release of the software compatible with the
            existing control system.
         c. Network data distribution inspection.
         d. Re-training of existing personnel and new training of new personnel. This training
            is to be at the same level or better than the original training.
         e. All material, components, accessories and services required to provide the work as
            specified herein.

END OF SECTION 116163 - APPENDIX A
SECTION 116163
THEATRICAL LIGHTING DIMMING & CONTROL

PART 1 - GENERAL

1.1 SUMMARY

A. The work in this section includes Theatrical Lighting (TL) systems and equipment within the following spaces and associated support areas:
   1. Proscenium Theatre
   2. Black Box Theatre
   3. Valade Jazz Center

B. Section Includes
   1. Major Systems and Equipment: furnish and supervise installation of the following major elements and associated accessories:
      a. Theatrical and Architectural dimmer racks
      b. Theatrical and Architectural DMX controlled panelboards
      c. Auxiliary equipment/electronics racks
      d. Lighting systems computers
      e. Theatrical lighting Ethernet data networks
         1) Network racks
         2) Network components
         3) Network devices
         4) Network receptacles
         5) Wireless network
      f. Lighting systems computers
      g. Architectural lighting control systems
         1) Architectural control processors
         2) House panic systems
         3) Architectural lighting emergency bypass devices
         4) Architectural control panels and receptacles
         5) Portable house light master station and receptacles
      h. Theatrical lighting wiring devices
      i. All elements shown on “TL” Series drawings

2. Work Results:
   a. Provide all hardware and software required for a complete and working theatrical lighting system as described herein.
   b. Provide fully coordinated and engineered equipment, installation, supervision and commissioning for the following major systems and associated accessories as required for each space.
   c. Provide supervision of Theatrical Lighting Systems low voltage signal cable pulling, termination and testing by the Division 26 Electrical Contractor.
   d. Provide coordination of conduit, backboxes and AC power wiring provided by the Division 26 Electrical Contractor.
   e. Provide coordination of digital fixture addressing for factor-configured architectural lighting fixtures/drivers provided by the Division 26 Electrical Contractor.
   f. Provide factor-trained technician on site to address all digital architectural lighting fixtures/drivers, configure system nodes and electronics, and assist the architectural lighting designer in programming architectural lighting presets.
g. Provide all material, components, accessories and services required to provide the work as specified herein, elsewhere in the project documents and/or as shown on related drawings.

h. Consult and coordinate with other affected work and contractors throughout the course of the work contained herein.

C. Products Supplied But Not Installed Under This Section
   1. All equipment shall be installed and terminated under Division 26, except as noted below in paragraph D.1.

D. Products Installed But Not Supplied Under this Section
   1. The work of this section includes supervision of the termination of all control wiring in panels and racks. All control cabling related to this section shall be installed under Division 26.

E. Related Requirements
   1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specifications apply to this Section.
   2. Examine Contract Documents for requirements that directly affect or are affected by work of this Section. A list of those Documents and Sections includes, but is not limited to the following:
      a. Division 01 – General Requirements
      b. Division 03 – Concrete
      c. Division 04 – Masonry
      d. Division 05 – Metals
      e. Division 09 – Finishes
      f. Division 11 – Equipment
         1) Section 116133 – Theatrical Rigging
         2) Section 116173 – Theatrical Lighting Instruments and Accessories
      g. Division 12 – Furnishings
         1) Section 126100 – Fixed Audience Seating
      h. Division 21 – Fire Suppression
      i. Division 22 – Plumbing
      j. Division 23 – Heating, Ventilating and Air Conditioning
      k. Division 26 – Electrical
         1) Section 265100 – Architectural Lighting Fixtures
         2) Section 265561 – Theatrical Systems Electrical Requirements
         3) General requirements for all Electrical work, including installation of system cable trays, terminal cabinets, empty conduit, junction/pull boxes and back boxes for system devices and panels (Division 26).
         4) Electrical terminations (AC power and grounding only) to all equipment racks and AC power receptacles (Division 26).
         5) Provision and installation of all conduit and back boxes (Division 26)
         6) Electrical services and main circuit protection (Division 26)
         7) Distribution system equipment (Division 26)
         8) Conduit, wire, pull boxes, junction boxes and miscellaneous hardware and components as required for a complete electrical installation.
         9) Terminations and testing of system continuity
      l. Division 27 – Communications
         1) Section 274100 – Performance AV Systems
         2) Structured cabling systems
         3) At common facility panels, coordinate receptacles for building standard communications systems.
1.2 PRICE AND PAYMENT PROCEDURES

A. Refer to Division 01 - General Requirements for information regarding price and payment procedures.

B. Unit Prices
   1. Provide Unit Price for items described in paragraph 1.7.A.2.

C. Alternates
   1. Provide separate price information for material and labor associated with the following equipment and systems:
      a. Alternate #4 – Multi-pin receptacles at catwalk plugging strips (Proscenium Theatre)
   2. Provide separate price information to deduct the material and labor associated with the following equipment and systems from the price of the full and complete systems as otherwise specified in this document:
      a. Alternate #8 - Device Type ‘ET3’ and associated network infrastructure (Valade Jazz Center)

1.3 REFERENCES

A. Abbreviations:
   1. The following abbreviations and acronyms are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
      a. DMX or DMX 512: ANSI E1.11 - 2008, USITT DMX512-A
      b. NFPA: National Fire Protection Association
      c. NEC: National Electric Code
      d. UL: Underwriters Laboratories
      e. IEEE: Institute of Electronic and Electrical Engineers
      f. IESNA: Illuminating Engineering Society of North America
      g. ANSI: American National Standards Institute
      h. AISC: American Institute of Steel Construction
      i. NEMA: National Electrical Manufacturers Association
      j. TIA/EIA: Electronic Industries Alliance/Telecommunications Industry Association

B. Definitions
   1. The following definitions are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
      a. In all cases where a device or a part of equipment is referred to in a singular manner within the contract documents, it is intended that such a reference shall include all devices required to complete the installation in accordance with the project documents.
      b. “Architect”: All references to the “Architect”, Hamilton Anderson Associates, will refer to the process by which the indicated action or decision regarding the work in this section will be administered. All such actions shall be initiated with or by the Architect, who will disseminate all pertinent information and documents to, as well as coordinate all efforts and site visits with, the Theater Consultant and all other project consultants who may have design responsibility relating to the work in this section.
      c. “Theater Consultant”: Auerbach + Associates, Inc. (d.b.a. Auerbach Pollock Friedlander). The Theater Consultant will be party to all actions and decisions regarding the work in this section.
      d. “Other Project Consultants”: Acoustical Consultant, Electrical Engineer, Structural Engineer, or Mechanical Engineer as is applicable to a particular issue.
e. “Contractor”: Manufacturer / Installer responsible for the fabrication and installation of the work contained in this section.
   1) Contractors involved with other work shall be indicated with a specific trade preceding the word “Contractor” (i.e. General, Electrical, etc.).

f. “Owner”: Authorized personnel representing Wayne State University.

g. “Furnish”: Purchase and/or fabricate and deliver to project site.

h. “Install”: Physically install the items in their proper location (s) on the project site.

i. “Provide”: Furnish and install.

C. Reference Standards:
1. Reference Division 01 for general project references and standards.
2. Reference to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies will refer to the latest edition of such publications adopted and published prior to submittal of the bid. All such codes and standards will be considered a part of this specification as if they were fully included herein.
3. If an applicable code or standard permits work of lesser quality or extent than this specification, then this specification and the related drawings will govern.
4. Comply with national, state and local codes.
5. Comply with national, state and local labor regulations and requirements.
6. The following standards apply to the work of this Section. It remains the Contractor’s responsibility to confirm and comply with all industry standards that are applicable to the work of this Section.
   a. Underwriters Laboratories
      1) UL 924
      2) UL 1008
   b. Institute of Electronic and Electrical Engineers
      1) IEEE 802.3ab
      2) IEEE 802.3af
      3) IEEE 802.3at
      4) IEEE 802.3z
   c. Illuminating Engineering Society of North America
   d. American National Standards Institute
      1) ANSI E1.11 - 2008, USITT DMX512-A
      2) ANSI E1.17-2010, Architecture for Control Networks
      3) ANSI E1.20, Remote Device Management over DMX512 Networks
   e. Electronic Industries Alliance/Telecommunications Industry Association
      1) ANSI/TIA/EIA 568-A
      2) Category 5e Standard
      3) ANSI/TIA/EIA-568-B
      4) Category 6 Standard
   f. American Institute of Steel Construction
      1) Specifications for the Design, Fabrication and Erection of Structural Steel Buildings
   g. National Electrical Manufacturers Association

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
1. The Contractor is required through drawings, memos and meetings to properly coordinate the work with the other sections as necessary to complete the work of this section.

B. Pre-installation Meeting:
1. Refer to Division 01 - General Requirements for information regarding pre-installation meeting with the General Contractor.
C. Sequencing:
   1. The installation of the equipment in this section shall be coordinated with other work which may be in conflict with or which must be completed before the work under this section may be installed, including:
      a. Principal foundation work (see Architectural Drawings)
      b. Installation of associated electrical work (see Electrical Drawings)
      c. Installation of HVAC work in ceilings (see Mechanical Drawings)
      d. The installation of the electromechanical systems equipment, panels and devices shall not occur until all painting in the area has been completed.
      e. Electromechanical and electronic equipment installation shall proceed after environmental site conditions are met. Refer to paragraph 1.10-B for class requirements.

1.5 ACTION SUBMITTALS

   A. All submittals shall be submitted in accordance with Division 01.

   B. All submittals shall be submitted in a timely manner, allowing sufficient time for adequate review and possible resubmittals without jeopardizing project schedule.

   C. Submittals will be reviewed, accepted and field dimension verified prior to proceeding with the fabrication of the work in this section.

   D. All submittals shall leave space available for review stamps and comments.

   E. The Architect and Theatre Consultant shall only mark one set of drawings per submittal with comments. Any additional sets of drawings or product data shall be returned unmarked.

   F. Provide insurance against loss or damage during shipment. Furnish certifications of such coverage to the General Contractor not less than 60 calendar days prior to the shipment of any equipment.

   G. Review all pertinent project Contract Documents. Following this review, provide to the Architect and General Contractor any additional information required to make a fully functioning system. In addition, the Manufacturer shall indicate the maximum accepted wire size as it relates to termination points on their equipment.

   H. Verify wire type, count and routing for all required data wiring between all components to allow for proper conduit sizing and routing by Division 26. Verify and coordinate all line voltage power input required by systems components that shall be provided under Division 26.

   I. Product Data:
      1. Where standard manufacturer parts are used, submit current product literature describing component, manufacturer's recommended applications, load ratings, safety factors and dimensions. The data shall include all information which indicates compliance with the specifications herein.
      2. Clearly indicate specific component and applicable options.

   J. Shop Drawings
      1. Provide shop drawings on D size minimum (24” x 36”) sheets.
      2. Include a cover sheet with a drawing index including the sheet number and title for each sheet in the set.
3. Provide complete, fully dimensioned, large-scale detailed drawings of all major components.
4. Provide requisite schematics, plans and sections indicating assembly and installation of components.
5. Provide indications by arrow and boxed caption of all variations from contract drawings and specifications, except where variation is indicated as acceptable.
6. Provide detailed one-line riser diagrams and installation circuit diagrams indicating all control and/or data electrical requirements and point to point connections. These shall be provided within 30 days of Contract Award.
7. Provide touchscreen layouts and functional narrative for review four weeks prior to final system checkouts.
8. Provide a full Bill of Materials to be supplied, including quantities, manufacturers, manufacturer's part numbers, reference to applicable drawings, etc.

K. Samples
1. Submit sample items including, but not limited to:
   a. Panel engraving or silk screen
   b. Distribution device engraved lamacoid label showing attachment method.
2. Additional samples must be submitted within 14 days of Architect's written request.

L. Source Quality Control Submittals
1. The Contractor shall supply as part of the submittal process the following Source Quality Control documents:
   a. Serial number of equipment tested
   b. Serial number of any component device(s)
   c. Batch number of major components
   d. Name of person conducting the test
   e. Date the test was conducted
   f. List of mechanical tests conducted
   g. List of electrical tests conducted

M. Special Procedure Submittals
1. Training
   a. To ensure proper training of the user group, the Contractor shall supply as part of the submittal process the following training documentation:
      1) Training syllabus
      2) Training guide (bound hard copy)
      3) Training guide (hands on system training)
      4) Testing document for confirmation of understanding
      5) DVD/ MPG video training file
   b. These shall be provided two (2) months prior to completion.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents:
1. Submit documents in accordance with Division 01 – General Requirements.
2. At the time of acceptance testing, submit three (3) copies of parts lists and maintenance instruction sheets.
3. Within 60 days of the acceptance testing, submit one (1) set of reproducible "as built and approved" drawing showing all equipment as installed. These drawings shall include all adjustments made during the checkout process.
4. Submit operation and maintenance manuals with the “as built and approved” drawings. Each manual shall be bound in an individual binder with the project name on the front cover and system identification on the spine. The manuals shall include:
a. Complete parts list for all equipment and telephone numbers for the authorized parts and service distributors.
b. Instructions as to the safe operation for all equipment.
c. Recommended maintenance schedule for component parts that may need periodic replacement or maintenance.
d. Recommendations for cleaning, maintaining and touch-up of all finished surfaces.

5. Where specific elements do not require manuals, instruction sheets as to care and handling shall be provided.

6. Warranties as required herein.

B. Maintenance Contract
1. Refer to 3.10 – Maintenance.
2. Submit maintenance contract proposal for Owner and Theatre Consultant review no later one month prior to substantial completion.

C. Submit verification that all punch list items have been rectified. Such written verification will be required for project closeout and initiation of the warranty period.

D. The record documents shall be reviewed by the Architect and all modifications to the documents stemming from this review shall be made as required.

E. Above submissions are required as a condition for final approval of the work.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Spare Parts:
1. Furnish a package of spare parts for all user serviceable portions of the theatrical lighting system equipment:
   a. Furnish 10% of total quantity of each type of small component or part in system as spare parts (minimum of one). Package may include connectors, bulbs, fuses, knobs, switches, and other miscellaneous parts, in addition to any spare parts specifically listed in individual product specifications.
   b. Label all spare parts with Manufacturer’s part number, designation and description, and location(s) where used.
   c. Furnish durable, clearly labeled, storage containers for all spare parts, including special static free containers for electronically sensitive parts.
   d. Furnish five (5) 16GB USB flash drives or other appropriate data storage medium.
2. Provide unit price for recommended package of parts.

B. Extra Stock Materials:
1. Deliver stock of maintenance material to Owner. Furnish the following to match those installed and taken from the same production run, packaged with protective covering for storage and identified with appropriate labels:
   a. Furnish spare dimmer modules (minimum of two, or in quantities as listed in the Appendix) for each type of installed dimmer module in the system.
   b. Furnish one spare node or complete internal components of each type of installed node in the system.
   c. Furnish 5% circuit breakers (minimum of one) of each size in the system, including automated circuit breakers.

1.8 QUALITY ASSURANCE

A. Regulatory Requirements:
1. Refer to Division 01 – General Requirements.

B. Qualifications:
1. Manufacturers
   a. The Manufacturer shall own and operate their own manufacturing facility for the fabrication of theatrical lighting dimming and control equipment, and be regularly engaged in the fabrication of such equipment. Fabrication of such equipment shall comprise no less than 90% of the Manufacturer’s business.

2. Installers / Integrators
   a. The systems and equipment under this Section shall be provided through a single pre-approved Contractor who is a factory authorized dealer, integrator and servicer of all of the equipment specified herein and meets the following requirements.
   b. The Contractor shall maintain a full-time Manufacturer-trained and certified field engineering staff of at least two people available within 4 hours travel of the project location on an emergency basis. Staff shall be employed by the local authorized dealer and trained in electronic lighting control systems and Ethernet systems services.
   c. The Contractor shall have been continuously engaged in the integration and installation of theatrical lighting equipment for no less than five years and shall have provided complete engineering and installation services on a minimum of five projects of similar scope and complexity in the past five years.
   d. Project Manager: The Contractor’s Project Manager shall be qualified and have experience in projects of similar size and scope. The Project Manager shall have binding authority to represent and act for the Contractor and Manufacturer of this equipment. The Project Manager shall be the primary conduit for all information between the supplier of this equipment and the General Contractor. All information given to the Project Manager shall be considered as given to the Contractor.
   e. The Contractor shall have, at the time of bid, a current contractor’s license and shall know, understand, and have the required documentation to work in the State of Michigan. This license shall be maintained throughout the course of the work of this contract.
   f. Contractor is responsible for proper installation, operation and safety of all component equipment.
   g. Contractor is responsible for the complete integration and engineering of all systems described herein. Contractor shall confirm project details and, if necessary, suggest modifications to the criteria established herein in order to maintain the design intent.
   h. Errors and omissions within the Contract Documents shall not relieve the Contractor and the General Contractor of the responsibility for providing a properly functioning installation of the system as described herein.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage and handling shall be coordinated with the General Contractor and shall meet all requirements described in Division 01.

B. Packing, Shipping, Handling and Unloading
1. All equipment shall be appropriately and substantially packed for shipment.
2. All equipment containers shall clearly indicate the equipment contained, “front”, “top”, “fragile”, the project name, and theater site allocation. Include packing and shipping lists for each container.
3. All shipping costs to the job site are the responsibility of the Contractor. The shipping method/company is at the total discretion of the Contractor in order to meet the published project schedules.
C. Acceptance at Site
   1. Coordinate responsibility for acceptance of material and equipment at job site with the General Contractor.
   2. The Contractor shall be responsible for acceptance of the Theatrical Lighting System components at the job site, confirming that all quantities and counts are correct and for keeping accurate logs and records of such information.

D. Storage and Protection
   1. Upon delivery, the materials shall be stored under cover in a clean and dry location, off the ground. Delivered materials which are damaged or otherwise not suitable for installation shall be removed from the job site and replaced with acceptable materials.
   2. Replace, at no additional expense to the Owner, all equipment and materials which are damaged during storage or handling.

1.10 SITE CONDITIONS

A. Existing Conditions
   1. Verify all conditions at job site. Promptly report variations and obstructions to the Architect. All additions and/or corrections are to be requested prior to fabrication.

B. Environmental Requirements
   1. Equipment is classified according to its susceptibility to construction conditions that may affect its operation. Classes shall be defined by the following paragraphs:
      a. Class 1:
         1) Cable and distribution apparatus, structural elements, electrical back boxes, face plates, terminal boxes, and empty equipment rack frames may be stored in weather protected spaces under "normal" construction site conditions provided that no electronic components are contained within devices, storage boxes are sturdy and well-sealed, and equipment is protected with imperforate inner plastic sheeting.
         2) Contractor may install this class of equipment in weather-protected spaces under "normal" construction site conditions provided that equipment is protected from dust and moisture by sturdy imperforate plastic sheeting and completely covered with corrugated cardboard held securely in place by duct tape. Cardboard covers shall not be removed until area is broom cleaned. Under no circumstances shall equipment remain uncovered overnight during installation or while work which causes high dust or moisture levels in area of placement is taking place.
      b. Class 2:
         1) Control panels, spare parts, test and other equipment (except as listed under Class 3) not subject to damage by concrete dust or dirt shall be stored and protected per Class 1 devices.
         2) Contractor shall not install equipment in this class until area of installation is broom cleaned, "blown" clean with pressurized air, mopped, air conditioned and secure. Contractor may install control panels with electronic components under Class 1 conditions, but electronic components must be removed and not installed until area of installation meets Class 2 conditions.
      c. Class 3:
         1) Control consoles, filled equipment racks and other electronic equipment shall not be shipped to site until the rack and control rooms are finished, air conditioned, dust free, broom and mop cleaned, secure, and in all respects complete and ready for occupation.
         2) This class of equipment shall not be unpacked until the system is complete in all other respects. Under no circumstances may any equipment in this class be opened before the entire system is complete and ready for occupation.
be removed from the rack and control rooms into or through spaces which are not cleaned, air conditioned, and complete.

C. Field Measurements
   1. Field measurements must be taken prior to preparation of final shop drawings and prior to fabrication to ensure proper fitting of work. Allow for adjustments during installation whenever taking field measurements.
   2. Should field measurement of site conditions alter the design or installation of system elements from the approved shop drawings, revised shop drawings shall be reissued for review.

1.11 WARRANTY
A. Comply with the warranty requirements of Division 01 and the following.
B. The Manufacturer shall warrant materials and workmanship of systems and equipment installed as free of defects. The Manufacturer shall guarantee in writing the repair or replacement within 14 days of any item found defective during a period of two (2) years following date of final acceptance. Ordinary wear and defects due to improper usage are excepted.
C. The Contractor shall warrant the workmanship of the installation services provided under this Section for a period of two (2) years following the date of final acceptance. Ordinary wear and damage due to improper usage are excepted.
D. During the warranty period, all emergency conditions where systems failures may be hazardous or may cause severe hardship or cancellation of performances shall be responded to within 24 hours. Immediate action shall be undertaken to ensure the safety of the audience and the performers.
E. During the Warranty Period, for each product that uses software, furnish manufacturer’s software updates to the Owner for installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. To establish comparative standards of quality the systems and equipment described herein shall be furnished by the manufacturers listed herein and in the Appendix.
   1. Manufacturers shall provide the Warranty and Maintenance services specified herein as applicable to their products.
   2. Manufacturers shall engineer, design, produce shop drawings and fabricate all custom equipment required in this section.

2.2 SYSTEMS DESCRIPTION

A. The following performance spaces shall contain the following major system components listed below and as shown on the TL-series drawings:
   1. Proscenium Theatre
      a. Theatrical Dimmer Racks and Modules
         1) Installed dimmer racks with 500ms rise-time flexible configuration dimmers
2) Paralleled branch circuits to some quantity of dimmers (ref. schedule)
3) Air flow modules in place of dimmer modules for some quantity of dimmer racks (ref. schedule)

b. DMX controlled panelboards
   1) 120V 20A single pole circuit breakers feeding receptacles for 120V lighting fixtures, including LED source fixtures with on-board dimming.
   2) 120V 20A single pole circuit breakers feeding branch circuits for 120V architectural lighting fixtures.

c. Network data system
d. Network connection devices
e. Architectural lighting control system
   1) DMX bypass for LED source house lighting
f. Architectural lighting control panels
g. Dimmed and switched power distribution devices
   1) Plugging strips
   2) Plugging boxes

2. Black Box Theatre
   a. DMX controlled panelboards
      1) 120V 20A single pole circuit breakers feeding receptacles for 120V lighting fixtures, including LED source fixtures with on-board dimming.
      2) 120V 20A single pole circuit breakers feeding branch circuits for 120V architectural lighting fixtures.

   b. Network data system
c. Network connection devices
d. Architectural lighting control system
   1) DMX bypass for LED source house lighting
e. Architectural lighting control panels
f. Switched power distribution devices
   1) Plugging strips
   2) Plugging boxes

3. Valade Jazz Center
   a. Architectural Dimmer Modules
      1) Electronic low voltage dimmer modules for line voltage dimming of new architectural lighting fixtures, for use in existing theatrical dimmer racks.

   b. DMX controlled relay panels
      1) 120V 20A single pole relays feeding branch circuits for 120V architectural lighting fixtures.

c. Network data system
d. Network connection devices
e. Architectural lighting control interfaces
   1) DMX control interfaces to support low voltage dimming of architectural lighting fixtures, for use with existing architectural control processor.

f. Architectural lighting control panels

B. The systems shall be professional theatrical lighting systems complete with all necessary accessories to provide control, dimming and switching of incandescent and LED theatrical lighting fixtures via a wired and wireless network of power and data distributed through each space included in the work of this section.

C. The system in each space shall be complete and operate independently allowing concurrent use without dependence on the equipment or components in other spaces. Each performance space’s data network system shall allow for a temporary connection to the main building network for communication with equipment manufacturers’ firmware updates.
D. The control system in each space shall be ACN, RDM and DMX compatible, operating over a TCP/IP network using CAT 5e cabling.
   1. Data shall be provided via theatrical lighting consoles, architectural lighting processors and control panels, and wired and wireless remote devices. Data shall be input to the network via direct network connection or via DMX input nodes.
      a. All input devices shall exist as network devices with distinct IP addresses capable of addressing any endpoint device on the network based on the properties defined by the master console.
   2. Data shall be distributed over the Ethernet network to installed DMX nodes or to network taps for use with portable DMX nodes. Data shall be converted to DMX at the nodes for use by endpoint devices.
   3. The system shall provide PoE via endspan network switches compatible with the specified DMX nodes.

E. State of the Art Development
   1. The Contractor shall furnish only the manufacturers' latest developed appropriate products. In cases where product development from a specified manufacturer surpasses the criteria of this specification, the Contractor shall inform the Architect and make the newer product available to the Owner for acceptance. In no case shall discontinued or obsolete equipment be acceptable. Should a newer product be suggested as a substitution for a discontinued product, or for a product that is in process of being phased out of production, that newer product shall be offered to the Owner at no additional cost.
   2. Should product recall by the Manufacturer require temporary or permanent replacement of a product specified under this section, the Contractor shall notify the Owner at the earliest reasonable time and shall arrange to replace the product in question at the earliest possible time.
   3. Equipment found defective or subject to recall prior to scheduled installation shall not be delivered to the job site.
   4. Equipment defect or intended recall shall not relieve the Contractor from his contractual obligation with regard to delivery schedule of product. In this circumstance, notification shall be made to the Architect by express carrier. Arrangement for alternate product shall be made at this time.
   5. Under no circumstances shall arrangement for alternate product necessarily require the Owner to accept superseded equipment except on a temporary basis.

F. Substitutions
   1. All requests for variations from the specified materials and products will be reviewed by the Architect according to the procedures outlined in Division 01.
   2. All requests for substitutions must be submitted in a timely manner, so as not to adversely impact the project schedule.
   3. Substitutions will only be accepted if, in the opinion of the Architect, the product is an equal to the specified product. No substitutions may be made without written acceptance from the Architect. All substitutions made prior to this acceptance are at the sole risk of the Contractor.
   4. A substitution must be a product of equal design, construction and performance. The Contractor must submit all pertinent information required to substantiate that the product is equal. The Contractor must submit all additional information, including test data, which may be requested in order for the Architect to fully evaluate the substitution. The burden of proof is solely on the Contractor.
   5. All additional expenses of any kind with respect to substitution(s) shall be borne by the Contractor. This shall include, but not be limited to, all fees and expenses incurred by the Architect and other related Consultants for evaluation of the substitution and subsequent integration into the project should the substitution be taken and/or additional costs of other contractors related to the substitution(s).
2.3 MATERIALS

A. General

1. All equipment and components shall be new and complete. No used or reconditioned equipment shall be acceptable.
2. All mounting hardware shall be included.
   a. All bolts and fasteners required to mount equipment to mounting hardware must be Grade 5 or better.
3. All equipment and components shall be factory tested prior to shipping.
4. All bolted attachments shall have lock washers or other approved self-locking hardware.
5. All internal wiring shall be factory completed and clearly marked. All field connections shall be by connector, terminal strip or other device specified herein. Any terminal strip connections shall be clearly labeled as to terminal designation.
6. All wire sizes and insulation shall comply with NEC, NFPA and UL standards and all other applicable national and local codes.
7. All wiring to be harnessed and bound. No loose or randomly routed wires shall be permitted.
8. All control wire counts shall include 10% spares.
9. All microprocessor controls shall utilize a non-volatile memory. System configuration, operating parameter, preset, etc. shall be protected against system power failure for a minimum of 48 hours.
10. Systems components shall be modular in nature. Individual dimming modules shall slide in and be easily disconnected from power and removed from the rack without disturbing adjacent components and shall require no special tools for these tasks. Control circuitry shall be contained on plug-in printed circuit cards. Plug-in circuit cards shall be individually removable without disturbing adjacent components.
11. All fixed components including dimmer modules, non-dim modules, circuit breakers, and cabinets shall be labeled sequentially for ease of maintenance.
12. No manufacturer’s logo shall appear on control station faceplates or any other device located in public areas.
13. Any supplementary or auxiliary equipment necessary for the operation of the system shall be supplied with overload and short-circuit protection.

2.4 DIMMER RACKS AND MODULES

A. Dimmer Equipment Racks:

1. The entire dimmer rack assembly shall be UL listed. Rack finishes shall be manufacturer’s standard baked enamel color.
2. Dimmer racks shall be floor mounted, dead front switch boards complete with all dimmers, control electronics, timers, circuit breakers, and wiring terminations. No external components shall be required.
3. Dimmer slots shall be sequentially numbered and labeled on both sides of the dimmer slots.
4. Each dimmer rack shall be labeled as indicated on the drawings or as listed in dimmer schedules. Engrave and fill or silk-screen labels.
5. Dimmer racks shall be completely wired internally by the Manufacturer. The Electrical Contractor shall provide input feed wiring, load wiring, low voltage wire pulls and individual cabinet disconnects. All terminals shall be clearly and permanently marked and numbered.
6. Dimmer racks shall be constructed of #14 or #16 US gauge cold rolled sheet steel.
7. Provide access panels or knockouts for bottom feed and top load/control wires.
8. All internal components shall be accessible from the front for testing and adjusting while system is operating. No rear access shall be needed for installation or future service.
9. Power distribution shall be by copper buss bars. Aluminum buss bars are not acceptable.
10. Theatrical and Architectural dimmer racks shall be 120/208 volt, 3 phase, 4 wire, size for minimum 600-amp feeds, as indicated on Division 26 contract documents.

11. Theatrical and Architectural dimmer rack load, neutral and ground terminals shall accept up to #2 AWG wire.

12. Individual rack disconnects shall be provided under Division 26. Coordinate fault current requirements with the Architect.

13. All internal wiring shall terminate in pressure wire or clamp type terminals for installation of Electrical Contractor’s wiring. No wire nuts or crimps shall be acceptable.

14. All wiring provided by the Electrical Contractor under Division 26 shall be individually labeled at both ends of wire and at all splice locations.

15. Each branch load circuit must have an individual neutral to the dimmer cabinet terminals. Common neutrals shall not be acceptable for any load wire from the load to the dimmer cabinet terminals. Clearly note this requirement on all documentation. Reduced sizes are acceptable with prior approval of Architect.

16. Standard advertised product dimensions are to be considered maximum and are not to be increased. Dimensions acceptable with prior approval of Architect.

17. Location of dimmer racks shall be as shown on drawings. Provide quantities of cabinets dictated by dimmer quantity indicated herein.

18. Provide requisite ancillary, current modifying, regulating, and monitoring devices required for operation of a complete fully functioning system.

19. Dimming panels may be cooled by free convection without the use of cooling fans or by fans or blowers with screened air inlet and outlet grilles. Regardless of cooling method, dimming panels shall operate within a maintained ambient room temperature range of no less than 32°F and no more than 95°F degrees.

20. Provide cabinet overheat sensor and pilot light for each cabinet mounted in face of cabinet. Automatic shut off of the dimming system components shall occur should maximum safe operating temperatures of the cabinet be exceeded. Over heat sensor shall be duplicated to provide remote warning messages located on the theatrical lighting control console.

21. The interior construction of the entire electrical assembly shall be designed for a minimum standard fault current of 50,000 AIC with the capability for increased protection to 100,000 AIC, if required.

22. Noise generated shall not exceed 55db per cabinet, as measured with a Type 2 sound level meter at a distance of three feet from the cabinet in installed dimmer location.

23. The racks shall be mounted on vibration isolation mounts or pads consisting of a neoprene core with steel bearing plate, and a neoprene friction surface. Isolation mounts shall be Mason Industries Type “ND” or as specified by the project Acoustician; isolation pads shall be Mason Industries Type “WMSW” or as specified by the project Acoustician.

24. Dimmer bank shall accept USITT standard DMX512-A protocol digital control signal or Category 5e or greater Ethernet control signal in addition to any proprietary protocol control signal supported by the Manufacturer. Ethernet dimmer rack shall provide two (2) data inputs functioning on a Highest Takes Precedence basis.

25. Selection of signal protocol shall be automatic and shall not require use of mechanical transfer relays.

26. Control signal input of each individual dimmer rack shall be fully opto-isolated from control signal input of any other rack, and fully opto-isolated from any control signal output.

B. Dimmer Modules:

1. Dimmers shall meet all dimming performance criteria as listed in this section.

2. Dimmer electronics shall be completely solid state. Silicon controlled rectifiers shall be used to control AC power supplied to the loads.

3. Dimmers shall utilize two silicon-controlled rectifiers in back-to-back electrical configuration and all required gating circuitry on high voltage side of an integral opto-coupled control voltage isolator.

4. Rectifiers shall be mounted on ceramic substrate and encapsulated along with other components in epoxy-filled high-impact plastic case.
5. All dimmer modules shall be able to operate as “non-dims” with selection of this function through dimmer rack and control console software.
   a. When selected as a “non-dim”, incoming control signal level is interpreted as either full on or full off signal.
   b. Level of control signal required to initiate turn-on and turn-off shall be user selectable from 0% to 100%.
   c. Non-dim function shall operate regardless of load type or wattage.

6. Dimmers shall operate properly on 60 Hz, 120 - 140 volts AC input. Dimmer output shall be AC, containing less than 1% DC component. At maximum input signal, the dimmer shall produce a full sine wave. With the input signal at zero, the dimmer output shall be zero voltage at any load with regulation set OFF. Output shall be symmetrical to the zero voltage axis at any control setting prior to any electronic enhancement.

7. Dimmer efficiency shall be at least 97% at any voltage and with any load to maximum capacity.

8. AC voltage control components shall be rated at a minimum of two times the rated capacity of the dimmer and shall sustain a total short circuit for a sufficient length of time to open primary circuit protection.

9. Incandescent dimmers (line and low voltage) shall be capable of hot patching cold tungsten loads up to full rated capacity without malfunction or change in operating characteristics regardless of control setting.

10. Speed of response of system processor modules to control signal changes shall be no more than 25 milliseconds.

11. Dimmer output shall repeat with respect to the control signal input unit value without hysteresis.

12. Dimmers set to equivalent control signals with equal types and amperage of loads shall not vary from one to another by more than one percent (1%) at any place in the control signal range from full-off to full-on. Dimmer response shall not be phase sensitive with respect to control signal. There shall be exact tracking from one dimmer to the next with no variation.

13. There shall be no visible dimming resolution stepping or flickering regardless of length of fade time or control fader settings.

14. Provide protection from overloads, short-circuiting, and transient voltage. Protection devices requiring reset or replacement must be accessible on the face of the dimming module or dimming cabinet.

15. Circuit Breakers:
   a. Provide input fully magnetic circuit breaker(s) mounted on the face of each dimmer module or cabinet faceplate. Provide one input breaker for each individual dimmer within a module (e.g. one for single module, two for dual modules, etc.).
   b. Input breakers must be rated for full load of the dimmer and must trip at 125% of rated capacity. Input breakers shall be rated for a minimum fault current of 10,000 AIC (120V) or 14,000 AIC (277V).
   c. Acceptable manufacturers: Airpax or approved equal

16. Provide dimmers with a ferrous core toroidal filter choke. This filter choke shall suppress lamp filament or transformer hum and vibration, prevent electromagnetic interference in professional quality audio, video, and computer equipment and limit objectionable harmonics. Laminated E.I. or C.I. type chokes are not acceptable.
   a. Rise Time Full Load (Theatrical Lighting Dimmers): Voltage rise time shall not be less than 500 microseconds measured and installed on site at 90 degree conduction angle from 10% to 90% of output wave form with dimmer operating at maximum load.

C. Dimmer Modules with Bypass
1. Dimmer modules with Bypass shall meet all of the criteria for dimmer modules listed above
2. Modules shall utilize the same chassis form as the dimmer modules
3. Modules shall contain two mechanically held relays
4. Each output in the module shall be configurable to operate as a dimmer or a relay
5. Local override switches shall permit full manual bypass of control signal at each output
6. Breakers shall be fully rated at 20 amps
7. Breakers shall be fully magnetic type

D. Non-Dim Modules
1. Non-dim modules shall utilize the same chassis form as the dimmer modules
2. Modules shall contain two true electrically held relays
3. Breakers shall be fully rated at 20 amps
4. Breakers shall be fully magnetic type

E. Dimmer Control Electronics:
1. Control electronics shall use digital electronic circuitry, be microprocessor based, and be designed specifically for the control of dimming systems. All user operated controls shall be low voltage, use Class II wiring and be electrically isolated from power wiring by means of a UL listed Class II transformer. Appropriate analog to digital conversion shall be acceptable provided circuitry is integral to the control system and not a stand-alone component.
2. System configuration, operating parameters, presets, levels and fade times shall be able to be field modified and shall not require components to be returned to the Manufacturer for such modifications.
3. System configuration, operating parameters, presets, levels and fade times shall be protected against system power failure for a minimum of 10 years. The state of the system status upon restoration of power shall be user selectable.
4. The dimmer control electronics may be capable of being addressed by the IEEE 802.3 Ethernet protocol.
   a. The dimmer control electronics shall be capable of being addressed by an ACN-compliant transport system for the USITT DMX512-A protocol when any lighting control console utilizing the same protocol is plugged into a DMX In Node.
5. Dimmers shall regulate output voltage to maintain constant output RMS voltage as long as input remains over 120V per phase.
6. Dimmer output RMS voltage versus control input signal shall be consistent with a modified square law curve. The dimmer curve shall be stable and shall not require individual curve adjustment devices. The dimming curve shall be predetermined and shall not vary unless modified through control device software.
   a. Modified square law curve shall provide a more uniform output response to control level changes than a standard square law curve.
   b. Other optional curves shall be available for installation through rack and/or control console operations software.
   c. Field adjustment of dimming curve shall not be required.

F. Provide:
1. ETC Sensor3 Racks and ThruPower 500ms rise AF dimmers
2. Architectural dimmer modules as listed in Appendix A

2.5 DMX CONTROLLED PANELBOARDS

A. DMX Motorized Breaker Panel
1. Panels shall provide over-current circuit protection and remote on and off circuit control utilizing motorized circuit breakers in a single wall-mounted enclosure.
2. Panels shall support single, double, and triple pole motorized circuit breakers, and include control electronics, electronics power supply, and isolated technical ground bar.
3. All panels and components shall be ETL or UL Listed.
4. Panels shall be no larger than 20” wide x 6” deep x 70” high.
5. Panels shall be constructed of 16-gauge steel with removable knockout panels to facilitate conduit entry. Front panel shall be easily removable for full access to all connections.
6. Panels shall be convection cooled.
7. Panels shall be fed by 3-Phase 4-wire (3-Phase conductors, 200% Neutral), Isolated Technical Ground and chassis ground 120/208 or 277/480 VAC 60 Hz supply.
8. Panels shall have Main Circuit Breaker protection on input feed.
9. All line, neutral and ground terminals shall accept up to 6 AWG wire.
10. The individual remote controlled circuit breakers shall contain motor driven, mechanically held contacts with ampacity ratings of 15, 20 or 30 amps at up to 480VAC, as required.
11. Each motorized circuit breaker shall have an integral manual override switch with on/off status indication.
12. The motorized circuit breakers shall have the following characteristics:
   a. Respond to control changes in less than 25 milliseconds.
   b. Rated for a minimum of 100,000 mechanical operations
13. The panel control electronics shall operate on single phase, 120-277V AC 60Hz fed from an included 15 amp circuit breaker. Fault current protection shall be 25,000 AIC @ 120 VAC.
14. The panel shall receive DMX512 control protocol. Up to two additional control protocols, including sACN, 0-10V Dimming, Contact Closure, and DALI, shall be available, as required, via on-board interface or accessory card. Addressing shall be set through a user interface.
15. Panels shall support discrete addressing of each breaker.
16. 2,500V of optical isolation shall be provided between the DMX512 inputs and the control electronics as well as between control and power components.
17. A voltage barrier shall be provided to separate line voltage and control voltage sections of the panel.
18. Provide:
   a. Electronic Theatre Controls Sensor IQ Intelligent Breaker Panel in configurations and with accessories as listed in the Appendix.

B. Small format DMX Relay Panel (Valade)
1. Panels shall provide remote on and off circuit control utilizing mechanically held relays in a single wall-mounted enclosure.
2. All panels and components shall be ETL or UL Listed.
3. Panels shall be no larger than 14" wide x 3.5" deep x 12" high.
4. Panels shall be constructed of 16-gauge steel with removable knockout panels to facilitate conduit entry. Front panel shall be easily removable for full access to all connections.
5. Panels shall be convection cooled.
6. Panels shall be fed by discrete 20A circuits from nearby branch circuit distribution board.
7. All line, neutral and ground terminals shall accept up to 6 AWG wire.
8. The individual relays shall contain mechanically held contacts with ampacity ratings of 20 amps at up to 277AC, as required.
9. Each relay shall have an integral manual override switch with on/off status indication.
10. The relays shall have the following characteristics:
    a. Respond to control changes in less than 25 milliseconds
    b. Rated for a minimum of 100,000 mechanical operations at full resistive load
11. The panel control electronics shall operate on single phase, 120-277V AC 60Hz fed from an ia nearby 15 amp branch circuit. Fault current protection shall be 25,000 AIC @ 120 VAC.
12. The panel shall receive DMX512 control protocol and sACN. Addressing shall be set through a user interface.
13. Panels shall support discrete addressing of each relay.
14. 2,500V of optical isolation shall be provided between the DMX512 inputs and the control electronics as well as between control and power components.
15. A voltage barrier shall be provided to separate line voltage and control voltage sections of the panel.

16. Provide:
   a. Electronic Theatre Controls Unison Foundry Mini Panel in configurations and with accessories as listed in the Appendix.

2.6 NETWORK DATA SYSTEM

A. Equipment Racks
   1. Equipment Racks shall be 19" standard freestanding or wall-anchored equipment racks, as indicated in the drawings. Enclosure shall provide adequate space for all network components and auxiliary equipment as required.
   2. Equipment racks shall be provided with knockouts as required on top, bottom and sides to allow conduit connection as required.
   3. In no case shall loose equipment be permanently mounted outside of a protective equipment rack or cabinet.
   4. Provide finished, blank panels, complete with rack-mounting holes and hardware as necessary.
   5. Label all controls that are contained within this contract as indicated on related drawings or as appropriate. All labels to be engraved and white filled.
   6. Coordinate wall backing requirements for mounting wall-anchored equipment racks with General Contractor.
   7. Network Control Racks (CR) shall contain network components and auxiliary equipment including but not limited to:
      a. Network switches, patch panels, and cable management, as required
      b. Network devices, including network nodes and taps, as required
      c. DMX Combine Merger and Splitter Units, as required
      d. Architectural processors, as required
      e. Uninterruptible power supplies
      f. Additional equipment as indicated on Drawings
   8. The Production Control Panel (PCP) rack shall contain the following elements:
      a. Rack Identification panel
      b. Task Light Panel
      c. Uninterruptible power supply rated to power equipment contained in this rack for 30 minutes.
      d. Blank and vent panels as required.
      e. Theatrical Lighting equipment as indicated on Drawings.
      f. Control panels and equipment for other theatrical systems (e.g., Rigging, Stage Lifts, Variable Acoustics, etc.). Equipment to be supplied and installed in the rack under the work of the respective sections.
      g. Confirm space requirements with other affected contractors in writing prior to fabrication.

B. Network Components:
   1. Network switches shall have the following characteristics and functions:
      a. Switches shall contain (24) auto-sensing ports, supporting 1000BASE-T, 100BASE-TX and 10BASE-T with PoE per IEEE 802.3af or 802.3at as appropriate.
      b. Switches shall be rack-mounted in standard 19" racks.
      c. Switches shall have front panel LEDs that shall report switch traffic, collisions and expansion status. Per port LEDs shall indicate link and partition status for individual connections.
      d. Switches shall have UTP ports on its front face for connecting to nodes and taps via standard 19” patch panel.
e. Should Ethernet wire runs exceed 300 feet, provide switches with fiber ports equal to the number of fiber runs in the system.

f. Acceptable manufacturers:
   1) Cisco
   2) Approved equal

2. UTP network patch panels
   a. Provide Category 5e Patch Bay (or bays as required) for termination of Category 5e wire runs.
   b. Provide Category 5e patch cords as required for connection between the patch bay (or bays), switches and Ethernet Power Supply.
   c. Patch bays shall be rack-mounted in standard 19" racks.
   d. Provide rack mounted standard 19" cable management system for each patch panel.
   e. Patch bays and cable management panels shall be finished in a black anodized finish and shall contain black Category 5e connectors as required.
   f. Acceptable Manufacturers:
      1) Hubbell

3. Fiber Optic network patch panels
   a. Provide Fiber Optic Patch Bay(s) as required, for termination of fiber optic cable runs.
   b. Each patch panel shall be populated with (12) LC Duplex MM adapters.
   c. Patch panels shall include internal cable management.
   d. Provide 1RU label panel above each patch panel with both the appropriate receptacle designation and location description for each patch jack.
   e. Legends shall correspond with receptacle panel legends where applicable.
   f. Patch bays shall be rack-mounted in standard 19" racks.
   g. Patch bays shall be finished in a black anodized finish.
   h. Provide:
      1) Hubbell Fiber Interconnection Shelf, 1RU (FEUR24LCDOM3)
      2) Approved equal

C. Network Cabling:
   1. Fiber Optic Cable (as required for all runs greater than 300 feet)
      a. Contractor to confirm all cable routing distances to determine appropriate use of fiber runs.
      b. Contractor shall specify 50/125µm fiber optic cable as required to support network components.
      c. The cable must exceed the IEEE802.3z Gigabit Ethernet Fiber specification for 50/125µm Fiber.
         1) For Gigabit Ethernet 1000sx over 50/125µm fiber, a modal bandwidth of 500mHz per km in the 850nm wavelength with 500m minimum distance is required.
         2) For Gigabit Ethernet 1000lx over 50/125µm fiber, a modal bandwidth of 500mHz per km in the 1300nm wavelength with 500m minimum distance is required.
      d. The cable must exceed the TIA/EIA 568B Fiber specification.
      e. Acceptable Manufacturers:
         1) Belden F13D006R9
         2) Or approved equal
   2. UTP Cable
      a. The copper cabling and connecting hardware must fully comply with the existing TIA/EIA 568B Standard and with the standard installation of Category 5e products.
      b. The copper cabling should also comply with the TIA/EIA Category 5e standard.
      c. Acceptable Manufacturers:
         1) For non-plenum rated applications:
            a) CommScope 55N4 Ultra II Enhanced Category 5 UTP cable
b) Belden 1583A
2) For plenum rated applications:
   a) CommScope 5504M Ultra II Enhanced Category 5 UTP cable (for plenum rated applications).
   b) Belden 1585A

D. Lighting Systems Computer
1. The lighting systems computer serves as both the Theatrical and Architectural lighting network programming device.
2. Provide one laptop PC with 14” diagonal 16:9 format screen, minimum Intel Core i7 processor (Microsoft Windows 7 compatible) with 8GB of RAM and 500 GB solid state hard drive, CD/DVD-RW drive, 3-USB slots, Wireless–N card. The Computer shall have the following:
   a. Network interface card for direct use over the lighting Ethernet data network.
   b. Provide fifteen foot cable for plug-in to the network receptacle.
3. Acceptable Manufacturers:
   a. Lenovo
   b. Toshiba
   c. Dell
4. System Software
   a. Provide one boxed set of the most current Windows based operating system compatible with the proprietary application software and system configuration.
   b. Provide networking software complete with manuals, technical support resources and CDROM as required allowing on line and off line Owner configuration and operation of all system parameters and dimmer rack configuration settings.
   c. Provide Architectural lighting system software as specified herein.

E. Wireless Network
1. Provide wireless access points (WAP) to provide continuous and consistent access to the available lighting network using wireless remote lighting control units and laptop computers.
2. Wireless switches shall comply with the latest IEEE 802.3 b/g standards.
3. Coordinate the Ethernet protocols (and frequencies) with other areas of work (AV, Automation, Administration, etc.) to ensure that the lighting system has its own dedicated secured channels and does not broadcast SSID information that would allow the system to be compromised. Setup MAC address filtering if nearby networks require it.
4. Each space shall have a distinct SSID and shall be secured using WPA-2 security.
5. Provide a wireless network map showing WAP locations, discrete address, and coordination with other wireless networks.
6. Provide external antenna connectors for auxiliary antennas.
7. Provide software to allow management and configuration of WAPs.
8. Wireless access points shall be provided with pipe mounting or other appropriate mounting hardware, power supply and 25’ Ethernet cable.
9. Manufacturers:
   a. Cisco Systems
   b. 3-Com
   c. Or equal
10. Provide a wireless network for each space listed below:
    a. Proscenium Theatre
    b. Black Box Theatre
    c. Valade Jazz Center
2.7 NETWORK NODES

A. DMX In/Out Nodes – General:
1. DMX In/Out nodes will be located as noted on drawings. Nodes shall be connected via the Ethernet data network on Category 5e wire.
2. DMX In/Out nodes shall be capable of translating Ethernet based protocol into usable signal for output to plug-in peripheral devices employing USITT standard DMX512-A. These nodes shall comply with IEEE 802.3 standards.
3. DMX In/Out nodes shall support Remote Device Management (RDM) protocol.
4. XLR connectors at each node shall be able to be configured to output or allow input for any one frame of DMX512 with normal assignment being sequential. All nodes indicated in the system shall be able to operate simultaneously without data collision or corruption while maintaining recommended minimum and maximum DMX512/RS485 frame length, packet size and refresh rates.
5. DMX distribution over the data network shall be independent of all devices on the system. Regardless of dedicated theatrical lighting devices that may be connected to the various nodes, the DMX distribution system shall be configurable from a PC or other independent control device. The PC or other independent control device shall be provided under this section. Saving and loading of the system configuration to disk shall be supported.

B. Install DMX In/Out Nodes - Type 'EN':
1. Provide nodes with female five-pin XLR connectors within one node box, as shown on the drawings.
   a. Label each receptacle with appropriate designations. All labels to be engraved with white core fill. Provide white acrylic write on surface as shown.
2. Each node shall be powered via its Ethernet connection using Power Over Ethernet (IEEE 802.3.af).
3. Devices shall be mounted at fixed locations and wired as indicated on the drawings.
4. Assembly shall have sheet metal back box and faceplate.
   a. Provide flush mount or surface back box and properly sized face plate as required for each location shown on drawings
   b. Face plate shall match edges of back box in surface mount conditions.
5. Provide quantities and configurations as indicated in drawings
   a. ETC Net3 DMX/RDM Output Gateway

C. 4-Port DMX In/Out Nodes:
1. Devices shall have (4) five-pin XLR receptacles within one node box.
   a. Provide male XLR receptacles for DMX ‘In’ ports
   b. Provide female XLR receptacles for DMX ‘Out’ ports
   c. Label each receptacle with appropriate designations. All labels to be engraved with white core fill.
2. Each node shall be powered via its Ethernet connection using Power Over Ethernet (IEEE 802.3.af).
3. Nodes shall be rack mounted in Network racks and wired as indicated on the drawings.
4. Provide quantities and configurations as indicated in drawings and as required for operation of the system as described herein:
   a. ETC Response 4-Port DMX/RDM Gateway

D. Portable 2-Port DMX In/Out Nodes
1. Device shall have (2) female five-pin XLR connectors within one node box.
   a. Label each receptacle with appropriate designations. All labels to be engraved with white core fill. Provide white acrylic write on surface as shown.
2. Each node shall be powered via its Ethernet connection using Power Over Ethernet (IEEE 802.3af).
3. Devices shall be portable.
4. Connection of Category 5e at nodes shall be via a ruggedized RJ45 connector or what is accepted as industry standard at the time of the installation.
5. Internal components shall be modular in nature and easily replaced as a unit in case of failure.
6. Assembly shall be a sheet metal enclosure and faceplate.
7. Provide 5'-0" Category 5e cable extension for each node.
8. Provide appropriate mounting hardware to mount node onto 1.5" Schedule 40 pipe.
9. Provide:
   a. ETC Net3 Two-Port DMX/RDM Output Touring Gateway

E. Portable Network Full Function Node
1. Provide one (1) 4-Port DMX In/Out Node and one (1) Remote Video Interface in a portable rack enclosure to provide for connection of Designer remote consoles, remote video monitors, focus remote and other DMX devices as required.
2. 120 Volt power.
3. All other network features as described above.

2.8 NETWORK CONNECTION DEVICES

A. General
1. Provide all network connection devices as indicated on the drawings and as specified herein, for installation by Division 26.
2. Coordinate size of device, orientation of circuits, and mounting detail to suite site condition.
3. Device back boxes and faceplates to be sheet metal construction, finished flat black unless otherwise noted.
   a. Provide surface mount or custom flush mount back box and properly sized faceplate as required for each location shown on drawings.
   b. Standard flush mount back boxes to be provided by Division 26.
   c. Faceplate shall match edges of back box in surface mount conditions.
   d. Flush mounted faceplates shall have chamfered edges, finished as per Architect.
4. All standard 19" rack panels to be flanged, black, anodized aluminum.
5. See drawings for device locations and control device schedules for device type, mounting type, and receptacle types and quantities.
6. Receptacles:
   a. 20A Edison (NEMA 5-20 R) duplex panel mounted receptacles
      1) All receptacles shall be of the same manufacture
      2) Color: Black except where specifically noted otherwise
   b. RJ45 panel mounted receptacles
      1) RJ45 receptacles must comply with all Category 5e or greater standards.
      2) Ruggedized locking connector system
      3) Provide:
         a) Neutrik etherCON RJ45 receptacles
   c. Fiber optic panel mounted receptacles
      1) Fiber optic receptacles must be LC-Duplex compatible.
      2) Ruggedized locking connector system
      3) Provide:
         a) Neutrik opticalCON receptacles with SCD-NC rubber sealing covers
   d. Multi-Pin receptacles
      1) Provide ruggedized multi-pin receptacles to mate with cord-mounted connector on device type HLP, portable houselight controller.
7. Labeling:
   a. Label each network receptacle with appropriate designations. All network receptacle labels to be engraved with white core fill, unless otherwise noted.
   b. Provide lamacoid tags for the following information:
1) Maximum length of external Category 5e cable that can be connected without violating the Category 5e standard
2) Circuit designation(s) of each power receptacle. Circuit designations to be verified by Division 26 prior to fabrication.
c. Lamacoid tags to be engraved on black (with white core) with chamfered edges, and shall be securely mechanically fastened to device.

8. Mounting:
a. Devices shall be surface, flush or recess mounted at locations and mounting heights as called out on drawings and device schedules.
b. Provide all requisite mounting hardware for installation of devices. Coordinate all device mounting requirements with Division 26.
c. All holes in mounting brackets to have 1” minimum slotted hole to enable adjustment for field conditions. Provide lock washers on bolts.

B. Console Connection panels – Type ‘CC’:
1. Provide device with one double duplex “clean” power receptacle and control receptacles as shown on the drawings.
2. RJ45 receptacles shall be connected via Category 5e cable to the Ethernet network and shall allow full function nodes or other peripheral portable nodes to be connected to the network.
3. Fiber optic receptacles shall be terminated with 2 fiber cable as specified herein.
4. Portable house light control receptacle shall allow full function of portable house lighting controller including panic and normal functions.

C. Network Taps – Type ‘ET’:
a. Provide device with one duplex “clean” power receptacle and control receptacles as shown on the drawings.
b. RJ45 receptacles shall be connected via Category 5e cable to the Ethernet network and shall allow full function nodes or other peripheral portable nodes to be connected to the network.
c. Fiber optic receptacles shall be terminated with 2 fiber cable as specified herein.

2.9 ARCHITECTURAL LIGHTING CONTROL SYSTEM

A. General
1. The Architectural lighting control system shall be a microprocessor-based control system that works in conjunction with the theatrical lighting control console in rooms where consoles are provided and otherwise independently to set and control auditorium house lighting or studio lighting levels.
2. The system shall control architectural LED house lighting, DMX relay-controlled work lighting and DMX-controlled switching for theatrical circuits as shown on the drawings.
3. The system shall operate through master control panels, preset recall stations and entry panel stations located as shown in the drawings. The system shall also be controlled remotely with a portable master station (specified herein) with plug-in locations as shown in the drawings.
4. The System shall be configured to allow multiple active presets to control architectural lighting, work lights, and theatrical fixtures simultaneously through the use of multiple room assignments.
5. Switching between panels shall not cause flicker or change in lighting levels when setting on panels or House Lighting master station are identical.
6. The System shall have the ability to “snapshot” DMX levels from the theatrical lighting console and record those levels into architectural system presets.
7. When in use, the theatrical console shall override preset levels on a highest takes precedence basis and shall directly control only those dimmed architectural and theatrical circuits within the same performance space.

8. The architectural and theatrical lighting circuits in the performance spaces shall operate independently of the lighting circuits in the lobbies and public spaces. This system shall not control the lobbies and public spaces.

9. All control panels and presets shall be programmed by the Contractor as part of the work of this Section, in coordination with the Architect, Theatre Consultant, and Owner.

10. Provide:
   a. Electronic Theatre Controls Unison Paradigm System

B. Architectural Control Processor
   1. The architectural control processor allows programming and recall of preset lighting states, time clock events and sequences, and control of fade times between presets.
      a. Provide support for a minimum of 99 lighting presets
   2. Provide sufficient quantity of processors for each system to support simultaneous control during preset recall of:
      a. All architectural fixture control addresses
      b. All dimmed and switched architectural circuits
      c. All switched theatrical circuits
      d. One (1) DMX universe for theatrical dimmers and/or fixture control addresses
   3. System operating program shall be stored in electrically erasable programmable read only memory (EEPROM).
   4. Data storage facilities shall retain memory for an indefinite period of time. In case of power failure, the control module shall retain preset memory for minimum of 72 hours.
   5. Provide control system configuration software operating on a PC platform to allow configuration and preset level setting.
   6. Provide in a rack-mount enclosure for installation in standard 19” racks.

C. House Light Panic System
   1. The House Panic Control System instantly brings the architectural lights to full with the push of one button. The system is always enabled at every location, regardless of the state of other control systems. The system must operate independently of emergency power transfer relays or other power failure reliant systems.
   2. House Light Panic System shall include a separate power supply and DMX driver so that house lights can be brought on in the event of failure of primary supply and/or electronics.
   3. House Light Panic control shall be included in all House Lighting Master Stations, including any portable stations.
   4. Operations:
      a. The NORMAL push button is illuminated at all locations whenever Panic System is not activated.
      b. Depressing any PANIC push button illuminates the PANIC push button and turns off illumination of the NORMAL push button at all locations, and causes a control signal from a dedicated set of control electronics and a dedicated power supply to be applied to selected house light dimmers. This causes those house light dimmers to output full line voltage to loads. This state remains until any NORMAL push button is depressed. Depressing any NORMAL push button illuminates the NORMAL push button and turns off illumination of the PANIC push button at all locations, and returns the system to the exact state it was in prior to depression of the PANIC push button.

D. Architectural LED Lighting Dimming & Control Interfaces
   1. Architectural lighting fixtures with LED sources compatible with low voltage dimming will be controlled via DMX data signals generated by the theatrical lighting control systems.
2. Architectural lighting fixtures with LED sources compatible with mains dimming will be controlled directly by dimmer modules in the theatrical lighting dimming system.

3. Low voltage drivers and theatrical system dimmer modules for all LED sourced architectural lighting fixture types shall be tested for full 0-100% dimming range compatibility at the dimming and control manufacturer’s factory.

4. Control interface devices, including control signal nodes and repeaters, shall be rack-mounted or provided in DIN rail enclosures.

5. Fixture interface devices, including device drivers and external power supplies, required between control signals and the LED fixtures shall be provided under Division 26 work.

6. Provide:
   a. DMX output nodes, DMX repeaters, and/or DMX-controlled 0-10V output nodes as listed in the Appendix. Review Division 26 Architectural Lighting documents to confirm quantity of outputs required for control of system.

E. Architectural LED Lighting Emergency Bypass Detection

1. Provide a power loss detection device that will monitor normal power feed and generate a contact closure output to trigger emergency lighting bypass operation upon loss of normal power.

2. Each unit shall provide isolated outputs for connection of multiple devices.

3. Unit shall be compatible with single or three phase systems.

4. Unit shall provide automatic sensing of normal power loss.

5. Unit shall include an integrated circuit breaker for over-current protection and simulation of normal power loss.

6. Unit shall provide a normally-closed input for interface with fire alarm systems.

7. The unit shall be UL924 listed.

8. Outputs shall be configurable as normally open or normally closed.

9. Provide:
   a. Electronic Theatre Controls Emergency Bypass Detection Kit, model EBDK

F. Architectural LED Lighting Emergency Bypass Controller

1. Provide low voltage bypass device that will allow LED sourced fixtures to operate as normal / emergency fittings by sending DMX512 directly to connected fittings. The unit shall override the control signals on associated emergency lighting fittings upon loss of normal power.

2. When in panic mode, the unit can provide a maintained normally open, normally closed, dry contact or +12VDC signal.

3. Each unit shall provide a full universe (512 channels) of DMX control.

4. The unit shall be UL924 listed.

5. Outputs shall be compatible with DMX512 protocol.

6. Provide:
   a. Electronic Theatre Controls DMX Emergency Bypass Controller, model DEBC

2.10 ARCHITECTURAL LIGHTING CONTROL PANELS

A. General:

1. Control electronics shall use digital electronic circuitry, be microprocessor based and be designed specifically for the control of architectural lighting systems. Location, overall dimensions, and quantity of control devices shall be as shown on drawings.

2. Controls shall be low voltage type and use N.E.C. Class II, low-voltage wiring.
   a. Only Belden control cables shall be acceptable.

3. Control device back boxes, where required, shall be standard deep masonry boxes by Square D or equal. Back box depth not to exceed 4” without prior approval.
   a. Provide surface mount or custom flush mount back boxes and properly sized faceplate as required for each location shown on drawings.
b. Standard flush mount back boxes to be provided by Division 26.
c. Faceplate shall match edges of back box in surface mount conditions.
d. Flush mounted faceplates shall have chamfered edges, finished as per Architect.

4. All standard 19” rack panels to be flanged, black, anodized aluminum.
5. Faceplates shall attach to the device with no visible mounting screws. No manufacturer’s logo or other marking shall appear on faceplates unless otherwise noted.
6. Faceplate finishes shall be manufacturer’s standard finish unless otherwise noted by Architect or Architectural Lighting Consultant. Selection of finish, custom or standard color shall be by Architect.
7. Control devices shall be provided with appropriate zone and/or scene descriptions. These descriptions shall be furnished to the Manufacturer prior to fabrication by the Architect or Architectural Lighting Consultant and shall be engraved and filled with color to be selected by Architect. Any silk screened borders, logos, potentiometer graduations, etc. shall use a chemically bonded graphic process which resists removal by scratching, cleaning, or other light abrasive scouring.
8. All slider potentiometers shall have a minimum travel of one (1) inch and shall have a graduated scale marked adjacent to the slider.

B. House Lighting Master Station with Panic System ‘HL’
1. Provide a panel assembly with flush mounted Color Touchscreen Controller capable of the following operations:
   a. Random playback of House Light presets as described herein.
   b. Control of relay-controlled work lighting circuits as described herein.
   c. House Light Panic system control as specified herein.
2. The Color Touchscreen Controller shall include the following:
   a. Back lit user customizable 7” color liquid crystal display with user interface touch screen face-plate.
   b. The Controller shall have multiple pages to enable:
      1) Preset selection and playback
      2) Preset, level and fade time recording
      3) Adjustment of individual dimmed channel and switched work light channel levels/status
      4) Recording of Theatrical Lighting console output into architectural system presets
   c. Products:
      1) Electronic Theatre Controls Unison Paradigm 7” Touchscreen
3. Provide front panel containing all controls as required to operate House Panic System as specified herein.
4. Provide EAO Series 31 Switches as specified above for PANIC, NORMAL controls.

C. Portable House Lighting Master Station ‘HLP’
1. Provide one Portable House Lighting Master Station with all of the features described above in a rugged portable enclosure.
2. Case: Provide sturdy case with carrying handles and rubber feet, as indicated on the Theatrical Lighting drawings.
3. Cables
   a. Provide 1 – 10’, and 1 – 25’ male to female combined power and control cable to mate with associated connection panels.
4. Mating Connectors
   a. Provide mating female multi-pin receptacle in the CC panels as shown on the drawings.

D. House Lighting Master Station ‘HL2’
1. Provide a Color Touchscreen Controller capable of the following operations:
   a. Random playback of House Light presets as described herein.
b. Control of relay controlled work lighting circuits as described herein.

2. The Color Touchscreen Controller shall include the following:
   a. Back lit user customizable 7” color liquid crystal display with user interface touch screen face-plate.
   b. The Controller shall have multiple pages to enable:
      1) Preset selection and playback
      2) Preset, level and fade time recording
      3) Adjustment of individual dimmed channel and switched work light channel levels/status
      4) Recording of Theatrical Lighting console output into architectural system presets

3. Provide:
   a. Electronic Theatre Controls Unison Paradigm 7” Touchscreen

E. Architectural entry stations - Type ‘EP’
   1. Provide push button entry stations in surface or flush mounted box in locations as shown on the drawings. See drawings for push button quantities per device type.
   2. Station shall recall designated preset(s) and may be disabled by the main system control.
   3. LED indicators in switches shall indicate the active preset on the panel.
   4. Stations shall allow multiple presets to be concurrently active.

2.11 THEATRICAL WIRING DEVICES

A. General
   1. Provide all theatrical wiring devices as indicated on the drawings and as specified herein, for installation by Division 26.
   2. Coordinate size of device, orientation of circuits and mounting detail to suit site condition.
   3. Device back boxes and faceplates to be sheet metal construction, finished flat black unless otherwise noted. Provide requisite mounting holes, conduit knockouts, etc.
      a. Provide surface mount or flush mount back box and properly sized faceplate as required for each location shown on drawings.
      b. Standard flush mount back boxes to be provided by Division 26.
      c. Faceplate shall match edges of back box in surface mount conditions.
      d. Flush mounted faceplates shall have chamfered edges, finished as noted or as per Architect.
   4. Receptacles:
      a. Stage Pin Connectors
         1) All 20 amp stage pin receptacles shall be of the same manufacture
         2) Flush mounted female receptacles shall have a screw-driven locking spring to ensure firm fit on face panel
         3) Provide for 20A stage pin connectors:
            a) Union Connector 20-2P&G series
            b) Rosco 2000 series
            c) Bates Connectors
      b. 20A Edison (NEMA 5-20R) duplex panel mounted receptacles
         1) All receptacles shall be of the same manufacture
         2) Hospital Grade to UL 498 Supplement SD
         3) Retention force of grounding pin tested to NFPA 99. Retention force shall not be less than 4 oz.
         4) Color: Black except where specifically noted otherwise
         5) Provide:
            a) Leviton 8300-E
            b) Legrand/Pass & Seymour 8300-BK
      c. 20A Edison (NEMA 5-20R) cord mounted receptacles
1) All receptacles shall be of the same manufacture
2) Hospital Grade to UL 498 Supplement SD
3) Retention force of grounding pin tested to NFPA 99. Retention force shall not be less than 4 oz.
4) Nylon and/or high impact polycarbonate body with screw-open cable gripping jaws
5) Straight body
6) Color: Black and white, black and clear, or clear and white
7) Provide:
   a) Leviton 8319C
   b) Legrand/Pass & Seymour PS5369XHG
   c) Hubbell 8319C
   d) Cooper (Arrow/Hart) 8369
d. Multi-Pin Locking Connectors
   1) All multi-pin receptacles shall be of the same manufacture, including panel mount female and cord mount male and female connectors
   2) Provide cord mounted connectors with appropriate strain relief:
   3) Single cables with double basket weave strain relief
   4) Multiple individual cords with clamping cable glands
   5) Multi-pin receptacles and plugs shall be 19-pin connectors wired for 6 circuits with dedicated line and neutral connections and 7 ground wires.
   6) Provide:
   7) Veam VSC
   8) Approved equal

5. Provide all wiring devices with either internal terminal strips or exterior terminal boxes for interconnection to the dimming and switched power system. All wiring devices may be internally wired at the factory prior to shipping.
   a. Size all terminals as required based on wire sizes indicated on the Electrical Documents.
   b. Terminal strips shall be grounded to the device enclosure.

6. Terminal Boxes:
   a. Provide terminal boxes factory assembled with numbered terminal blocks for field connection by others, as indicated in the drawings and schedules.
   b. All terminal boxes regardless of quantity of circuits shall be the same size.
   c. Provide six spare terminals in each terminal box in addition to the spare circuits indicated in the schedules. Provide 4 ground lugs per box. Size all lugs and terminals as required based on wire sizes indicated on the Electrical Documents.
   d. Sheet metal construction, finish flat black. Reinforce base of terminal boxes as required to take load from multi-cable.
   e. Back box to be clearly labeled with circuit numbers.

7. Labeling:
   a. Label each receptacle with appropriate circuit designation indicated on distribution schedule and drawings. All labels to be engraved on black (with white core) lamicoid tags with chamfered edges. Tags to be securely mechanically fastened to wiring device.

8. Mounting:
   a. Devices shall be surface, flush or recess mounted at locations and mounting heights as called out on drawings.
   b. Provide all requisite mounting hardware for installation of theatrical wiring devices. Coordinate all device mounting requirements with Division 26.
   c. All holes in mounting brackets to have 1” minimum slotted hole to enable adjustment for field conditions. Provide lock washers on bolts.

9. The Manufacturer is responsible for providing all wiring devices to meet all requirements as stated by the National Electrical Code and local code in reference to separation,
isolation, and clearances for all voltages specified, as well as terminal sizes for all cable sizes, cable entry sizes, and exit routes and standoff.

B. Plug Boxes with Flush Receptacles - Type ‘PBR’
1. Provide plug boxes with flush mounted receptacles as shown on the drawings. See drawings for device locations and distribution schedule for device type, mounting type and circuit quantity.
2. Label each receptacle with appropriate switched circuit designation and DMX address or dimmer designation indicated on distribution schedule and drawings.

C. Plugging Strip with Pigtails - Type ‘PSP’
1. Provide plugging strips of standard plug batten construction with pigtail mounted receptacles as shown on the drawings. See drawings for device locations and distribution schedule for device type, mounting type and circuit quantity.
2. Pigtail length shall be as indicated on drawings.
3. Provide pigtail of 12/3 ‘S’ or ‘SO’ neoprene jacketed cable with appropriate strain relief.
4. Label each receptacle with appropriate switched circuit designation and DMX address or dimmer designation indicated on distribution schedule and drawings.
5. Provide with integral control device panels where indicated on drawings.
6. Provide brackets and hardware for mounting boxes. All holes in mounting bracket to have 1” minimum slotted hole to enable adjustment for field conditions. Provide lock washers on bolts.

D. Multi-cable Box with Flush Receptacles – Type ‘MBR’
1. Provide multi-cable boxes with flush mounted receptacles as shown on the drawings. See drawings for device locations and distribution schedule for device type, mounting type and circuit quantity.
2. Provide metal dust caps on cable lanyard captive to back box for each multi-pin receptacle.
3. Provide boxes with forged shouldered eye bolts mounted to reinforced edges of back box for multi-cable strain relief.
4. Label each receptacle with appropriate switched circuit designation and DMX address or dimmer designation indicated on distribution schedule and drawings.

E. Multi-cable Box with Pigtails - Type ‘MBP’
1. Provide multi-cable boxes with pigtail mounted receptacles as shown on the drawings. See drawings for locations of devices and distribution device schedule for device type, mounting type and circuit quantity.
2. Provide metal dust caps on cable lanyard captive to back box for each multi-pin receptacle.
3. Provide boxes with forged shouldered eye-bolts mounted to reinforced edges of back box for multi-cable strain relief.
4. Pigtail length shall be as indicated on drawings.
5. Provide multi-cables built from 75°C Extra-Hard Usage Cords, which consist of specified number of circuits rated 20 amps at 125 volts in accordance with Article 520 of National Electric Code.
6. Strain Relief:
   a. Provide Hubbell Kellems Deluxe Cord type grips correctly sized to restrain permanently attached multi-conductor cables to all multi-cable junction boxes and drop boxes.
   b. Provide Hubbell Kellems Heavy Duty, Single Eye, Closed Mesh Strain relief on each multi-cable extension.
7. Label each receptacle with appropriate switched circuit designation and DMX address or dimmer designation indicated on distribution schedule and drawings.
2.12 SOURCE QUALITY CONTROL

A. All equipment and components shall be factory tested prior to shipping.

B. Assemble in factory any and all system assemblies and subassemblies at Architect or Theatre Consultant's request, for testing in presence of Architect or Theatre Consultant, prior to shipment. Notify Architect at least 3 weeks prior to date when equipment is complete and ready for testing. Make equipment available to Architect or Theatre Consultant in Manufacturer's factory for period of at least 2 weeks for testing prior to shipment.

C. During the test provide test equipment for all testing required and any other testing requested by the Architect or Theatre Consultant.
   1. Test Equipment shall consist of any item that is proprietary to the testing of Manufacturer's equipment. Meters and oscilloscope need not be supplied.

D. Control Testing:
   1. Theatre Lighting Control Console and Network system shall be assembled in factory and tested for control console update time, video refresh rate, remote video picture quality, and any other function requested by Architect.
   2. Architect shall be sole judge of extent of testing necessary and sole judge of acceptability of any system tested.

E. Verification of Performance:
   1. Provide Architect with all test results for verification of system performance.

F. For equipment that requires in-house testing, do not ship any piece of equipment without either written verification of factory testing or written waiver of factory testing from Architect for that particular piece of equipment.

2.13 FABRICATION

A. Fabricate all work in this section in accordance with the Architect’s direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.

B. Machine finish all operating parts to standard trade tolerance, fits and finishes.

C. Carry out shop welding in full accordance with the appropriate sections of “Specifications for the Design, Fabrication and Erection of Structural Steel Buildings” of the American Institute of Steel Construction (AISC).

D. Fabrication, assembly and wiring shall be neat and workmanlike throughout.

E. Control desks, racks and cabinets shall be welded assemblies of sheet steel or aluminum or of bar size angles, channels and tees or aluminum extrusions forming rigid enclosures to support internal components.

F. All face panels shall be fully supported on all edges, either internally or by rolling interior edges of panels.

G. All control device faceplate screws to be countersunk.

H. All distribution device faceplate screws to be slotted Phillips pan head type.
I. Wood furniture/cabinet work for control desks acceptable with prior approval.

J. Operating elements shall be mechanically safe and electrically "dead".

K. All steel parts and panels shall be cleaned and primed with rust inhibiting primer. Exterior finishes shall be epoxy resin or baked enamel in matte black or in anodized black aluminum where approved.

L. Control element working face panels shall be heavy aluminum or bakelite. Legends and control and protective device designations shall be engraved in panels, or in permanently attached plates, and located for ready identification.

M. Operating instructions shall be similarly engraved and appropriately located on designated equipment.

N. All panel engraving shall be in Helvetica Regular, height as indicated herein. Engraving shall be ¼" or 3/16" as shown in drawings. In no case shall the engraving be less than 3/16" high without Architect’s approval.

O. All internal wiring shall be factory completed and clearly marked.

P. Field connections shall be made by connector devices and cables as specified in preceding sections.

Q. Dimmer modules, dimmer controllers and other plug-in components may have spade lug and/or receptacle devices for connection.

R. Control relays wherever possible shall be the glass or polycarbonate enclosed plug-in type. Relays shall be acoustically damped.

S. Uniform components shall be used throughout the system. All dimmer, fader and preset controllers shall be physically similar; they may vary in voltage according to the Theatrical Lighting Manufacturer circuit requirements.

T. All wire sizes and insulation to comply with UL standards and local codes and meet or exceed electronics industry standards.

U. All wiring to be harnessed and bound. No loose or randomly routed wires permitted.

V. All printed circuit cards to be suitably racked with numbered and indexed guides. Legends to be provided on panel door.

W. Key all components in this section with locks or key switches alike. Provide six keys minimum.

X. Each receptacle within a wiring device must have a home run to the dimmer rack or DMX controlled panelboard of its hot and neutral. Circuits with more than one receptacle must be paralleled at the dimmer rack. The method of termination must not void UL listing. Circuits with more than one receptacle within a single wiring device may be paralleled within the device and require only one home run of the hot and neutral to the dimmer rack or DMX controlled panelboard.

Y. Minimize feeder inductance by twisting the hot and neutral conductors in long connector strips. Neutral conductor must be at least the same size or greater than the hot conductor.
PART 3 - EXECUTION

3.1 INSTALLERS / INTEGRATORS

A. To establish comparative standards of quality, the provision of equipment and services of this section shall be by one of the following authorized dealers:

Beck Studios, Inc
1001 Tech Drive
Milford, OH 45150
Tel: (513) 831-6650

Fantasee Lighting
14857 Martinsville Road
Belleville, MI 48111
Tel: (734) 699-7200

Texas Scenic Co.
8053 Potranco Road
San Antonio, TX 78251
Tel: (210) 684-0091

Vincent Lighting Systems
36500 Ford Rd.
Westland, MI 48185
Tel: (734) 660-8959

B. Substitution Limitations

1. Any contractor who wishes to be listed and has not been pre-approved must submit qualification information to the Architect. Proposal shall include all of the information listed below:

a. Statements of financial responsibility for the past five fiscal years showing assets and liabilities.

b. List of principal officers and design and service engineers in an organizational structure flow chart.

c. List of not less than 5 projects of similar size and scope completed within the five years on which contractor has provided full services: product engineering, shop drawings, manufacture, installation and commissioning. In each instance, indicate specifics of scope of fabrication and installation. Include a contact list: name, address and phone numbers of person(s) directly responsible for operation and maintenance of equipment in each facility.

d. List of current projects and approximate contract value and completion dates. Include list of names, phone numbers and addresses of owner, owner's representatives and architect.

e. For each above described project, list of names of persons who supervised preparation of shop drawings, manufacture of components, and installation of equipment.

f. List of names of persons who would do project management, product engineering, supervision of shop drawing, and supervision of installation should this contract be awarded.

g. Contract Bond Company information indicating that contractor has bonding capacity for full duration of project. Include list of other bonded projects coinciding with this project.
h. Evidence of ability to undertake custom product engineering to meet specific requirements of project specifications. Provide sample project engineering drawings for custom products and contact information for facility operators where those products have been installed.

2. Standards of Acceptance:
   a. Refer to Paragraph 1.8B - Quality Assurance/Qualifications.

3.2 EXAMINATION
   A. Verification of Conditions: Contractor must examine areas and conditions under which the equipment is to be installed and must notify the General Contractor in writing of conditions detrimental to proper and timely completion of work. Work will not proceed until unsatisfactory conditions have been corrected in a manner acceptable to the Contractor.

3.3 INSTALLATION
   A. Install all work in this section in accordance with the Architect’s direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.
   B. Provide site supervision during the installation of electrical work associated with the Theatrical and Architectural Lighting system elements.
   C. Install all work securely, complete with all bolts, nuts, washers, clips, fittings, supports, and other items required for proper installation and operation.
   D. Position all items accurately as indicated on drawings and true to plumb, line and level. Maintain maximum headroom and clearances at all points.
   E. Coordinate work with all other trades to avoid causing delays in construction schedule.
   F. All field welding requires prior approval of the Architect and Contractor’s Structural Engineer.
   G. Carry out approved field welding in full accordance with the appropriate sections of “Specifications for the Design, Fabrication and Erection of Structural Steel Buildings” of the American Institute of Steel Construction (AISC).
   H. Do all cutting, drilling, tapping and approved welding required to properly install work. Obtain Architect’s prior approval for cutting and drilling of existing structural work.
   I. Clean structural steel and fabricated steelwork of rust, scale and foreign matter by grinding; prime with 1 coat of chromated primer; finish with 1 coat of first quality machinery enamel free of skips, runs and saps. Touch up all field connections, welds and abraded places with primer and enamel.

3.4 FIELD QUALITY CONTROL
   A. The installation of the equipment indicated in this section shall be supervised by qualified personnel who are regularly employed by the Contractor for supervision of equipment installation similar to that indicated herein.
   B. Installers must be appropriately skilled and experienced for the type and quality of work.
C. Arrange for all tests and inspections required by the General Requirements.

3.5 SYSTEM STARTUP AND COMMISSIONING

A. Commissioning
1. Upon completion of installation work required by the work of this Section, the Contractor shall perform all required tests and inspections, including but not limited to the Compliance Testing Procedures specified herein.
2. Contractor shall supply all equipment required for the commissioning process including access equipment (personnel lifts, ladders and appropriate protective equipment), test instruments and communications equipment.
3. Contractor shall provide staff to assist in the commissioning process.
4. Compliance Testing Procedures (CTP)
   a. Test all dimmed/switched receptacle circuits:
      1) Polarity
      2) Circuit identification
      3) Assignment to designated device
   b. Test all control receptacles for data integrity
      1) DMX
      2) Ethernet
   c. Test all theatrical control devices for function
      1) DMX Nodes
      2) Remotes
      3) Consoles
      4) Architectural Panels
   d. Test all cables provided as part of this section

B. Lighting Preset Programming
1. Coordinate with the Owner to determine the desired lighting presets including the layout and functionality of touchscreen pages as described herein, button station presets and keyswitch operations.
   a. Preliminary programming of touchscreen control stations shall be completed prior to final system checkout.
   b. Preliminary programming of preset light control stations shall be completed prior to final system checkout.
2. At the Demonstration, the touchscreen layouts, functionality, and preliminary lighting presets will be reviewed by the Owner and changes may be required at that time.

3.6 ADJUSTING

A. Adjust all equipment and components for operation in accordance with the specifications, approved shop drawings and pertinent Contract Drawings prior to the demonstration indicated herein.

3.7 CLEANING

A. Touch up minor abrasions and imperfections as required.
B. Remove from the premises all debris caused by this work. All unnecessary equipment and materials shall be removed from the area(s) of this work upon completion, removed from the job site and disposed of legally at no additional cost to the Owner.
3.8 CLOSEOUT ACTIVITIES

A. Demonstration
1. Upon completion of Commissioning, the Contractor will notify the Architect and Theatre Consultant that system is complete, conforms to specification and is ready for Demonstration.
2. Installed equipment is to be operated for approval and inspected for quality by the Theatre Consultant, the Architect and the Owner.
3. The Theatre Consultant will perform the tests listed in the Compliance Testing Procedures to verify compliance with specifications.
4. Contractor shall supply all equipment required for the Demonstration, including access equipment (personnel lifts, ladders and appropriate protective equipment), test instruments and communications equipment.
5. Contractor shall provide staff to assist in the Demonstration, as necessary.
6. Adjustments or modifications shall be made as directed by the Architect and the Theatre Consultant.
7. Costs of re-inspection and additional testing by the Architect and Theatre Consultant, if required, due to lack of completion and/or errors and omissions shall be paid by the Contractor. This work will be conducted on a time and materials basis, including the Architect’s and Theatre Consultant’s standard hourly rates, and shall be scheduled and approved in writing prior to the re-inspection/testing session.

B. Training
1. Following the equipment demonstration, inspection and final adjustments, provide an instruction session to the Owner’s staff or representatives on the safe operation, care and maintenance of the system.
   a. Provide instruction of not less than eight hours total, in 2 separate sessions.
   b. Instruction shall include, but not be limited to, proper general maintenance of the system, replacement procedures for user replaceable parts, and operating procedure to obtain maximum usage of system.
   c. Deliver all copies of approved Operations Manual to Owner prior to first instruction session, and review it as part of that session.
   d. The first session shall take place in the presence of the Architect or Theatre Consultant and shall occur directly after finish of Completion Checkout. If Owner, Architect judge that any work inspected fails to conform to the specification or is not substantially complete at time of Completion Checkout, postpone instruction session until Owner and Architect judge the entire Lighting System to conform with specification.
   e. The second session shall occur at a time arranged by the Owner no sooner than 1 day and no later than 1 month after first session.
2. Console Operator Instruction:
   a. Provide instruction to Owner or Owner’s selected key Lighting Control Console Operators on the detailed operation of Console. This training shall take place in two separate sessions. Each session shall be no less than four hours and shall take place on site.
3. Timing for all sessions shall be scheduled by the Owner at their convenience.
4. Instruction must be by qualified expert operators who have actual experience with systems in performance conditions.

3.9 PROTECTION

A. Provide full protection from damage, construction dirt and debris for all equipment from the point of installation to testing and commissioning.
B. Remove all equipment protection and clean components thoroughly prior to the demonstration session.

3.10 MAINTENANCE

A. Maintenance Service

1. One month prior to the end of the first year following the date of final systems acceptance, a factory engineer shall be provided to examine, adjust and repair the equipment included in this section which is found to require warranty work prior to the end of the warranty period. This service shall not cover adjustments, repairs or replacement of parts due to negligence, misuse, abuse or accidents caused by persons other than the Manufacturer. All labor and materials which are required to perform this service shall meet or exceed these specifications and shall not compromise the performance of the equipment in any way.

2. Following this inspection and maintenance service, the Contractor shall provide the Owner and Theatre Consultant with a written report itemizing the results of the inspections and the warranty work that was conducted. The Contractor shall also include in this written report recommendations for any corrective actions which the Contractor feels should be taken with respect to the equipment included in this section, but are outside the scope of the warranty agreement.

B. System Programming Updates

1. Contractor shall review system operation and control system programming with the Owner’s representatives. Any required adjustments and changes to the control system programming requested by the Owner shall be performed and completed during the time of the corrective service site visit. All control system programming changes shall be documented by the Contractor.

3.11 ATTACHMENTS

A. Refer to Appendix A of this section for quantities and accessories.

END OF SECTION 11 61 63
SECTION 122413
ROLLER WINDOW SHADES

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Manual roller shades (WT-1).
   2. Motorized roller Shades (WT-2)
   3. Motorized double roller shades (WT-3).
   4. Manual double roller shades (WT-4)

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product indicated. Include styles, material descriptions, construction
details, dimensions of individual components and profiles, features, finishes, and operating
instructions.
   1. Motorized Shade Operators: Include operating instructions.
B. Shop Drawings: Show location and extent of roller shades. Include elevations, sections, details,
fabric width and dimensions not shown in Product Data. Show installation details, mountings,
attachments to other work, operational clearances, and relationship to adjoining work.
   1. Motorized Shade Operators: Show locations and details for installing operator components,
      switches, and controls. Indicate motor size, electrical characteristics, drive arrangement,
mounting, and grounding provisions.
   2. Wiring Diagrams: Power, system, and control wiring.
C. Samples for Initial Selection: For each colored component of each type of shade indicated.
   1. Include similar Samples of accessories involving color selection.
D. Shade Material Samples for Verification: Not less than 3 inches square, with specified treatments
   applied. Mark face of material.

1.3 INFORMATIONAL SUBMITTALS
A. Product Certificates: For each type of roller shade, signed by product manufacturer.
B. Qualification Data: For Installer.
C. Product Test Reports: For each type of roller shade.

1.4 CLOSEOUT SUBMITTALS
A. Maintenance Data: For roller shades to include in maintenance manuals. Include the following:
   1. Methods for maintaining roller shades and finishes.
   2. Precautions about cleaning materials and methods that could be detrimental to fabrics, finishes,
      and performance.
   3. Operating hardware.

1.5 QUALITY ASSURANCE
A. Installer Qualifications: Fabricator of products.
B. Source Limitations: Obtain roller shades through one source from a single manufacturer.
C. Fire-Test-Response Characteristics: Provide roller shade band materials with the fire-test-response characteristics indicated, as determined by testing identical products per test method indicated below by UL or another testing and inspecting agency acceptable to authorities having jurisdiction:

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

E. Product Standard: Provide roller shades complying with WCMA A 100.1.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver shades in factory packages, marked with manufacturer and product name, fire-test-response characteristics, and location of installation using same designations indicated on Drawings and in a window treatment schedule.

1.7 PROJECT CONDITIONS

A. Environmental Limitations: Do not install roller shades until construction and wet and dirty finish work in spaces, including painting, is complete and ambient temperature and humidity conditions are maintained at the levels indicated for Project when occupied for its intended use.

B. Field Measurements: Where roller shades are indicated to fit to other construction, verify dimensions of other construction by field measurements before fabrication and indicate measurements on Shop Drawings. Allow clearances for operable glazed units' operation hardware throughout the entire operating range. Notify Architect of discrepancies. Coordinate fabrication schedule with construction progress to avoid delaying the Work.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide either the specified products or comparable products by one of the following manufacturers:
   1. MechoShade Systems, Inc.,
   2. Draper Inc.,
   3. Hunter Douglas, Inc.,
   5. Castec.

2.2 MANUALLY-OPERATED ROLLER SHADES

   1. Basis of Design:
      a. FlexShade by Draper, Inc.,
      b. Mecho/5 by MechoShade Systems, Inc.
   2. Visually Transparent Shade Fabric: Refer to Material Identification List.

2.3 MOTOR-OPERATED ROLLER SHADES

1. Basis of Design:
   a. Motorized FlexShade by Draper, Inc.
   b. ElectroShade by MechoShade Systems, Inc.
2. Visually-Transparent, PVC-Free Single-Fabric Shade: PVC-free cloth fabricated from TPO yarn; Cradle to Cradle certified; with straight bottom hem.
   a. Basis of Design: Draper GreenScreen Revive.
      1) Openness Factor: 1 percent.
   b. Open Basket Weave: EcoVeil 1350 Series by MechoShade Systems, Inc..
      1) Openness Factor: 5 percent.

2.4 MOTOR-OPERATED DOUBLE ROLLER SHADES
A. (WT-3) Motor-Operated Double-Roller Shade: Motor-operated, double roller shades, with [fascia], and related heavy duty mounting systems and accessories.
   1. Product and Manufacturer:
      a. ElectroShade DoubleShades by MechoShade Systems, Inc.
   2. Visually-Transparent, PVC-Free Single-Fabric Shade, Interior Face: PVC-free cloth fabricated from TPO yarn; Cradle to Cradle certified; with straight bottom hem.
      a. Basis of Design: Draper GreenScreen Revive.
         1) Openness Factor: 1 percent.
      b. Open Basket Weave: EcoVeil 1350 Series by MechoShade Systems, Inc..
         1) Openness Factor: 5 percent.
   3. Blackout Shade, Exterior Face: Opaque shade, 0 percent openness factor; straight bottom hem.
         1) Material: 53 percent fiberglass, 45 percent acrylic, 2 percent polyester finish (PVC-free).

2.5 MANUALLY-OPERATED DOUBLE ROLLER SHADES
A. (WT-4) Manually-Operated Double-Roller Shade: Manually-operated, double roller shades, with housing as indicated on Drawings, continuous jamb channels, and related heavy duty mounting systems and accessories.
   1. Basis of Design: DoubleShades by MechoShade Systems, Inc..

2.6 SYSTEM COMPONENTS
A. Provide complete system with side angles, bottom bar, headbox, sponge liner, roller tube, controls, wiring, switches, fascia panel, and necessary accessories and fasteners.
B. Rollers: Electro-galvanized or epoxy primed steel or extruded-aluminum tube of diameter and wall thickness required to support and fit internal components of operating system and the weight and width of shade band material without sagging; designed to be easily removable from support brackets; with manufacturer's standard method for attaching shade material. Provide capacity for one roller shade band per roller, unless otherwise indicated.
C. Mounting Brackets: Galvanized or zinc-plated steel, painted to match fascia (where applicable).
D. Fascia: L-shaped, formed-steel sheet or extruded aluminum; long edges returned or rolled; continuous panel concealing front and bottom of shade roller, brackets, and operating hardware and operators; length as indicated on Drawings; removable design for access.
1. Top/Back Cover: L-shaped; material and finish to match fascia; combining with fascia and end caps to form a six-sided headbox enclosure sized to fit shade roller and operating hardware inside.

2. Pocket-Style Headbox: U-shaped, formed-steel sheet or extruded aluminum; long edges returned or rolled; with a bottom cover consisting of slot opening of minimum dimension to allow lowering and raising of shade and a removable or an openable, continuous metal access panel concealing shade roller, brackets, and operating hardware and operators within.

E. Pocket with Ceiling Slot Opening: Six-sided box units for recessed installation; fabricated from formed-steel sheet, extruded aluminum, or wood; with a bottom consisting of slot opening of minimum dimension to allow lowering and raising of shade and a removable or an openable, continuous metal access panel concealing rollers, brackets, and operating hardware and operators within.

F. Bottom Bar: Steel or extruded aluminum, with metal capped ends. Provide concealed, by pocket of shade material, internal-type bottom bar with concealed weight bar as required for smooth, properly balanced shade operation.

G. Mounting: As indicated on Drawings, mounting permitting easy removal and replacement without damaging roller shade or adjacent surfaces and finishes.

H. Manual Shade Operating Mechanisms: Manual-operated, with continuous-loop bead-chain, clutch, and cord tensioner and bracket lift operator; in compliance with WCMA A 100.1, including requirements for flexible, chain-loop devices; lead content of components; and warning labels.
   1. Chain-and-Clutch Operating Mechanisms: With continuous-loop bead chain and clutch that stops shade movement when bead chain is released; permanently adjusted and lubricated.
      a. Operating Function: Stop and hold shade at any position in ascending or descending travel.

2.7 ROLLER SHADE FABRICATION

A. Product Description: Roller shade consisting of a roller, a means of supporting the roller, a flexible sheet or band of material carried by the roller, a means of attaching the material to the roller, a bottom bar, and an operating mechanism that lifts and lowers the shade.

B. Concealed Components: Noncorrodible or corrosion-resistant-coated materials, with permanently lubricated moving parts.

C. Unit Sizes: Obtain units fabricated in sizes to fill window and other openings.

D. Installation Brackets: Designed for easy removal and reinstallation of shade, for supporting roller, and operating hardware and for hardware position and shade mounting method indicated.

E. Installation Fasteners: No fewer than two fasteners per bracket, fabricated from metal noncorrosive to shade hardware and adjoining construction; type designed for securing to supporting substrate; and supporting shades and accessories under conditions of normal use.

F. Color-Coated Finish: For metal components exposed to view, apply manufacturer's standard baked finish complying with manufacturer's written instructions for surface preparation including pretreatment, application, baking, and minimum dry film thickness.
2.8 MOTORIZED ROLLER SHADE OPERATORS

A. General: Provide factory-assembled motorized shade operation systems designed for lifting shades of type, size, weight, construction, use, and operation frequency indicated. Provide operation systems of size and capacity and with features, characteristics, and accessories suitable for Project conditions and recommended by shade manufacturer, complete with electric motors and factory-prewired motor controls, remote-control stations, remote-control devices, power disconnect switches, enclosures protecting controls and all operating parts, and accessories required for reliable operation without malfunction. Include wiring from motor controls to motors. Coordinate operator wiring requirements and electrical characteristics with the building electrical system.

B. Comply with NFPA 70.

C. Control Equipment: Comply with NEMA ICS 1, NEMA ICS 2, and NEMA ICS 6 with NFPA 70, Class 2 control circuit, maximum 24-V ac or dc.

D. Electric Motors: UL-approved or -recognized, totally enclosed, insulated motor, complying with NEMA MG 1, with thermal-overload protection, brake, permanently lubricated bearings, and limit switches; sized by shade manufacturer to start and operate size and weight of shade considering service factor or considering Project's service conditions without exceeding nameplate ratings.
   1. Service Factor: According to NEMA MG 1, unless otherwise indicated.

E. Remote Controls: Electric controls with NEMA ICS 6, Type 1 enclosure for [surface] [recessed or flush] mounting. Provide the following devices for remote-control activation of shades:
   1. Individual/Group Control Stations: [Maintained] [Momentary]-contact, three-position, rocker-style, wall switch-operated control station with open, close, and center off functions for individual and group control.

F. Limit Switches: Adjustable switches, interlocked with motor controls and set to automatically stop shade at fully raised and fully lowered positions.

G. Operating Function: Stop and hold shade at any position.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine substrates, areas, and conditions, with Installer present, for compliance with requirements for installation tolerances, operational clearances, accurate locations of connections to building electrical system, and other conditions affecting performance.
   1. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 ROLLER SHADE INSTALLATION

A. Install roller shades level, plumb, and aligned with adjacent units according to manufacturer's written instructions, and located so shade band is not closer than 2 inches to interior face of glass.

3.3 ADJUSTING

A. Adjust and balance roller shades to operate smoothly, easily, safely, and free from binding or malfunction throughout entire operational range.

3.4 CLEANING AND PROTECTION

A. Clean roller shade surfaces after installation, according to manufacturer's written instructions.
B. Provide final protection and maintain conditions, in a manner acceptable to manufacturer and Installer, that ensure that roller shades are without damage or deterioration at time of Substantial Completion.

C. Replace damaged roller shades that cannot be repaired, in a manner approved by Architect, before time of Substantial Completion.

3.5 DEMONSTRATION

A. Engage factory-authorized service representative to train Owner maintenance personnel to adjust, operate, and maintain system.

END OF SECTION
PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Music instrument storage lockers (MESC-1).
   2. High-density sheet music storage (MESC-3).
   3. High-density sheet music storage (MESC-4).
B. Related Sections:
   1. Section 061000 - Rough Carpentry: Blocking in frame walls required to anchor casework.
   2. Section 064000 - Architectural Woodwork: (PLAM).

1.2 ACTION SUBMITTALS
A. Product Data: Manufacturer's data sheets, installation instructions, and maintenance recommendations.
B. Product Test Reports: Indicating compliance of products with requirements, from a qualified independent testing agency.
C. Shop Drawings: Prepared by manufacturer. Include elevations showing casework components, details of each condition of installation, and types and locations of hardware and fasteners. Show fabrication and installation details. Include plans, elevations, sections, details, and attachments to other Work.

1.3 INFORMATIONAL SUBMITTALS
A. Samples: For each color and finish for each exposed casework component.
B. Operation and Maintenance Data.
C. Warranty: Submit sample meeting warranty requirements of this Section.

1.4 QUALITY ASSURANCE
A. Manufacturer Qualifications: Approved manufacturer listed in this section, with minimum 5 years’ experience manufacture of similar products in use in similar environments. Obtain music education storage casework through one source from a single approved manufacturer.

1.5 DELIVERY, STORAGE, AND HANDLING
A. Deliver, store, and handle music education storage casework in accordance with manufacturer’s recommendations. Ship to jobsite only after roughing-in, painting work, and other related finish work has been completed and installation areas are ready to accept casework and recommended temperature and humidity levels will be maintained during the remainder of construction.

1.6 COORDINATION
A. Coordinate installation of blocking and supports in frame wall assemblies under work of other sections where required for anchoring of music education storage casework.
1.7 WARRANTY

A. Special Warranty: Manufacturer's written warranty indicating manufacturer’s intent to repair or replace components of music education storage casework that fail in materials or workmanship within 10 years from date of Substantial Completion. Failures are defined to include, but are not limited to, the following:
   1. Fracturing or breaking of casework components including doors, panels, shelves, or hardware resulting from normal wear and tear and normal use other than vandalism.
   2. Delamination or other failures of glue bond of components.
   3. Warping of casework components not resulting from leaks, flooding, or other uncontrolled moisture or humidity.
   4. Failure of operating hardware.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Storage Casework Component Load Capacities: Unless otherwise indicated, comply with the following:
   1. Storage Casework Wire-Grille Door Hinge: Each weld capable of resisting 400 lbf pull test without visible damage or permanent deformation.
   2. Storage Casework Full Grille Door Hinge: Full length door capable of supporting 315 lbs. Through open and close cycle without permanent damage.
   3. Sheet Music Storage Casework: Units shall support 35 lb/lin. ft. uniform shelf loading with maximum 1/16 inch deflection.

2.2 PLASTIC LAMINATE MATERIALS

A. PLAM Door Panels and Exposed Surfaces: Flush overlay 3/4 inch thick HDPL.
   1. (PLAM-2) Basis of Design: Refer to Material Identification List and Section 064000 - Architectural Woodwork.
B. Particleboard: ANSI A208.1, minimum 43 lb/cu. ft. density.
C. Particleboard Thermoset Panels: Particleboard finished with thermally-fused polyester surfacing on both sides meeting performance properties of NEMA LD 3 for VGS grade, edge-banded to match PLAM faces.
D. Plywood Thermoset Panels: Plywood finished with thermally-fused polyester surfacing on both sides meeting performance requirements of NEMA LD 3 for VGS grade, edge-banded to match PLAM faces.
E. Polyethylene Shelves: High-density, one-piece, blow-molded or polyethylene, with radiused front edge, for abuse-resistant shelves.

2.3 INSTRUMENT STORAGE

A. (MESC-1) Music Instrument Storage Lockers: Modular instrument storage casework with integral bases, adjustable levelers, and through-bolted fastening, enabling owner reconfiguration of unit layout.
B. Components and Materials:
   1. Plastic Laminate: (PLAM-2), unless noted otherwise.
2. Side Panels and Divider Panels: Particleboard thermoset panel, 3/4 inch thick. Side panels machined to accept unit-to-unit through-bolting.
4. Open Casework: Provide casework without doors.
   a. Provide for casework indicated.
5. Panel Edge Banding: Matching PLAM faces, 3 mm thick, heat-bonded, with beveled and profiled edges and corners.
6. Shelving: Sized with adequate gap between shelving and casework side panels to allow air movement inside casework.
7. Unexposed Surfaces: Particleboard thermoset panel, 3/4 inch thick. Side panels machined to accept unit-to-unit through-bolting.
8. Hardware: Provide both of the following:
   a. Cam Padlock Hasp: Surface-mounted, steel; finished to match other hardware.
   b. Built-in Combination Locks: Key-controlled, three-number dialing combination locks.

C. Shelving: Sized with adequate gap between shelving and casework side panels to allow air movement inside casework.
   1. Up to 27 inches wide: Removable molded polyethylene shelf, with impact-resistant, radiused front edge, mounted to cabinet wall with self-locking clip.
   2. Over 27 inches wide: For large instrument casework: Removable formed polyethylene shelf, ribbed, with high-impact-resistant, radiused front edge, supported by steel tube frame.
   3. Corner cabinet revolving shelving: 0.053 inch min. thickness steel sheet bolted to revolving steel center post, with radiused hardboard deflector panel.

2.4 SHEET MUSIC STORAGE
A. (MESC-3): Music Library High-Density Storage: Sheet music storage casework in wheeled retractable units providing high-density storage, adjustable to fit most sizes of published sheet music, enabling owner reconfiguration of unit layout.
B. Unit Configurations:
   1. Unit Type: 7-shelf units, 92''H with 4 adjustable shelves and 3 fixed
   2. Standard Compartment: 10.5''H x 13''D. Each unit is 44''D and 16''W in the closed position.
   3. Oversized Compartment: 10.5''H x 16''D. Each unit is 44''D and 19''W in the closed position.
C. Components and Materials:
   1. End Panels: Particleboard thermoset panel, 3/4 inch thick.
   2. Shelving: Plywood thermoset panel, 3/4 inch thick. 7-shelf unit with 4 adjustable and 3 fixed shelves, with metal book supports.
   5. Guide Frame: 1 by 1 inch by 16 gauge/0.053 inch steel tubes, factory finished, with limiting cable, bumpers, and hat channel wall anchor.
   6. Casework Panel Color: As selected by Architect from manufacturer's standard colors.

2.5 HIGH-DENSITY OPERABLE STORAGE
A. (MESC-4) High-Density Music Library Storage: Provide manufacturer's standard mobile storage shelving systems and components. Where components are not otherwise indicated, provide manufacturer's standard components as required for a complete system.
B. Inserts: Furnish required concrete inserts and similar anchorage devices for installing track system, and furnish other components of work where installation of devices is specified in another Section.
C. Tracks: Steel rails with tops machined to mate with guide wheels and with ends designed to provide smooth, secure continuity between sections without field welding. Provide mounting brackets, anchorage devices, adjustable leveling devices, and stops at terminations of rails to prevent carriages from running off track ends.
   1. Mounting: [Surface mounted] [Recessed].

D. Carriages: Rigid frames consisting of C-shaped cold-formed steel beams and cross beams, designed to allow secure anchorage of shelving units.
   1. Wheels: Manufacturer's standard number of bearing-mounted, steel wheels, precision ground to mate with tracks.
   2. Bumpers: Provide two rubber bumpers with minimum depth of 1/2 inch each side.

E. Carriage End Panels: Full depth and height of shelving units. Provide at [the operating end] [both ends] of each range.
   1. Material: High-pressure decorative laminate.

F. Mechanical Assistance:
   1. Drive Systems: Geared transmission and chain systems with tensioning device to provide mechanical assistance and uniform movement along entire length of each carriage. Permanently shielded and lubricated.
   2. Drive Shaft: Continuous tubular or solid steel shaft, capable of transmitting torque from drive system without distortion.
   3. Locking Pins: Located on range end panels to allow locking of individual range carriage when depressed.

G. Steel-Case Shelving: Shelving consisting of full end, top, and back panels, with end panels made to receive adjustable shelves in slots or to receive clips to support adjustable shelves. Configure units for mounting on mobile carriages.

H. Steel Four-Post Shelving: Shelving consisting of four angle-iron uprights per section, with adjustable shelves resting on shelf supports hung on uprights. Configure units for mounting on mobile carriages.

2.6 ACCESSORIES

A. Filler Panels and Closure Kits: 3/4 inch thick particleboard thermoset panels matching cabinet side panels. Provide the following, cut to fit field conditions, where indicated:
   1. Wall filler between cabinet side and wall.
   2. Top filler between cabinet top and wall.
   3. Top of cabinet closure panel between cabinet and finished ceiling or soffits.
   4. Finished back panel for exposed cabinet backs.

2.7 HARDWARE

A. Butt Hinges: 2-3/4 inch, 5-knuckle steel hinges made from 0.090 inch thick metal, ANSI/BHMA A156.9, Grade 1, with powder-coated finish, through-bolted to door and side panels. Provide 2 hinges on compartment doors, and 4 hinges on full-height doors.

B. Slide Latch: 0.105 inch min. thickness steel, with padlock eye, powder-coat finish, through-bolted to panel door and side panel. Latches securely without padlock. Provide with clear plastic label holder with numbering system.

C. Panel Connectors: 1/4–20 by 1.77 inch panel connectors, with steel thread inserts, powder coated to match panels.
D. Cabinet Levelers: Leveling glides with 3/8 inch diameter threaded steel rod in steel corner brackets, minimum two each per cabinet side, accessible from within unit, and concealed in completed installation.

E. Fasteners: Manufacturer-recommended fasteners as required for casework substrate and project performance requirements, consisting of one or more of the following:
3. Expansion Anchors in Concrete and Concrete Masonry Units: Carbon-steel, zinc plated.

2.8 FINISHES
A. Steel Sheet, Steel Wire, and Exposed Fasteners: Urethane-based electrostatic powder coating, color as indicated.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine casework installation areas for compliance with requirements for installation tolerances, location of blocking and other anchoring reinforcements, and other existing conditions affecting installation and performance of casework. Proceed with casework installation upon correction of unsatisfactory conditions.

3.2 CASEWORK INSTALLATION
A. Install plumb, level, and true; using integral levelers. Install in accordance with manufacturer’s recommendations and approved submittals.

B. Install hardware uniformly and precisely. Set hinges snug and flat. Adjust and align hardware so moving parts operate freely and contact points meet accurately. Allow for final adjustment after installation.

C. Adjust casework and hardware so doors and drawers operate smoothly without warp or bind and close with uniform reveals.

3.3 HIGH-DENSITY STORAGE INSTALLATION
A. Level and plumb tracks to a tolerance of 0.09 inch in 120 inches with no more than 0.06-inch variation between adjacent rails. Use permanent shims or non-shrink grout as indicated by manufacturer.

B. Surface-Mounted Track Systems: Install underlayment, ramps, and finish flooring according to manufacturer’s written instructions and flush with track surfaces. Do not extend ramps beyond ends of carriages.

C. Carriage Installation: Mount mobile carriages on track system and adjust for smooth operation. Provide non-moving carriages securely fixed to rails where indicated.

3.4 INSTALLED WORK
A. Repair or replace defective work as directed by Architect upon inspection.
B. Clean casework surfaces. Touch up, refinish, or replace damaged components in a manner acceptable to Architect.
C. Turn over operation and maintenance instructions to Owner.
D. Engage a factory-authorized service representative to train Owner’s maintenance personnel to adjust, operate, and maintain mobile storage shelving.

END OF SECTION
SECTION 126100

FIXED AUDITORIUM SEATING APPENDIX

BASIS OF DESIGN IMAGES
Basis of Design

Proscenium Theatre

Basis of Design

Valade Center

END OF APPENDIX 12 61 00
SECTION 126100

FIXED AUDITORIUM SEATING

PART 1 GENERAL

1.1 SUMMARY

A. The work in this section includes the fixed auditorium seating system within the following spaces:
   1. Proscenium Theatre
   2. Valade Jazz Center

B. Section Includes
   1. Furnish and install all elements of the fixed auditorium seating system and associated accessories.
   2. Work Results:
      a. Provide a complete, working and code compliant fixed auditorium seating system.
      b. Provide fully coordinated and engineered equipment, installation, supervision and commissioning for the major systems and associated accessories as required for each space.
      c. Provide all material, components, accessories and services required to provide the work as specified herein, elsewhere in the project documents and/or as shown on related drawings.
      d. Consult and coordinate with other affected work and contractors throughout the course of the work contained herein.

C. Products Supplied But Not Installed Under This Section:
   1. Specified seat fabric of the same dye lot issued to Loose Seating Contractor for upholstery of loose furniture chair specified under Division 12. Provide 2 yards per loose chair.
      a. Proscenium Theatre – 14 chairs
      b. Valade Jazz Center – 18 Chairs
   2. Extra materials as listed in Paragraph 1.7A, Extra Materials.

D. Related Requirements:
   1. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specifications apply to this Section.
   2. Examine Contract Documents for requirements that directly affect or are affected by Work of this Section. A list of those Documents and Sections includes, but is not limited to the following:
      a. Division 01 – General Requirements
      b. Division 03 – Concrete
         1) Fastener requirements
         2) Floor box location and blockouts
         3) Mechanical diffusers
      c. Division 04 – Masonry
         1) Fastener requirements
      d. Division 05 – Metals
         1) Structural steel supporting the work of this section
      e. Division 09 – Finishes
         1) Adjacent walls and floors
         2) Metal fabrication
      f. Division 23 – Mechanical
Division 26 – Electrical
1) Section 265561 – Theatrical Systems Electrical Requirements
2) Conduit, wire, pull boxes, junction boxes and miscellaneous hardware and components as required for a complete electrical installation
3) Terminations and testing of system continuity

1.2 PRICE AND PAYMENT PROCEDURES

A. Refer to Division 01 - General Requirements for information regarding price and payment procedures.

1.3 REFERENCES

A. Abbreviations:
1. The following abbreviations and acronyms are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
a. UL: Underwriters Laboratories

B. Definitions
1. The following definitions are relevant to this Section and are in addition to those defined in Division 01 – General Requirements:
a. In all cases where a device or a part of equipment is referred to in a singular manner within the contract documents, it is intended that such a reference shall include all devices required to complete the installation in accordance with the project documents.
b. “Architect”: All references to the “Architect”, Hamilton Anderson Associates, will refer to the process by which the indicated action or decision regarding the work in this section will be administered. All such actions shall be initiated with or by the Architect, who will disseminate all pertinent information and documents to, as well as coordinate all efforts and site visits with, the Theatre Consultant and all other project consultants who may have design responsibility relating to the work in this section.
c. “Theatre Consultant”: Auerbach + Associates, Inc. (d.b.a. Auerbach Pollock Friedlander). The Theatre Consultant will be party to all actions and decisions regarding the work contained in this section.
d. “Other Project Consultants”: Acoustical Consultant, Electrical Engineer, Structural Engineer, or Mechanical Engineer as is applicable to a particular issue.
e. “Contractor”: Manufacturer / Installer responsible for the fabrication and installation of the work contained in this section.
1) Contractors involved with other work shall be indicated with a specific trade preceding the word “Contractor” (i.e. General, Electrical, etc.).
f. "Owner": Authorized personnel representing Wayne State University.
g. "Furnish": Purchase and/or fabricate and deliver to project site.
h. "Install": Physically install the items in their proper location(s) on the project site.
i. "Provide": Furnish and install complete.

C. Reference Standards:
1. Reference Division 01 for general project references and standards.
2. References to codes, standards, specifications and recommendations of technical societies, trade organizations and governmental agencies will refer to the latest edition of such publications adopted and published prior to submittal of the bid. All such codes and standards will be considered a part of this specification as if they were fully included herein.
3. If an applicable code or standard permits work of lesser quality or extent than this specification, then this specification and the related drawings will govern.

4. Comply with national, state and local codes.

5. Comply with national, state and local labor regulations and requirements.

6. The following standards apply to the work of this Section. It remains the Contractor’s responsibility to confirm and comply with all industry standards that are applicable to the work of this Section.
   b. Americans with Disabilities Standard for Accessible Design
   c. Local Authority Building Regulations
   d. Local Authority Licensing Regulations

1.4 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. The Contractor is required through drawings, memos and meetings to properly coordinate the work with the other sections as necessary to complete the work of this section.

B. Pre-Installation Meeting:
   1. Refer to Division 01 - General Requirements for information regarding pre-installation meeting with the General Contractor.

C. Sequencing:
   1. The delivery and installation of the equipment in this section shall be coordinated with other work which may be in conflict with or which must be completed before the work under this section may be installed, including:
      a. Principal foundation work (see Architectural Drawings)
      b. Installation of associated electrical work (see Electrical Drawings)
      c. Drywall, mudding, sanding or painting of ceilings and walls
      d. Sanding or application of finishes to floors

1.5 ACTION SUBMITTALS

A. All submittals shall be submitted in accordance with Division 01.

B. All submittals shall be submitted in a timely manner, allowing sufficient time for adequate review and possible resubmittals without jeopardizing the project schedule.

C. Submittals will be reviewed, accepted and field dimension verified prior to proceeding with the fabrication of the work in this section.

D. All submittals shall leave space available for review stamps and comments.

E. The Architect and Theatre Consultant shall only mark one set of drawings per submittal with comments. Drawing markups will be provided on PDF files provided by the Contractor or on paper drawings which shall be scanned and returned electronically.

F. Provide full insurance against loss or damage during shipment. Furnish certifications of such coverage to the General Contractor not less than 60 calendar days prior to the shipment of any equipment.
G. Review all pertinent project Contract Documents. Following this review, provide to the Architect and General Contractor any additional information required to make a fully functioning system. In addition, the Manufacturer shall indicate maximum accepted wire size as it relates to termination points on their equipment.

H. Product Data:
1. Where standard manufacturer parts are used, submit current product literature describing component, manufacturer's recommended applications, load ratings, safety factors and dimensions. The data shall include all information which indicates compliance with the specifications herein.
2. Clearly indicate specific component and applicable options.

I. Shop Drawings:
1. Provide shop drawings on D size minimum (24” x 36”) sheets.
2. Include a cover sheet with a drawing index including the sheet number and title for each sheet in the set.
3. Provide a 4” x 4” area near the title block for review stamps and comments. This area should be in relatively the same location on each sheet.
4. Provide a minimum of one sheet for each seating level.
5. Provide ¼” scale layout plan(s) clearly indicating seat widths, dimensions for coordination for seat mounting, aisle widths and row-to-row clearances.
6. Provide ½” scale details showing relationship of seat rows, indicating seat back to back spacing and clear aisle accessway.
7. Provide complete, fully dimensioned, large scale detailed fabrication drawings of all major components. Include plan or schedules with quantities of each seat size, removable seats, transfer arm seating, end panel lights, and all other accessories.
8. Provide plan of electrical junction box locations and details.
9. Provide plan of row letter and seat number layout.
10. Provide requisite schematics, plans and sections indicating assembly and installation of components.
11. Provide indications by arrow and boxed caption of all variations from contract drawings and specifications, except where variation is indicated as acceptable.
12. Provide power requirements, one-line riser diagrams and installation circuit diagrams for electrical equipment. Show all required wire sizes and counts between all components. These shall be provided within 30 days of Contract Award.
13. Provide detailed drawings of trolley for transport and storage of ‘removable’ seating.
14. Provide a full Bill of Materials to be supplied, including quantities, manufacturer, manufacturer's part number, reference to applicable drawings, etc.
15. Per the requirements of the approved schedule, provide a provisional set of shop drawings with all required information included. A revised set of drawings shall be provided after site verification measurements can be taken. The second set shall show any modifications to the layout due to unexpected site conditions.
16. Shop drawings shall provide sufficient detail to show fabrication, installation, anchorage and interface of the work of this Section with the work of adjacent trades.
17. Responsibility to prevent or remedy conflicts with any floor element shall rest solely on the Contractor.
18. Responsibility for providing a seating layout that meets prevailing code requirements, as demonstrated in the Contract Documents, rests with the Contractor.

J. Samples:
1. Submit samples for approval as per the approved project schedule.
2. Submit samples of each of the following elements in each color, finish, pattern and texture specified per the terms of the Works Contract. If qualities of an element have not been specifically indicated herein, submit manufacturer's color charts or samples of actual
materials indicating the full range of standard colors, finishes, patterns and textures available. The samples shall include, but are not limited to:

a. Provide two 30” square “quality” samples of each seating fabric.
b. Manufacturer’s color charts or actual samples of electrostatically applied powder finishes to be used on exposed parts.
c. Manufacturer’s color charts or actual samples of plastics to be used on seat backs or bottoms.
d. Wood and plywood materials with finish samples for color selection.
e. Seat and back cushion.
f. Seat pan assembly with padding and upholstery.

3. Additional samples must be submitted within 14 days of Architect’s written request.

K. Certificates
1. Provide manufacturer’s certificate stating materials meet fire performance characteristics specified herein.
2. Provide test certificates for specified performance testing.

1.6 CLOSEOUT SUBMITTALS

A. Project Record Documents:
1. Submit documents in accordance with Division 01 - General Requirements.
2. At the time of acceptance testing, submit three (3) copies of parts lists and maintenance instruction sheets.
3. Within 60 days of the acceptance testing, submit one (1) set of reproducible "as built and approved" drawings showing all equipment as installed. These drawings shall include all adjustments made during the checkout process.
4. Submit operation and maintenance manuals with the “as built and approved” drawings. These manuals shall include all comments and adjustments made during the acceptance and review processes. Each manual shall be bound in an individual binder with the project name on the front cover and system identification on the spine. The manuals shall include:
   a. Complete parts list for all equipment and telephone numbers for the authorized parts and service distributors.
   b. Instructions as to the safe operation for all equipment.
   c. Recommended maintenance schedule for all component parts
   d. Recommendations for cleaning, maintaining and touch-up of all finished surfaces
   e. Provide specific recommendations for cleaning upholstery, including precautions against materials and methods which could damage upholstery fabric.
5. Where specific elements do not require manuals, instruction sheets as to care and handling shall be provided.
6. Certificates of flame resistance as required herein.
7. Warranties as required herein.

B. Submit verification that all punch list items have been rectified. Such written verification will be required for project closeout and initiation of the warranty period.

C. The record documents shall be reviewed by the Architect and Theatre Consultant, and all modifications to the documents stemming from this review shall be made as required.

D. Above submissions are required as a condition for final approval of the work.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Extra Stock Materials:
1. Deliver stock of maintenance material to Owner. Furnish the following to match those installed and taken from the same production run, packaged with protective covering for storage and identified with appropriate labels:
   a. Seat and back covers in a quantity equal to five percent (5%) of each type of chair and each color provided, with covers prorated to sizes of chairs used.
   b. Provide LED end panel light assemblies in a quantity equal to five percent (5%) of end panel lights installed.
   c. Provide mounting hardware for all mounting conditions equal to five percent (5%) of chairs installed.

1.8 QUALITY ASSURANCE

A. Regulatory Requirements:
   1. Refer to Division 01 – General Requirements.

B. Qualifications:
   1. All equipment and installation to be the responsibility of a single Contractor, who shall own and operate their own manufacturing facility for the fabrication of theatrical seating equipment, and be regularly engaged in the fabrication of such equipment. Fabrication of such equipment shall comprise no less than 90% of the Contractor’s business.
   2. The Contractor shall have been continuously engaged in the fabrication and installation of equipment of the type indicated herein for no less than five years.
   3. The Contractor shall have under their control all parts composing the complete chair including castings, steel, plywood, fabric, and accessories, as well as mounting and installation components. Contractor shall do all fabrication and coordinate installation, and shall maintain thorough test and inspection procedures to assure uniform high quality of all raw materials used as well as the finished product.
   4. The Contractor shall have, at the time of bid, a current contractor’s license and shall know, understand, and have the required documentation to work in the State of Michigan. This license shall be maintained throughout the course of the work of this contract.

C. Contractor is responsible for proper installation, operation and safety of all component equipment.

D. Contractor is responsible for the complete design and engineering of all systems described herein. Contractor shall confirm project details and, if necessary, suggest modifications to the criteria established herein in order to maintain the design intent.

E. Errors and omissions within the Contract Documents shall not relieve the Contractor and the General Contractor of the responsibility for providing a properly functioning installation of the system as described herein.

F. Mock-Ups:
   1. Following approval of shop drawings and samples indicated above, and prior to fabrication, a mock-up shall be provided for quality review, verification and testing by the Architect, Theatre Consultant and Owner.
   2. The mock-up for quality review shall meet the following criteria:
      a. Provide a minimum of two (2) chairs including selected fabric, finishes, etc.
      b. One of the chairs of the mock-up will include an ADA transfer arm as specified herein; the other shall have a fixed decorative end standard with integral end panel light as specified herein.
      c. The mock-up should include the actual widths of chairs to be provided.
   3. Fabrication will not proceed until written approval of all mock-ups has been received from the Architect.
4. It shall be the Contractor's obligation to provide shipping of the mock-up to the Architect's office and, following installation, to the job site. Following approval of the finished installation, the mock-up shall be turned over to the Owner.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Delivery, storage and handling shall be coordinated with the General Contractor and shall meet all requirements described in Division 01.

B. Packing, Shipping, Handling and Unloading
1. All equipment shall be appropriately and substantially packed for shipment.
   a. Packaging should include humidity resistant wrapping with desiccant as appropriate to protect contents. Contractor shall ensure that seating and related materials are delivered to the job site in their original and undamaged cartons bearing the manufacturer's name, product name and stock numbers.

2. All equipment containers shall clearly indicate the equipment contained, "front", "top", "fragile", the project name, and theatre site allocation. Include packing and shipping lists for each container.

3. All shipping costs to the job site are the responsibility of the Contractor. The shipping method/company is at the total discretion of the Contractor in order to meet the published project schedules.

C. Acceptance at Site
1. Coordinate responsibility for acceptance of material and equipment at job site with the General Contractor.

2. The Contractor shall be responsible for acceptance of the fixed audience seating system components at the job site, confirming that all quantities and counts are correct and for keeping accurate logs and records of such information.

D. Storage and Protection
1. Upon delivery, the materials shall be stored in their original cartons under protective cover in a dry and clean location, off the ground. Materials shall be stacked or positioned as directed by the Contractor. Delivered materials which are damaged or otherwise not suitable for installation shall be removed from the job site and replaced with acceptable materials.

2. Replace, at no additional expense to the Owner, all equipment and materials which are damaged during storage or handling.

1.10 SITE CONDITIONS

A. Existing Conditions:
1. Verify all conditions at job site. Promptly report variations and obstructions to the Architect. All additions or corrections are to be requested through the General Contractor prior to fabrication.

B. Environmental Requirements:
1. Coordinate all environmental requirements for all materials provided and installed under this contract.

C. Field Measurements:
1. Field measurements must be taken prior to preparation of final shop drawings and prior to fabrication to ensure proper fitting of work. Allow for adjustments during installation whenever taking field measurements.
2. Should field measurement of site conditions alter the design or installation of system elements from the approved shop drawings, revised shop drawings shall be reissued for review.

1.11 WARRANTY

A. Comply with the warranty requirements of Division 01 and the following.

B. The Contractor shall warrant materials and workmanship of systems and equipment as free of defects. The Contractor shall guarantee in writing the repair or replacement within 30 days of any item found defective during a period of one (1) year following date of final acceptance. Ordinary wear and damage due to improper usage are excepted.

C. The Contractor shall warrant the workmanship of installation services provided under this section for a period of five (5) years following the date of final acceptance. Ordinary wear and damage to improper usage are excepted.

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. To establish comparative standards of quality, the equipment and services of this section shall be by one of the following manufacturers:

   Ducharme Seating  
   9275 rue le Royer  
   Saint-Léonard, Québec  
   Canada H1P 3H7  
   Tel: (514) 438-2772

   Irwin Seating Company  
   3251 Fruit Ridge NW  
   Grand Rapids, MI 49544  
   Tel: (616) 574-7400

   Series Seating  
   20900 NE 30th Avenue  
   Suite 901  
   Miami, FL 33180  
   Tel: (305) 932 4626

B. Substitution Limitations
1. Any contractor who wishes to be listed, and has not been pre-approved, must submit qualification information to the Architect. Proposal shall include all of the information listed below:
   a. Statements of financial responsibility for the past five fiscal years showing assets and liabilities.
   b. List of principal officers and design and service engineers in an organizational structure flow chart.
c. List of not less than 5 projects of similar size and scope completed within the five years on which contractor has provided full services: product engineering, shop drawings, manufacture, installation and commissioning. In each instance, indicate specifics of scope of fabrication and installation. Include a contact list: name, address and phone numbers of person(s) directly responsible for operation and maintenance of equipment in each facility.

d. List of current projects and approximate contract value and completion dates. Include list of names, phone numbers and addresses of owner, owner's representatives and architect.

e. For each above described project, list of names of persons who supervised preparation of shop drawings, manufacture of components, and installation of equipment.

f. List of names of persons who would do project management, product engineering, supervision of shop drawing, supervision of installation should this contract be awarded.

g. Contract Bond Company information indicating that Contractor has bonding capacity for full duration of project. Include list of other bonded projects coinciding with this project.

h. Evidence of ability to undertake custom product engineering to meet specific requirements of project specifications. Provide sample project engineering drawings for custom products and contact information for facility operators where those products have been installed.

2. Standards of Acceptance:
   a. Refer to Paragraph 1.8B - Quality Assurance/Qualifications.

2.2 SYSTEMS DESCRIPTION

A. Refer to ‘TS’ Series Contract Drawings for seating layout plans and to architectural and structural drawings for floor and riser plans.

B. The seating layout drawings indicate acceptable seat widths and quantities at each width. Proposed manufacturer’s alterations from this layout shall be explained in the shop drawings.

C. Layout Requirements:
   1. Seating layout shall conform to critical aisle dimensions as indicated on the Drawings. These dimensions are based on project code requirements.
   2. Actual makeup of rows and requisite seat widths shall be the responsibility of the Contractor and shall be based on the Contractor's own field measurements and Theatre Consultant’s review of final shop drawings.
   3. The chairs must stagger from row to row on the centerline of the theatre to maximize vertical sightlines. End of rows shall align as indicated on the Drawings.
   4. In rows which contain varying width chairs, the following criteria shall generally be followed:
      a. A narrow seat is to be mounted adjacent to an aisle.
      b. A wide seat is to be mounted adjacent to side-walls or railing.
      c. The remaining varying width seats shall be distributed throughout the row so that the narrow seats are not mounted adjacent to one another and the overall quantity is at the absolute minimum.

2.3 DESIGN CRITERIA

A. All auditorium seating must be designed, manufactured and installed to:
   1. Perform satisfactorily in their intended situation and under their expected conditions in use.
   2. Have sufficient strength to meet their intended conditions of use.
3. Be free from any dimensional inaccuracy or distortion likely to affect its installation or operation.
4. Ensure that they do not contain any material which by direct contact or otherwise can be detrimental to the health and safety of the user.

B. Overall front to back envelope with seat in upright position shall not exceed 21” without notifying Architect in writing.

C. The audience seating shall be fabricated using molded foam cushions for maximum comfort, using materials which are carefully selected to be free of defects, objectionable projections, or irregularities. Smoothly round corners, edges and exposed fasteners to present least possible snagging and pinching hazards.

D. Basis of design:
   1. The basis of design for the fixed and removable auditorium seat shall be the following with special components as indicated herein or an approved equal:
      a. Proscenium Theatre
         1) Basis of design appearance:
            a) Ducharme – Model Arte
               1) 35” high back with wood back panel, Red Oak veneer on exposed sides, Cherry stain TBD by architect
               2) Top of back cushion is held short to create a reveal.
               3) Upholstered seat with wood bottom, Red Oak veneer, Cherry stain TBD by architect
               4) Wood aisle end panel with angled back and block front, Red Oak veneer, Cherry stain TBD by architect
               5) Solid wood arm rests, Cherry stain TBD by architect
               6) Concealed low voltage LED end panel lights
               7) Fabric: Maharam, Divina by Kvadrat 460730 color 173
               8) Recessed row letters
               9) Recessed seat numbers
               10) Recessed donor tags
            b. Valade Jazz Center
               1) Basis of design appearance:
                  a) Series – Model Bravo
               2) 35” high back with curvedwood back panel, Red Oak veneer on exposed sides, Cherry stain TBD by architect
               3) Maximum seat envelope 19”.
               4) Top and sides of back cushion are held short to create a reveal.
               5) Upholstered seat with flat wood bottom, Red Oak veneer, Cherry stain TBD by architect
               6) Wood aisle end panel with angled back and block front, Red Oak veneer, Cherry stain TBD by architect
               7) Solid wood arm rests, Cherry stain TBD by architect
               8) Concealed low voltage LED end panel lights
               9) Fabric: Maharam, Divina by Kvadrat 460730 color 173
               10) Recessed row letters
               11) Recessed seat numbers
               12) Recessed donor tags
      2. See Appendix for basis of design example images.

E. Capacities:
   1. Seats:
a. Seats shall be tested and professionally certified through an independent testing laboratory to support and withstand an evenly distributed minimum of 600 lbs. static load located 3" back from the front of the seat without deflection.
b. Seats shall be tested and professionally certified through an independent testing laboratory to withstand 300,000 operating cycles without added lubrication, spring fatigue or measurable bearing wear.
c. Seats shall be tested and professionally certified through an independent testing laboratory to withstand, without failure, not less than 100,000 impacts of a 40 lb. sandbag dropped equally from heights of 6", 8", 10" and 12".
d. All up-stops and down-stops shall be completely concealed.

2. Backs:
   a. Backs shall withstand an evenly distributed front or rear load of 450 lbs.
   b. Backs shall be tested and professionally certified through an independent testing laboratory to withstand, without failure, not less than 40,000 alternating swinging impact cycles by each of 2 opposing 40 lb. sandbags. Sandbags shall be moved horizontally and equally through various distances of 6", 8", 10" and 12" at 35 cpm.

3. Arm rests:
   a. Armrests shall be tested and professionally certified through an independent testing laboratory to accept a 250 lb. sandbag placed at the front of the armrest with no deflection.
   b. The same test shall be performed on the rear of the armrest.

F. Acoustic Performance
   1. Seat bottoms shall not create high-frequency noise that may disrupt performances when allowed to spring to their upright position from their down position. The sound level of the seats in motion shall not exceed 30 dB(A) when measured 3 feet from the seat bottom using a precision sound level meter on the fast response setting.

G. Fire Performance Characteristics
   2. Padding: Provide new (prime manufacture) polyurethane foam with an average burn length not exceeding 8" and average flame time after removal of flame source not exceeding 15 seconds, with drippings from test specimen not continuing to flame for more than 5 seconds after falling, when tested vertically in compliance with Federal Test Method Standard 191, Method 5903.2.
   3. Fabric to comply with 16 CFR Part 1610 Class 1.

2.4 MATERIALS

A. General
   1. All equipment and components shall be new and complete. No used or reconditioned equipment shall be acceptable unless otherwise noted.
   2. All equipment to have pertinent testing labels.
   3. All variations from the specified materials and product must be approved by the Architect.

B. Materials shall conform to the following minimum standard specifications:
   3. Steel Sheets for Baked Enamel Finish: American Society of Testing Materials A591, commercial and drawing quality; Class C, galvanized-bonderized; 20 gauge minimum unless otherwise indicated.
4. Expansion Bolts: FS FF-B-588; Type, Class, and Style as recommended by the chair manufacturer.

C. Finishes
1. Finish for all exposed metal parts shall be selected by the Architect and shall match.
2. Finish for all exposed plastic parts shall be selected by the Architect and shall match.
3. Exposed Wood (including plywood): Manufacturer’s standard hardwood, free of visible defects. Color shall be stain per the Architect. Species shall be as specified. Seal with lacquer.
4. Fabric:
   a. Upholstery fabric shall be as specified.
   c. Light Fast: Exceeds 48 hour NAFM requirement. Test method A.A.T.C.C.-16A.
   d. The fabric shall be strengthened with an acrylic or similar backing.
5. Cushions: Seat and back cushions made of open cell polyurethane foam.
6. Fasteners: All fasteners shall be concealed. No exposed fasteners permitted.

2.5 UPHOLSTERED SEATS
A. The seat shall have seat pans constructed of steel and upholstered molded foam cushion, with a wood panel bottom.
B. The seat should be well shaped to provide maximum comfort.
C. Equip chairs with noiseless gravity uplift devices, so that unoccupied seats quietly rise to uniform full vertical fold.
D. Provide for seat rotation on bushings which do not require lubrication and have a positive internal return stop of rubber or neoprene.
E. The seats shall be free of exposed screws and bolts on the bottom, front and sides.

2.6 UPHOLSTERED BACKS
A. The seat back will be upholstered on the front with a wood panel on the rear.
B. The seat back will be ergonomically designed back with lumbar support.
C. Inner structure will be a rigid triple curved, molded, compressed fire-retardant chipboard.
D. Foam padding will be cold molded CMHR polyurethane foam.
E. The backs shall be free of screws and bolts on the bottom, front and sides.
F. The back of the rear panel shall not be upholstered nor covered with fabric of any kind.
   1. Wood type and stain will be chosen by the Architect from the manufacturer’s standard products.
2.7 AISLE AND INTERMEDIATE CHAIR STANDARDS

A. Standards shall be fabricated from tubular steel.
   1. Tubular Steel Standards: Fabricate chair standards of heavy gauge rectangular steel tubing securely welded to steel mounting plate, with seat, back and armrest connections welded to tubing.
      a. All weldments shall be gas shielded, arc welded.
   2. Fabricate standards, or provide adaptors if necessary, for attachment to floor conditions. Use products which have been manufactured to allow maximum cleaning space below point of attachment while maintaining seat level orientation and proper height above floor.
   3. Provide bolt caps at each floor standard foot which cover mounting stud and nut. Color to match selected metal finish for aisle standard.

2.8 AISLE END PANEL

A. The aisle end panel shall be a decorative panel as described above.

2.9 TRANSFER ARMS

A. Provide aisle standards equipped with swing-away end panel assemblies in locations shown on drawings and as required by building codes and the ADA.

B. The aisle end panel assembly shall swing away to allow the individual access to the seat. Aisle standards shall use positive latching hardware to secure swinging panel in place.

C. The accessible aisle end panels shall match others that are not accessible.

D. The accessible aisle end panels shall be designated with code complying graphics. All graphic elements shall be set flush in chair surfaces and shall be permanently affixed to the chair with dry adhesive.

2.10 ARMREST

A. Provide armrest at each aisle and between chairs, designed for concealed mounting to standards.

B. Armrests shall be of solid wood construction with exposed edges well rounded.

C. Armrests at aisle end standards accepting concealed light elements shall be wider than intermediate armrests and shall be routed or coped to accept concealed light assembly.

D. Attachment shall be with 2 keyhole slots plus 1 security screw, or countersunk fasteners on underside.

2.11 END PANEL LIGHTS

A. Provide integral end panel lights in locations as shown on the drawings.

B. End panel light shall be a low voltage LED luminaire that is recessed within the aisle end standard armrest.
C. End panel LED strip light fixture:
   1. Visual Lighting Technologies – Catalog #ELL-1QL-1720-30-AL-OP2, WE1-0-6"-UL, 130 lumens, .9w, 83CRI, remote dimming driver AC-PWR-PB-DMX1 (Type L103 specification section 26 52 01)

D. The end panel light on fixed chairs shall be pre-wired with No. 14 AWG wire with THHN type insulation, extending 24 inches beyond the end standard mounting foot. Provide a flex-steel conduit whip and fittings pre-attached to the interior of the end standard.
   1. Mounting of whip shall be tight to leg support/foot of aisle end standard, so as to be as unobtrusive as possible.
   2. Bright finishes of flex steel conduit shall be painted over with base color matching end standards to reduce visibility.

E. The end panel light on removable chairs shall be pre-wired with black S or SO neoprene covered cable with L1-15 locking plug, extending 24 inches beyond the chair mounting foot. Provide fittings pre-attached to standard.
   1. Plug shall mate with floor box receptacle provided by Division 26.

F. Provide low voltage DMX compatible transformers as required for installation under Division 26. Transformers shall be provided in quantities to allow for zoning of the aisle lights as shown on the drawings. Transformers shall be housed in a steel safety enclosure complete with primary and secondary fuses, terminal blocks and safety disconnect.
   1. End panel lighting and all associated power and transformers shall be inaudible under all operating conditions.
   2. Provide all necessary hardware for vibration isolation mounting. Mounting shall prevent vibration from being transmitted into the concrete slab. Assembly shall include:
      a. Unistrut, bolts, washers and nuts
      b. Mason Industries HLW multiple layer neoprene impregnated duck washers or equal.

G. Provide one LED DMX compatible dimming driver per transformer / zone allowing smooth full to zero percent dimming for all aisle end panel lights. Drivers installed under Division 26.

2.12 NUMBER AND LETTER PLATES

A. Provide seat number plates for seat location identification system corresponding to approved shop drawings.
   1. Plate type and finish to be manufacturer standard and shall be selected by the Architect.
   2. Font, color and text size information to be provided by the Architect.

B. Provide row letter plates mounted to aisle end standards for seat location identification system corresponding to approved shop drawings.
   1. Plate type and finish to manufacturer standard and shall be selected by the Architect.
   2. Font, color and text size information to be provided by the Architect.

C. Text fill shall be deep in color and consistent. Characters shall be centered on the plate.

D. Fixing shall be by two-part epoxy adhesive.

E. Number, letter plates located on wood finishes will be located in a recess resulting in an even flush surface across the wood finish and plate. Recesses will be identical in location, size and quality of workmanship.
2.13 MOVABLE CHAIR BASES

A. Designated chairs on the drawings shall be provided with low-profile steel platforms fitted with specially designed locking devices to provide for easy removal and re-attachment of the chair to accommodate conversion of the space for equipment access.

B. Release/transport tool shall be provided to the Owner with each chair/platform.

2.14 FABRICATION

A. Fabricate all work in this section in accordance with the Architect’s direction, specifications, approved shop drawings, pertinent project drawings, established trade practices, and applicable code requirements.

B. Machine finish all operating parts to standard trade tolerances, fits and finishes.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: Contractor must examine areas and conditions under which auditorium seating is to be installed, including condition of substrate to which seating standards are to be attached, and must notify the Architect in writing of conditions detrimental to proper and timely completion of work. Work will not proceed until unsatisfactory conditions have been corrected in a manner acceptable to the Contractor.

B. Surface Preparation: Prepare all surfaces as to manufacturer’s recommendations. Comply with all industry standards regarding surface materials.

3.2 INSTALLATION

A. Install all work in this section in accordance with the Architect’s direction, specifications, approved shop drawings, pertinent project drawings, established trade practices and applicable code requirements.

B. Install all work securely, complete with all bolts, nuts, washers, clips, fittings, supports, and other items required for proper installation and operation.

C. Position all items accurately as indicated on drawings and true to plumb, line and level. Maintain maximum headroom and clearances at all points.

D. Install seats in locations indicated on approved shop drawings, with required clearances, elevations, and sightlines.

E. Install standards in locations necessitated by seating layout with each standard attached to the substrate by no less than two (2) anchoring devices of recommended size.

F. Install seats by mounting components to standards or brackets mounted on standards using industry approved hardware and fasteners.
G. Seats in back rows with a wall behind them or seats with a balustrade behind them should be set forward by 4”. Maintain aisle width.

H. Contractor shall ensure that mounting bolts and assembly hardware are cut and capped and/or otherwise finished to achieve both a finished appearance to the installation and eliminate protrusions and sharp edges which could cut and tear.

3.3 FIELD QUALITY CONTROL

A. The installation of the equipment indicated in this section shall be supervised by qualified personnel who are regularly employed by the Contractor for supervision of equipment installation similar to that indicated herein.

B. Installers must be appropriately skilled and experienced for the type and quality of work.

C. Arrange for all tests and inspections required by the General Requirements.

3.4 ADJUSTING

A. Adjust all equipment and components for operation in accordance with the specifications, approved shop drawings and pertinent project drawings prior to the demonstration indicated herein.

B. Verify that moving components operate smoothly and quietly.

C. Adjust seat uplift mechanisms to ensure that seats in each row are aligned when in upright position.

D. Replace any upholstery damaged during installation.

3.5 CLEANING

A. Touch-up minor abrasions and imperfections as required.

B. Remove from the premises all debris caused by this work. All unnecessary equipment and materials shall be removed from the area(s) of this work upon completion, removed from the job site and disposed of legally at no additional cost to the Owner.

3.6 CLOSEOUT ACTIVITIES

A. Demonstration
   1. Upon completion of the installation work required by the work of this Section, the Contractor will notify the Architect that the work is complete, conforms to specification and is ready for Demonstration.
   2. Installed equipment shall be operated for approval and inspected for quality by the Theatre Consultant, the Architect and the Owner.
   3. Installed seating shall be compared with the approved mock-up. They shall be identical in all respects.
   4. Adjustments or modifications shall be made as directed by the Architect and the Theatre Consultant.
5. Cost of re-inspection and additional testing by the Architect and Theatre Consultant, if required, due to lack of completion and/or errors and omissions shall be paid by the Contractor respective to the area of work concerned. This work will be conducted on a time and materials basis, including the Architect’s and Theatre Consultant’s standard hourly rates, and shall be scheduled and approved in writing prior to the re-inspection/testing session.

B. Training
   1. Following the equipment demonstration, inspection and final adjustments, the Owner’s designated staff or representatives shall be instructed in the use, care and maintenance of all items.
   2. Schedule the instruction in conformance with project construction schedule and the availability of the Owner.

3.7 PROTECTION
   A. Provide full protection from damage, construction dirt and debris for all equipment from the point of installation to testing and commissioning.
   B. Remove all equipment protection and clean all components thoroughly prior to the demonstration session.

3.8 ATTACHMENTS
   A. Refer to Appendix A of this section for basis of design illustrations

END OF SECTION 12 61 00
SECTION 134898
SOUND & VIBRATION CONTROL

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes: Manufactured components for sound and vibration isolation.
   1. Slab underlayment.
   2. Slab perimeter isolation.
   3. Ceiling hangers.
   4. Compact ceiling hangers.
   5. Partition sway braces.
B. Related Sections:
   1. Section 018122 - Facility Acoustic Performance Requirements:
   2. Sections 031100, 031500, 032000 and Section 033000: Isolated concrete slabs.
   3. Sections 054000, 092216 and 092900: Isolated gypsum board assemblies.

1.2 ACTION SUBMITTALS
A. Product Data: For each product.
B. Shop Drawings: Prepared by component manufacturer, include layout, section, and transition details, load conditions, isolator natural frequency and load deflection curves, and construction sequence.
C. Isolator Selection:
   1. Bearing surface area and spacing of each isolator shall be determined by Manufacturer based on final evaluation of concentrated and uniformly imposed loads.
   2. At load, isolator shall maintain uniform deflection of the floating floor.
D. Product Schedule:
   1. Component manufacturer and type.
   2. Deflection of each isolation element.
   3. Spring constant of each isolation element.
   4. Estimated imposed load on each isolation element.
   5. Spring o.d., free operating, and solid heights.
E. Isolated Floating Floor:
   1. Dead, live and concentrated loads.
   2. Isolator sizes, deflections, frequencies and locations.
   3. Any drains or other penetrations.
   4. Size, type, elevation and spacing of concrete reinforcement.
   5. Caulking details.
   6. Floating floor construction procedure.
F. Spring-Isolated Ceiling Assemblies:
   1. Indicate layout and location of each isolation hanger, location and direction of cold-rolled carrying channel.
   2. Include details of edge conditions where isolated ceiling construction meets or adjoins other construction.
   3. loads for all ceiling supported systems for incorporation in calculations of spring sizing
G. Isolated Partitions:
1. Load and deflection curves of all sway braces in both planes. Load and deflection curves of wall isolation pads. Detail drawings of angle braces.
2. Sway Brace Layout: Engineered by contractor in conjunction with steel stud framing.

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: A firm experienced in producing products similar to those indicated for this Project and with a record of successful in-service acoustical performance. Qualified firm will provide authorized technical representatives to observe and inspect installation of products, equipment and assemblies.

B. Installers Qualifications: A firm or individual experienced in installing, erecting, or assembling work similar in material, design, and extent to that indicated for this Project, being familiar with special acoustical requirements indicated, and whose work has resulted in construction with a record of successful acoustical performance.

C. Preconstruction Conference: Prior to start of Work, conduct a conference to ensure understanding of Construction Documents and special acoustical requirements of acoustically-critical spaces and construction.

PART 2 PRODUCTS

2.1 PRODUCTS AND MANUFACTURERS

A. Products and Manufacturers: Subject to compliance with specified requirements, provide Basis of Design or equivalent product as approved by Architect, by one of the following Manufacturers:
1. ECORE International.
2. General Rubber Corporation.
3. Impacta-Regupol
4. Kinetics Noise Control, Inc..
5. Mason Industries.
6. Pliteq.
7. RPG, Inc..
8. The VMC Group.

2.2 ISOLATED SLABS

A. (SVC-3) Continuous Concrete Slab Isolation Underlayment: Single-ply, non-laminated, re-bonded recycled rubber underlayment with dimpled profile.
2. Basis of Design: Pliteq FF25

B. (SVC-5) Continuous Polystyrene Perimeter Isolation:
1. Flat Re-bonded recycled rubber perimeter isolation strip, 1/2-inch thick.
   a. Type PIS Perimeter Rubber Isolation Strip by Pliteq.
   a. GenieMat Polyethylene Foam Perimeter Isolation Strip by Pliteq.

C. Caulking Compound: Non-hardening, drying or bleeding. Troweling or pouring grade.
1. Basis of Design: Type CC-75 by Mason Industries, Inc..

D. Angle Brackets: 1-1/2” x 2” angle iron sections with provision for bolting to the structure and a minimum thickness of 3/8” sponge cemented to the vertical leg.
1. Basis of Design: Type AB-716 by Mason Industries.
E. Isolators: Bell shaped castings with integral lugs to locate reinforcing, shrouding 2"(50mm) thick LDS isolators molded to the following AASHO bridge bearing specifications. All housings shall have 3/4"(20mm) minimum diameter jackscrews. Deflections shall not exceed 0.3"(75mm) nor the frequency 10Hz.

1. Basis of Design: Type FSN by Mason Industries, Inc.

2.3 ISOLATED CEILINGS

A. Spring Hangers:
   1. Fail safe.
   2. AASHTO Quality and Dynamic Stiffness

B. (SVC-11) Ceiling Hangers: Combination Neoprene and Spring Hanger, consisting of a steel frame containing a neoprene isolation element at the top and a coil steel spring seated in a neoprene cup on the bottom.
   1. rubber bushing extending through the box to prevent metal to metal contact between the steel suspension rod and the frame.
   2. allow a 30° swing from side to side before rod contact.
   3. Springs shall be factory precompressed to 70% of the assigned deflection.
   4. Basis of Design: Type Mason Industries 30NCC for channel, W30N for wire, or W30NCC for wire and channel.
   5. Hangers shall be selected for a minimum of 0.75" (19mm) spring deflection and factory precompressed 70% of the total deflection determined by the assigned load per hanger.

C. (SVC-12) Ceiling Hanger, Compact: Low-profile, Combination Neoprene and Spring Hanger, compact spring and neoprene pad isolator hangers.
   1. Basis of Design:
      a. Type 30CSCH by Mason Industries.
      b. Type KSCH Super-Compact Ceiling Hanger by Kinetics Noise Control

2.4 ISOLATED PARTITIONS

A. (SVC-21) Continuous Isolation Strip and Bushings for Partition Headers and Sills: 30 or 40 durometer continuous strip, 1/2-inch thick and 6-inches wide; with resilient stabilizing bushing, steel washer and anchors.

B. (SVC-22) Sway Brace: Standard neoprene sway brace, 60 durometer neoprene.
   1. Basis of Design: Type DNSB Sway Brace by Mason Industries.

2.5 RESILIENT PADS

   1. Durometer: 40
   2. Thickness: 3/4-inch.
   3. Basis of Design: Super W Pads by Mason Industries

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and conditions under which Work is to be installed. Do not proceed with work until unsatisfactory conditions have been corrected.
B. Ensure concrete floors are dry and meet moisture conditions required by flooring and adhesive manufacturer’s (3 pounds per 1000 square feet based on ASTM F1869, calcium chloride test) and exhibit negative alkalinity, carbonization or dusting. Also ensure substrate meets requirements of adhesive and flooring manufacturer’s requirements. Remove curing agents and other surface residue that may negatively affect adhesion or flooring installation and performance.

3.2 INSTALLATION

A. All building components supported by the isolation hangers shall be free from rigid contact with any part of the non-isolated building structure to prevent unwanted sound flanking.

3.3 ISOLATED CONCRETE FLOOR

A. Division 03

B. The installation of all sound isolation materials specified herein, including those installed under other sections of the specifications shall be in accordance with procedure submitted by the isolation material manufacturer and approved by the Architect, Structural Engineer, and Acoustical Consultant.

C. Clean and prepare substrate in accordance with underlayment manufacturer’s instructions.

D. Lay mat seam to seam covering the area

E. Tape joints between rolls of the base mat and joints between base mat and perimeter isolation board to avoid leakage during concrete pour.

F. Perimeter Isolation:
   1. Install perimeter isolation strip from the top of the underlayment to a minimum of 1” above the scheduled thickness of the isolated concrete slab.
   2. Ensure a maximum gap between the perimeter isolation board and underlayment of 1/8”
   3. After concrete has cured, cut back excess perimeter isolation board and caulk perimeter.

G. Inspection: Notification shall be given by the Contractor to the Architect at the following stage. Architect approval shall be obtained prior to proceeding to the next stage of construction.
   1. Upon completion of all areas prior to the placement of isolation material.
   2. Upon completion of placement of isolation materials prior to installation of isolated concrete slab.
   3. Upon completion of installation of concrete pouring form and isolated, prior to start of concrete pour.
   4. Upon completion of concrete isolated slab.

3.4 SPRING-ISOLATED CEILING ASSEMBLIES

A. Prior to start of the installation of the isolated ceiling, adhesively apply a continuous strip of neoprene surface of perimeter partition; allow for deflection of isolators.

B. Lay on top of the gypsum board mineral wool in thickness as shown on the drawings.

C. After installation of isolated ceiling, cut exposed neoprene and caulk perimeter and all penetrations.

3.5 ISOLATED PARTITIONS

A. Bolt the sway braces to the structural wall as shown on approved Shop Drawings and use the leveling nuts to plumb the channels and set them in their vertical position.

B. Caulk all joints.
END OF SECTION
SECTION 142100

ELECTRIC TRACTION ELEVATORS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Standard pre-engineered machine-roomless, electric traction elevators
   2. Passenger cab including cab doors
   3. Elevator car enclosures, hoistway entrances, frames and sills
   5. Motors, operation and control systems
   6. Accessibility provisions for physically disabled persons
   7. Equipment, machines, controls, systems and devices as required for safely operating the
      specified elevators at their rated speed and capacity.
   8. Materials and accessories as required to complete the elevator installation.

B. Related Sections:
   1. Division 5 Metals: Providing hoist beams, pit ladders, steel framing, auxiliary support steel and divider beams
      for supporting guide-rail brackets.
   2. Division 9 Finishes: Providing elevator car finish flooring and field painting unfinished and shop
      primed ferrous materials.
   3. Division 22 Plumbing:
   4. Division 23: Heating, Ventilation and Air Conditioning
   5. Division 26 Sections:
      a. Providing electrical service to elevators, including fused disconnect switches.
      b. Emergency power supply, transfer switch and auxiliary contacts.
      c. Heat and smoke sensing devices
      d. Convenience outlets and illumination in machine room, hoistway and pit

C. Work Not Included: General contractor shall provide the following in accordance with the
   requirements of the Model Building Code and ANSI A17.1 Code. For specific rules, refer to ANSI
   A17.1, Section 300 for hydraulic elevators. State or local requirements must be used if more
   stringent.
   1. Elevator hoist beam to be provided at top of elevator shaft. Beam must be able to accommodate
      proper loads and clearances for elevator installation and operation.
   2. Supply in ample time for installation by other trades, inserts, anchors, bearing plates, brackets,
      supports and bracing including all setting templates and diagrams for placement.
   3. Hatch walls require a minimum two hour fire rating. Hoistway should be clear and plumb with
      variations not to exceed 1/2” at any point.
   4. Elevator hoistways shall have barricades, as required.
   5. Install bevel guards at 75° on all recesses, projections or setbacks over 2” (4” for A17.1 2000
      areas) except for loading or unloading
   6. Provide rail bracket supports at pit, each floor and roof.
   7. Pit floor shall be level and free of debris. Reinforce dry pit to sustain normal vertical forces from
      rails and buffers.
   8. Where pit access is by means of the lowest hoistway entrance, a vertical ladder of non-
      combustible material extending 42” minimum, (48” minimum for A17.1-2000 areas) shall be
      provided at the same height, above sill of access door or handgrips.
9. Access to the machinery space must be in accordance with the governing authority or code.
10. Provide an 8” x 16” cutout through machine room wall, for oil line and wiring duct, coordinated with elevator contractor at the building site.
11. All wire and conduit should run remote from the hoistways.
12. When heat, smoke or combustion sensing devices are required, connect to elevator machine room terminals. Contacts on the sensors should be sided for 120 volt D.C.
13. Provide finished flooring in elevator cab.
14. Finished floors and entrance walls are not to be constructed until after sills and door frames are in place. Consult elevator contractor for rough opening size. The general contractor shall supply the drywall framing so that the wall fire resistance rating is maintained, when drywall construction is used.
15. Where sheet rock or drywall construction is used for front walls, it shall be of sufficient strength to maintain the doors in true lateral alignment. Drywall contractor to coordinate with elevator contractor.
16. Before erection of rough walls and doors; erect hoistway sills, headers, and frames. After rough walls are finished; erect fascias and toe guards. Set sill level and slightly above finished floor at landings.
17. The elevator wall shall interface with the hoistway entrance assembly and be in strict compliance with the elevator contractor's requirements.
18. Elevator sill supports shall be provided at each opening.
19. All walls and sill supports must be plumb where openings occur.
20. Locate a light fixture and convenience outlet in pit with switch located adjacent to the access door.
21. A light switch and fused disconnect switch for each elevator should be located inside the machine room adjacent to the door, where practical, per the National Electrical Code (NFPA No. 70).
22. As indicated by elevator contractor, provide a light outlet for each elevator, in center of hoistway.
23. For signal systems and power operated door: provide ground and branch wiring circuits, including main line switch. For car light and fan: provide a feeder and branch wiring circuits, including main line switch.
24. Wall thickness may increase when fixtures are mounted in drywall. These requirements must be coordinated between the general contractor and the elevator contractor.
25. Provide supports, patching and recesses to accommodate hall button boxes, signal fixtures, etc..
26. Locate telephone and convenience outlet on control panel.
27. Main line disconnects for each elevator.
   a. One fused three phase permanent power in building electrical distribution room
   b. One non fused three phase permanent power in hoist way at top landing
28. Hoistway ventilation shall be in accordance with local and national building code requirements.
29. Guide Rail Support shall be structurally adequate to extend from pit floor to top of hoistway, with spans in accordance with requirements of authority having jurisdiction and final layouts.
30. Lifeline attachments capable of withstanding 5000 lb load in accordance with OSHA 29 CFR 1926.502. Provide a minimum of 2 at the top, front of each hoistway.

1.2 REGULATORY REQUIREMENTS

A. Conform to:
   2. NSI A17.1b - Supplement to Safety Code for Elevators and Escalators.
   4. ANSI A17.2 - Practice for Inspection of Elevators, Escalators, and Moving Walks.
   5. American Disability Act (ADA).

B. Welding: AWS D1.1.
1.3 ACTION SUBMITTALS

A. Product data: Submit manufacturer’s product data for each system proposed for use. Include the following:
   1. Signal and operating fixtures, operating panels and indicators.
   2. Cab design, dimensions and layout.
   3. Hoistway-door and frame details.
   4. Electrical characteristics and connection requirements.
   5. Expected heat dissipation of elevator equipment in hoistway (BTU).
   6. Color selection chart for Cab and Entrances.

B. Shop Drawings: Submit in accordance with Division 1.
   1. Clearly indicate space requirements, general arrangement of elevator equipment, and material being supplied. Show connections, attachments, reinforcing, anchorage and location of exposed fastenings, and location and amount of loads and reactions to be carried on building structure.
   2. Provide plans, elevations, sections and details of assembly, erection, anchorage, and equipment location.
   3. Show equipment arrangement in the control space, pit and hoistway.
   4. Show floors served, travel distances, maximum loads imposed on the building structure at points of support and all similar considerations of the elevator work.
   5. Submit descriptive brochures or detail drawings of landing buttons, hall fixtures, car position indicators and car operating panels, car interior and hoistway doors and frames for review.
   6. Indicate electrical power requirements and branch circuit protection device recommendations.

C. Samples: Submit in accordance with Division 1.
   1. Submit samples of finishes and materials required for cars, operating and signal system fixtures and finish of hoistway entrances and doors.
   3. Plastic laminate selection: Submit sample as verification of match to PLAM specified in Elevator Schedule at end of this Section.
   4. Metal Finishes: Provide samples of standard specified metal finishes.

D. Prior to seeking final acceptance for the completed project as specified by the Contract Documents, the Elevator Contractor shall deliver to the Owner any specialized tool(s) that may be required to perform diagnostic evaluations, adjustments, and/or parametric software changes and/or test and inspections on any piece of control or monitoring equipment installed. This shall include any specialized tool(s) required for monitoring, inspection and/or maintenance where the means of suspension other than conventional wire ropes are furnished and installed by the Elevator Contractor. Any and all such tool(s) shall become property of the Owner. Any diagnostic tool provided to the Owner by the Elevator Contractor shall be configured to perform all levels of diagnostics, systems adjustment and parametric software changes which are available to the Elevator Contractor. In those cases where diagnostic tools provided to the Owner require periodic recalibration/or re-initiation, the Elevator Contractor shall perform such tasks at no additional cost to the Owner for a period equal to the term of the maintenance agreement from the date of final acceptance of the completed project. During those intervals in which the Owner might find it necessary to surrender a diagnostic tool for re-calibration, re-initiation, or repair, the Elevator Contractor shall provide a temporary replacement for the tool at no additional cost to the Owner. The Elevator Contractor shall deliver to the Owner, printed instructions for the proper use of any tool that may be necessary to perform diagnostic evaluations, system adjustment, and/or parametric software changes on any unit of microprocessor-based elevator control equipment and means of suspension other than standard elevator steel cables furnished and install by the Elevator Contractor. Accompanying the printed instructions shall be any and all access codes, password, or other proprietary information that is necessary to interface with the microprocessor-control equipment.
1.4 INFORMATIONAL SUBMITTALS
A. Operation and Maintenance Manuals: Include operations and maintenance instructions, parts listing with sources indicated, recommended parts inventory listing, emergency instructions, and similar information. Include diagnostic and repair information available to manufacturer's and installer's maintenance personnel.
   1. Owner's Manual and Wiring Diagrams
   2. Parts list, with recommended parts inventory.
B. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted elevator use.

1.5 QUALITY ASSURANCE
A. Manufacturer Qualifications: An approved manufacturer with minimum fifteen years experience in manufacturing, installing, and servicing elevators of the type required for the project.
   1. Must be the manufacturer of the power unit, controller, signal fixtures, door operators cab, entrances, and all other major parts of the elevator operating equipment.
      a. The major parts of the elevator equipment shall be manufactured in the United States, and not be an assembled system.
   2. The manufacturer shall have a documented, on-going quality assurance program.
   3. ISO-9001:2000 Manufacturer Certified
   4. ISO-14001:2004 Environmental Management System Certified
B. Installer Qualifications: Elevator manufacturer or experienced installer approved by elevator manufacturer who has completed elevator installations similar in material, design, and extent to that indicated for this Project and with fifteen-year record of successful in-service performance.
C. Fire-rated Entrance Assemblies: Opening protective assemblies including frames, hardware, and operation shall comply with ASTM E2074, (ULC-S104), UL10(B), and NFPA 80. Provide entrance assembly units bearing Class B or 1 1/2 hour label by a Nationally Recognized Testing Laboratory.
D. Inspection and testing: Elevator Installer shall obtain and pay for all required inspections, tests, permits and fees for elevator installation.
   1. Arrange for inspections and make required tests.
   2. Deliver to the Owner upon completion and acceptance of elevator work.
E. Product Qualifications:
   1. LCA, EPD and HPD data must be provided for all major components of the elevator system.
   2. LCA data must be compatible with GaBI Software.
   3. Environmental Product Declaration (EPD): Publicly available, critically reviewed life cycle analysis having at least a cradle-to-gate scope.
   4. GreenScreen Chemical Hazard Analysis: All ingredients of 100 parts-per-million or greater evaluated using GreenScreen for Safer Chemicals Method v1.2.
   5. Health Product Declarations (HPD v2 or later): Complete, published declaration with full disclosure of known hazards, prepared using the Health Product Declaration Collaborative's "HPD builder" on-line tool; Unknown hazard listed will not be considered acceptable.

1.6 DELIVERY, STORAGE AND HANDLING
A. Deliver items or materials to site until area in which they are to be installed is ready to receive them in their place of final installation.
B. Store materials in storage area allotted and in such manner as to prevent deterioration, damage, or loss of their essential properties.
C. Fully protect movable and operating equipment from weather.
D. Wrap and crate factory finished materials in manner to protect their finishes.
1.7 PROJECT CONDITIONS
A. Prohibited Use: Elevators shall not be used for temporary service or for any other purpose during the construction period before Substantial Completion and acceptance by the purchaser unless agreed upon by Elevator Contractor and General Contractor with signed temporary agreement.

1.8 POWER CHARACTERISTICS
A. Elevator Apparatus: Volt as indicated by Electrical, phase as required, 60 Hz alternating current.
B. Lighting: 120 volt, 60 Hz alternating current.

1.9 WARRANTY
A. Provide manufacturer warranty for a period of one year after completion of installation or acceptance thereof by beneficial use, whichever is earlier. The warranty period is to begin upon Substantial Completion of the Contract. Warranty covers defects in materials and workmanship not due to ordinary wear and tear or improper use or care. Damage due to ordinary use, vandalism, improper or insufficient maintenance, misuse, or neglect do not constitute defective material or workmanship.

1.10 MAINTENANCE
A. Maintain entire elevator installation for 12 months after date of Substantial Completion of Work.
B. Include systematic examination, adjustment and lubrication of elevator equipment, repair or replace worn electrical and mechanical parts of elevator equipment using only genuine standard parts produced by manufacturer of equipment concerned to keep the elevator in proper operation.
C. Replace seals, packing, and valves to maintain required factor of safety.
D. Perform work without removing cars during peak traffic periods.
E. Provide 24 hour emergency call back service during maintenance period.
F. Ensure that competent personnel handle maintenance service. Maintain locally adequate stock of parts for replacement or emergency purposes and have qualified personnel available at such places to ensure fulfillment of this service without unreasonable loss of time.
G. Provide system capabilities to enable a remote expert to create a live, interactive connection with the elevator system to enable the following functions:
   1. Remotely diagnose elevator issues with a remote team of experts
   2. Remotely return an elevator to service
   3. Provide real-time status updates via email
   4. Remotely make changes to selected elevator functions including:
      a. Control building traffic: Restrict floor access, remove car from group operation, shut down elevator, select up peak / down peak mode, activate independent service
      b. Conserve energy: Activate cab light energy save mode, activate fan energy save mode, shut down car(s)
      c. Improve passenger experience: Extend door open times, change parking floor, activate auto car full, activate anti-nuisance, advance door opening, door nudging, extend specific floor extended opening time, release trapped passengers

1.11 MAINTENANCE PROPOSAL
A. Proposal for maintenance of installed elevator work for period of 3 years after termination of regular maintenance as required in preceding article.
B. Proposal shall include stipulated sum for above stated time period with premiums due annually.
C. Maintenance shall include requirements stated in preceding article.
PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Source Limitations: Obtain elevators from single manufacturer.
   1. Major elevator components, including driving machines, controllers, signal fixtures, door operators, car frames, cars, and entrances, shall be manufactured by single manufacturer.

B. Car Performance
   1. Car Speed ± 5% of contract speed under any loading condition or direction of travel.
   2. Car Capacity: Safely lower, stop and hold (per code) up to 125% of rated load.

C. System Performance
   1. Vertical Vibration (maximum): 15 mg ISO187338/ISO 8041 system pk -pk
   2. Horizontal Vibration (maximum): 12 mg ISO187338/ISO 8041 system pk -pk
   3. Jerk Rate (maximum): 3.3 ft/sec3
   4. Acceleration (maximum) 1.3 ft/sec2
   5. In Car Noise: = 55 dB(A)
   6. Leveling Accuracy: ±0.2 inches
   7. Starts per hour (maximum): 180

2.2 MATERIALS AND COMPONENTS

A. Rolled Steel Sections, Shapes, Rods: ANSI A17.1.

B. Sheet Steel: ASTM A446, G90 coating designation, stretcher levelled commercial grade.

C. Stainless Steel: ASTM A167, Type 302/304, No. 4 finish.

D. Plywood: PS 1, Western Softwood; (Douglas Fir) good one side, fire retardant treated per following requirements:
   1. Each piece to bear:
      a. UL FR-S rating (flame spread and smoke developed less than 25),
      b. Complying with extended 30-minute tunnel test, ASTM E84 or UL 723
      c. Meet interior Type A requirements in AWPA Standard C-27 for plywood.
      d. And shall be registered for use as a wood preservative by the U.S. Environmental Protection Agency.
   2. Treatment to provide protection against:
      a. Termites.
      b. Fungal decay.
   3. Treatment to be free of:
      a. Hologens.
      b. Sulfates.
      c. Ammonium phosphate.
      d. Formaldehyde.
   4. After treatment: Material shall be dried to an average moisture content of 15 percent or less for plywood and 19 percent or less for other lumber.
   5. Coat surfaces cut after treatment with heavy brush coat of same fire-retardant chemical

6. Manufacturers:
   a. Dricon by Arch Wood Products.
   b. Pyro-Guard by Hoover Treated Wood Products.

E. Plastic Laminate: FS L-P-508; color, texture and pattern selected by Architect.

2.3 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. KONE Inc. (Basis of Design)
2. Otis Elevator Co.
3. Schindler Elevator Corp.
5. Substitutions: Allowed in accordance with the requirements of Division 1.

2.4 ELECTRIC TRACTION ELEVATORS

A. (ELEV-1) Electric Gearless Traction Elevator:
2. Rated Capacity: 2000 lb
3. Rated Speed: 150 fpm minimum
4. Equipment Control: KCM831
5. Drive: Non-Regenerative
6. Quantity of Elevators: 1
7. Landings: 3
8. Openings: 3 Front Openings, 0 Back Openings
9. Travel: 29' 3" nominal (refer to Drawings)
10. Clear Inside Dimensions (W x D): 5' 9" x 4' 4"
11. Cab Height: 8' 0"
12. Clear height under suspended ceiling: 7' 6"
13. Entrance Width and Type: 3' 0" and Left Opening
14. Entrance Height: 7' 0"
15. Main Power Supply: 208 Volts + 5%, three-phase
16. Operation: Simplex
17. Machine Location: Inside the hoistway mounted on car guide rail
18. Control Space Location: Machine-roomless
19. Elevator Equipment shall conform to the requirements of seismic zone: non-seismic
20. Controller: Provide microcomputer based control system to perform all of the functions.
   a. All high voltage (110V or above) contact points inside the controller cabinet shall be protected from accidental contact in a situation where the controller doors are open.
   b. Controller shall be separated into two distinct halves; Motor Drive side and Control side. High voltage motor power conductors shall be routed and physically segregated from the rest of the controller.
   c. Provide a serial cardrack and main CPU board containing a non-erasable EPROM and operating system firmware.
   d. Variable field parameters and adjustments shall be contained in a non-volatile memory module.
21. Drive: Provide Variable Voltage Variable Frequency AC drive system to develop high starting torque with low starting current.
23. Emergency Operation: Connect to existing emergency power
24. Provide keyed control access (only) to basement level

B. (ELEV-4) Electric Gearless Traction Elevator:
2. Rated Capacity: 5000 lb
3. Rated Speed: 150 fpm minimum
4. Equipment Control: KCM831
5. Drive: Non-Regenerative
6. Quantity of Elevators: 1
7. Landings: 3
8. Openings: 3 Front Openings, 0 Back Openings
9. Travel: 28' 0" nominal (refer to Drawings)
10. Clear Inside Dimensions (W x D): 5' 9" x 9' 0"
11. Cab Height: 9' 0"
12. Clear height under suspended ceiling: 8' 6"
13. Entrance Width and Type: 3' 0" and Left Opening  
14. Entrance Height: 7' 0"
15. Main Power Supply: 208 Volts + 5%, three-phase
16. Operation: Simplex  
17. Machine Location: Inside the hoistway mounted on car guide rail  
18. Control Space Location: Machine-roomless
19. Elevator Equipment shall conform to the requirements of seismic zone: non-seismic
20. Controller: Provide microcomputer based control system to perform all of the functions.  
   a. All high voltage (110V or above) contact points inside the controller cabinet shall be protected from accidental contact in a situation where the controller doors are open.
   b. Controller shall be separated into two distinct halves; Motor Drive side and Control side. High voltage motor power conductors shall be routed and physically segregated from the rest of the controller.
   c. Provide a serial cardrack and main CPU board containing a non-erasable EPROM and operating system firmware.
   d. Variable field parameters and adjustments shall be contained in a non-volatile memory module.
21. Drive: Provide Variable Voltage Variable Frequency AC drive system to develop high starting torque with low starting current.
23. Emergency Operation: Connect to existing emergency power

C. Equipment and Controls:

1. Equipment Hoistway Components:
   a. Machine: AC gearless machine, with permanent magnet synchronous motor, direct current electro-mechanical disc brakes and integral traction drive sheave, mounted to the car guide rail at the top of the hoistway.
   b. Governor: Friction type over-speed governor rated for the duty of the elevator specified.
   d. Hoistway Operating Devices:
      1) Emergency stop switch in the pit  
      2) Terminal stopping switches.
      3) Emergency stop switch on the machine
   e. Positioning System: System consisting of magnets and proximity switches.
   f. Guide Rails and Attachments: Steel rails with brackets and fasteners.
2. Equipment Hoistway Entrances:
   a. Hoistway Entrances
      1) Sills: Aluminum extruded.
      2) Doors: Hollow metal construction with vertical internal channel reinforcements.
      3) Fire Rating: Entrance and doors shall be UL fire-rated for 1-1/2 hour.
      4) Entrance Finish: Brushed Stainless Steel.
      5) Entrance Markings Jamb Plates: Provide standard entrance jamb tactile markings on both jambs, at all floors. Plate Mounting: Refer to manufacturer drawings.
3. Equipment Car Components:
   a. Car Frame: Provide car frame with adequate bracing to support the platform and car enclosure.
   b. Platform: Platform shall be all steel construction.
   c. Car Guides: Provide guide-shoes mounted to top and bottom of both car and counterweight frame. Each guide-shoe assembly shall be arranged to maintain constant contact on the rail surfaces. Provide retainers in areas with Seismic design requirements.
   d. Steel Cab Cool Vintage Standard - 42009
   e. Car Wall Finish:
      1) Rear Wall: Non-removable vertical panels Graphic Bamboo printed laminate.
      2) Side Walls: Non-removable vertical panels Pearl Silver laminate.
   f. Car Skirting Finish: Brushed Stainless Steel
   g. Car Front Finish: Brushed Stainless Steel
h. Car Door Finish: Brushed Stainless Steel
i. Ceiling: Rectangular LED light panel, Brushed Stainless Steel
j. Handrail: Round, straight ends, Brushed Stainless Steel
   1) Rails to be located on Side Walls of car enclosure.
k. Threshold: Aluminum
l. Flooring: By others. (Not to exceed 6lb/sqft and 1/2” finished depth.)
m. Emergency Car Signals
   1) Emergency Siren: Siren mounted on top of cab that is activated when the alarm button in the car operating panel is engaged. Siren shall have rated sound pressure level of 80 dB(A) at a distance of three feet from device. Siren shall respond with a delay of not more than one second after activation of alarm button.
   2) Emergency Car Lighting: Provide connection to existing emergency power to maintain elevator operation and to illuminate the elevator car and provide current to the alarm bell in the event of building power failure.
   3) Emergency Exit Contact: An electrical contact shall be provided on the car-top exit.
n. Ventilation: Fan

4. Equipment Signal Devices and Fixtures:
   a. Car Operating Panel: Provide car operating panel with all push buttons, key switches, and message indicators for elevator operation. Fixture finish to be: Brushed Stainless Steel
      1) Main Flush mounted car operating panel shall contain a bank of round, mechanical, illuminated buttons marked to correspond to landings served, emergency call button, door open button, door close button, and key switches for lights, inspection, and exhaust fan. Buttons have Amber illumination (halo). All buttons to have raised text and Braille marking on left hand side. The car operating display panel shall be Amber DOT-matrix. All texts, when illuminated, shall be Amber. The car operating panel shall have a Brushed Stainless Steel finish.
      2) Additional features of car operating panel shall include:
         (a) Car Position Indicator within operating panel (Amber).
         (b) Elevator Data Plate marked with elevator capacity and car number on car top.
         (c) Help buttons with raised markings.
         (d) In car stop switch per local code.
         (e) Call Cancel Button.

   b. Hall Fixtures: Wall mounted hall fixtures shall be provided with necessary push buttons and key switches for elevator operation. Wall mounted hall fixtures shall have a Brushed Stainless Steel.
      1) Hall fixtures shall feature round, mechanical, buttons in applied mount face frame. Hall fixtures shall correspond to options available from that landing. Buttons shall be in a vertically mounted fixture. Hall fixtures shall not be jambmounted. Hall lanterns shall feature Amber illumination.
   c. Car Lantern and Chime: A directional lantern visible from the corridor shall be provided in the car entrance. When the car stops and the doors are opening, the lantern shall indicate the direction in which the car is to travel and a chime will sound. The chime will sound once for up and twice for down. The car riding lantern face plate shall have a Brushed Stainless Steel finish

5. Equipment Elevator Operation and Controller
   a. Elevator Operation
      1) Simplex Collective Operation: Using a microprocessor-based controller, operation shall be automatic by means of the car and hall buttons. If all calls in the system have been answered, the car shall park at the last landing served.
      2) Zoned Car Parking.
      3) Relative System Response Dispatching.
   b. Standard Operating Features to include:
      1) Full Collective Operation
      2) Fan and Light Control.
      3) Load Weighing Bypass.
4) Ascending Car Uncontrolled Movement Protection
5) Top of Car Inspection Station.

c. Additional Operating Features to include:
d. Elevator Control System for Inspections and Emergency
   1) Provide devices within controller to run the elevator in inspection operation.
   2) Provide devices on car top to run the elevator in inspection operation.
   3) Provide within controller an emergency stop switch to disconnect power from the brake and prevents motor from running.
   4) Provide the means from the controller to mechanically lift and control the elevator brake to safely bring car to nearest available landing when power is interrupted.
   5) Provide the means from the controller to reset the governor over speed switch and also trip the governor.
   6) Provide the means from the controller to reset the emergency brake when set because of an unintended car movement or ascending car over speed.
   7) Provide the means for the control to reset elevator earthquake operation.

6. Equipment Door Operator and Control:
a. Door Operator: A closed loop permanent magnet VVVF high-performance door operator shall be provided to open and close the car and hoistway doors simultaneously. Door movement shall be cushioned at both limits of travel. Electro-mechanical interlock shall be provided at each hoistway entrance to prevent operation of the elevator unless all doors are closed and locked. An electric contact shall be provided on the car at each car entrance to prevent the operation of the elevator unless the car door is closed.
b. The door operator shall be arranged so that, in case of interruption or failure of electric power, the doors can be readily opened by hand from within the car, in accordance with applicable code. Emergency devices and keys for opening doors from the landing shall be provided as required by local code.
c. Doors shall open automatically when the car has arrived at or is leveling at the respective landings. Doors shall close after a predetermined time interval or immediately upon pressing of a car button. A door open button shall be provided in the car. Momentary pressing of this button shall reopen the doors and reset the time interval.
d. Door hangers and tracks shall be provided for each car and hoistway door. Tracks shall be contoured to match the hanger sheaves. The hangers shall be designed for power operation with provisions for vertical and lateral adjustment. Hanger sheaves shall have polyurethane tires and pre-lubricated sealed-for-life bearings.
e. Electronic Door Safety Device. The elevator car shall be equipped with an electronic protective device extending the full height of the car. When activated, this sensor shall prevent the doors from closing or cause them to stop and reopen if they are in the process of closing. The doors shall remain open as long as the flow of traffic continues and shall close shortly after the last person passes through the door opening.

PART 3 EXECUTION

3.1 EXAMINATION AND PREPARATION

A. Examine work of other trades on which work of this Section depends. Report defects to Architect in writing which may affect Work of this trade or equipment operation. Do not proceed with elevator installation until unsatisfactory conditions have been corrected in a manner acceptable to the installer.

B. Ensure that shafts and openings for moving equipment are plumb, level and in line and that pit is to proper depth, waterproofed and drained with necessary access doors, cylinder opening, ladder, guard and verify all critical dimensions.

C. Before fabrication, take necessary job site measurements and verify where work is governed by other trades. Check measurements of space for equipment and means of access for installation and operation. Obtain dimensions from site for preparation of shop drawings.
D. Ensure following preparatory work, provided under other Sections has been properly completed to receive elevator work:
   1. Supply of electric feeder wires to terminals of elevator control panel, including fused main line switch or circuit breaker. Provision of hoistway outlets for car light, and for light and outlets in pit. Furnishing of electric power for testing and adjusting elevator equipment
   2. Provision of hoistway outlet for telephone
   3. Supply of power for emergency cab lighting and ventilation from power panel specified in Division 26 Electrical fed by building emergency circuits

E. Supply in ample time for installation, inserts, anchors, pipe sleeves, bearing plates, brackets, supports and bracing including setting templates and diagrams for placement.

F. Installation constitutes acceptance of existing conditions and responsibility for satisfactory performance.

3.2 PREPARATION
A. Coordinate installation of anchors, bearing plates, brackets and other related accessories.

3.3 INSTALLATION
A. Install elevator systems components and coordinate installation of hoistway wall construction.
   1. Work shall be performed by manufacturer-approved competent elevator installation personnel in accordance with ASME A17.1, manufacturer's installation instructions and approved shop drawings and under direct control and supervision of elevator manufacturer's experienced foreman
   2. Comply with the National Electrical Code for electrical work required during installation.
B. Coordination: Coordinate elevator work with the work of other trades, for proper time and sequence to avoid construction delays. Use benchmarks, lines, and levels designated by the Contractor, to ensure dimensional coordination of the work.
   1. Coordinate emergency power transfer switch and power change pending signals as required for termination at the primary elevator signal control cabinet in each group
C. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with cars. Where possible, delay final adjustment of sills and doors until car is operable in shaft. Reduce clearances to minimum safe, workable dimensions at each landing.
D. Install machinery, guides, controls, car and equipment and accessories in accordance with manufacturer's instructions, applicable codes, and standards to provide quiet, smoothly operating installation, free from sidesway, oscillation, or vibration.
E. Install and hookup piping between machine and cylinder.
F. Erect hoistway sills, headers and frames prior to erection of rough walls and doors; erect fascias and toe guards after rough walls finished.
G. Grout sills and hoistway entrance doors.
H. Provide stainless steel license holders in each elevator car to suit certificate issued. Design holder with nonvisible tamperproof fastenings.
I. Provide wall hooks and protective mats for walls of elevator car
J. Locate hall buttons and indicators as detailed on drawings
K. Lubricate operating parts of system where recommended by manufacturer.
### 3.4 FIELD QUALITY CONTROL

A. **Acceptance testing:** Upon completion of the elevator installation and before permitting use of elevator, perform acceptance tests as required by A17.1 Code and local authorities having jurisdiction. Perform other tests, if any, as required by governing regulations or agencies.
   1. Obtain and pay for inspections and permits and make such tests as are required by regulations of authorities. Make tests in presence of Architect.
   2. Final inspection shall be after elevator installation and hoisting enclosure are complete.

B. Advise Owner, Contractor, Architect, and governing authorities in advance of dates and times tests are to be performed on the elevator.

C. Deliver test certificates and permits to Architect.

### 3.5 ADJUST AND BALANCE

A. Make necessary adjustments of equipment to ensure elevator operates smoothly and accurately.

### 3.6 CLEANING

A. Before final acceptance, remove protection from finished surfaces and clean and polish surfaces in accordance with manufacturer's recommendations for type of material and finish provided. Stainless stall shall be cleaned with soap and water and dried with a non-abrasive surface; shall not be cleaned with bleached-based cleansers.

B. At completion of elevator work, remove tools, equipment, and surplus materials from site. Clean equipment rooms and hoistway. Remove trash and debris.  
   1. Use environmentally preferable and low VOC emitting cleaners for each application type. Cleaners that contain solvents, pine and/or citrus oils are not permitted.

### 3.7 PROTECTION

A. Locate and protect moveable equipment and controls in such way that they can only be operated by authorized persons.

B. At time of Substantial Completion of elevator work, or portion thereof, provide suitable protective coverings, barriers, devices, signs, or other such methods or procedures to protect elevator work from damage or deterioration. Maintain protective measures throughout remainder of construction period.

### 3.8 INSTRUCTION AND MAINTENANCE

A. Instruct Owner's personnel in proper use, operation and daily maintenance of elevators. Review emergency provisions, including emergency access and procedures to be followed at time of failure in operation and other building emergencies. Train Owner's personnel in normal procedures to be followed in checking for sources of operational failures or malfunctions. Confer with Owner on requirements for complete elevator maintenance program.

B. Make final check of each elevator operation, with Owner's personnel present and just prior to date of substantial completion. Determine that control systems and operating devices are functioning properly.

**END OF SECTION**
SECTION 142600 LIMITED-USE/LIMITED-APPLICATION ELEVATORS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Limited-use/limited-application (LU/LA) elevators (LIFT-3).
B. Related Sections:
   1. Section 142100 – Electric Traction Elevators.
   2. Section 144200 – Wheelchair Lifts
   3. Division 26: Electrical service to lift equipment.

1.2 DEFINITIONS
A. Definitions in ASME A17.1/CSA B44 apply to Work of this Section.
B. LU/LA: Limited use/limited application.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components, and finishes for lifts.
   2. Include rated capacities, operating characteristics, electrical characteristics, safety features, controls, finishes, and accessories.
B. Shop Drawings: For each lift.
   1. Include plans, elevations, sections, details, attachments to other work, and required clearances.
   2. Indicate dimensions, weights, loads, and points of load to building structure.
   3. Include details of equipment assemblies, method of field assembly, components, and location and size of each field connection.
   4. Include diagrams for power, signal, and control wiring.
C. Samples: Submit samples of side panels for color and appearance acceptance.

1.4 INFORMATIONAL SUBMITTALS
A. Qualification Data: For Installer.
B. Manufacturer Certificates: Signed by elevator manufacturer certifying that hoistway, pit, and machine room layout and dimensions, as shown on Drawings, and electrical service, as shown and specified, are adequate for elevator being provided.
C. Preinstallation Examination Report: Indicating dimensional discrepancies and conditions detrimental to performance or indicating that dimensions and conditions were found to be satisfactory.
D. Sample Warranty: For special warranty.

1.5 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For elevators to include in emergency, operation, and maintenance manuals.
   1. Submit manufacturer's/installer's standard operation and maintenance manual, according to ASME A17.1.
B. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction, for normal, unrestricted elevator use.
C. Continuing Maintenance Proposal: Provide a continuing maintenance proposal from Installer to Owner, in the form of a standard five-year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.6 QUALITY ASSURANCE
A. Installer Qualifications: Elevator manufacturer or an authorized representative who is trained and approved by manufacturer.

1.7 DELIVERY, STORAGE, AND HANDLING
A. Deliver, store, and handle materials, components, and equipment in manufacturer's protective packaging. Store materials, components, and equipment off of ground, under cover, and in a dry location.

1.8 COORDINATION
A. Examine supporting structure and conditions under which lift is to be installed, and notify Contractor in writing of conditions detrimental to proper and timely completion of work.
B. Coordinate installation of sleeves, block outs, and items that are embedded in concrete or masonry for elevator equipment. Furnish templates and installation instructions and deliver to Project site in time for installation.
C. Coordinate locations and dimensions of other work relating to LU/LA elevators including sumps and floor drains in pits; entrance subsills; electrical service; and electrical outlets, lights, and switches in hoistways, pits, and machine rooms.

1.9 WARRANTY
A. Warranty: Provide a two year limited warranty for wheelchair lift materials and workmanship.
B. Extended Warranty: Provide an extended manufacturer's warranty covering the wheelchair lift materials and workmanship for the following additional extended period beyond the initial two year warranty. Preventive Maintenance Agreement required
  1. Five Years (7 years total)

1.10 MAINTENANCE SERVICE
A. Initial Maintenance Service: Beginning at Substantial Completion, provide one year's full maintenance by skilled employees of elevator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
  1. Perform maintenance, including emergency callback service, during normal working hours.
  2. Include 24-hour-per-day, 7-day-per-week emergency callback service.

PART 2 PRODUCTS

2.1 PRODUCT REQUIREMENTS
A. Accessibility Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines.

2.2 MANUFACTURERS
A. Manufacturers: Subject to compliance with specified requirements, provide Basis of Design or equivalent product by one of the following Manufacturers, and as approved by Architect:
1. Garaventa Lift (Basis of Design)
2. Symmetry Elevator - Custom Hydraulic Drive LU/LA Elevator
3. Arrow Lift
4. Substitutions: Allowed in accordance with the requirements of Division 1

2.3 HYDRAULIC LU/LA ELEVATOR

A. (LIFT-2) LU/LA Elevator:
1. Basis of Design: Garaventa Lift, Elvoron LU/LA Hydraulic Elevator, Model 1L; 1,400 pounds (635 kg) capacity cable hydraulic elevator.
2. Capacity: 1,400 pounds (635 kg).
3. Car Size: Maximum of 18 SF (1.67 sm).
   a. Style 1L: 48 inches by 54 inches (1220 by 1372 mm) with one side right sliding doors.
4. Travel:
   a. 258 inches unless indicated otherwise on Drawings.
5. Stops:
   a. 3 stops.
6. Speed: Nominal 30 feet per minute (0.15 m/sec).
7. Pit Depth: Minimum 14 inches (355 mm) required.
8. Overhead: Total overhead clearance (Refuge Space) 135 inches (3330 mm) above the finished upper landing floor. This space allowance can be reduced to 114" (2896 mm) with the use of a car top prop.
9. Drive System: 1:2 Cable Hydraulic, Heavy Duty car sling with roller guide shoes running on 8 lb. per foot steel T-rails, Quiet submersed pump and motor, factory pre-set and tested 2-speed valve for smooth start and stop.
10. Power Requirements:
    a. 208 VAC three phase
    b. 110 VAC single phase, 15 amps (for lighting)
11. Controls:
    a. PLC Controller with integrated self diagnostics.
    b. Fully automatic push button at car and landings with Braille markings.
    c. Automatic car light switch upon entry.
    d. Digital floor indicator in Car.
    e. Car arrival lanterns in car door jamb.
    f. Arrival Gong
12. Car and Hoistway Doors: Nominal 36 inch by 80 inch (914 by 2032 mm) two-speed horizontal sliding hoistway and car doors.
13. Safety Features:
    a. Emergency back-up power with a manual lowering device.
       1) Connect to existing emergency power
    b. Safety brake system.
    c. Car operator with integral gate switch.
    d. Automatic bi-directional floor leveling.
    e. Emergency alarm button in car, Emergency keyed stop switch in car.
    f. Overspeed valve.
    g. Final limit switch.
    h. Low oil protection timer circuit.
14. Standard Features:
    a. Car direction lantern comes with audio and visual signals.
    b. Full height photo-electric door sensors.
    c. Automatic home park feature (can be disengaged during installation if desired).
15. Options:
    a. Integrated hands free telephone.
16. Machine Location:
    a. As indicated on the Drawings.
17. Cab Design:
a. Interior Walls: Laminate panel sections.
   1) As selected by Architect from manufacturer’s standards
b. Cab Frame:
   1) Mild steel powder coated in a custom color as selected by the Architect.
c. Ceiling Finish:
   1) Stainless Steel, brushed finish.
d. Handrail Finish:
   1) Stainless Steel, brushed finish.
e. Car Operating Panel Finish:
   1) Stainless Steel, brushed finish.
f. Floor: Unfinished plywood for final finish by others (as indicated)
g. Lighting: Four recessed L.E.D. down lights.
   1) Black Trim.
h. Car Direction Lantern: Car direction lantern complete with auto and visual signaling device indicating direction of travel and arrival at selected floor.
i. Car Doors: When open the doors provide a 36 inch (915 mm) by 80 inch (2032 mm) clear opening.
   1) Two Speed Horizontal Sliding equipped with full height photo-electric door sensors, color as follows:
      (a) Stainless steel, brushed finish.

18. Hoistway Entrances:
   a. Hoistway Entrances: When open the doors provide a 36 inch (915 mm) by 80 inch (2032 mm) clear opening.
      1) Two Speed Horizontal doors, finish as follows:
         (a) Stainless Steel, brushed finish.
   b. Hall Call Stations:
      1) Hall Station Type:
         (a) Keyless Push Button.
      2) Finish:
         (a) Stainless Steel, brushed finish.

B. Emergency Communication System: Provide system that complies with ASME A17.1 and the U.S. Architectural & Transportation Barriers Compliance Board’s "Americans with Disabilities Act (ADA), Accessibility Guidelines for Buildings and Facilities (ADAAG)." On activation, system dials preprogrammed number of monitoring station and identifies elevator location to monitoring station. System indicates when it has been activated and when monitoring station has responded. System provides for two-way communication, by both voice and visual display, together with push buttons. System is contained in cabinet, with identification, instructions for use, and battery backup power supply.

C. Door Reopening Devices
   1. Photoelectric Device: Provide photoelectric device that projects light beam across car entrance. Interruption of light beam shall cause doors to stop and reopen.

**PART 3 EXECUTION**

**3.1 EXAMINATION**

A. Do not begin installation until preliminary work including hoistway, landings and machine space has been properly prepared.

B. Verify hoistway is constructed in accordance with ASME17.1 /CSA B-44 and all local codes.

C. Verify hoistway and machine room environment is designed to have maintainable temperatures between 50 degrees F (15 degrees C) and 90 degrees F (32 degrees C) and between 5% and 90% non-condensing.
D. Verify machine room if required provided with lighting, light switch and convenience outlet and conforms to CEC and clear space requirements and local codes.
E. Verify hoistway shaft and openings are of correct size and within tolerance.
F. Verify electrical power is available and of correct characteristics.
G. If preliminary work is the responsibility of another installer, notify Architect of unsatisfactory preparation before proceeding.

3.2 PREPARATION
A. Clean surfaces thoroughly prior to installation.
B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best result for the substrate under the project conditions.

3.3 INSTALLATION
A. Install elevator in accordance with applicable regulatory requirements including ASME A17.1 /CSA B-44 and the manufacturer's instructions.
B. Install system components and connect to building utilities.
C. Alignment: Coordinate installation of hoistway entrances with installation of elevator guide rails for accurate alignment of entrances with car. Reduce clearances to minimum safe workable dimension at each landing.
D. Leveling Tolerance: 1/4 inch, up or down, regardless of load and direction of travel.
E. Set sills flush with finished floor surface at landing. Fill space under sill solidly with nonshrink, non-metallic grout.
F. Accommodate equipment in space indicated.
G. Startup equipment in accordance with manufacturer's instructions.
H. Adjust for smooth operation.

3.4 FIELD QUALITY CONTROL
A. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times tests are to be performed.
B. Perform tests in compliance with ASME A17.1 /CSA B-44 and as required by authorities having jurisdiction.
C. Schedule tests with agencies and Architect, Owner, and Contractor present.
D. Submit test and approval certificates issued by jurisdictional authorities.

3.5 ADJUSTING
A. Adjust for smooth acceleration and deceleration of car so not to cause passenger discomfort.
B. Adjust automatic floor leveling feature at each floor to provide stopping zone of 1/4 inch (6 mm).

3.6 CLEANING
A. Remove protective coverings from finished surfaces.
B. Clean surfaces and components ready for inspection.

3.7 PROTECTION
A. Protect installed products until completion of project.
B. Touch-up, repair or replace damaged products before Substantial Completion.

3.8 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner’s maintenance personnel to operate, adjust, and maintain elevator. Refer to Division 01 Section "Demonstration and Training."

B. Check operation of elevator with Owner’s personnel present and before date of Substantial Completion. Determine that operation systems and devices are functioning properly.

C. Check operation of elevator with Owner’s personnel present not more than one month before end of warranty period. Determine that operation systems and devices are functioning properly.

3.9 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 month full maintenance by skilled employees of lift installer.
   1. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper lift operation at rated speed and capacity.
   2. Provide parts and supplies same as those used in manufacture and installation of original equipment.

END OF SECTION
SECTION 144200

WHEELCHAIR LIFTS

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Vertical wheelchair lift (LIFT-2).
   2. Motor, controls and wiring.
B. Related Sections:
   1. Section 142100 – Electric Traction Elevators.
   2. Section 142600 - Limited-use/Limited-Application Elevators
   3. Division 26: Electrical service to lift equipment.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components, and finishes for lifts.
   2. Include rated capacities, operating characteristics, electrical characteristics, safety features, controls, finishes, and accessories.
B. Shop Drawings: For each lift.
   1. Include plans, elevations, sections, details, attachments to other work, and required clearances.
   2. Indicate dimensions, weights, loads, and points of load to building structure.
   3. Include details of equipment assemblies, method of field assembly, components, and location and size of each field connection.
   4. Include diagrams for power, signal, and control wiring.
C. Samples: Submit samples of side panels for color and appearance acceptance.

1.3 INFORMATIONAL SUBMITTALS
A. Qualification Data: For manufacturer, vendor and Installer.
B. Product Certificates: For each type of lift. Include statement that runway, ramp or pit, dimensions as shown on Drawings, and electrical service as shown and specified are adequate for lift being provided.

1.4 CLOSEOUT SUBMITTALS
A. Operation and Maintenance Data: For each type of lift.
B. Inspection and Acceptance Certificates and Operating Permits: As required by authorities having jurisdiction for normal, unrestricted use of lifts.
C. Continuing Maintenance Proposal Submittal: Submit a continuing maintenance proposal from Installer to Owner, in the form of a standard five year maintenance agreement, starting on date initial maintenance service is concluded. State services, obligations, conditions, and terms for agreement period and for future renewal options.

1.5 PROJECT CONDITIONS
A. Examine supporting structure and conditions under which lift is to be installed, and notify Contractor in writing of conditions detrimental to proper and timely completion of work.
B. Coordinate work directly with other subcontractors as necessary to insure proper fitting, joining to or clearance of their work. Furnish or exchange shop drawings and resolve required dimensions and details.

1.6 QUALITY ASSURANCE
A. Installer Qualifications: An authorized representative who is trained and approved by manufacturer.

1.7 WARRANTY
A. Warranty: Provide a two year limited warranty for wheelchair lift materials and workmanship.
B. Extended Warranty: Provide an extended manufacturer's warranty covering the wheelchair lift materials and workmanship for the following additional extended period beyond the initial two year warranty. Preventive Maintenance Agreement required
   1. Five Years (7 years total)

1.8 MAINTENANCE SERVICE
A. Initial Maintenance Service: Beginning at Substantial Completion, provide one year's full maintenance by skilled employees of elevator Installer. Include monthly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper elevator operation at rated speed and capacity. Provide parts and supplies same as those used in the manufacture and installation of original equipment.
   1. Perform maintenance, including emergency callback service, during normal working hours.
   2. Include 24-hour-per-day, 7-day-per-week emergency callback service.

PART 2 PRODUCTS

2.1 PRODUCT REQUIREMENTS
A. Accessibility Requirements: Comply with applicable provisions in the U.S. Architectural & Transportation Barriers Compliance Board's ADA-ABA Accessibility Guidelines.

2.2 MANUFACTURERS
A. Manufacturers: Subject to compliance with specified requirements, provide Basis of Design or equivalent product by one of the following Manufacturers, and as approved by Architect:
   1. Garaventa Lift (Basis of Design)
   2. Bruno Independent Living Aids, Inc.
   3. Apex Wheelchair Lifts
   4. Symmetry Elevating Solutions
   5. Substitutions: Allowed in accordance with the requirements of Division 1

2.3 PERFORMANCE VERTICAL LIFT
A. (LIFT-2) Vertical Platform Lift:
   1. Basis of Design: Model GVL-EN-168 by Garaventa Lift
   2. Capacity: Capacity: 750 lbs (340 kg) rated capacity
   3. Lifting Height: 156 inches (4343 mm), using hydraulic drive.
   4. Number of Stops: Two.
   5. Nominal Clear Platform Dimensions:
      a. Standard: 37-1/4 inches (947 mm) by 54 inches (1370 mm)
   6. Platform Configuration:
      a. Straight Through Entry/Exit: Front and rear openings
   7. Landing Openings:
a. Lower Landing: Door
b. Upper Landing: Door

8. Doors and Gates: Doors and gates shall be self closing type.
   a. Door Height: Flush mount, 80 inches (2032 mm).
   b. Door Construction: Aluminum frame with:
      1) Panels of 1/4 inch (6 mm) laminated safety glass with 16 gauge (1.5 mm) galvanized steel kick plate.
      2) D-Handle Pull: 12 inch (305 mm) offset D-Handle.

9. Lift Components:
   c. Platform Side Wall Panels: 42-1/8 (1070 mm) inches high. 16 gauge (1.5 mm) galvanized steel sheet. Custom aluminum extrusion tubing frame.
   d. Enclosure Panels:
      1) 16 gauge (1.5 mm) painted galvanized steel sheet.

10. Infill Panel Kit: Provide 16 gauge (1.5 mm) galvanized panels and mounting hardware to cover void between side of enclosure, drive mast and adjacent wall at the following locations:
    a. Lower landing.
    b. Upper landing.

11. Base Mounting and Access to Lift at Lower Landing:
    a. Floor Mount: Base of lift shall be mounted on the floor surface of the lower landing. For access onto the platform provide a ramp of 16 gauge (1.5 mm) galvanized steel sheet with a slip resistant surface.

12. Hydraulic Drive:
    a. Drive Type: Chain hydraulic.
    b. Emergency Operation: Manual device to lower platform and use auxiliary battery power to raise or lower platform.
    c. Safety Devices:
       1) Slack chain safety device.
       2) Shoring device.
    d. Travel Speed: 17 fpm (5.2 m/minute).
    e. Motor: 3.0 hp (2.2 kW); 24 volts DC.
    f. Power Supply:
       1) 120 VAC single phase; 60 Hz on a dedicated 15 amp circuit.
       2) Powered by building continuous mains converted to 24 VDC and equipped with auxiliary battery backup power system capable of running lift up and down for a minimum of 5 trips with rated load. Required for high use lifts and lifts equipped with a fan and ventilation system.

13. Platform Controls: 24 VDC control circuit with the following features.
    a. Direction Control: Illuminated tactile and constant pressure push buttons with dual platform courtesy lights and safety light.
    b. Keyless operation.

14. Call Station Controls: 24 VDC control circuit with the following features.
    a. Direction Control: Illuminated tactile and constant pressure push buttons with illuminated "In Use" indicator.
    b. Keyless operation.
    c. Call Station Mounting:
       1) Lower: Wall mounted recessed.
       2) Upper: Wall mounted recessed.

15. Safety Devices and Features:
    a. Grounded electrical system with upper, lower, and final limit switches.
    b. Tamper resistant interlock to electrically monitor that the door is in the closed position and the lock is engaged before lift can move from landing.
    c. Emergency Operation: Connect to existing emergency power

16. Finishes
    a. Ferrous Components: Electrostatically applied baked powder finish, fine textured.
1) Color: Satin Grey, RAL 7030.
   b. Lift Finish: Baked powder coat finish, color as selected by the Architect from manufacturers
      optional RAL color chart.

2.4 FABRICATION
A. Fabrication, General: Construct lift of steel or aluminum structural frame with welded or bolted
   connections.
B. Verify dimensions on site prior to shop fabrication.
C. Fit and shop assemble in largest practical sections for delivery to site and installation.
D. Supply components required for proper anchorage of lift.
E. All welded parts by a certified welder in accord with AWS/D1.1

PART 3 EXECUTION

3.1 EXAMINATION
A. Do not begin installation until substrates have been properly prepared.
B. Verify shaft and machine space are of correct size and within tolerances.
C. Verify required landings and openings are of correct size and within tolerances.
D. Verify electrical rough-in is at correct location.
E. If substrate preparation is the responsibility of another installer, notify Architect of unsatisfactory
   preparation before proceeding.

3.2 PREPARATION
A. Clean surfaces thoroughly prior to installation.
B. Prepare surfaces using the methods recommended by the manufacturer for achieving the best
   result for the substrate under the project conditions.

3.3 INSTALLATION
A. Install lifts in accordance with applicable regulatory requirements including ASME A 17.1, ASME A
   18.1 and the manufacturer's instructions.
B. Install system components and connect to building utilities.
C. Accommodate equipment in space indicated.
D. Startup equipment in accordance with manufacturer's instructions.
E. Adjust for smooth operation.

3.4 PROTECTION
A. Protect installed products until completion of project.
B. Touch-up, repair or replace damaged products before Substantial Completion.

3.5 FIELD QUALITY CONTROL
A. Advise Owner, Architect, and authorities having jurisdiction in advance of dates and times tests are
   to be performed on lifts.
B. Acceptance Testing: On completion of lift installation and before permitting use of lifts, perform
   acceptance tests as required and recommended by ASME A18.1 and authorities having
   jurisdiction.
C. Operating Test: In addition to acceptance testing, load lifts to rated capacity and operate continuously for 30 minutes between lowest and highest landings served. Readjust stops, signal equipment, and other devices for accurate stopping and operation of system.

3.6 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain lifts. Include a review of emergency systems and emergency procedures to be followed at time of operational failure and other building emergencies.

B. Check operation of lifts with Owner's personnel present and before date of Substantial Completion. Determine that operating systems and devices are functioning properly.

C. Check operation of lifts with Owner's personnel present not more than one month before end of warranty period. Determine that operating systems and devices are functioning properly.

3.7 MAINTENANCE SERVICE

A. Initial Maintenance Service: Beginning at Substantial Completion, provide 12 month full maintenance by skilled employees of lift Installer.

1. Include quarterly preventive maintenance, repair or replacement of worn or defective components, lubrication, cleaning, and adjusting as required for proper lift operation at rated speed and capacity.

2. Provide parts and supplies same as those used in manufacture and installation of original equipment.

END OF SECTION
SECTION 210500
COMMON WORK RESULTS FOR FIRE SUPPRESSION

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Design Development
   1. Documents: Design development specifications may include plumbing and HVAC equipment not required for this project. Equipment and capacities are identified on the drawings. Refer to the specifications for equipment characteristics, components, accessories, and installation requirements. These documents are not for construction.

B. GMP pricing documents: This is a preliminary copy of the contract documents. The documents (drawings and project manual) are incomplete and issued to present the design intent. Equipment, material, and labor required to provide complete operating systems shall be included in the GMP.

C. This Section includes the following:
   1. Piping materials and installation instructions common to most piping systems.
   2. Grout.
   3. Fire-suppression equipment and piping demolition.
   4. Equipment installation requirements common to equipment sections.
   5. Painting and finishing.
   6. Concrete bases.
   7. Supports and anchorages.

1.3 DEFINITIONS

A. GMP: Guaranteed Maximum Price

B. Finished Spaces: Spaces other than mechanical and electrical equipment rooms, furred spaces, pipe chases, unheated spaces immediately below roof, and spaces above ceilings, unexcavated spaces, crawlspace, and tunnels.

C. Exposed, Interior Installations: Exposed to view indoors. Examples include finished occupied spaces and mechanical equipment rooms.

D. Exposed, Exterior Installations: Exposed to view outdoors or subject to outdoor ambient temperatures and weather conditions. Examples include rooftop locations.

E. Concealed, Interior Installations: Concealed from view and protected from physical contact by building occupants. Examples include above ceilings and in chases.

F. Concealed, Exterior Installations: Concealed from view and protected from weather conditions and physical contact by building occupants but subject to outdoor ambient temperatures. Examples include installations within unheated shelters.

G. The following are industry abbreviations for rubber materials:
   1. EPDM: Ethylene-propylene-diene terpolymer rubber.
   2. NBR: Acrylonitrile-butadiene rubber.
1.4 BASIS-OF-DESIGN
A. Equipment manufacturers listed on the equipment schedules are the basis-of-design. Manufactures listed in the specification other than the basis-of design manufacture are acceptable substitutions. Equipment schedules are on the drawings. Refer to specifications for unscheduled equipment.

1.5 INFORMATIONAL SUBMITTALS
A. Equipment startup reports.
   1. Reports will indicate equipment was started and tested according to the manufactures recommendations and is operating as specified. Included test data.

B. Coordination Drawings: Submit one copy for the engineers use. Division 21 coordination drawings will not be returned.
   1. Detail major elements, components, and systems of fire protection equipment and materials in relationship with other systems, installations, and building components. Show space requirements for installation and access. Indicate if sequence and coordination of installations are important to efficient flow of the Work. Include the following:
      a. Planned piping layout, including valve and specialty locations and valve-stem movement.
      b. Planned piping hanger layout including building attachments and building structural coordination.
      c. Clearances for installing and maintaining insulation.
      d. Clearances for servicing and maintaining equipment, accessories, and specialties, including space for disassembly required for periodic maintenance.
      e. Equipment and accessory service connections and support details
      f. Exterior wall and foundation penetrations.
      g. Fire- and smoke-rated wall and floor penetration.
      h. Sizes and locations of required concrete equipment curbs and bases.
      i. Scheduling, sequencing, movement, and positioning of large equipment into building during construction.
      j. Floor plans, elevations, and details to indicate penetrations in floors, walls, and ceilings and their relationship to other penetrations and installations.
      k. Access door and panel locations.
      l. Reflected ceiling plans to coordinate and integrate installation of air outlets and inlets, light fixtures, communication system components, sprinklers, and other ceiling-mounted items.

1.6 QUALITY ASSURANCE
A. Comply with ASHRAE Guideline 4 – 2008 Preparation of operating and maintenance documentation for building systems.

B. Steel Support Welding: Qualify processes and operators according to AWS D1.1, "Structural Welding Code--Steel."

C. Steel Pipe Welding: Qualify processes and operators according to ASME Boiler and Pressure Vessel Code: Section IX, "Welding and Brazing Qualifications."
   1. Comply with provisions in ASME B31 Series, "Code for Pressure Piping."
   2. Certify that each welder has passed AWS qualification tests for welding processes involved and that certification is current.

D. All grooved couplings, and fittings, valves and specialties shall be the products of a single manufacturer. Grooving tools shall be of the same manufacturer as the grooved components.
   1. All castings used for coupling housings, fittings, valve bodies, etc., shall be date stamped for quality assurance and traceability.
E. Electrical Characteristics for Fire-Suppression Equipment: Equipment of higher electrical characteristics may be furnished provided such proposed equipment is approved in writing and connecting electrical services, circuit breakers, and conduit sizes are appropriately modified. If minimum energy ratings or efficiencies are specified, equipment shall comply with requirements.

F. Multiple Units: When two or more units of materials or equipment of the same type or class are required, these units shall be products of one manufacturer.

G. Nameplates: Nameplate bearing manufacturer's name or identifiable trademark shall be securely affixed in a conspicuous place on equipment, or name or trademark cast integrally with equipment, stamped or otherwise permanently marked on each item of equipment.

1.7 GUIDELINES, CODES AND STANDARDS

A. Refer to the most recently published edition for references to guidelines, and standards unless a specific edition is listed.

B. Installation and materials shall comply with applicable national, state, and local codes and ordinances.

C. In addition to other applicable codes, comply with the Michigan Fire Prevention Code, Act 207; the Michigan State Construction Code, Act 230 as well as all fire safety rules adopted by the State of Michigan Fire Safety Board.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver pipes and tubes with factory-applied end caps. Maintain end caps through shipping, storage, and handling to prevent pipe end damage and to prevent entrance of dirt, debris, and moisture.

B. Store any plastic pipes protected from direct sunlight. Support to prevent sagging and bending.

1.9 COORDINATION

A. Arrange for pipe spaces, chases, slots, and openings in building structure during progress of construction, to allow for fire-suppression installations.

B. Coordinate installation of required supporting devices and set sleeves in poured-in-place concrete and other structural components as they are constructed.

C. Coordinate requirements for access panels and doors for fire-suppression items requiring access that are concealed behind finished surfaces. Access panels and doors are specified in Division 08 Section "Access Doors and Frames."

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where subparagraph titles below introduce lists, the following requirements apply for product selection:

1. Manufacturers: Subject to compliance with requirements, provide products by the manufacturers specified.

2.2 PIPE, TUBE, AND FITTINGS

A. Refer to individual Division 21 piping Sections for pipe, tube, and fitting materials and joining methods.
B. Pipe Threads: ASME B1.20.1 for factory-threaded pipe and pipe fittings.

1. Rigid Type: Coupling housings with offsetting, angle-pattern bolt pads shall be used to provide system rigidity and support and hanging in accordance with NFPA-13. Couplings shall be fully installed at visual pad-to-pad offset contact. Couplings that require exact gapping of bolt pads at specific torque ratings are not permitted. Installation-ready, for direct stab installation without field disassembly.
2. Flexible Type: Use in locations where vibration attenuation and stress relief are required.

2.3 JOINING MATERIALS
A. Refer to individual Division 21 piping Sections for special joining materials not listed below.

B. Pipe-Flange Gasket Materials: Suitable for chemical and thermal conditions of piping system contents.
1. ASME B16.21, nonmetallic, flat, asbestos-free, 1/8-inch maximum thickness unless thickness or specific material is indicated.
   a. Full-Face Type: For flat-face, Class 125, cast-iron and cast-bronze flanges.
   b. Narrow-Face Type: For raised-face, Class 250, cast-iron and steel flanges.
2. AWWA C110, rubber, flat face, 1/8 inch thick, unless otherwise indicated; and full-face or ring type, unless otherwise indicated.

C. Flange Bolts and Nuts: ASME B18.2.1, carbon steel, unless otherwise indicated.

D. Grooved Joint Lubricants: Lubricate gaskets in accordance with the manufacturer’s published installation instructions, using lubricant compatible with the gasket elastomer and fluid media.

E. Solder Filler Metals: ASTM B 32, lead-free alloys. Include water-flushable flux according to ASTM B 813.

F. Brazing Filler Metals: AWS A5.8, BCuP Series, copper-phosphorus alloys for general-duty brazing, unless otherwise indicated; and AWS A5.8, BAg1, silver alloy for refrigerant piping, unless otherwise indicated.

G. Welding Filler Metals: Comply with AWS D10.12 for welding materials appropriate for wall thickness and chemical analysis of steel pipe being welded.

2.4 CONCRETE BASES
A. Refer to Division 03 Section "Cast-in-Place Concrete" or Miscellaneous Cast-in-Place Concrete."

2.5 GROUT
A. Description: ASTM C 1107, Grade B, nonshrink and nonmetallic, dry hydraulic-cement grout.
2. Design Mix: 5000-psi, 28-day compressive strength.
PART 3 EXECUTION

3.1 PREPARATION
A. Obtain current fire-hydrant flow test results from the local authority having jurisdiction. Use results for system design calculations required in “Quality Assurance” Article.

3.2 FIRE-SUPPRESSION DEMOLITION
A. Refer to other sections and drawings for general demolition requirements and procedures.
B. Disconnect, demolish, and remove fire-suppression systems, equipment, and components indicated to be removed.
   1. Piping to Be Removed: Remove portion of piping indicated to be removed and cap or plug remaining piping with same or compatible piping material.
   2. Piping to Be Abandoned in Place: Drain piping and cap or plug piping with same or compatible piping material.
   3. Equipment to Be Removed: Disconnect and cap services and remove equipment.
   4. Equipment to Be Removed and Reinstalled: Disconnect and cap services and remove, clean, and store equipment; when appropriate, reinstall, reconnect, and make equipment operational.
   5. Equipment to Be Removed and Salvaged: Disconnect and cap services and remove equipment and deliver to Owner.
C. If pipe, insulation, or equipment to remain is damaged in appearance or is unserviceable, remove damaged or unserviceable portions and replace with new products of equal capacity and quality.

3.3 SERVICE-ENTRANCE PIPING
A. Connect fire sprinkler and standpipe piping to water-service piping for service entrance to building. Comply with requirements for exterior piping.
B. Install shutoff valve, backflow preventer, pressure gage, drain, and other accessories indicated at connection to water-service piping.

3.4 PIPING SYSTEMS - COMMON REQUIREMENTS
A. Install piping according to the following requirements and Division 21 Sections specifying piping systems.
B. Drawing plans, schematics, and diagrams indicate general location and arrangement of piping systems. Indicated locations and arrangements were used to size pipe and calculate friction loss, expansion, pump sizing, and other design considerations. Install piping as indicated unless deviations to layout are approved on Coordination Drawings.
C. Install piping in concealed locations, unless otherwise indicated and except in equipment rooms and service areas.
D. Install piping indicated to be exposed and piping in equipment rooms and service areas at right angles or parallel to building walls. Diagonal runs are prohibited unless specifically indicated otherwise.
E. Install piping above accessible ceilings to allow sufficient space for ceiling panel removal.
F. Install piping to permit valve servicing.
G. Install piping at indicated slopes.
H. Install piping free of sags and bends.
I. Install fittings for changes in direction and branch connections.
J. Install piping to allow application of insulation.
K. Select system components with pressure rating equal to or greater than system operating pressure.
L. Verify final equipment locations for roughing-in.
M. Refer to equipment specifications in other Sections of these Specifications for roughing-in requirements.

3.5 PIPING JOINT CONSTRUCTION

A. Join pipe and fittings according to the following requirements and Division 21 Sections specifying piping systems.
B. Ream ends of pipes and tubes and remove burrs. Bevel plain ends of steel pipe.
C. Remove scale, slag, dirt, and debris from inside and outside of pipe and fittings before assembly.
D. Soldered Joints: Apply ASTM B 813, water-flushable flux, unless otherwise indicated, to tube end. Construct joints according to ASTM B 828 or CDA's "Copper Tube Handbook," using lead-free solder alloy complying with ASTM B 32.
F. Grooved Joints: Grooved joints shall be installed in accordance with the manufacturer's latest published installation instructions. Grooved ends shall be clean and free from indentations, projections, and roll marks. Gaskets shall be molded and produced by the coupling manufacturer, and shall be verified as suitable for the intended service. A factory-trained field representative (direct employee) of the mechanical joint manufacture shall provide on-site training for contractor's field personnel in the proper use of grooving tools and installation of grooved piping products. The factory-trained representative shall periodically review the product installation and ensure best practices are being followed. Contractor shall remove and replace any improperly installed products. A distributor's representative is not considered qualified to conduct the training.
G. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

H. Welded Joints: Construct joints according to AWS D10.12, using qualified processes and welding operators according to Part 1 "Quality Assurance" Article.
   1. Shop weld pipe joints where welded piping is indicated. Do not use welded joints for galvanized-steel pipe.
I. Flanged Joints: Select appropriate gasket material, size, type, and thickness for service application. Install gasket concentrically positioned. Use suitable lubricants on bolt threads.

3.6 PAINTING

A. Painting of fire-suppression systems, equipment, and components as specified in other sections.
B. Damage and Touchup: Repair marred and damaged factory-painted finishes with materials and procedures to match original factory finish.
3.7 CONCRETE BASES

A. Concrete Bases and Curbs:
   1. Provide scaled layouts of bases and curbs with sizes and locations dimensioned to concrete walls and columns.
   2. Determine base and curb sizes and locations based on “Accepted” equipment shop drawings. Base and curb sizes shall not be scaled from the Drawings.
   3. Anchor equipment to concrete base according to equipment manufacturer's written instructions and according to vibration requirements at Project.

B. Construction Details: Refer to Architectural Details for base and curb construction types. If not indicated, construct as follows:
   1. Provide concrete bases sized 4 inches larger in both directions than the supported equipment.
   2. Provide 4-inch high curbs and bases with finished edges, unless otherwise indicated.
   3. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of the base.
   4. Install epoxy-coated anchor bolts for supported equipment that extend through concrete base, and anchor into structural concrete floor.
   5. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   6. Install anchor bolts to elevations required for proper attachment to supported equipment.
   7. Install anchor bolts according to anchor-bolt manufacturer's written instructions.
   8. Use 3000-psi, 28-day compressive-strength concrete and reinforcement.
   9. Chamfer all outside corners of concrete bases and curbs.

C. Concrete Base Painting: Provide 3” wide safety stripe at outside edge of all concrete bases and curbs. Start paint at bottom edge of chamfer. Color shall be selected by architect.

3.8 ERECTION OF METAL SUPPORTS AND ANCHORAGES

A. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor fire-suppression materials and equipment.

B. Field Welding: Comply with AWS D1.1.

3.9 GROUTING

A. Mix and install grout for fire-suppression equipment base bearing surfaces, pump and other equipment base plates, and anchors.

B. Clean surfaces that will come into contact with grout.

C. Provide forms as required for placement of grout.

D. Avoid air entrapment during placement of grout.

E. Place grout, completely filling equipment bases.

F. Place grout on concrete bases and provide smooth bearing surface for equipment.

G. Place grout around anchors.
H. Cure placed grout.

3.10 SEALANTS

A. Comply with appropriate joint-sealant materials and applications specified in other sections.

3.11 CYBERSECURITY RISK MITIGATION STRATEGY

A. Coordinate with Owner’s IT Department to restrict external network access to Internet connected system through virtual private network (VPN) connections only.

B. Security Event Log: Coordinate with the Owner to configure security event logging. Access to security logs shall be limited to users with proper authentication. Security logs shall be time stamped with Time and Date metadata for auditing and back-up.

C. Disable any protocols for remote connectivity, unless constantly required for day-to-day operations.

D. All external transport data shall be routed through encrypted channels with 2048-bit secure sockets layer (SSL).

E. Coordinate with Owner’s IT Department to implement a Web server-based human machine interface (HMI) that relies on IT technologies to secure access and restrict ports that can be opened on the firewall. Coordinate with Owner’s IT Department to restrict access to known IP addresses only.

F. Where building system networks are not physically separate from IT business networks, coordinate with Owner’s IT Department to segregate networked and Internet connected systems from the IT business network using virtual local area network (VLAN) IT technologies to restrict internal attacks/breakdowns.

G. Set unique, cryptographically strong passwords for administrator and user accounts. Default passwords must be changed before systems are connected to the Owner’s network.

H. Collect only the data that is necessary for analytics and optimization.

END OF SECTION
SECTION 210502 - BASIC FIRE PROTECTION REQUIREMENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Where contradictions occur between this Section and Division 01, the most stringent of the two shall apply. Architect shall decide which is most stringent.

B. These Basic Requirements apply to the entire Division 21 work.

C. All referenced and related provisions of Divisions 22, 23, 26, 27 and 28 shall also apply to the work of this section as if fully repeated herein.

1.2 SUMMARY

A. The definitions of Division 01 and the General Conditions of the Specification also apply to the Division 21 contract.

B. “Contract Documents” constitute the drawings, specifications, general conditions, project manuals, etc., prepared by engineer (or other design professional in association with Engineer) for contractor's bid or contractor's negotiations with the Owner. The Division 21 drawings and specifications prepared by the Engineer are not Construction Documents.

C. “Construction Documents”, “construction drawings”, and similar terms for Division 21 work refer to installation diagrams, shop drawings and coordination drawings prepared by the contractor using the design intent indicated on the Engineer’s contract documents. These specifications detail the contractor’s responsibility for “Engineering by Contractor” and for preparation of construction documents.

D. “Install” means to "set in place, connect and place in full operational order".
   1. “Provide” means to "furnish and install".

E. “Equal” or “Equivalent” means “meets the specifications of the referenced product or item in all significant aspects”. Significant aspects shall be as determined by the Owner's Representative.

F. “Work by other(s) divisions”, “re:Division”, and similar expressions means work to be performed under the contract documents, but not necessarily under the division or section of the work on which the note appears. It is the contractors’ sole responsibility to coordinate the work of the contract between his/her suppliers, subcontractors and employees. If clarification is required, consult Owner’s Representative before submitting bid.

G. By inference, any reference to a "contractor" or “sub-contractor” means the entity, which has contracted with the Owner for the work of the Contract Documents.

H. “Engineer” means the design professional firm, which has preferred these contract documents. All questions, submittals, etc. of this division shall be routed to the Engineer (through proper contractual channels).

1.3 COORDINATION WITHIN DIVISION 21

A. Contract Documents:
   1. General: The Contract Documents are diagrammatic showing certain physical relationships, which must be established within Division 21 work and its interface with other work. Such establishment is the exclusive responsibility of the Contractor. Drawings shall not be scaled for the purpose of establishing dimensions, clearances or material quantities.
2. Supplemental Instructions: The exact location for some items in this Specification may not be shown on the Drawings. The location of such items may be established by the Owner’s Representative during the progress of the work.

3. Discrepancies:
   a. Examine Drawings and Specifications of all Divisions of the work.
   b. Report any discrepancies to the Owner’s Representative and obtain written instructions before proceeding.
   c. Should there be a conflict within or between the Specifications or Drawings, the most stringent or higher quality requirements shall apply.
   d. Items called for either in the Specifications or on the Drawings shall be required as if called for in both.

4. Constructability:
   a. Examine Drawings and Specifications of all Divisions of the work.
   b. Report any issues to the Owner’s Representative which may prevent installation of Division 21 work in accordance with the Contract Documents and the original construction contract.

B. Contractor shall be responsible for providing proper documentation of equipment product data and shop drawings to all entities providing service.

C. Coordination Drawings: Prepare coordination drawings in accordance with Division 01, Section “Submittals” to scale of 1/4” = 1’-0” or larger, detailing major elements, components, and systems of mechanical equipment (i.e. equipment rooms, and exterior equipment areas) and materials in relationship with other system, installations, and building components. Indicate locations where space is limited for installation and access and where sequencing and coordination of installations are important to the efficient flow of the work, including (but not necessarily limited to) the following:
   1. Indicate all major piping (HVAC, Plumbing and Fire Suppression), electrical equipment and conduits, structural, and architectural elements in these areas as well.
   2. Sizes and locations of required concrete pads, piers, curbs, and bases.
   3. Provide all necessary sections and elements for clarification.
   4. Indicate all seismic restraint and support systems to be used for all mechanical equipment throughout the project.
   5. Ductwork and piping transitions from rooftop units to shafts or horizontal ducts.
   6. Failure to produce or submit coordination drawings does not dismiss the Contractor’s responsibility for translating the design intent of the Contract Documents into Construction Drawings.

D. Deferred Approval Items: Division 01.

E. Utility Connections:
   1. Coordinate the connection of fire protection system with utilities and services.
   2. Comply with regulations of utility suppliers.
   3. The contract documents indicate the available information on existing utilities and services, and on new services (if any) to be provided to the project by utility companies and agencies.
      a. Notify the Owner’s Representative immediately if discrepancies are found.
   4. Coordinate mechanical utility interruptions one week in advance in writing with the Owner’s Representative and the Utility Company.
      a. Plan work so that duration of the interruption is kept to a minimum.

1.4 COORDINATION WITH OTHER DIVISIONS

A. General:
   1. Coordinate the Division 21 work with the progress of the work of the other trades.
   2. Complete the entire installation as soon as the condition of the building will permit.
   3. Contractor is responsible for coordination of his/her work with Owner’s facility staff engaged in building automation, commissioning of systems, fire alarm system, etc.
B. Chases, Inserts and Openings:
1. Provide measurements, drawings, and layouts so that opening, inserts and chases in new construction can be built and coordinated as construction progresses.
2. Check sizes and locations of openings provided.
3. Any cutting and patching made necessary by failure to provide measurements, drawings, and layouts at the proper time shall be done at no additional cost to the Owner.

C. Support Dimensions: Provide dimensions and drawings so that concrete bases and other equipment supports to be provided under other Sections of the Specifications can be built at the proper time.

D. Deferred Approved Items: Division 01.

1.5 ENGINEERING BY CONTRACTOR
A. The construction of this building requires the Contractor to design several systems or subsystems. All such designs shall be the complete responsibility of the Contractor.

B. Systems or subsystems which require responsibility by the Contractor and submitted to the Engineer for review include, but are not limited to:
1. Equipment and piping supports, not detailed in the drawings.
2. Pipe hangers and anchors not specified in these documents, or catalogued by the manufacturer.
4. Thermal pipe stress analysis.

1.6 REGULATORY REQUIREMENTS
A. General:
1. Regulatory Compliance: Work performed under this Division shall comply with the latest currently adopted editions of Codes and Regulations including, but not limited to those listed below.
2. Minimum Requirements: The requirements of the Drawings and Specifications are the minimum that will be allowed, unless such requirements are exceeded by applicable codes or Regulations, in which case the Code or Regulation requirement shall govern.
3. Code Changes: Should a code change occur between time of proposal and date of permit issue, and the Contractor has unnecessarily delayed the acquisition of permits, the contractor shall hold the Owner free from additional expense resulting from such Code change.

B. Codes: Comply With the Currently Adopted (At Time of Contract Award) Codes

C. Comply With the Latest Editions of Applicable Regulations and Standards, Including:
1. Uniform Plumbing Code
3. Underwriter’s Laboratories, Inc. (UL).
6. American Society of Mechanical Engineers (ASME).
9. Compressed Gas Association (CGA).
13. Plumbing and Drainage Institute (PDI).
15. Factory Mutual Standards

D. Requirements of Local Utility Companies: Comply with rules and regulations of local utility companies. Include in bid the cost of all valves, valve boxes, meter boxes, meters and such accessory equipment, which will be required for the project.

E. Additional Regulations: Follow additional regulations which appear in individual Sections of these Specifications.

F. Contradictions: Where codes are contradictory, follow the most stringent, unless otherwise indicated in Plans or Specifications. The Owner’s Representative shall determine which is most stringent.

G. Contract Documents Not in Compliance:
   1. Where it is not noted that the Drawings and Specifications do not comply with the minimum requirements of the codes, either notify the Owner’s Representative in writing during the Bidding Period of the revisions required to meet Code Requirements. After entering into contract, Contractor will be held to complete all work necessary to meet Code Requirements without additional expense to the Owner.
   2. Follow Drawings and Specifications where they are superior to Code Requirements.

H. Permits:
   1. Contractor shall pay for and obtain all permits required by authorities and agencies having jurisdiction for the work in this Division.
   2. Post permits as required.

I. Inspections and Tests:
   1. Arrange for all required inspections and tests.
   2. Pay all charges.
   3. Notify the Owner’s Representative in writing 72 hours before tests.
   4. Submit one copy for Owners record of permits. Licenses, inspection reports and test reports.

1.7 EQUIVALENTS AND SUBSTITUTIONS

A. The applicable paragraphs for General Requirements, Division 01 apply herein.

B. Basis for Design: The manufacturer’s name and product listed on the drawings, or listed first of several names in these Specifications, is used as a basis for design to establish space requirements, a standard of quality and performance.

C. Equivalents: Products of one or more other manufacturer’s names listed in these Specifications following the words “or equivalent by” may be selected, subject to paragraph below titled “Contractor’s Responsibility for Equivalent and Substitutions.”

D. Other Options:
   1. For products specified by naming only one manufacturer, refer to paragraph below under “Substitutions”.
   2. For products specified only by performance characteristics or reference standards, select any manufacturer meeting the requirements.

E. Substitutions: Requests for acceptance of a product of manufacturer’s name not listed in these specifications will be considered if any one of the following conditions is met:
   1. The named product is not available because of strikes or discontinuance of manufacture, and the proposed product is equivalent to the named product.
   2. The proposed product is superior to the named product, in the opinion of the Owner’s representative.
3. The proposed product is equivalent to the named product and its use will be to the advantage of the Owner, by the Owner receiving an equitable credit or cost savings. The Owner’s Representative reserves the right to reject any substitution.

4. Submit proposed substitutions with bid along with alternate price, complete descriptive data and a comparison of the substitute manufacturer’s product with specified product. Request for acceptance of a product of manufacturer’s name not listed in these specifications, is subject to the paragraph titled “Contractor’s Responsibility Equivalents and Substitutions”.

F. Contractor’s Responsibility for Equivalents and Substitutions:

1. Items submitted as a substitution to the basis of design or listed general equivalents shall be identified as such and shall include a written request for substitution indicating the following:
   b. Contract time adjustment.
   c. Item by item breakdown of differences between basis of design and substituted item.
   d. Operation, maintenance and energy cost difference.

2. Products of manufacturer must match the features, construction, performance and size of those selected for design. Standard catalogued may require certain modifications to meet specified requirements.

3. The responsibility for providing that specified requirements have been met remains with the manufacturer and contractor. Should the substituted item fail to perform in accordance with the Specifications, replace same with the originally specified item without extra cost to the contract.

4. When requesting review of an equivalent or substituted product, submit a comparison chart listing features, construction, performance and sizes of named product versus equivalent or substituted product.

5. Submittals for review of an equivalent or substituted product will be reviewed for acceptability when all the above requirements have been met. Contractor shall be responsible for all costs incurred by the Architect and Engineer for review of equivalency beyond initial review.

6. Coordinate the installation of the product with all trades.

7. Contractor shall be responsible for changes in electric wiring, materials and for all other additional costs of construction by all trades involved to accommodate the product to perform same as product used on the “Basis of Design”.

8. Coordination of General Equivalents and Substitutions: Where Contract Documents permit selection from general equivalents, or where substitutions are authorized, coordinate clearance and other interface requirements with mechanical and other work.

9. Provide necessary additional items so that selected or substituted item operates equivalent to the Basis of Design and properly fits in the available space allocated for the Basis of Design.

10. Contractor is responsible for assuring that piping, conduit, duct, flue and other service locations for general equivalents or substitutions do not cause access, service or operational difficulties any greater than would be encountered with the Basis of Design.

11. Failure to comply with these requirements will result in immediate rejection of the request for substitution.

1.8 GENERAL SUBMITTAL REQUIREMENTS

A. Refer to Division 01.

B. Coordination and Sequencing:

1. Coordinate submittals 3 weeks (minimum) prior to expected order date so that work will not be delayed by submittals.

2. Do not submit product data, or allow its use on the project until compliance, with requirement of Contract Documents has been confirmed by Contractor.

3. Submittal is for information and record, unless otherwise indicated, and is not a change order request.
4. Submitting contractor is responsible for routing reviewed submittals to all parties affected including but not limited to electrical, building automation and temperature control, and test and balance subcontractors.
5. Make submittals for group of similar products or materials such as valves, fixtures, pumps, insulation, etc., or area of work complete and at one time, not in piecemeal fashion.
6. Identify submittals with Architect’s project name and number, with item designation as indicated on drawings, and referenced to applicable paragraphs of the specifications. Submit in brochure form.
7. Submittals of products needed at start of Project for its installation, or those requiring a long lead time for assembly or manufacturing, should be submitted before the others.

C. Preparations of Submittals:
   1. Refer to Division 01 requirements.
   2. Provide permanent marking on each submittal to identify project, date, Contractor, Subcontractor, Supplier, submittal name and similar information to distinguish it from other submittals.
   3. Indicate any portions of work, which deviate from the Contract Documents.
      a. Explain the reasons for the deviations.
      b. Show how such deviations coordinate with interfacing portions of other work.
   4. Show Contractor’s executed review and approval marking.
   5. Provide space for the Owner’s Representative “Action” marking.
   6. Submittals, which are received from sources other than through Contractor’s office, will be returned “Without Action”.
   7. Submittals shall be presented in a neat and legible fashion and shall be returned “Without Action” if presented in any other fashion.

D. Response to Submittals: Where standard product data has been submitted, it is recognized:
   1. That the Submitter has determined that the products fulfill the specified requirements.
   2. That the submittal is for the Owner’s Representative information only, but will be returned with appropriate action where observed to be not in compliance with the requirements.

E. If more than two submittals (either for shop drawings, as-buils drawings, or test and balance reports) are made by the contractor due to the incompletion, non-compliance, errors, omissions, etc. the Owner reserves the right to charge the contractor for subsequent reviews by their consultants. Such extra fees shall be deducted from payments by the Owner to the Contractor.

1.9 SPECIFIC CATEGORY SUBMITTAL REQUIREMENTS

A. Manufacturer’s Data:
   1. Where pre-printed data covers more than one distinct product, size, type, material, trim, accessory group or other variation, mark submitted copy with black ink to indicate which of the variations is to be provided.
   2. Delete or mark-out significant portions of pre-printed data, which are not applicable.
   3. Where operating ranges are shown, mark data to show portion of range required for project application.
   4. For Each Product, Include the Following:
      a. Sizes.
      b. Weights.
      c. Speeds.
      d. Capacities.
      e. Piping and electrical connection sizes and locations.
      f. Statements of compliance with the required standards and regulations. g. Performance data.
      g. Manufacturer’s specifications and installation instructions.
B. Shop Drawings:
   1. Prepare fire protection shop drawings, except diagrams, to accurate scale.
      a. Show clearance dimensions at critical locations.
   b. Show dimensions of spaces required for operation and maintenance.
   c. Show interfaces with other, work, including structural support.

C. Test Reports:
   1. Submit test reports, which have been signed and dated by the firm performing the test.
   2. Prepare test reports in the manner specified in the standard or regulation governing the test
      procedure (if any) as indicated.

D. Required Equipment and Shop Drawing Submittals:
   1. Provide a submittal schedule with bid.
   2. Provide equipment submittals for each item of equipment specified or scheduled in the Contract
      Documents.
   3. Submittal schedule shall show each item of equipment, applicable section of the Specifications
      where it is described, applicable drawing number and schedule name where it is scheduled,
      date of Contractor’s proposed submittal to the Owner’s Representative, required date to receive
      submittal from the Owner’s Representative and schedule order date.
   4. Provide a Mechanical Shop Drawing Schedule for submission to the Owner’s Representative
      with the Submittal Schedule.

1.10 COMPATIBILITY

A. General: Provide products, which are compatible with other products of the mechanical work, and
   with other work, requiring interface with the mechanical work.

B. Power Characteristics: Where power characteristics are not stated in Division 21 Sections, refer to
   the Sections of Division 26 and the Electrical Drawings for the power characteristics of each power
   driven item of mechanical equipment. Coordinate available power with Electrical Contractor before
   ordering equipment. Mechanical Contractor shall be responsible for ordering equipment to meet
   the available power characteristics. If there is a conflict between Division 21 documents and
   Division 26 documents, provide a written notification to the Owner’s Representative for direction.
   Do not order equipment prior to determining the proper electrical service. No contract cost
   adjustment will be allowed for equipment ordered in conflict with the available power
   characteristics.

1.11 RECORD DRAWINGS

A. Drawings:
   1. Record of Project Progress: Purchase from the Architect a complete set of reproducible
      contract drawings and maintain drawings available at the job site for inspection. Keep an
      accurate, legible and continuously updated record of installed locations and all project revisions
      other than revised drawings issued by the Architect, including source and date of authorization.
      Utilize only contract drawing symbols for recording the work. Drawing notations to be
      sufficiently clear in the representation of the work, for utilization by a CADD operator (drafts
      person) who is not necessarily familiar with the installed work.
   2. Record of Installation: At the conclusion of the work, deliver one (1) set of blue prints of the
      progress drawings to the Owner’s Representative for review. Following the review, Contractor
      shall have incorporated by a competent CADD operator all of the installed data represented on
      the project progress drawings.
   3. Include in Record Drawings the Following:
a. Revisions, including sketches, bulletins, change orders, written addenda and directives, clarifications and responses generated by requests for information (RFIs), regardless of source of the revision.
b. Location and configuration of equipment with related housekeeping pads.
c. Location of fixtures, drains and appurtenances.
d. Physical routing of piping, underground, exposed, and above ceiling with locations of valves and accessories plainly marked and identified.
e. Location of piping below building and on exterior, valves, manholes, appurtenances and stub outs dimensioned from buildings and permanent structures, both horizontally and vertically.
f. Location of wall and ceiling access panels.

B. Acceptance: As a condition for acceptance of the work, deliver two (2) sets of Auto CAD Latest Version CDs and one set of signed and dated reproducible drawings to the Owner’s Representative and obtain a receipt.

1.12 OPERATING AND MAINTENANCE DATA
A. Refer to Division 01 requirements.
B. Submission:
1. Submit three typed and bound copies of Operating and Maintenance (O&M) Manuals prior to scheduling systems demonstrations for the Owner’s Representative, as specified in Division 01.
2. Bind each Maintenance Manual in one or more vinyl covered, 3-ring binders, with pockets for folded drawings.
   a. Mark the spine of each binder with system identification and volume number.
C. Required Contents:
1. Manuals shall have index with tab dividers for each major equipment section to facilitate locating information on a specific piece of equipment.
2. Identify data within each section with drawing code numbers as they appear on Drawings and Specifications. Include as a minimum the following data:
   a. Alphabetical list of system components, with the name, address and 24 hour telephone number of the company responsible for servicing each item during the first year of operation. Include point of contact for company.
   b. Operating instructions for complete system including:
      1) Emergency procedures for fire and failure of major equipment.
      2) Major start, operation and shut down procedures.
   c. Maintenance Instructions for Each Piece of Equipment Including:
      1) Equipment lists.
      2) Proper lubricants and lubricating instructions for each piece of equipment.
      3) Necessary cleaning, replacement and/or adjustment schedule.
      4) Product data.
      5) Installation instructions.
      6) Parts list.
   d. Marked or changed prints locating concealed parts and variations from the original system design (as-built drawings).
   e. Valve schedule and associated piping schematics. See Section 220553, IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT.
   f. Copies of any extended equipment warranties which are greater than one year.

1.13 WARRANTIES
A. The warranty period is two years after Date of Acceptance:
1. During this period, provide labor and materials as required to repair or replace defects in the mechanical system at no additional cost to the Owner. Provide certificate with O&M Manual submittal, which guarantees same-day service response to Owners call for all such warranty service.
2. Provide certificate for such items of equipment, which have warranties in excess of one year. Insert copies in O&M Manuals.
3. Provide extended manufacturers warranties to cover two years from date of acceptance if standard warranty starts any time prior to that date.
4. At time of bid, submit additional costs or extended warranties for principal equipment (e.g. point of use water heaters, pumps, air compressor, etc.).

B. Provide longer warranties where specified in individual specification sections.
C. Refer to Division 01 for additional requirements.

1.14 SPARE PARTS, SPECIAL TOOLS
A. Deliver spare parts to the Owner’s Representative and obtain receipts at the time operating instructions are given to the Owner’s personnel.

B. Include the Following:
1. V-Belts: One complete set of each size.
2. Fuses: each type used for all equipment utilizing fuses. Quantity 10%, but not less than two.
3. Pilot Light Lamps: Each type used on the project. Quantity of 10%, but not less than two.
4. Special Tools: Furnish special tools required for assembly, adjustment, setting or maintenance of equipment if such tool is not readily available on the commercial tool market.
5. Maintenance Paint: Furnish one can of touch-up paint for each different factory finish, which is to be the final finished surface of the product.
6. Alternate Parts: Under the individual mechanical sections, there are listed spare parts to be furnished under a bid alternate. Should the alternate be accepted, such spare parts shall be similarly delivered to the Owner.

1.15 SYSTEM ACCEPTANCE
A. Acceptance shall be contingent upon completion of final review and correction of all deficiencies. Satisfactory completion of the operational tests, which shall demonstrate compliance with all performance criteria, and the requirements of the Contract Documents.

B. Request a Final Review Prior to System Acceptance After Completion of the Following:
1. Installation of all systems required by Contract Documents.
2. Submission and acceptance of service manuals.
3. Identification.
4. Cleaning.
5. Satisfactory operation of all systems for a period of one week.

1.16 MANDATORY GOVERNING PROVISION
A. Omissions of words or phrases, such as “the Contractor shall”, in conformity with”, “shall be”, “as noted on the Drawings”, “according to the Drawings”, “an”, “the”, and “all” are intentional.

B. Omitted words or phrases shall be supplied by inference.

1.17 OWNER FURNISHED EQUIPMENT
A. All equipment called out in the Specifications or shown on the Drawings as “Owner Furnished Equipment” shall be installed and connected under this contract. Provide rough-ins for all future connections indicated, unless otherwise specifically indicated on Drawings.
1.18 TEMPORARY FACILITIES
A. Light, heat, power, etc.
   1. Contractor shall be responsible for providing temporary electricity, heat and other facilities as specified in Division 01.
   2. Contractor shall be responsible for maintaining the equipment in an as-new condition. Equipment will not be turned over to the Owner until it is brought up to as-new condition.

1.19 SAFETY PROVISIONS
A. Equipment Nameplates: provide power-oriented fire protection equipment with a permanent nameplate attached by the manufacturer, indicating:
   1. The manufacturer.
   2. Product name.
   3. Model number.
   4. Serial number.
   5. Speed.
   6. Capacity.
   7. Power characteristics.
   8. Labels of testing, or inspecting agencies.
   9. Other similar data.
B. Where manufacturer affixed nameplate is not available, Contractor shall fabricate and attach nameplate.
C. Guards:
   1. Unless equivalent guards are provided integral with the equipment, enclose each belt drive (including sheaves) on both sides in a galvanized, one inch, mesh screen of No. 18 gauge steel wire or expanded metal, fastened to an approved, structural steel frame, securely fastened to the equipment or floor.
   2. Provide tachometer holes at shaft centers. Unless equivalent guards are provided integral with the equipment, install a solid guard of No. 20 gauge galvanized steel over the coupling of each item of direct-driven equipment.
   3. Sides are not required on these guards except to ensure rigidity.

PART 2 - PRODUCTS (Not Used)

PART 3 - EXECUTION

3.1 INSTALLATION GENERAL REQUIREMENTS
A. Furnish, apply, install, connect, erect, clean, and condition manufactured materials and equipment as recommended in manufacturer’s printed directions (maintained on job site during installation).
B. Provide all attachment devices and materials necessary to secure materials together or to other materials.
C. Make allowance for ample and normal expansion and contraction for all building components and piping systems that are subject to such.
D. Install materials only when conditions of temperature, moisture, humidity and conditions of adjacent building components are conducive to achieving the best installation results.
E. Erect, install and secure components in a structurally sound and appropriate manner.
F. Where necessary, temporarily brace, shore, or otherwise support members until final connections are installed.

G. Leave all temporary bracing, shoring, or other structural supports in place as long as practical for safety and to maintain proper alignment.

H. Handle materials in a manner to prevent scratching, abrading, distortion, chipping, breaking, or other disfigurement.

I. Conduct work in a manner to avoid injury or damage to previously placed work.

J. Any work so impaired or damaged shall be replaced at no expense to Owner.

K. Fabricate and install materials true to line, plumb and level.

L. Leave finished surfaces smooth and flat, free from wrinkles, wraps, scratches, dents and other imperfections.

M. Furnish materials in longest practical lengths and largest practical sizes to avoid all unnecessary jointing.

N. Make all joints secure, tightly fitted, and as inconspicuous as possible by the best, accepted practice in joinery and fabrication.

O. Consult the Owner’s Representative for mounting height or position of any unit not specifically indicated or located on Drawings or specified in Specifications.

P. Job mixed multi-component materials used in the work shall be mixed in such regulated and properly sized batches that material can be used before it begins to “set”.

Q. Mixing of a partially “set” batch with another batch of fresh materials will not be accepted and entire batch shall be discarded and removed from site.

R. Clean all mixing tools and appliances that can be contaminated prior to mixing of fresh materials.

S. In addition to the above, refer to each Section of the Specifications for additional installation requirements for the proper completion of all work.

3.2 COORDINATION OF FIRE PROTECTION INSTALLATION

A. Inspection and Preparation:
   1. Examine the work interfacing with fire protection work, and the conditions under which the work will be preformed, and notify the Owner’s Representative of conditions detrimental to the proper completion of the work at original contract price.
   2. Do not proceed with the work until unsatisfactory conditions have been corrected.

B. Layout:
   1. Layout the dire protection work in conformity with the Contract Drawings, Coordination Drawings and other Shop Drawings, product data and similar requirements so that the entire fire protection system will perform as an integrated system, properly interfaced with other work recognizing that portions of the work are shown only in diagrammatic form.
   2. Where coordination requirements conflict with individual system requirements, comply with the Owner’s Representative decision on resolution of the conflict.
   3. Take necessary field measurements to determine space and connection requirements.
   4. Provide sizes and shapes of equipment so the final installation conforms to the intent of the Contract Documents.
   5. Provide necessary fittings to create offsets as required to coordinate with building structure and other trades, even if fittings are not shown on the Contract Drawings.
C. Integrate fire protection work in ceiling spaces with the ceiling suspension system, light fixtures and other work, so that required performance of each will be achieved.

3.3 PRODUCT INSTALLATION

A. Manufacturer's instructions:
   1. Except where more stringent requirements are indicated, comply with the product manufacturer's instructions and recommendations.
   2. Consult with manufacturer's technical representatives, who are recognized as technical experts, for specific instructions on special projects conditions.
   3. If conflict exists, notify the Owner's in writing and obtain his instruction before proceeding with the work in question.

B. Movement of Equipment:
   1. Wherever possible, arrange for the movement and positioning of equipment so that enclosing partitions, walls and roofs will not be delayed or need to be removed.
   2. Otherwise, advise Contractor of opening requirements to be maintained for the subsequent entry of equipment.

C. Heavy Equipment:
   1. Coordinate the movement of heavy items with shoring and bracing so that the building structure will not be overloaded during the movement and installation.
   2. Where fire protection products to be installed on the existing roof are too heavy to be hand-carried, do not transport across the existing roof deck. Position by crane or other device so as to avoid overloading or otherwise damaging the roof deck.

D. Clearances:
   1. Install Piping:
      a. Straight and true.
      b. Aligned with other work.
      c. Close to walls and overhead structure (allowing for insulation).
      d. Concealed, where possible, in occupied spaces.
      e. Out-of-the-way with maximum passageway and headroom remaining in each space.
   2. Do not obstruct windows, doors and other openings.
   3. Coordinate location of piping systems required to slope for drainage (over other service lines and ductwork).

E. Access:
   1. Provide For Removal, Without Damage To Other Parts, Of:
      a. Seals.
      b. Shafts.
      c. Gaskets.
      d. Drives.
      e. Filters.
      f. Strainers.
      g. Bearings.
      h. Control components.
      i. Other parts requiring periodic replacement or maintenance.
   2. Connect equipment for ease of disconnecting with minimum of interference with other work.
   3. Provide unions where required.
   4. Locate operating and control equipment and devices for easy access.
   5. Provide access panels where equipment or devices are concealed by non-accessible finishes and similar work.
6. Ensure grease fittings for equipment are readily visible and accessible. Extend fittings when necessary.

3.4 PROTECTION OF WORK
A. Provide protection against dust migration, rain, wind, storms, frost, or heat, so as to maintain all work, materials, apparatus and fixtures free from injury or damage.
B. At end of each day’s work, cover all new work likely to be damaged.
C. Do not interrupt the integrity of the building security overnight.
D. Refer to Division 01 for additional requirements.
E. All pipe ends, valves and equipment left unconnected shall be capped, plugged or otherwise properly protected to prevent damage and the intrusion of foreign matter.
F. Any equipment or piping systems found to have been damaged or contaminated above “MILL” or “SHOP” conditions shall be replaced or cleaned to the Owner’s Representative satisfaction.
G. Provide initial water seal fill for all waste P-traps or similar traps.

3.5 PROTECTION OF POTABLE WATER SYSTEMS
A. All temporary water connections shall be made with an approved back flow preventer.
B. All hose bibs shall have as a minimum, a vacuum breaker, to prevent back flow.
C. Direct connections to hydronic systems shall only be made through a reduced pressure back flow preventer.

3.6 OBJECTIONABLE NOISE AND VIBRATION
A. Mechanical equipment and piping system shall operate without objectionable noise and vibration, as determined by the judgment of the Owner's Representative.
B. If objectionable noise and vibration should be produced, make necessary changes or additions required to produce satisfactory result without additional cost to the Owner.

3.7 CLOSING-IN OF UN-INSPECTED WORK
A. Do not allow or cause any work to be covered up or enclosed until inspected, tested and approved.
B. Should any work be enclosed or covered up before such inspection and test, Contractor shall, at his/her own expense, uncover work and after it has been inspected, tested and approved, make repairs with such materials as necessary to restore his/her work and that of other Divisions to original and proper condition.

3.8 CLEANING
A. After installation is complete, clean all systems as indicated below.
B. Piping and Equipment To Be Insulated: Clean exterior thoroughly to remove rust, plaster, cement and dirt before insulation is applied.
C. Piping and Equipment Remain Un-insulated: Clean exterior thoroughly to remove rust, plaster, cement, dirt and other foreign substances.
D. Piping and Equipment To Be Painted: Clean exterior to be exposed in completed structure. Remove rust, plaster, cement and dirt by wire brushing. Remove grease, oil and other foreign materials by wiping with clean rags and suitable solvents.
E. During Progress of Work: Carefully clean up the premises and keep all portions of the building free of debris.

F. Chrome Or Nickel Plated Work: Thoroughly polish.

3.9 DAMAGE RESPONSIBILITY
A. Contractor shall be responsible for damage to the grounds, buildings or equipment and the loss of refrigerants, fuels or gases, caused by leaks or breaks in pipes for equipment furnished or installed under this Division.

3.10 PRELIMINARY OPERATION
A. The Owner’s Representative reserves the right to operate portions of the mechanical system on a preliminary basis without voiding the guarantee or relieving the Contractor of his/her responsibilities.

3.11 OPERATIONAL TESTS
A. Before operational tests are performed, demonstrate to the Owner’s Representative that systems and components are complete and fully charged with operating fluid and lubricants. Systems shall be operable and capable of maintaining continuous uninterrupted operation during the operating and demonstration period.

B. After systems have been completely installed, connections made, and tests completed, operate the systems continuously for a period of five working days during the hours of a normal working day.

C. Rotating equipment shall be in dynamic balance and alignment.

D. Tests required in various sections herein shall be completed.

E. Notify the Owner’s Representative, in writing, two weeks in advance of this operational period.

F. This operational test may be concurrent with instruction of the Owner’s operating personnel.

3.12 COMPLIANCE TESTS
A. Conduct tests for individual components, such as chiller, boiler, cooling tower, air handling unit, etc. of all portions of the installation as may be required by the various Sections of this Division to comply with the Contract Documents. Tests shall be made in the presence of the Owner’s Representative. Costs of tests shall be borne by the Contractor. Contractor shall provide all instruments, equipment, labor and materials to complete the tests. These tests may be required at any time between the installation of the work and the end of the warranty period. Should these tests expose any defective materials, poor workmanship or variance with requirements of Contract Documents, Contractor shall make any changes necessary and remedy any defects at no cost to the Owner.

END OF SECTION
SECTION 210517
SLEEVES AND SLEEVE SEALS FOR FIRE-SUPPRESSION PIPING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Sleeves.
   2. Sleeve-seal systems.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product indicated.

PART 2 PRODUCTS

2.1 SLEEVES
A. Cast-Iron Wall Pipes: Cast or fabricated of cast or ductile iron and equivalent to ductile-iron pressure pipe, with plain ends and integral water stop unless otherwise indicated.
B. Galvanized-Steel Wall Pipes: ASTM A 53/A 53M, Schedule 40, with plain ends and welded steel collar; zinc coated.
C. Galvanized-Steel-Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, with plain ends.
D. Galvanized-Steel-Sheet Sleeves: 0.0239-inch minimum thickness; round tube closed with welded longitudinal joint.

2.2 SLEEVE-SEAL SYSTEMS
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Advance Products & Systems, Inc.
   2. CALPICO, Inc.
   3. Metraflex Company (The).
   4. Pipeline Seal and Insulator, Inc.
   5. Proco Products, Inc.
B. Description: Modular sealing-element unit, designed for field assembly, for filling annular space between piping and sleeve.
   1. Sealing Elements: EPDM-rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
   2. Pressure Plates: Stainless steel.
   3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.3 SLEEVE-SEAL FITTINGS
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Holdrite.
B. Description: Manufactured plastic, sleeve-type, water stop assembly made for imbedding in concrete slab or wall. Unit has plastic or rubber water stop collar with center opening to match piping OD.

2.4 GROUT
B. Characteristics: Non-shrink; recommended for interior and exterior applications.
C. Design Mix: 5000-psi, 28-day compressive strength.
D. Packaging: Premixed and factory packaged.

PART 3 EXECUTION

3.1 SLEEVE INSTALLATION
A. Install sleeves for piping passing through penetrations in floors, partitions, roofs, and walls.
B. For sleeves that will have sleeve-seal system installed, select sleeves of size large enough to provide 1-inch annular clear space between piping and concrete slabs and walls.
   1. Sleeves are not required for core-drilled holes in walls.
C. Install sleeves in concrete floors, concrete roof slabs, and concrete walls as new slabs and walls are constructed.
   1. Cut sleeves to length for mounting flush with both surfaces.
      a. Exception: Extend sleeves installed in floors of mechanical equipment areas, pipe chases, or other wet areas 2 inches above finished floor level.
   2. Using grout, seal the space outside of sleeves in slabs and walls without sleeve-seal system.
D. Install sleeves for pipes passing through interior partitions.
   1. Cut sleeves to length for mounting flush with both surfaces.
   2. Install sleeves that are large enough to provide 1/4-inch annular clear space between sleeve and pipe or pipe insulation.
   3. Seal annular space between sleeve and piping or piping insulation; use joint sealants appropriate for size, depth, and location of joint. Comply with requirements for sealants specified in "Joint Sealants."
E. Fire-Barrier Penetrations: Maintain indicated fire rating of walls, partitions, ceilings, and floors at pipe penetrations. Seal pipe penetrations with fire stop materials. Comply with requirements for fire stopping specified in "Penetration Firestopping."

3.2 SLEEVE-SEAL-SYSTEM INSTALLATION
A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at service piping entries into building.
B. Select type, size, and number of sealing elements required for piping material and size and for sleeve ID or hole size. Position piping in center of sleeve. Center piping in penetration, assemble sleeve-seal system components, and install in annular space between piping and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make a watertight seal.

3.3 SLEEVE-SEAL-FITTING INSTALLATION
A. Install sleeve-seal fittings in new walls and slabs as they are constructed.
B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position water stop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal the space around outside of sleeve-seal fittings.

3.4 SLEEVE AND SLEEVE-SEAL SCHEDULE

A. Use sleeves and sleeve seals for the following piping-penetration applications:

1. Exterior Concrete Walls above Grade:
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves.

2. Exterior Concrete Walls below Grade:
   a. Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves with sleeve-seal system.
      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves with sleeve-seal system.
      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

3. Concrete Slabs-on-Grade:
   a. Piping Smaller Than NPS 6: Galvanized-steel-pipe sleeves with sleeve-seal system.
      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves.
      1) Select sleeve size to allow for 1-inch annular clear space between piping and sleeve for installing sleeve-seal system.

4. Concrete Slabs above Grade:
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves.

5. Interior Partitions:
   b. Piping NPS 6 and Larger: Galvanized-steel-pipe sleeves.

END OF SECTION
SECTION 210518
ESCUTCHEONS FOR FIRE-SUPPRESSION PIPING

PART 1 GENERAL

1.1 SUMMARY
A. Section Includes:
   1. Escutcheons.
   2. Floor plates.

1.2 ACTION SUBMITTALS
A. Product Data: For each type of product indicated.

PART 2 PRODUCTS

2.1 ESCUTCHEONS
A. One-Piece, Cast-Brass Type: With polished, chrome-plated and rough-brass finish and setscrew fastener
   One-Piece, Deep-Pattern Type: Deep-drawn, box-shaped brass with chrome-plated finish and spring-clip fasteners.
B. One-Piece, Stamped-Steel Type: With chrome-plated finish and spring-clip fasteners.
C. Split-Casting Brass Type: With polished, chrome-plated and rough-brass finish and with concealed hinge and setscrew.
D. Split-Casting Brass Type: With polished, chrome-plated and rough-brass finish and with concealed hinge and setscrew.
E. Split-Plate, Stamped-Steel Type: With chrome-plated finish, concealed and exposed-rivet hinge, and spring-clip fasteners.

2.2 FLOOR PLATES
A. One-Piece Floor Plates: Cast-iron flange with holes for fasteners.
B. Split-Casting Floor Plates: Cast brass with concealed hinge.

PART 3 EXECUTION

3.1 INSTALLATION
A. Install escutcheons for exposed piping penetrations of walls, ceilings, and finished floors.
B. Install escutcheons with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
   1. Escutcheons for New Piping:
      a. Piping with Fitting or Sleeve Protruding from Wall: One-piece, deep-pattern type.
      b. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
      c. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
d. Bare Piping in Unfinished Service Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated rough-brass finish.

e. Bare Piping in Equipment Rooms: One-piece, cast-brass or split-casting brass type with polished, chrome-plated rough-brass finish.

2. Escutcheons for Existing Piping in Renovated Areas:
   a. Bare Piping at Wall and Floor Penetrations in Finished Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.
   b. Bare Piping at Ceiling Penetrations in Finished Spaces: One-piece, cast-brass or split-casting brass type with polished, chrome-plated finish.

C. Install floor plates for piping penetrations of equipment-room floors.

D. Install floor plates with ID to closely fit around pipe, tube, and insulation of piping and with OD that completely covers opening.
   1. New Piping: One-piece, floor-plate type.
   2. Existing Piping: Split-casting, floor-plate type.

3.2 FIELD QUALITY CONTROL

A. Replace broken and damaged escutcheons and floor plates using new materials.

END OF SECTION
SECTION 210523
GENERAL-DUTY VALVES FOR FIRE-SUPPRESSION PIPING

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Two-piece ball valves with indicators.
   2. Iron butterfly valves with indicators.
   3. Check valves.
   4. Bronze OS&Y gate valves.
   5. Iron OS&Y gate valves.
   6. NRS gate valves.
   7. Indicator posts.
   8. Trim and drain valves.

1.3 DEFINITIONS
A. NBR: Acrylonitrile-butadiene, Buna-N, or nitrile rubber.
B. NRS: Nonrising stem.
C. OS&Y: Outside screw and yoke.
D. SBR: Styrene-butadiene rubber.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of valve.

1.5 DELIVERY, STORAGE, AND HANDLING
A. Prepare valves for shipping as follows:
   1. Protect internal parts against rust and corrosion.
   2. Protect threads, flange faces, grooved ends, and weld ends.
B. Use the following precautions during storage:
   1. Maintain valve end protection.
   2. Store valves indoors and maintain at higher than ambient dew point temperature. If outdoor storage is necessary, store valves off the ground in watertight enclosures.
C. Use sling to handle large valves; rig sling to avoid damage to exposed parts. Do not use operating handles or stems as lifting or rigging points.
D. Protect flanges and specialties from moisture and dirt.

General-Duty Valves for Fire-Suppression Piping
PART 2 PRODUCTS

2.1 GENERAL REQUIREMENTS FOR VALVES

A. UL Listed: Valves shall be listed in UL's "Online Certifications Directory" under the headings listed below and shall bear UL mark:

1. Main Level: HAMV - Fire Main Equipment.
   a. Level 1: HCBZ - Indicator Posts, Gate Valve.
   b. Level 1: HLOT - Valves.
      1) Level 3: HLUG - Ball Valves, System Control.
      2) Level 3: HLXS - Butterfly Valves.
      3) Level 3: HMER - Check Valves.
      4) Level 3: HMRZ - Gate Valves.

   a. Level 1: VQGU - Valves, Trim and Drain.

B. FM Global Approved: Valves shall be listed in its "Approval Guide," under the headings listed below:

1. Automated Sprinkler Systems:
   a. Indicator posts.
   b. Valves.
      1) Gate valves.
      2) Check valves.
         (a) Single check valves.
      3) Miscellaneous valves.

C. Source Limitations for Valves: Obtain valves for each valve type from single manufacturer.

D. ASME Compliance:

1. ASME B16.1 for flanges on iron valves.
2. ASME B1.20.1 for threads for threaded-end valves.
3. ASME B31.9 for building services piping valves.

E. AWWA Compliance: Comply with AWWA C606 for grooved-end connections.

F. NFPA Compliance: Comply with NFPA 24 for valves.

G. Valve Pressure Ratings: Not less than the minimum pressure rating indicated or higher as required by system pressures.

H. Valve Sizes: Same as upstream piping unless otherwise indicated.

I. Valve Actuator Types:

1. Worm-gear actuator with handwheel for quarter-turn valves, except for trim and drain valves.
2. Handwheel: For other than quarter-turn trim and drain valves.
3. Handlever: For quarter-turn trim and drain valves NPS 2 and smaller.

2.2 TWO-PIECE BALL VALVES WITH INDICATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. NIBCO, Inc. (www.nibco.com)
2. Victaulic Company (www.victaulic.com)

B. Description:

1. UL 1091, except with ball instead of disc and FM Global standard for indicating valves (butterfly or ball type), Class Number 1112.
4. Body Material: Forged brass or bronze.
5. Port Size: Full or standard.
6. Seats: PTFE.
7. Stem: Bronze or stainless steel.
8. Ball: Chrome-plated brass.
9. Actuator: Weatherproof actuator housing with worm gear or traveling nut.
10. Supervisory Switch: Internal or external.
11. End Connections for Valves NPS 1 through NPS 2: Threaded ends.

2.3 IRON BUTTERFLY VALVES WITH INDICATORS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Globe Fire Sprinkler Corporation (www.globesprinkler.com)
2. Kennedy Valve Company; a division of McWane, Inc. (www.kennedyvalve.com)
3. Nibco Inc. (www.nibco.com)
4. Tyco Fire & Building Products (www.tyco-fire.com)
5. Victaulic Company (www.victaulic.com)
6. Zurn Industries, LLC (www.zurn.com)

B. Description:
1. Standard: UL 1091 and FM Global standard for indicating valves, (butterfly or ball type), Class Number 112.
3. Body Material: Cast or ductile iron.
4. Seat Material: Pressure responsive EPDM.
5. Stem: Stainless steel.
   a. Stem shall be offset from the disc centerline to allow complete 360 degree circumferential seating.
6. Disc: Ductile iron.
7. Actuator: Weatherproof actuator housing with worm gear or traveling nut.
8. Supervisory Switch: Internal or external.

2.4 CHECK VALVES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Anvil International (www.anvilintl.com)
2. Fire Protection Products, Inc. (www.fppi.com)
4. Kennedy Valve Company; a division of McWane, Inc. (www.kennedyvalve.com)
5. Matco-Norca (www.matco-norca.com)
7. Reliable Automatic Sprinkler Company (www.reliablesprinkler.com)
8. Shurjoint Piping Products (www.shurjoint.com)
9. Tyco Fire & Building Products (www.tyco-fire.com)
10. United Brass Works, Inc. (www.ubw.com)
12. Victaulic Company (www.victaulic.com)
13. Viking Corporation (www.vikingcorp.com)
14. Watts; a Watts Water Technologies Company (www.wattswater.com)
15. Wilson & Cousins Inc. (www.wilsonandcousins.com)
16. Zurn Industries, LLC (www.zurn.com)
B. Description:
3. Type: Spring assisted single swing check.
4. Suitable for horizontal or vertical installation.
5. Body Material: Cast iron, ductile iron, or bronze.
6. Clapper: Bronze, ductile iron, or stainless steel with elastomeric seal.
7. Clapper Seat: Brass, bronze, or stainless steel.
8. Hinge Shaft: Bronze or stainless steel.
10. End Connections: Flanged, grooved, or threaded.

2.5 BRONZE OS&Y GATE VALVES
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Milwaukee Valve Company (www.milwaukeevalve.com)
   2. NIBCO, Inc. (www.nibco.com)
   3. United Brass Works, Inc. (www.ubw.com)
   4. Zurn Industries, LLC (www.zurn.com)
B. Description:
   3. Body and Bonnet Material: Bronze or brass.
   4. Wedge: One-piece bronze or brass.
   5. Wedge Seat: Bronze.
   6. Stem: Bronze or brass.
   7. Packing: Non-asbestos PTFE.
   8. Supervisory Switch: External.

2.6 IRON OS&Y GATE VALVES
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. NIBCO, Inc. (www.nibco.com)
   2. Victaulic Company (www.victaulic.com)
   3. Watts; a Watts Water Technologies Company (www.wattswater.com)
   4. Zurn Industries, LLC (www.zurn.com)
B. Description:
   3. Body and Bonnet Material: Cast or ductile iron.
   4. Wedge: Cast or ductile iron, or bronze.
   5. Wedge Seat: Cast or ductile iron, or bronze.
   6. Stem: Brass or bronze.
   7. Packing: Non-asbestos PTFE.
   8. Supervisory Switch: External.

2.7 NRS GATE VALVES
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. NIBCO, Inc. (www.nibco.com)
2. Victaulic Company (www.victaulic.com)
3. Zurn Industries, LLC (www.zurn.com)

B. Description:
3. Body and Bonnet Material: Cast or ductile iron.
4. Wedge: Cast or ductile iron.
5. Wedge Seat: Cast or ductile iron, or bronze.
6. Stem: Brass or bronze.
7. Packing: Non-asbestos PTFE.
8. Supervisory Switch: External.

2.8 INDICATOR POSTS
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. American Cast Iron Pipe Company (www.american-usa.com)
2. Clow Valve Company; a subsidiary of McWane, Inc. (www.clowvalve.com)
3. Kennedy Valve Company; a division of McWane, Inc. (www.kennedyvalve.com)
5. NIBCO, Inc. (www.nibco.com)
6. Victaulic Company (www.victaulic.com)

B. Description:
2. Type: Wall.
3. Base Barrel Material: Cast or ductile iron.
4. Cap: Cast or ductile iron.

2.9 TRIM AND DRAIN VALVES
A. Ball Valves:
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   a. NIBCO, Inc. (www.nibco.com)
   b. Victaulic Company (www.victaulic.com)
   c. Watts; a Watts Water Technologies Company (www.wattswater.com)
   d. Zurn Industries, LLC (www.zurn.com)
2. Description:
   b. Body Design: Two piece.
   c. Body Material: Forged brass or bronze.
   d. Port size: Full or standard.
   e. Seats: PTFE.
   f. Stem: Bronze or stainless steel.
   g. Ball: Chrome-plated brass.
   h. Actuator: Handlever.
   i. End Connections for Valves NPS 1 through NPS 2-1/2: Threaded ends.
   j. End Connections for Valves NPS 1-1/4 and NPS 2-1/2: Grooved ends.
B. Angle Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      b. NIBCO, Inc. (www.nibco.com)
      c. United Brass Works, Inc. (www.ubw.com)
   2. Description:
      b. Body Material: Brass or bronze.
      c. Ends: Threaded.
      d. Stem: Bronze.
      e. Disc: Bronze.
      f. Packing: Asbestos free.
      g. Handwheel: Malleable iron, bronze, or aluminum.

C. Globe Valves:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. NIBCO, Inc. (www.nibco.com)
      b. United Brass Works, Inc. (www.ubw.com)
   2. Description:
      c. Ends: Threaded.
      d. Stem: Bronze.
      e. Disc Holder and Nut: Bronze.
      f. Disc Seat: Nitrile.
      g. Packing: Asbestos free.
      h. Handwheel: Malleable iron, bronze, or aluminum.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling.
B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.
C. Examine threads on valve and mating pipe for form and cleanliness.
D. Examine grooved ends for form and cleanliness. Grooved ends shall be clean and free from indentations or projections in the area from valve or fitting end to (and including) the groove.
E. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.
F. Do not attempt to repair defective valves; replace with new valves.

3.2 GENERAL REQUIREMENTS FOR VALVE INSTALLATION
A. Comply with requirements in the following Sections for specific valve installation requirements and applications:
1. Division 21 "Fire-Suppression Standpipes" for application of valves in fire-suppression stand-pipes.
2. Division 21 "Wet-Pipe Sprinkler Systems" for application of valves in wet-pipe, fire-suppression sprinkler systems.

B. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire-department connections. Install permanent identification signs indicating portion of system controlled by each valve.

C. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.

D. Install valves having threaded connections with unions at each piece of equipment arranged to allow easy access, service, maintenance, and equipment removal without system shutdown. Provide separate support where necessary.

E. Install valves in horizontal piping with stem at or above the pipe center.

F. Install valves in position to allow full stem movement.

G. Install valve tags. Comply with requirements in Division 21 "Identification for Fire-Suppression Piping and Equipment" for valve tags and schedules and signs on surfaces concealing valves; and the NFPA standard applying to the piping system in which valves are installed. Install permanent identification signs indicating the portion of system controlled by each valve.

H. Install listed fire-protection shutoff valves supervised-open, located to control sources of water supply except from fire-department connections.

I. Install check valve in each water-supply connection. Install backflow preventers instead of check valves in potable-water-supply sources.

END OF SECTION
SECTION 210529
HANGERS AND SUPPORTS FOR FIRE SUPPRESSION PIPING AND EQUIPMENT

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. This Section includes the following hangers and supports for fire suppression systems piping and equipment:
   1. Steel pipe hangers and supports.
   2. Trapeze pipe hangers.
   3. Metal framing systems.
   4. Fastener systems.
   5. Equipment supports.

1.3 DEFINITIONS
A. MSS: Manufacturers Standardization Society for the Valve and Fittings Industry Incorporated
B. Terminology: As defined in MSS SP-90, “Guidelines on Terminology for Pipe Hangers and Supports.”

1.4 PERFORMANCE REQUIREMENTS
A. Design supports for multiple pipes, including pipe stands, capable of supporting combined weight of supported systems, system contents, and test water.
B. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

1.5 SUBMITTALS
A. Product Data: For the following:
   1. Steel pipe hangers and supports.
   2. Powder-actuated fastener systems.
   3. Pipe positioning systems.
B. Shop Drawings: Show fabrication and installation details and include calculations for the following:
   1. Trapeze pipe hangers. Include Product Data for components.
   2. Metal framing systems. Include Product Data for components.
   3. Pipe stands. Include Product Data for components.
   4. Equipment supports.

1.6 QUALITY ASSURANCE
A. Welding: Qualify procedures and personnel according to the following:
   1. AWS D1.1, "Structural Welding Code--Steel."
   3. AWS D1.4, "Structural Welding Code--Reinforcing Steel."
   4. ASME Boiler and Pressure Vessel Code: Section IX.
PART 2 PRODUCTS

2.1 MANUFACTURERS
A. In other Part 2 articles where titles below introduce lists, the following requirements apply to product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the manufacturers specified.

2.2 STEEL PIPE HANGERS AND SUPPORTS
A. Description: MSS SP-58, Types 1 through 58, factory-fabricated components. Refer to Part 3 "Hanger and Support Applications" Article for where to use specific hanger and support types.
B. Manufacturers:
   1. AAA Technology & Specialties Company, Incorporated (www.aaatech.com)
   2. Anvil International (www.anvilintl.com)
   4. B-Line Systems, Incorporated; a division of Cooper Industries (www.cooperindustries.com)
   5. Carpenter & Paterson, Incorporated; a division of Cooper Industries (www.carpenterandpaterson.com)
   6. Empire Industries, Incorporated (www.empireindustries.com)
   7. ERICO/Michigan Hanger Company (www.erico.com)
  10. PHD Manufacturing, Incorporated (www.phd-mfg.com)
  11. PHS Industries, Incorporated
  13. Tolco Incorporated; a division of Cooper Industries (www.cooperindustries.com)
C. Galvanized, Metallic Coatings: Pre-galvanized or hot dipped.
D. Nonmetallic Coatings: Plastic coating, jacket, or liner.

2.3 TRAPEZE PIPE HANGERS
A. Description: MSS SP-58, Type 59, shop- or field-fabricated pipe-support assembly made from structural-steel shapes with MSS SP-58 hanger rods, nuts, saddles, and U-bolts.

2.4 METAL FRAMING SYSTEMS
A. Description: MFMA-4, shop- or field-fabricated pipe-support assembly made of steel channels and other components.
B. Manufacturers:
   1. B-Line Systems, Incorporated; a division of Cooper Industries (www.cooperindustries.com)
   2. ERICO/Michigan Hanger Company (www.erico.com)
   3. Power-Strut Division; Tyco International, Ltd. (www.powerstrut.com)
   4. Thomas & Betts Corporation (www.tnb.com)
   5. Tolco Incorporated; a division of Cooper Industries (www.cooperindustries.com)
   6. Unistrut Corporation; a part of Atkore International (www.unistrut.us)
C. Coatings: Manufacturer's standard finish unless bare metal surfaces are indicated.
D. Nonmetallic Coatings: Plastic coating, jacket, or liner.
2.5 FASTENER SYSTEMS

A. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Manufacturers:
      a. Hilti, Incorporated (www.us.hilti.com)
      b. ITW Ramset/Red Head (www.ramset.com)
      c. MKT Fastening, LLC (www.mkffastening.com)
      d. Powers Fasteners (www.powers.com)

B. Mechanical-Expansion Anchors: Insert-wedge-type stainless steel, for use in hardened Portland cement concrete with pull-out, tension, and shear capacities appropriate for supported loads and building materials where used.
   1. Manufacturers:
      a. B-Line Systems, Incorporated; a division of Cooper Industries (www.cooperindustries.com)
      b. Empire Industries, Incorporated (www.empireindustries.com)
      c. Hilti, Incorporated (www.us.hilti.com)
      d. ITW Ramset/Red Head (www.ramset.com)
      e. MKT Fastening, LLC (www.mkffastening.com)
      f. Powers Fasteners (www.powers.com)

2.6 MISCELLANEOUS MATERIALS

A. Structural Steel: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

B. Grout: ASTM C 1107, factory-mixed and -packaged, dry, hydraulic-cement, non-shrink and nonmetallic grout; suitable for interior and exterior applications.
   2. Design Mix: 5000-psi, 28-day compressive strength.

PART 3 EXECUTION

3.1 HANGER AND SUPPORT APPLICATIONS

A. Shared hangers and supports with other systems that have vibration control devices is prohibited.

B. Attachments to metal roof decks will not be permitted.

C. Comply with MSS SP-69 for pipe hanger selections and applications that are not specified in piping system Sections.

D. Use hangers and supports with galvanized, metallic coatings for piping and equipment that will not have field-applied finish.

E. Use nonmetallic coatings on attachments for electrolytic protection where attachments are in direct contact with copper tubing.

F. Horizontal-Piping Hangers and Supports: Unless otherwise indicated; install the following types:
   1. Adjustable, Steel Clevis Hangers (MSS Type 1): For suspension of non-insulated stationary pipes, NPS 1/2 to NPS 30.
   2. Adjustable, Steel Band Hangers (MSS Type 7): For suspension of non-insulated stationary pipes, NPS 1/2 to NPS 8.
   3. Extension Hinged or 2-Bolt Split Pipe Clamps (MSS Type 12): For suspension of non-insulated stationary pipes, NPS 3/8 to NPS 3.
   4. U-Bolts (MSS Type 24): For support of heavy pipes, NPS 1/2 to NPS 30.
5. Pipe Stanchion Saddles (MSS Type 37): For support of pipes, NPS 4 to NPS 36, with steel pipe base stanchion support and cast-iron floor flange and with U-bolt to retain pipe.

G. Vertical-Piping Clamps: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Extension Pipe or Riser Clamps (MSS Type 8): For support of pipe risers, NPS 3/4 to NPS 20.
   2. Carbon- or Alloy-Steel Riser Clamps (MSS Type 42): For support of pipe risers, NPS 3/4 to NPS 20, if longer ends are required for riser clamps.

H. Hanger-Rod Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel Turnbuckles (MSS Type 13): For adjustment up to 6 inches for heavy loads.
   2. Steel Clevises (MSS Type 14): For 120 to 450 deg F piping installations.
   3. Swivel Turnbuckles (MSS Type 15): For use with MSS Type 11, split pipe rings.
   4. Malleable-Iron Sockets (MSS Type 16): For attaching hanger rods to various types of building attachments.
   5. Steel Weldless Eye Nuts (MSS Type 17): For 120 to 450 deg F piping installations.

I. Building Attachments: Unless otherwise indicated and except as specified in piping system Sections, install the following types:
   1. Steel or Malleable Concrete Inserts (MSS Type 18): For upper attachment to suspend pipe hangers from concrete ceiling.
   2. Top-Beam C-Clamps (MSS Type 19): For use under roof installations with bar-joist construction to attach to top flange of structural shape.
   3. Welded-Steel Brackets: For support of pipes from below, or for suspending from above by using clip and rod. Use one of the following for indicated loads:
      a. Light (MSS Type 31): 750 lb.
      b. Medium (MSS Type 32): 1500 lb.
      c. Heavy (MSS Type 33): 3000 lb.
   4. Side-Beam Brackets (MSS Type 34): For sides of steel or wooden beams.

J. Comply with MSS SP-69 for trapeze pipe hanger selections and applications that are not specified in piping system Sections.

K. Comply with MFMA-102 for metal framing system selections and applications that are not specified in piping system Sections.

L. Use powder-actuated fasteners or mechanical-expansion anchors instead of building attachments where required in concrete construction.

3.2 HANGER AND SUPPORT INSTALLATION

A. Steel Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Install hangers, supports, clamps, and attachments as required to properly support piping from building structure.

B. Trapeze Pipe Hanger Installation: Comply with MSS SP-69 and MSS SP-89. Arrange for grouping of parallel runs of horizontal piping, and support together on field-fabricated trapeze pipe hangers.
   1. Pipes of Various Sizes: Support together and space trapezes for smallest pipe size or install intermediate supports for smaller diameter pipes as specified above for individual pipe hangers.
   2. Field fabricate from ASTM A 36/A 36M, carbon-steel shapes selected for loads being supported. Weld steel according to AWS D1.1/D1.1M.

C. Metal Framing System Installation: Arrange for grouping of parallel runs of piping, and support together on field-assembled metal framing systems.

D. Fastener System Installation:
1. Install powder-actuated fasteners for use in lightweight concrete or concrete slabs greater than 4 inches thick in concrete after concrete is placed and completely cured. Use operators that are licensed by powder-actuated tool manufacturer. Install fasteners according to powder-actuated tool manufacturer’s operating manual.

2. Install mechanical fasteners for use in lightweight concrete or concrete slabs less than 4 inches thick in concrete after concrete is placed and completely cured.

3. Install mechanical-expansion anchors in concrete after concrete is placed and completely cured. Install fasteners according to manufacturer’s written instructions.

E. Install hangers and supports complete with necessary inserts, bolts, rods, nuts, washers, and other accessories.

G. Install lateral bracing with pipe hangers and supports to prevent swaying.

H. Install building attachments within concrete slabs or attach to structural steel. Install additional attachments at concentrated loads, including valves, flanges, and strainers, NPS 2-1/2 and larger and at changes in direction of piping. Install concrete inserts before concrete is placed; fasten inserts to forms and install reinforcing bars through openings at top of inserts.

I. Load Distribution: Install hangers and supports so piping live and dead loads and stresses from movement will not be transmitted to connected equipment.

J. Pipe Slopes: Install hangers and supports to provide indicated pipe slopes and to not exceed maximum pipe deflections allowed by ASME B31.9 for building services piping.

3.3 EQUIPMENT SUPPORTS
A. Fabricate structural-steel stands to suspend equipment from structure overhead or to support equipment above floor.

B. Grouting: Place grout under supports for equipment and make smooth bearing surface.

C. Provide lateral bracing, to prevent swaying, for equipment supports.

3.4 METAL FABRICATIONS
A. Cut, drill, and fit miscellaneous metal fabrications for trapeze pipe hangers and equipment supports.

B. Fit exposed connections together to form hairline joints. Field weld connections that cannot be shop welded because of shipping size limitations.

C. Field Welding: Comply with AWS D1.1/D1.1M procedures for shielded, metal arc welding, appearance and quality of welds, and methods used in correcting welding work, and with the following:
   1. Use materials and methods that minimize distortion and develop strength and corrosion resistance of base metals.
   2. Obtain fusion without undercut or overlap.
   3. Remove welding flux immediately.
   4. Finish welds at exposed connections so no roughness shows after finishing and contours of welded surfaces match adjacent contours.

3.5 ADJUSTING
A. Hanger Adjustments: Adjust hangers to distribute loads equally on attachments and to achieve indicated slope of pipe.
B. Trim excess length of continuous-thread hanger and support rods to 1-1/2 inches.

3.6 PAINTING
A. Touch Up: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils.
B. Touch Up: Cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal are specified in Division 09 painting Sections.
C. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

3.7 CLEANING
A. Clean exposed hangers and supports located finished spaces.

END OF SECTION
SECTION 210553
IDENTIFICATION FOR FIRE SUPPRESSION PIPING AND EQUIPMENT

PART 1 GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Equipment labels.
   2. Warning signs and labels.
   3. Pipe labels.
   4. Valve tags.
   5. Warning tags.

1.3 SUBMITTALS
A. Product Data: For each type of product indicated.
B. Samples: For color, letter style, and graphic representation required for each identification material and device.
C. Equipment Label Schedule: Include a listing of all equipment to be labeled with the proposed content for each label.
D. Valve numbering scheme.
E. Valve Schedules: For each piping system to include in maintenance manuals.

PART 2 PRODUCTS

2.1 EQUIPMENT LABELS
A. Plastic Labels for Equipment:
   1. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.
   2. Letter Color: White
   3. Background Color: Red
   4. Maximum Temperature: Able to withstand temperatures up to 160 deg F.
   5. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.
   6. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.
   7. Fasteners: Stainless-steel rivets or self-tapping screws.
   8. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.
B. Label Content: Include equipment's Drawing designation or unique equipment number, Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified.
C. Equipment Label Schedule: For each item of equipment to be labeled, on 8-1/2-by-11-inch bond paper. Tabulate equipment identification number and identify Drawing numbers where equipment is indicated (plans, details, and schedules), plus the Specification Section number and title where equipment is specified. Equipment schedule shall be included in operation and maintenance data.

2.2 WARNING SIGNS AND LABELS

A. Material and Thickness: Multilayer, multicolor, plastic labels for mechanical engraving, 1/8 inch thick, and having predrilled holes for attachment hardware.

C. Background Color: Red.

D. Maximum Temperature: Able to withstand temperatures up to 160 deg F.

E. Minimum Label Size: Length and width vary for required label content, but not less than 2-1/2 by 3/4 inch.

F. Minimum Letter Size: 1/4 inch for name of units if viewing distance is less than 24 inches, 1/2 inch for viewing distances up to 72 inches, and proportionately larger lettering for greater viewing distances. Include secondary lettering two-thirds to three-fourths the size of principal lettering.

G. Fasteners: Stainless-steel rivets or self-tapping screws.

H. Adhesive: Contact-type permanent adhesive, compatible with label and with substrate.

I. Label Content: Include caution and warning information, plus emergency notification instructions.

2.3 PIPE LABELS

A. General Requirements for Manufactured Pipe Labels: Preprinted, color-coded, with lettering indicating service, and showing flow direction.

B. Pretensioned Pipe Labels: Precoiled, semi rigid plastic formed to [partially cover] [cover full] circumference of pipe and to attach to pipe without fasteners or adhesive.

C. Self-Adhesive Pipe Labels: Printed plastic with contact-type, permanent-adhesive backing.

D. Pipe Label Contents: Include identification of piping service using same designations or abbreviations as used on Drawings, pipe size, and an arrow indicating flow direction.
   1. Flow-Direction Arrows: Integral with piping system service lettering to accommodate both directions or as separate unit on each pipe label to indicate flow direction.
   2. Lettering Size: At least 1-1/2 inches high.

2.4 VALVE TAGS

A. Valve Tags: Stamped or engraved with 1/4-inch letters for piping system abbreviation and 1/2-inch numbers.
   1. Tag Material: Brass, 0.032-inch minimum thickness, and having predrilled or stamped holes for attachment hardware.
   2. Fasteners: Brass wire-link or beaded chain; or S-hook.

B. Valve Schedules: For each piping system, on 8-1/2-by-11-inch bond paper. Tabulate valve number, piping system, system abbreviation (as shown on valve tag), location of valve (room or space), normal-operating position (open, closed, or modulating), and variations for identification. Mark valves for emergency shutoff and similar special uses.
   1. Valve-tag schedule shall be included in operation and maintenance data.
2.5 WARNING TAGS
A. Warning Tags: Preprinted or partially preprinted, accident-prevention tags, of plasticized card stock with matte finish suitable for writing.
   1. Size: Approximately 4 by 7 inches.
   2. Fasteners: Brass grommet and wire.
   3. Nomenclature: Large-size primary caption such as "DANGER," "CAUTION," or "DO NOT OPERATE."

PART 3 EXECUTION

3.1 PREPARATION
A. Clean piping and equipment surfaces of substances that could impair bond of identification devices, including dirt, oil, grease, release agents, and incompatible primers, paints, and encapsulants.

3.2 EQUIPMENT LABEL INSTALLATION
A. Install or permanently fasten labels on each major item of fire suppression equipment.
B. Locate equipment labels where accessible and visible.

3.3 PIPE LABEL INSTALLATION
A. Where piping is exposed to view from public below, locate labels on top of piping just outside of public view.
B. Locate pipe labels where piping is exposed or above accessible ceilings in finished spaces; machine rooms; accessible maintenance spaces such as shafts, tunnels, and plenums; and exterior exposed locations as follows:
   1. Near each valve and control device.
   2. Near each branch connection.
   3. Near penetrations through walls, floors, ceilings, and inaccessible enclosures.
   4. At access doors, manholes, and similar access points that permit view of concealed piping.
   5. Near major equipment items and other points of origination and termination.
   6. Spaced at maximum intervals of 50 feet along each run. Reduce intervals to 25 feet in areas of congested piping and equipment.
C. Pipe Label Color Schedule:
   1. Fire Suppression Piping:
      a. Background Color: Red.

3.4 VALVE-TAG INSTALLATION
A. Install tags on valves and control devices in piping systems. List tagged valves in a valve schedule.
B. Valve-Tag Application Schedule: Tag valves according to size, shape, and color scheme and with captions similar to those indicated in the following subparagraphs:
   1. Valve-Tag Size and Shape:
      b. Compressed Air: 1-1/2 inches round.
   2. Valve-Tag Color: Red

3.5 WARNING-TAG INSTALLATION
   A. Attach warning tags to, equipment and other items where required.

END OF SECTION
SECTION 211119
FIRE-DEPARTMENT CONNECTIONS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Exposed-type fire-department connections.
   2. Flush-type fire-department connections.

1.3 ACTION SUBMITTALS
A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for each fire-department connection.

PART 2 PRODUCTS

2.1 EXPOSED-TYPE FIRE-DEPARTMENT CONNECTION
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. American Fire Hose & Cabinet (www.americanfirehose.com)
   2. Elkhart Brass Mfg. Co., Inc. (www.elkhartbrass.com)
   4. Fire-End & Croker Corporation (www.croker.com)
   5. GMR International Equipment Corporation (www.gmr-fire.com)
   8. Wilson & Cousins Inc. (www.wilsonandcousins.com)
B. Standard: UL 405.
C. Type: Exposed, projecting, for wall mounting.
D. Pressure Rating: 175 psig minimum.
E. Body Material: Corrosion-resistant metal.
F. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
G. Caps: Brass, lugged type, with gasket and chain.
H. Escutcheon Plate: Round, brass, wall type.
I. Outlet: Back, with pipe threads.
J. Number of Inlets: Three.
K. Escutcheon Plate Marking: Similar to “AUTO SPKR & STANDPIPE.”
L. Finish: Rough brass or bronze.
M. Outlet Size: NPS 4.

2.2 FLUSH-TYPE FIRE-DEPARTMENT CONNECTION
A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. American Fire Hose & Cabinet (www.americanfirehose.com)
   2. Elkhart Brass Mfg. Co., Inc. (www.elkhartbrass.com)
   3. GMR International Equipment Corporation (www.gmr-fire.com)
   5. Potter Roemer LLC (www.potterroemer.com)
B. Standard: UL 405.
C. Type: Flush, for wall mounting.
D. Pressure Rating: 175 psig minimum.
E. Body Material: Corrosion-resistant metal.
F. Inlets: Brass with threads according to NFPA 1963 and matching local fire-department sizes and threads. Include extension pipe nipples, brass lugged swivel connections, and check devices or clappers.
G. Caps: Brass, lugged type, with gasket and chain.
H. Escutcheon Plate: Rectangular, brass, wall type.
I. Outlet: With pipe threads.
J. Body Style: Horizontal.
K. Number of Inlets: Three.
L. Outlet Location: Back or Top.
M. Escutcheon Plate Marking: Similar to "AUTO SPKR & STANDPIPE."
N. Finish: Rough brass or bronze.
O. Outlet Size: NPS 4.

PART 3 EXECUTION

3.1 EXAMINATION
A. Examine conditions, with Installer present, for compliance with requirements for installation tolerances and other conditions affecting performance of fire-department connections.
B. Examine roughing-in for fire-suppression standpipe system to verify actual locations of piping connections before fire-department connection installation.
C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION
A. Install wall-type fire-department connections.
B. Install two protective pipe bollards on sides of each fire-department connection.
C. Install automatic (ball-drip) drain valve at each check valve for fire-department connection.
SECTION 211200
FIRE-SUPPRESSION STANDPIPES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS
A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY
A. Section Includes:
   1. Pipes, fittings, and specialties.
   2. Fire-protection specialty valves.
   3. Hose connections.
   6. Control panels.
   7. Pressure gages.
B. Related Sections:
   1. Division 21 Section "Wet-Pipe Sprinkler Systems" for wet-pipe sprinkler piping.
   2. Division 21 Section "Electric-Drive, Centrifugal Fire Pumps" for fire pumps, pressure-maintenance pumps, and fire-pump controllers.
   3. Division 28 Section "Digital, Addressable Fire-Alarm System" for alarm devices not specified in this Section.

1.3 DEFINITIONS
A. Standard-Pressure Standpipe Piping: Fire-suppression standpipe piping designed to operate at working pressure 175 psig maximum.

1.4 ACTION SUBMITTALS
A. Product Data: For each type of product. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.
B. Shop Drawings: For fire-suppression standpipes.
   1. Include plans, elevations, sections, and attachment details.
   2. Include diagrams for power, signal, and control wiring.
C. Delegated-Design Submittal: For standpipe systems indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.

1.5 INFORMATIONAL SUBMITTALS
A. Approved Standpipe Drawings: Working plans, prepared according to NFPA 14, that have been approved by authorities having jurisdiction, including hydraulic calculations if applicable.
B. Fire-hydrant flow test report.
C. Field Test Reports and Certificates: Indicate and interpret test results for compliance with performance requirements and as described in NFPA 14. Include "Contractor's Material and Test Certificate for Aboveground Piping" and "Contractor's Material and Test Certificate for Underground Piping."

D. Field quality-control reports.

**1.6 CLOSEOUT SUBMITTALS**

A. Operation and Maintenance Data: For fire-suppression standpipes specialties to include in emergency, operation, and maintenance manuals.

**1.7 QUALITY ASSURANCE**

A. Installer Qualifications:
   1. Installer’s responsibilities include designing, fabricating, and installing fire-suppression standpipes and providing professional engineering services needed to assume engineering responsibility. Base calculations on results of fire-hydrant flow test.
      a. Engineering Responsibility: Preparation of working plans, calculations, and field test reports by a qualified professional engineer.

B. Welding Qualifications: Qualify procedures and operators according to ASME Boiler and Pressure Vessel Code.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. NFPA Standards: Fire-suppression standpipe equipment, specialties, accessories, installation, and testing shall comply with NFPA 14, "Installation of Standpipe and Hose Systems."

**1.8 PROJECT CONDITIONS**

A. Interruption of Existing Fire-Suppression Standpipe Service: Do not interrupt fire-suppression standpipe service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary fire-suppression standpipe service according to requirements indicated:
   1. Notify Architect and Owner no fewer than two days in advance of proposed interruption of fire-suppression standpipe service.
   2. Do not proceed with interruption of fire-suppression standpipe service without Owner’s written permission.

**PART 2 PRODUCTS**

**2.1 SYSTEM DESCRIPTIONS**

A. Automatic Wet-Type, Class I Standpipe System: Includes NPS 2-1/2 hose connections. Has open water-supply valve with pressure maintained and is capable of supplying water demand.

B. Automatic Wet-Type, Class II Standpipe System: Includes NPS 1-1/2 hose stations. Has open water-supply valve with pressure maintained and is capable of supplying water demand.

C. Automatic Wet-Type, Class III Standpipe System: Includes NPS 1-1/2 hose stations and NPS 2-1/2 hose connections. Has open water-supply valve with pressure maintained and is capable of supplying water demand.
2.2 PERFORMANCE REQUIREMENTS
A. Standard-Pressure, Fire-Suppression Standpipe System Component: Listed for 175-psig minimum working pressure.
B. Delegated Design: Design fire-suppression standpipes, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
C. Fire-suppression standpipe design shall be approved by authorities having jurisdiction.
   1. Minimum residual pressure at each hose-connection outlet is as follows:
      a. NPS 1-1/2 Hose Connections: 65 psig
      b. NPS 2-1/2 Hose Connections: 100 psig.

2.3 PIPING MATERIALS
A. Comply with requirements in “Piping Schedule” Article for applications of pipe, tube, and fitting materials, and for joining methods for specific services, service locations, and pipe sizes.

2.4 BLACK STEEL PIPE AND ASSOCIATED FITTINGS
A. Schedule 40: ASTM A 53/A 53M, Type E, Grade B; with factory- or field-formed ends to accommodate joining method.
